Prop-2-yn-1-yl 4,6-di-O-acetyl-2,3-dideoxy- α -D-erythro-hex-2-enopyranoside

Fanuel M. Mesfin, Henok H. Kinfe* and Alfred Muller*

Research Center for Synthesis and Catalysis, Department of Chemistry, University of Johannesburg (APK Campus), PO Box 524, Auckland Park, Johannesburg 2006, South Africa

Correspondence e-mail: hhkinfe@uj.ac.za, mullera@uj.ac.za

Received 28 October 2011; accepted 8 November 2011

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.002$ Å; R factor = 0.023; wR factor = 0.058; data-to-parameter ratio = 12.6.

The absolute structure of the title compound, $\text{C}_{13}\text{H}_{16}\text{O}_6$, was determined. The pyranosyl ring adopting an envelope conformation. The acetyl groups are located in equatorial positions. The crystal structure features weak $\text{C}-\text{H}\cdots\text{O}$ interactions.

Prop-2-yn-1-yl 4,6-di-*O*-acetyl-2,3-dideoxy- α -D-erythro-hex-2-enopyranoside

F. M. Mesfin, H. H. Kinfe and A. Muller

Comment

Treatment of 3,4,6-tri-*O*-acetyl-D-glucal with a Lewis acid catalyst in the presence of alcohols and other C and S nucleophiles results to allylic rearrangement of the glucal and the reaction is called Ferrier rearrangement (Ferrier & Prasad, 1969; López *et al.*, 1995; Yadav *et al.*, 2001; Kinfe *et al.*, 2011). Recently, we reported the synthesis of the title compound by treating a glucal with NaHSO₄ supported on silica gel in the presence of propargyl alcohol (Kinfe *et al.*, 2011). Herein, we report the crystal structure of the pure diastereomer obtained by crystallization from the mixture of products.

In the crystal structure of the title compound the acetyl groups are in equatorial positions (see Fig. 1). The pyran ring adopts an envelope conformation with ring puckering parameters of $q_2 = 0.4180(14)$ Å, $q_3 = 0.3070(14)$ Å, $Q = 0.5186(13)$ Å and $\varphi_2 = 324.1(2)^\circ$ (see Cremer & Pople, 1975). Several weak C—H \cdots O interactions are noted and listed in Table 1.

Experimental

To a solution of a tri-*O*-acetyl-D-glucal (100 mg, 0.36 mmol) and propargyl alcohol (0.042 ml, 0.72 mmol) in CH₃CN (1 ml) NaHSO₄-SiO₂ (2.5 mg, 3.0 mmol NaHSO₄/g) was added (see Breton, 1997). The resulting mixture was stirred at 80 °C for 5 min. After adding silica gel to the reaction mixture at room temperature, the solvent was evaporated *in vacuo* without heating until a free-flowing solid was obtained. The resulting solid was column chromatographed using 1:9 ethyl acetate:hexane eluent to afford α : β (6:1) mixture of 2,3-unsaturated glycosides in 90% yield as a white solid. Recrystallization from a mixture of DCM and hexane afforded the title compound in 50% yield as colorless crystals.

Refinement

All hydrogen atoms were positioned in geometrically idealized positions with C—H = 1.00 Å (methine), 0.99 Å (methylene), 0.98 Å (methyl) and 0.95 Å (aromatic and acetylenic). All hydrogen atoms were allowed to ride on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$, except for the methyl where $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}$ was utilized. The initial positions of methyl hydrogen atoms were located from a Fourier difference map and refined as fixed rotor. The D enantiomer was determined on the basis of 872 Friedel pairs with the final Flack parameter refined to -0.05 (14). The highest residual electron density of 0.10 e.Å⁻³ is 0.63 Å from H6A representing no physical meaning.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.023$	H-atom parameters constrained
$wR(F^2) = 0.058$	$w = 1/[\sigma^2(F_o^2) + (0.0281P)^2 + 0.1772P]$
$S = 1.06$	where $P = (F_o^2 + 2F_c^2)/3$
2184 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
174 parameters	$\Delta\rho_{\text{max}} = 0.1 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.12 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 872 Friedel pairs
	Flack parameter: $-0.05 (14)$

Special details

Experimental. The intensity data was collected on a Bruker Apex DUO 4 K CCD diffractometer using an exposure time of 5 s/frame. A total of 2276 frames were collected with a frame width of 1° covering up to $\theta = 64.63^\circ$ with 98.1% completeness accomplished.

Analytical data: ^1H NMR (CDCl_3 , 300 MHz): δ 5.90 (d, $J = 10.4$ Hz, 1H), 5.82 (td, $J = 2.4$ and 10.0 Hz, 1H), 5.32 (dd, $J = 1.2$ and 9.6 Hz, 1H), 5.21 (s, 1H), 4.40–4.03 (m, 5H), 2.44 (t, $J = 2.4$ Hz, 1H), 2.08 (s, 3H), 2.07 (s, 3H); ^{13}C NMR (CDCl_3 , 75 MHz): δ 170.8, 170.2, 129.8, 127.2, 92.8, 79.0, 74.8, 67.2, 65.1, 62.7, 55.0, 20.9, 20.8

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
