## Contents

Preface Acknowledgements		xi xiii
1	Introduction	1
1.1	What is CFD?	1
1.2	How does a CFD code work?	2
1.3	Problem solving with CFD	4
1.4	Scope of this book	6
2	Conservation laws of fluid motion and boundary	
	conditions	9
2.1	Governing equations of fluid flow and heat transfer	9
	2.1.1 Mass conservation in three dimensions	10
	2.1.2 Rates of change following a fluid particle and for	
	a fluid element	12
	2.1.3 Momentum equation in three dimensions	14
	2.1.4 Energy equation in three dimensions	16
2.2	Equations of state	20
2.3	Navier-Stokes equations for a Newtonian fluid	21
2.4	Conservative form of the governing equations of fluid flow	24
2.5	Differential and integral forms of the general transport equations	24
2.6	Classification of physical behaviours	26
2.7	The role of characteristics in hyperbolic equations	29
2.8	Classification method for simple PDEs	32
2.9	Classification of fluid flow equations	33
2.10	Auxiliary conditions for viscous fluid flow equations	35
2.11	Problems in transonic and supersonic compressible flows	36
2.12	Summary	38
3	Turbulence and its modelling	40

3.1	What is turbulence?	40
3.2	Transition from laminar to turbulent flow	44
3.3	Descriptors of turbulent flow	49

3.4.1       Free turbulent flows       53         3.4.2       Flat plate boundary layer and pipe flow       57         3.4.3       Summary       61         3.5       The effect of turbulent fluctuations on properties of the mean flow       61         3.6       Turbulent flow calculations       65         3.7       Reynolds-averaged Navier-Stokes equations and classical       66         3.7.1       Mixing length model       69         3.7.2       The k-e model       72         3.7.3       Reynolds stress equation models       85         3.7.4       Advanced turbulence models       87         3.7.5       Closing remarks – RANS turbulence models       98         3.8.1       Spacial filtering of unsteady Navier–Stokes equations       98         3.8.2       Smagorinksy–Lily SGS model       102         3.8.3       Higher-order SGS models       104         3.8.4       Advanced SGS models       105         3.8.5       Initial and boundary conditions for LES       109         3.8.6       LES applications in flows with complex geometry       108         3.8.7       General comments on performance of LES       109         3.9       Direct numerical simulation       110	3.4	Characteristics of simple turbulent flows	52
3.4.3       Summary       61         3.5       The effect of turbulent fluctuations on properties of the mean flow       61         3.6       Turbulent flow calculations       65         3.7       Reynolds-averaged Navier-Stokes equations and classical turbulence models       66         3.7.1       Mixing length model       69         3.7.2       The k-c model       72         3.7.3       Reynolds stress equation models       80         3.7.4       Advanced turbulence models       80         3.7.4       Advanced turbulence models       80         3.7.4       Advanced turbulence models       80         3.7.5       Closing remarks – RANS turbulence models       98         3.8.1       Spacial filtering of unsteady Navier-Stokes equations       98         3.8.2       Smagorinksy-Lily SGS model       102         3.8.3       Higher-order SGS models       105         3.8.4       Advanced SGS models       106         3.8.5       Initial and boundary conditions for LES       109         3.8.6       LES applications in flows with complex geometry       108         3.8.7       General comments on performance of LES       109         3.9       Direct numerical simulation       110		3.4.1 Free turbulent flows	53
3.5       The effect of turbulent fluctuations on properties of the mean flow       61         3.6       Turbulent flow calculations       65         3.7       Reynolds-averaged Navier–Stokes equations and classical turbulence models       66         3.7.1       Mixing length model       69         3.7.2       The k-e model       72         3.7.3       Reynolds stress equation models       80         3.7.4       Advanced turbulence models       80         3.7.5       Closing remarks – RANS turbulence models       97         3.8       Large eddy simulation       98         3.8.1       Spacial filtering of unsteady Navier–Stokes equations       98         3.8.2       Smagorinksy–Lilly SGS model       102         3.8.3       Higher-order SGS models       105         3.8.5       Initial and boundary conditions for LES       106         3.8.6       LES applications in flows with complex geometry       108         3.8.7       General comments on performance of LES       109         3.9       Direct numerical simulation       110         3.9.1       Numerical sinulation       111         3.9.2       Some achievements of DNS       113         3.10       Summary       113			
3.6       Turbulent flow calculations       65         3.7       Reynolds-averaged Navier-Stokes equations and classical       66         3.7.1       Mixing length model       69         3.7.2       The k-e model       72         3.7.3       Reynolds stress equation models       80         3.7.4       Advanced turbulence models       80         3.7.5       Closing remarks - RANS turbulence models       97         3.8       Large eddy simulation       98         3.8.1       Spacial filtering of unsteady Navier-Stokes equations       98         3.8.1       Spacial filtering of unsteady Navier-Stokes equations       98         3.8.2       Smagorinksy-Lilly SGS model       102         3.8.3       Higher-order SGS models       104         3.8.4       Advanced SGS models       105         3.8.5       Initial and boundary conditions for LES       106         3.8.7       General comments on performance of LES       109         3.9.1       Numerical issues in DNS       111         3.9.2       Some achievements of DNS       113         3.10       Summary       113         4       The finite volume method for one-dimensional steady state diffusion       115         4.3 <td></td> <td></td> <td></td>			
3.7       Reynolds-averaged Navier-Stokes equations and classical turbulence models       66         3.7.1       Mixing length model       69         3.7.2       The <i>k</i> - <i>e</i> model       72         3.7.3       Reynolds stress equation models       80         3.7.4       Advanced turbulence models       80         3.7.5       Closing remarks – RANS turbulence models       97         3.8       Large eddy simulation       98         3.8.1       Spacial filtering of unsteady Navier–Stokes equations       98         3.8.1       Spacial filtering of unsteady Navier–Stokes equations       98         3.8.2       Smagorinksy–Lilly SGS model       102         3.8.3       Initial and boundary conditions for LES       106         3.8.4       Advanced SGS models       104         3.8.5       Initial and boundary conditions for LES       106         3.8.6       LES applications in flows with complex geometry       108         3.8.7       General comments on performance of LES       109         3.9       Direct numerical simulation       110         3.9.1       Numerical insues in DNS       111         3.9.2       Some achievements of DNS       113         3.10       Summary       131
