## 1. Introduction

To implement the readout of the VELO sensors requires three successive wire bonding steps during production: back end bonding [1], front end bonding [2] and finally sensor end bonding. This note describes the sensor end bonding of the VELO modules. The purpose of the sensor end bonding is to electrically connect the sensors, which have been tested[3] and glued[4] to the hybrid. In the sensor end bonding process wire bonds are placed between the pitch adaptors and the sensors on the hybrid. Each hybrid has two sensors attached, an r-measuring detector and a phi-measuring detector. Although there are 2048 channels on both designs of sensor and the pad layout of the radial side is not geometrically the same as that of the phi side. The sensors were designed to accommodate two row bonding whilst the pitch adaptors are four row bonding. All sensor end bonding on the production modules was carried out on two Hesse and Knipps bondjet 710 machines (710A and 710B). Details of the wire bonding process can be found in [2].

## 2. Mechanical Setup Procedure

For sensor end bonding, the bonding jig needs to be mounted as for front end bonding with the sensor furthest away from the operator. Following the procedure for backend and front end bonding the hybrid is mounted into the bonding jig whilst in its handling frame (See in Figure 1). This is done to avoid direct handling of the hybrid and to ensure safe insertion of the double sided hybrid onto the bonding jig. The first side to be bonded is the nominated radial sides (with the r-type pitch adaptors) face up onto the bonding jig. Vacuum from a dedicated high volume pump is applied to hold the hybrid down firmly to the jig. Any loss of suction around the hybrid was shown to lead to problem bonds. A thin sheet of clean room paper is placed between the surface of the detector (laying face down) and the bonding jig to avoid scratching the surface of the Si.

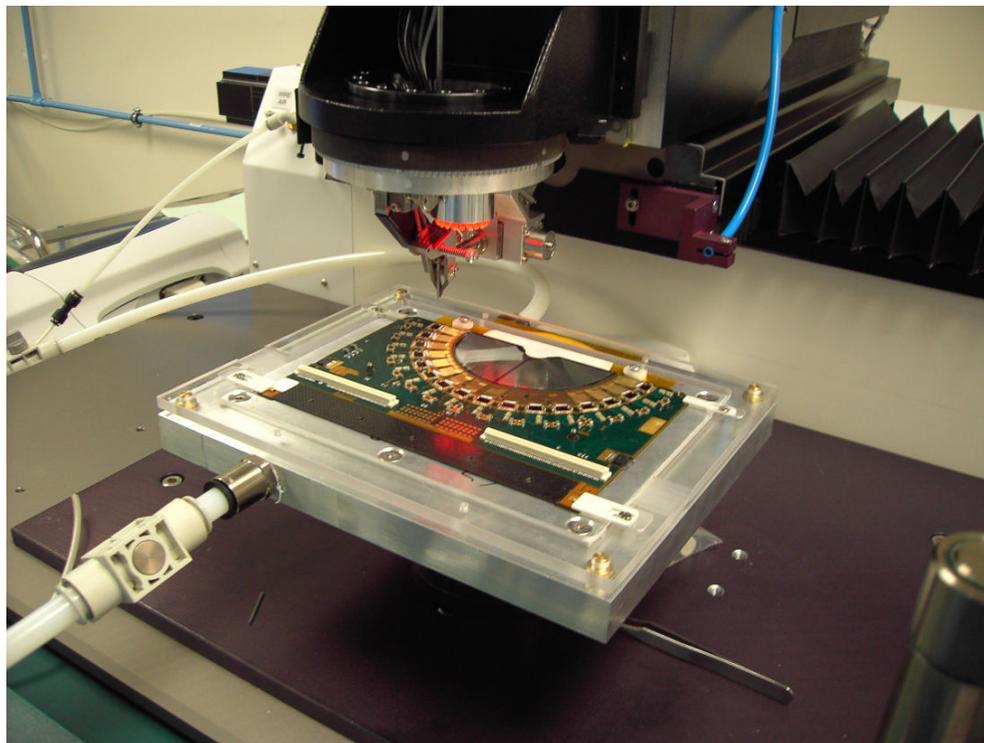

Figure 1: Sensor in frame and on bonding jig ready for sensor end bonding on the H&K 710 machines. Note the orientation of the jig.

## 3. Quality Assurance & Calibration

### 3.1. Initial Tests

The initial setup of the machines for sensor end bonding was identical to that for the front end bonds[2]. The gold “scratch pad” on the hybrid (Figure 2) was used to place several test bonds and these destructively tested using a Dage 4000 series wire bond strength tester. All of the test bonds were required to have a strength of  $> 6g$  for bonding to proceed.

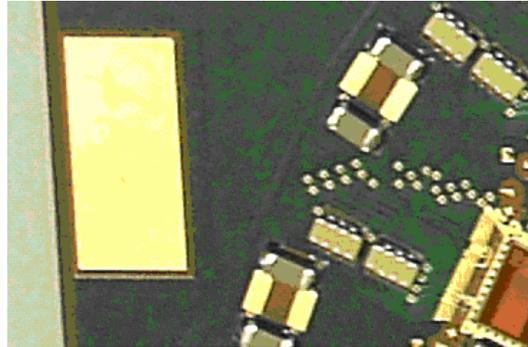

Figure 2: Gold bond pad on hybrid used for calibration.

Before bonding proceeded the hybrid number, wire spool number and the number of bonds the wedge has performed (using the “wedge counter” in options) were recorded.

### 3.2. Bonding map for sensor end bonds

The bonding map for the two sensor types ( $r$  and  $\phi$ ) is not identical as the geometry and the readout for both detectors are different. In both cases the sensors have double rows of bond pads whereas the pitch adaptors have four layers of bonds. Thus the bonding scheme must go between two to four row bonding. This is visually extremely complicated and must be coded into the bonders. It should be noted that the validity of the bond scheme was checked channel by channel on all completed detectors using an infrared laser and precision automatic “x-y” table that allowed each channel to be individually illuminated [5].

The design of the  $\phi$  sensors is such that there are approximately twice as many “outer” strips (1365) as inner strips (683). The readout of the inner strips is interlaced with that of the outer strips on the sensor. Due to the complexity of laying out the sensor geometry the pattern of the inner and outer strips does not follow the ASIC bonds in a natural way. The schematic for the bonding of  $\phi$  sensor is shown in Figure 3. The relation with the strip numbers, pitch adaptors and chips is shown in Figure 4 whilst the details of the sensor pad to Beetle pads connections are enumerated in Appendix C.

The schematic for the bonding of  $r$  sensor and its pad layout are shown in Figure 5 and Figure 6. The details of the sensor pad to Beetle pads connections are given in Appendix D. The designed pad sizes for the pitch adaptor to sensor were as follows pitch adaptor Sensor end  $R1 = 100\mu m$ ,  $R2 = 70\mu m$ ,  $R3 = 50\mu m$ ,  $R4 = 50\mu m$ . PHI sensor  $70\mu m \times 300\mu m$  Radial Sensor outer tracks  $80\mu m \times 250\mu m$  inner tracks  $70\mu m \times 300\mu m$ .

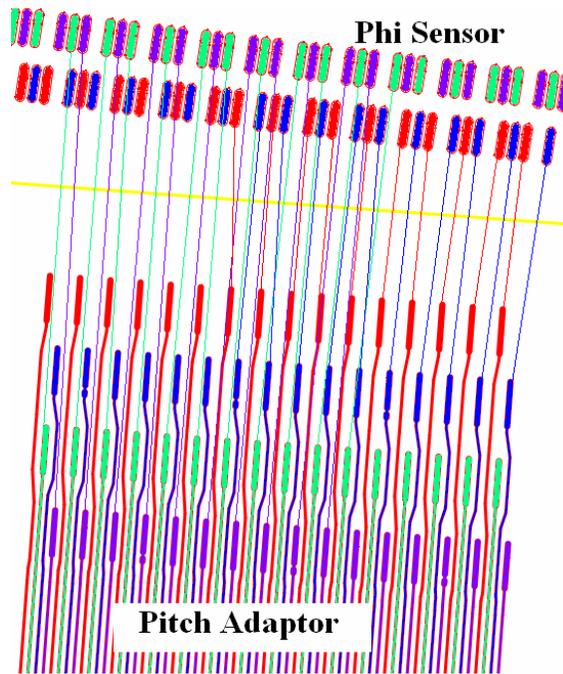

Figure 3: Schematic used for the bonding of the phi type sensors. Note that the four rows of bonds on the pitch adaptors and the two rows of bonds on the sensors. The bond wires are shown in their corresponding pad colours, Red to Red Row 1, Blue to Blue Row 2, Green to Green Row 3 and Purple to Purple Row 4.

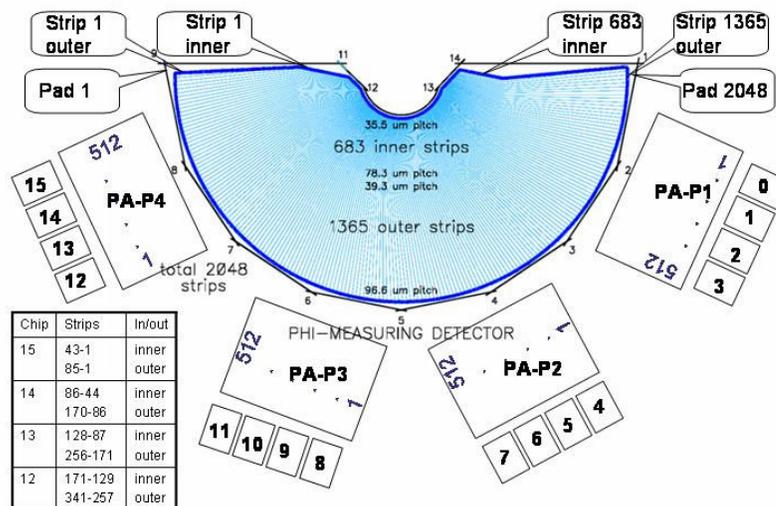

Figure 4: Schematic of readout on the phi side of the module showing the coarse relationship between strip numbers, pitch adaptors and beetle channel numbers. Rows one and two on the pitch adaptor go to row one on the sensor. Rows three and four on the pitch adaptor go to row two on the sensor

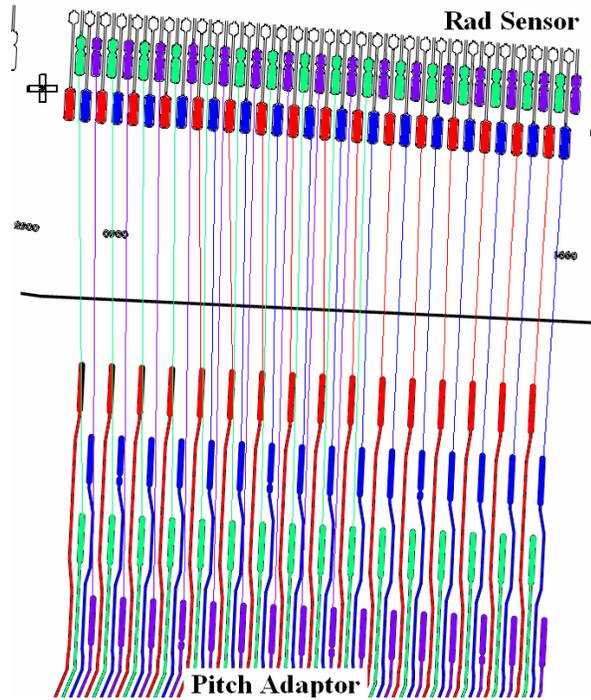

Figure 5: Schematic used for the bonding of the r type sensors. Note that the four rows of bonds on the pitch adaptors and the two rows of bonds on the sensors. The bond wires are shown in their corresponding pad colours, Red to Red Row 1, Blue to Blue Row 2, Green to Green Row 3 and Purple to Purple Row 4.

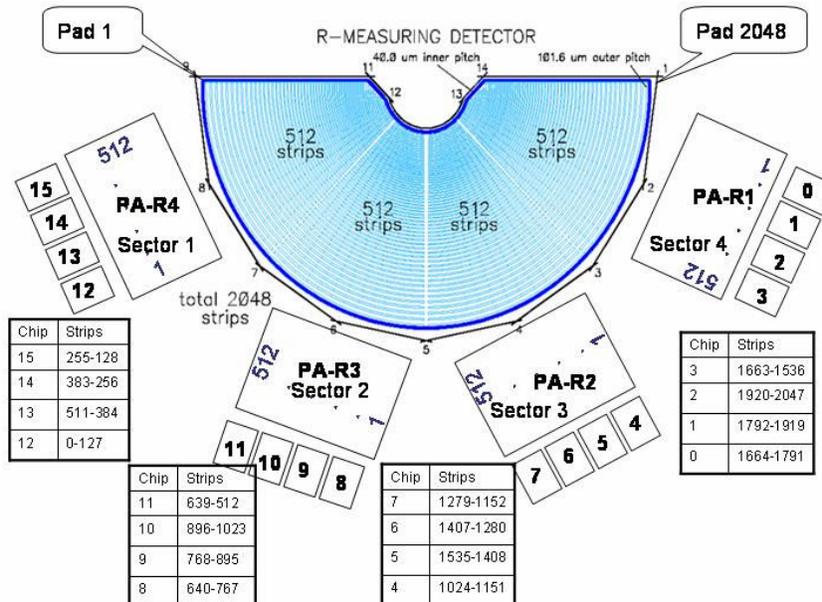

Figure 6: Schematic of readout on the R side of the module showing the coarse relationship between strip numbers, pitch adaptors and Beetle channel numbers. Rows one and two on the pitch adaptor go to row one on the sensor.

### 3.3. Bonding Procedure

The bonding is performed in four layers/rows, as is the front-end bonding.: row one has a loop height of 450um, row two has a loop height of 600um, row three has a loop height of 750um, row four has a loop height of 950um. Each row is bonded in sequence starting with the lowest. Separate programmes (see Appendix B) are required for each row.

Each of the programmes uses one of 8 reference systems shown in Figure 7.

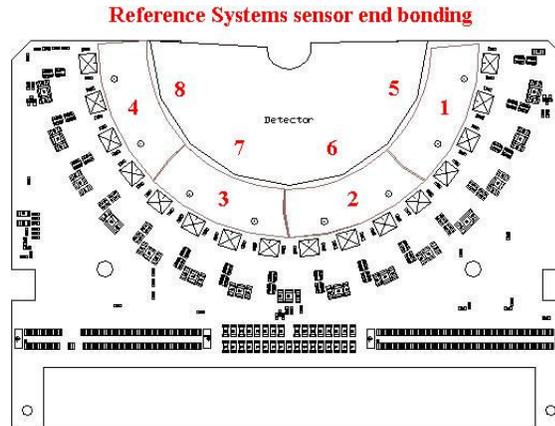

Figure 7: Reference systems for sensor end bonding

Note that for the bonding programmes reference systems 5, 6, 7 and 8 are identical.

Figure 8: Fiducial marks for the sensors used to define the references 5 to 8. These are in identical positions for both the r and phi sensors.

The fiducial marks for the sensors are shown in Figure 8 and for the pitch adaptors in Figure 9. The above pictures show the radial sensor, but the fiducials for the phi sensor are in the same place. The sensor has four reference systems to enable four touchdown points this is to eliminate any damage that could be caused to the sensor should the glue thickness be uneven.

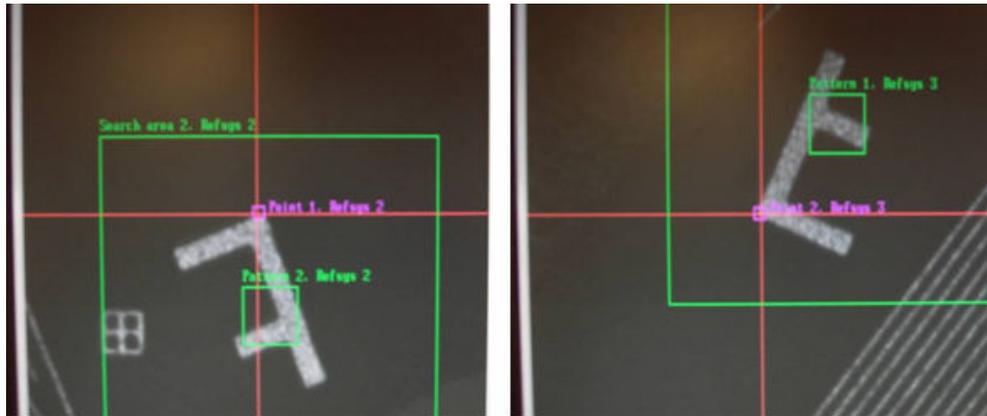

Figure 9: Fiducial marks on the pitch adaptors used as references for fiducials 1-4.

Should the program you have loaded (either RADR1, RADR2 ETC) fail to identify automatically the fiducials these can be manually aligned. There are 512 wires in each rad program and 512 wires in each phi program. A total number of 4,096 sensor end bonds for the complete modules which reflects the numbers of sensor strips. Figure 1 shows a photo of the bonding.

During production we note the sensor end bonds have four row bonding visual inspection is carried out on each row and any repairs are performed prior to loading the next program

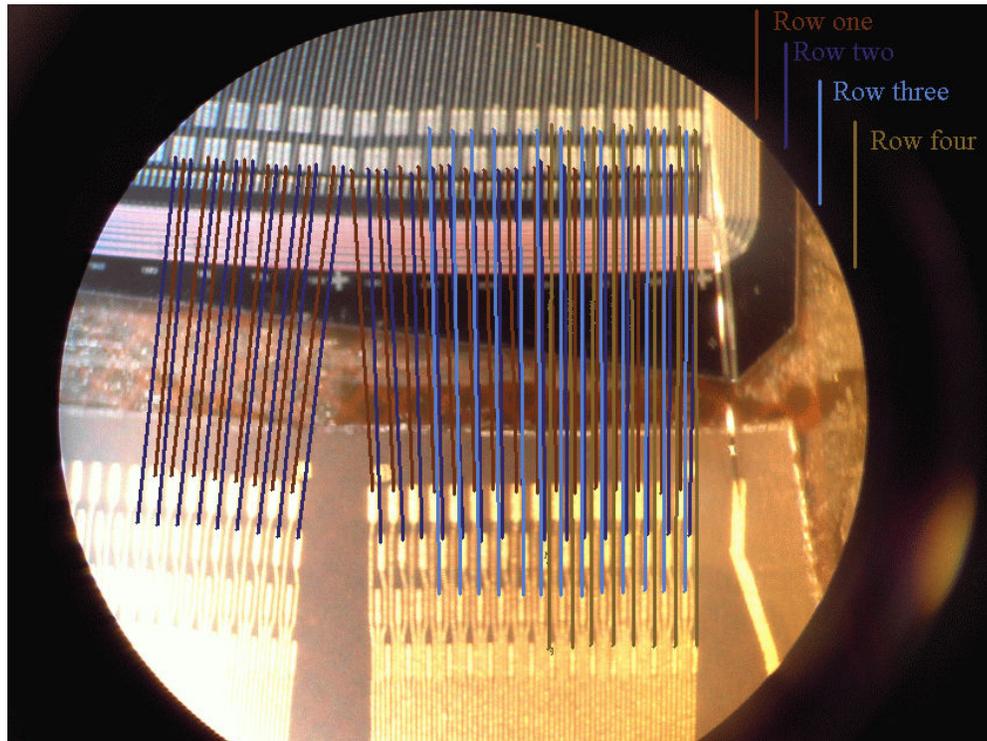

Figure 10: Photograph of sensor end bonding. Superimposed is the bond map for the 4 rows.

## 4. Bonding Results

### 4.1. Pull strengths

The front-end bonding was performed on the Hesse and Knipps bondjet 710 machines. Samples of bonds were tested by measuring the pull required to break the bond, and the data analysis for the two machines is shown below. These are the same data as for the front end bonds as the machines are used for both purposes during a bonding sessions. Note the Lower limit for acceptable bonds was 6g. Mean pull and the standard deviations for the two machines were:

710A:  $8.9 \pm 1.6$  g (1% below limit)

710B:  $8.8 \pm 1.8$  g (5% below limit).

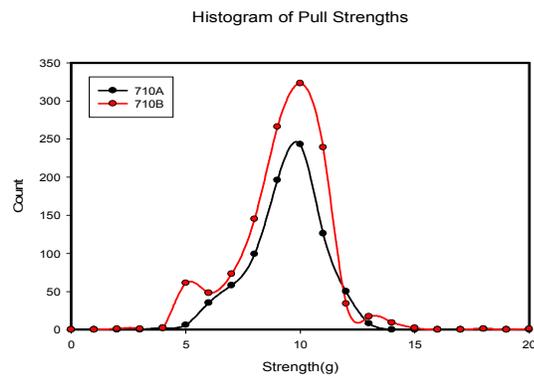

Figure 11: Pull strengths for the two 710 machines.

### 4.2. Bonding Failures

During the testing of the sensors, certain strips were found to be problematic, there was a QA requirement that the number of problem strips must be less than 1% of the 2048 total strips per sensor. It was a requirement that problem strips should be excluded during the bonding of the sensors to the pitch adaptors. The database system was used to provide the requisite information to the bonding machine operators so that these bonds could be excluded.

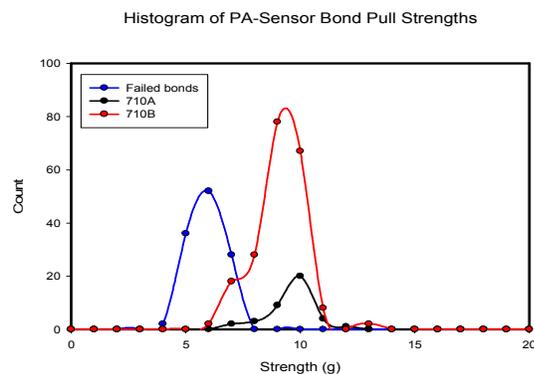

Figure 12: Rebonding or repairs on the sensor end bonding allowed samples of the real bond strength. Displayed are the samples of PA/Sensor bonds from two failed hybrids and for the rest of the production for both the 710A and 710B machines.

Apart from the excluded bonds, there was a requirement that all the bonds between the sensor and the pitch adaptor should be made, in order to ensure the readout of the silicon strip. Where a bond failed, additional attempts were made and the information that a bond required multiple attempts was logged in the database. In the worst case, where a bond could not be made, the failure was logged so that it could be tracked and explain readout failures in the subsequent testing.

The repair of bonds (or replacement of chips or pitch adaptors) allowed the sensor end bond strengths to be sampled (destructively) for the 710A and 710B these are shown in Figure 12. On these limited samples the 710A and 710B have bond strengths  $9.0 \pm 1.0$  and  $9.3 \pm 1.4$ g. Two hybrids that were rejected had bond strengths  $5.4 \pm 0.7$ g (also shown in Figure 12). The problems with these hybrids was contaminated pitch adaptors from gluing

Additional information was available from the database which contains full information on the sensor end bonding performance over the 44 production modules. The distribution of bad bonds as a function of chip channel number (Figure 13) shows no obvious structure. The distribution of bad sensor end bonds as a function of chip number is not remarkable except for a very small asymmetry between the left half and right of the hybrid for which there is no explanation (Figure 14). The distribution as a function of the module production number is also shown (Figure 15) and this presents some limited evidence for an increase in bonding quality during production. Note that for all these figures a bad bond is one that required multiple bonding attempts, or failed to be made.

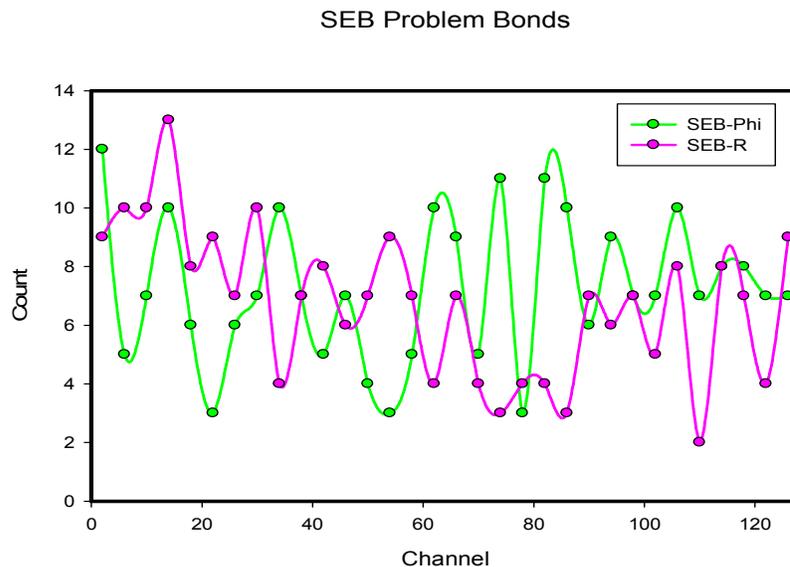

Figure 13: Distribution of problem bonds as a function of channel number on the sensor end bonding. Due to the matching of pitches by the adaptors to the sensor there is little evidence of variations.

Overall more than 180000 front end bonds made, there were only 2 failed R side bonds and 1 failed Phi side bonds (0.002% total). The total number of problem strips that were not bonded was 557 (0.3%). Multiple attempts were required on 1179 bonds. This data is summarized in Table 1.

Additional photos of the sensor end bonds are shown in Figure 17 and Figure 16.

### SEB Problem Bonds

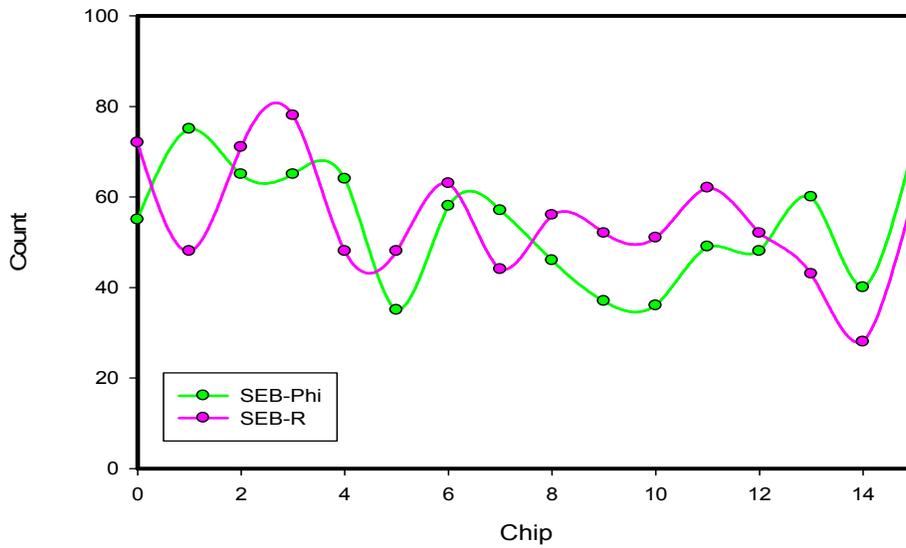

Figure 14: The distribution of the problems as a function of chip number. There appears to be a small (unexplained) asymmetry between chips 0-7 and 8-15.

### SEB Problems v Module

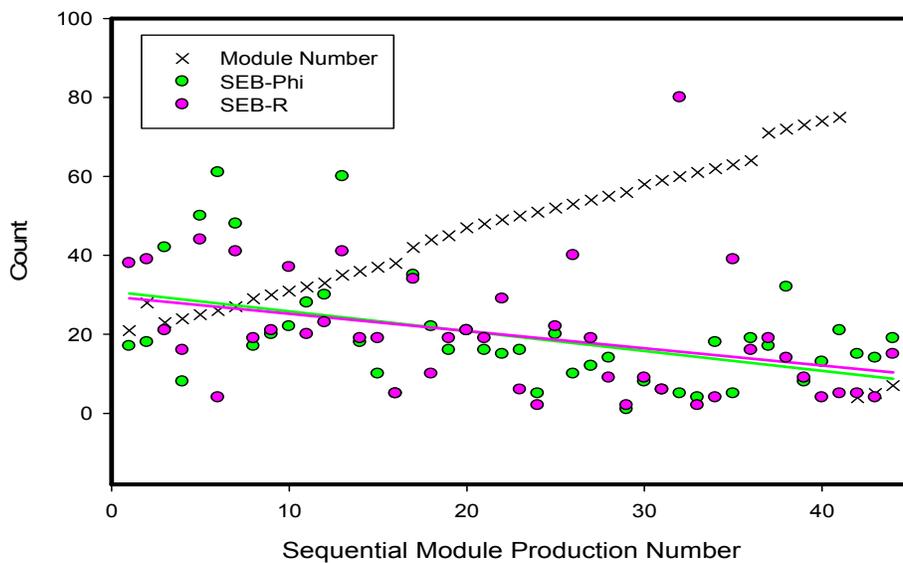

Figure 15: the distribution of problems in SEB as a function of module production number. Fits to the number of problems indicate an improvement in the production quality as a function of time.

Table 1: Summary of sensor end bonding performance.

SEB		
	R-side	Phi-side
No of modules	44	44
No of bonds/module	2048	2048
Total Bonds	90112	90112
Failed bonds	2	1
% failed bonds	0.002	0.001
Repeat bonds	585	594
% repeat bonds	0.65	0.66
Excluded bonds	293	264
%excluded	0.33	0.29

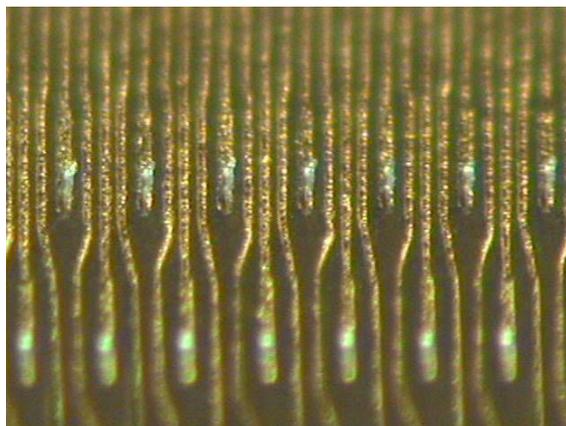

Figure 16: Photo of bond feet and PA

## 5. Conclusion

Over 180000 bonds were made for LHCb VELO module front ends. Only 0.002% failed. However 0.3% were not bonded for other reasons – mostly due to faults in the sensors themselves. The PA bonding presented substantial problems due to the size of pads.

## Appendix D Lookup table for R Detector

The data from this table is currently available (in more economical form) in the channel lookup tool (<http://velodb.ph.liv.ac.uk/lhcb/channelmap/channelmap.php?type=R&sort=cc>.)

Sensor Pad	Pad Row	Sector	Strip	PA	PA-pad	Channel	Chip	s/w Strip
