

Improving Utilization of SGLT2 Inhibitors in the Inpatient Setting

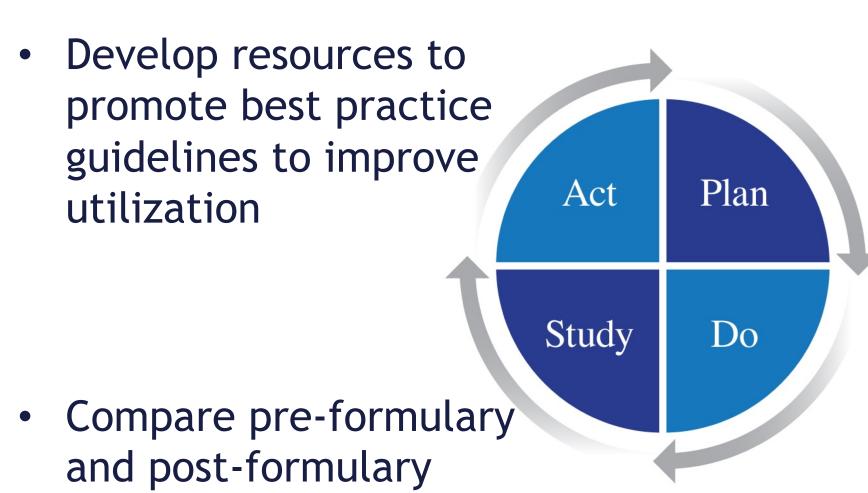

Andrea Verghese MD, Bharaniabirami Rajaram MD, Fred Karaisz MD, Jason Ho MD, Kaya Patel MD, Michael Grodsky MD, Shifa Gandhi MD, Xuejun Wang MD, Yair Lev MD

Background

- SGLT2 inhibitors have been shown to have a significant benefit for patients with DM2 or CAD (DAPA-HF, Emperor-reduced)
- The usage of these medications are low compared to other Goal Directed Medical Therapy.
- There are multiple contributing factors as to why these medications are underutilized

Intervention

- Expanding SGLT2-i availability in the inpatient setting by adding them on formulary.
- Survey attending level physicians on their SGLT2 inhibitor prescribing practices.

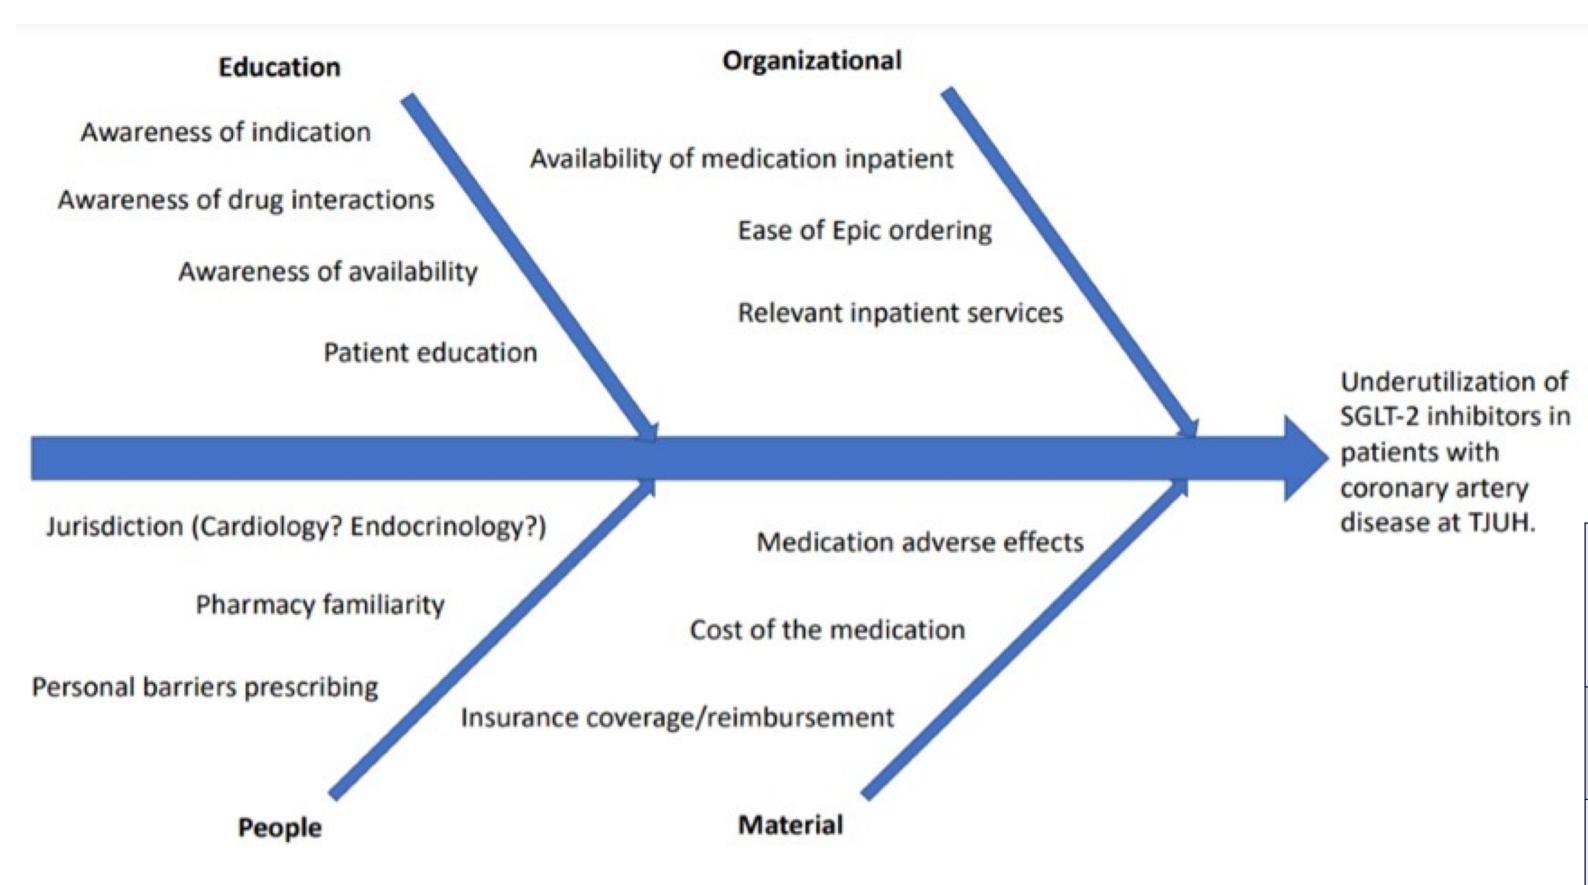

utilization

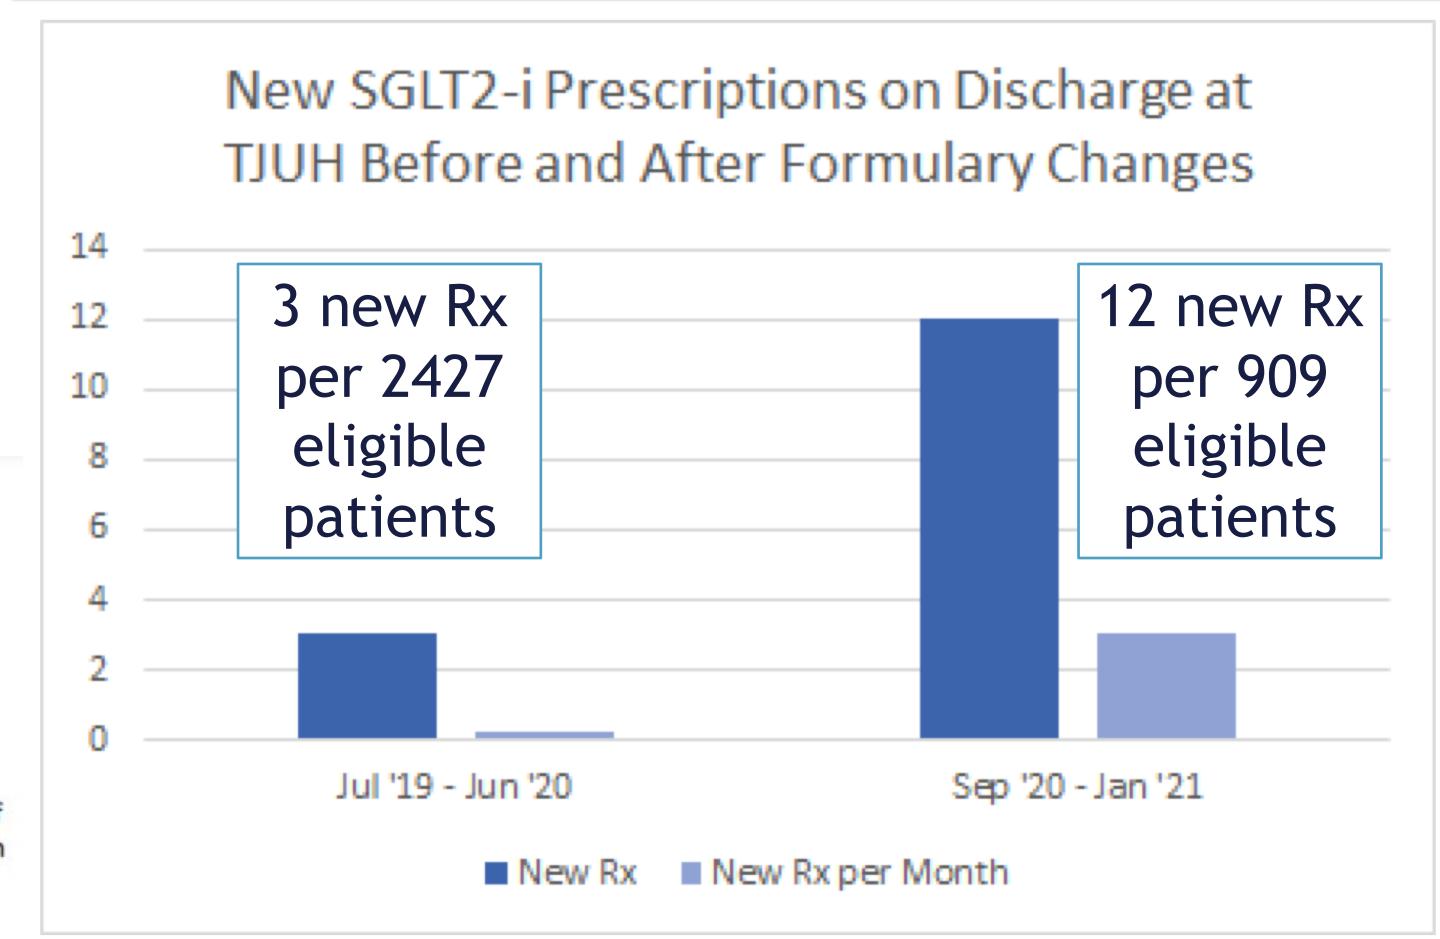

- Understand the causes of SGLT2-I underutilization at TJUH
- Add SGLT2-i to inpatient formulary

Aims For Improvement

Our aim is to assess barriers against prescription of SGLT2-i at the time of discharge from TJUH and to increase utilization after placement on formulary.

Measurements/ Results

Specialty (No. Participants)	Comfort Level Prescribing (1 to 5) (SDEV)	Most Common Factor Preventing Initiating as Inpatient
Hospital Medicine (4)	2.75 (1.5)	Unfamiliarity with the evidence for SGLT-2 inhibitors
Endocrinology (7)	4.86 (0.38)	Preference for outpatient initiation, lack of availability inpatient
Cardiology (17)	3.29 (1.36)	Cost of medication

Lessons Learned

Did you meet your aim for improvement?

We determined barriers to inpatient prescription and saw an increase after the medications was added on formulary. However, the increase in prescriptions was not as dramatic as expected.

If not, why not? What will you do or what would you recommend the next team to in order to improve on your efforts?

Despite removing the barrier of non-formulary status for SGLT2-is, there remains a large gap between patients who have an indication to begin therapy and those who were appropriately prescribed it while at TJUH.

If yes, what will your next goal for improvement be and how will you reach it?

The next goal is to increase the number of providers comfortable with prescribing SGLT2-i during an inpatient stay, in an effort to increase appropriate prescriptions of SGLT2-i in the inpatient setting.

To do this, we can provide EMR guidelines and education modules on when to initiate therapy and to clarify contraindications on inpatient initiation.

What did your team learn about the improvement process?

In addition to removing barriers for quality gaps, it is necessary to actively facilitate changes practicing trends regarding evolving clinical updates to optimize patient care.
