

First-year survival of North East Atlantic mackerel (*Scomber scombrus*) from 1998 to 2012 appears to be driven by availability of *Calanus*, a preferred copepod prey - DTU Orbit (09/11/2017)

First-year survival of North East Atlantic mackerel (*Scomber scombrus*) from 1998 to 2012 appears to be driven by availability of *Calanus*, a preferred copepod prey

Mackerel (*Scomber scombrus*) is one of the ecologically and economically most important fish species in the Atlantic. Its recruitment has, for unknown reasons, been exceptional from 1998 to 2012. The majority (75%) of the survivors in the first winter were found north of an oceanographic division at approximately 52°N, despite the fact that mackerel spawns over a wide range of latitudes. Multivariate time series modelling of survivor abundance in the north revealed a significant correlation with the abundance of copepodites (stage I–IV) of *Calanus* sp. in the spawning season (April to June). The copepodites were a mix of *C. helgolandicus* (dominating) and *C. finmarchicus*. The growth of mackerel larvae is known to be positively related to the availability of nauplii and copepodites of preferred prey species, namely, large calanoid copepod species such as *Calanus*. The statistical relationship between mackerel survivors and abundance of *Calanus*, therefore, most likely, reflected a causal relationship: high availability of *Calanus* probably reduced starvation, stage-specific predation and cannibalism (owing to prey switching). The effects of other abundant, but less preferred zooplankton taxa, (*Acartia* sp., Branchiopoda spp. and Echinodermata spp. larvae), as well as stock size, temperature and wind-induced turbulence were not found to be significant. However, stock size was retained in the final model because of a significant interaction with *Calanus* in oceanic areas west of the North European continental shelf. This was suggested to be a consequence of a density driven expansion of the spawning area that increased the overlap between early life stages of mackerel and food (*Calanus*) in new areas.
