

A comparative study on the flow over an airfoil using transitional turbulence models - DTU Orbit (09/11/2017)

A comparative study on the flow over an airfoil using transitional turbulence models

This work addresses the simulation of the flow over NREL S826 airfoil under a relatively low Reynolds number ($Re = 1 \times 10^5$) using the CFD solvers OpenFoam and ANSYS Fluent. The flow is simulated using two different transition models, $\gamma - Re\theta$ and $k - kL - \omega$ model, and the results are examined against the $k - \omega$ SST model without transitional formulations. By comparing the simulations with the available experimental data, we find that the using the transitional model can effectively improve the flow prediction, especially the drag coefficient results, before the stall.

General information

State: Published

Organisations: Department of Wind Energy, Fluid Mechanics, Technical University of Denmark

Authors: Lin, M. (Ekstern), Sarlak Chivae, H. (Intern)

Number of pages: 5

Publication date: 2016

Conference: 13th International Conference of Numerical Analysis and Applied Mathematics 2015 (ICNAAM 2015),
Greece, 22/09/2015 - 22/09/2015

Main Research Area: Technical/natural sciences

Publication information

Journal: AIP Conference Proceedings

Volume: 1738

Article number: 500006
