

## Effect of Plastic Pre-straining on Residual Stress and Composition Profiles in Low-Temperature Surface-Hardened Austenitic Stainless Steel - DTU Orbit (09/11/2017)

### Effect of Plastic Pre-straining on Residual Stress and Composition Profiles in Low-Temperature Surface-Hardened Austenitic Stainless Steel

The present work deals with the evaluation of the residual stress profiles in expanded austenite by applying grazing incidence X-ray diffraction (GI-XRD) combined with successive sublayer removal. Annealed and deformed ( $\epsilon_{eq}=0.5$ ) samples of stable stainless steel EN 1.4369 were nitrided or nitrocarburized. The residual stress profiles resulting from the thermochemical low-temperature surface treatment were measured. The results indicate high-residual compressive stresses of several GPa's in the nitrided region, while lower-compressive stresses are produced in the carburized case. Plastic deformation in the steel prior to thermochemical treatment has a hardly measurable influence on the nitrogen-rich zone, while it has a measurable effect on the stresses and depth of the carbon-rich zone.

#### General information

State: Published

Organisations: Department of Mechanical Engineering, Materials and Surface Engineering

Authors: Bottoli, F. (Intern), Christiansen, T. L. (Intern), Winther, G. (Intern), Somers, M. A. J. (Intern)

Pages: 4001–4011

Publication date: 2016

Main Research Area: Technical/natural sciences

#### Publication information
