LADIES AND GENTLEMEN, DEAR GUESTS!

With great honor and pleasure I welcome You on behalf of all teachers, associates, employees and students of the Faculty of Educational Sciences at the University "Gotse Delchev" in Shtip and I wish You pleasant moments during this solemn event organized to mark 20 years of university education of teachers.

But in fact, the Faculty of Educational Sciences basis its twenty vears of existence on 146 year continuous development of formal education of teachers and preschool teachers in the region. The achievements of the Pedagogical-Seminary school founded in 1869, the existence of which is linked to the name of the creator of the first primer and the first textbook for teachers - School Pedagogy - Josif Kovachev,

and to the name of the great teacher Gotse Delchev, followed by the School for Teachers established in 1946, Higher Pedagogical School founded in 1959, and the Pedagogical Academy (1961) are woven into the tradition and development of our Faculty.

In 1995 the two-year formal education of teachers and preschool teachers developed into four-vear university studies.

In 2007 the Pedagogical Faculty became part of the State University "Goce Delchev" in Shtip, said to be the fastest growing university in Macedonia.

Following the global trends in teacher education, modern trends in education policymaking in Europe and in the world, respecting the knowledge of the history of civilizations as an important intellectual resource for social development, as well as scientifically and experientially diagnosed educational challenges that have emerged as a result of deep changes of values in our society and globalization trends (scientific, educational, technological, and economic) the Faculty of Educational Sciences has designed study programs for I, II and III cycle of studies in accordance with the organizational - pedagogical quality standards in compliance with the principles of the Bologna Declaration and European credit-transfer system with a high level of recognition in the area of European Higher Education.

If 20 years ago our Faculty started to implement teaching with 5 PhDs and 3 masters as regular employees, today we can proudly say that our academic community is comprised of 20 PhDs and one master.

Today our students have the opportunity to educate themselves at the faculty which sees its future as a continuous development aimed at:

- Strengthening and expanding international partnerships
- Popularization of mobility of students and staff,
- Internationalization and improvement of scientific research work,
- Improvement of pedagogical approaches to teaching and links with practice, putting students at the center of the educational process.

Ladies and Gentlemen,

I take this opportunity to thank you for coming today to celebrate with us the teaching profession and our contribution to it.

We are quite aware that the road to success is long and winding and it is easier to travel with joint forces. That is why we wanted to mark this celebration by organizing a scientific conference dedicated to education in the 21st century. Let us share our knowledge, understanding and experiences regarding the situation and perspectives and suggest possible ways of modernization. 89 papers have been submitted and there are authors from 8 countries. This is really promising!

Once again, I wish you all a warm welcome and successful work.

Dean, Prof. d-r Sonja Petrovska 24. 09. 2015., Stip

ПОЧИТУВАНИ ...

Со голема чест и задоволство, Ве поздравам во името на сите наставници, соработници, вработени и студенти на Факултетот за образовни науки при Универзитетот Гоце Делчев во Штип и Ви посакувам пријатни моменти во текот на оваа свечена манифестација организирана по повод 20 годишно факултетско образование на наставници и воспитувачи.

Факултетот за образовни науки своето постоење го темели на 146 годишниот континуиран развој на формалното образование на наставници и воспитувачи на овие простори. Во традицијата и развојот на нашиот факултет се вткаени достигнувањата на Педагошко-богословското училиште основано во 1869 год. Со чие постоење се врзува името на творецот на првиот буквар и првиот учебник за наставници — Школска педагогија — Јосиф Ковачев, и името на големиот учител Гоце Делчев, па Учителската школа основана во 1946 год, Вишата педагошка школа формирана во 1959 год, Педагошката академија (1961 год.).

Во 1995 година формалното двегодишно образование на наставници и воспитувачи прераснува во четиригодишно факултетско образование.

Во 2007 година Педагошкиот факултет стана дел на државниот Универзитет "Гоце Делчев" во Штип, кој го носи епитетот најбрзорастечки Универзитет во Р Македонија.

Следејќи ги глобалните тенденции во образованието на наставници, современите тенденции во креирањето на образовните политики во Европа и во Светот, респектирајќи ги знаењата за историјата на цивилизациите како значаен интелектуален ресурс за општествениот развој, како и научно и искуствено дијагностицираните воспитни предизвици кои се појавија како резултат на длабоките вредносни промени во нашето општество и глобализациските тенденции (научни, образовни, техничко-технолошки, економски) ФОН дизајнираше студиски програми за I, II и III циклус на студии согласно организациско —

педагошки стандарди за квалитет, согласно принципите на Болоњската декларација и Европскиот кредит-трансфер систем, со високо ниво на препознатливост во Европскиот високообразовен простор.

Ако пред 20 години нашиот факултет започна да ја реализира наставата и вежбите со 5 доктори на науки и 3 магистри, како редовно вработени, денес со гордост можеме да кажеме дека оваа академска заедница ја сочинуваат 20 доктори на науки и 1 магистер.

Денес нашите студенти имаат можност да се образуваат на факултет кој својата иднина ја гледа како континуиран развој во насока на:

- зајакнување и проширување на меѓународните партнерства.
- омасовување на мобилноста на студентите и на вработените.
- интернационализација и подобрување на научно-истражувачката работа.
- унапредување на педагошките пристапи во наставата и врските со практиката, поставувајќи ги студентите во центарот на образовниот процес.

Почитувани присутни,

Ја користам оваа прилика, да ви се заблагодарам што дојдовте денес заеднички да го чествуваме учителското дело и нашиот придонес во него.

Ние сме сосема свесни дека патот до успехот е долг и кривулест но и дека полесно се патува со заеднички сили. Затоа ова наше празнување сакавме да го одбележиме со Научна конференција посветена на образованието во 21 век, да ги споделиме нашите знаења, разбирања и искуства во врска со состојбите и перспективите како и да предложиме можни начини за негово осовременување.

Уште еднаш, На сите Ви посакувам топло добредојде и успешна работа!

Декан,

Проф. д-р Соња Петровска 24. 09. 2015. година Штип

RISK ASSESSMENT OF HYGIENIC AIR QUALITY UPON PRESCHOOL CHILDREN'S HEALTH IN KINDERGARTEN "VERA CIRIVIRI TRENA" IN SHTIP

Snezana STAVREVA-VESELINOVSKA 1

Abstract

The paper will present the results of routine sanitary-hygienic controls of the air hygiene at the study halls and bedrooms of Branch 1 and Branch 4 in the kindergarten "Vera Ciriviri - Trena" in Shtip. The controls were carried out in the period from 2009 to 2014. Aero sediments were taken from premises at random in time after airing, when there is no movement. At the time of setting the plates for aero sediment the children were already asleep so the air dustiness is less and the sedimentation lasted two hours. In all samples the presence of microorganisms was proved as number of colonies, such as: pathogenic staphylococci and conditionally pathogenic staphylococci coagulase negative and the presence of germs. Results show that the greatest source of air pollution of the premises is the retention of impurities that are the source of bacteria, viruses, molds and mites in Sintelon carpets that do not really allow for proper and thorough hygiene of floors. Although the floors are regularly cleaned by mechanical and wet cleaning and regular and appropriate disinfection, it is still not enough to the requirements for clean and quality air in the premises where children and employees dwell.

Key words: aero sediment, air pollution, sanitary-hygienic controls, micro-organisms, children.

Introduction

Children face the excitement of a changing world, with many opportunities and challenges; but they also encounter formidable barriers to their health, development and well-being in the form of environmental threats. During recent decades, new knowledge has emerged about the special vulnerability of children to environmental risks in the places where they live, learn and grow. Children's and adolescents' exposure to chemical, physical, and biological risks at home, in school, in the playground, at work and elsewhere deserves our immediate attention and needs to be recognized as an important threat to their development and survival. Action to reduce the risks is required at global, regional and national levels.

Children around the world today confront environmental hazards that were neither known nor suspected a few decades ago. More than 80000 new synthetic chemical compounds have been developed over the past 50 years. Children are especially at risk of exposure to the 15000 of these chemicals produced in quantities of 4500 kg or more per year, and to the more than 2800 chemicals produced in quantities greater than 450000 kg per year. These high-production volume (HPV) chemicals are those most widely dispersed in air, water, food crops, communities, waste sites and homes (1). Worldwide many thousands of deaths occur as a result of poisoning, with the vast majority being among children and adolescents after accidental exposure. Many hundreds of H PV chemicals have been tested for their potential human toxicity, but fewer than 20% have been examined for their potential to cause developmental toxicity to fetuses, infants, and children (1, 2).

Until about ten years ago, chemical exposure was principally a problem for children in the developed countries. However, it is becoming a problem in developing countries as hazardous industries relocate there as a consequence of globalization and in an effort to escape ever stricter lab our and environmental laws in the developed countries. In addition to the hazards of new chemicals, children worldwide confront traditional environmental hazards, including poor water quality and sanitation, ambient and indoor air pollution, vector-borne diseases, unintentional injuries, inadequate housing, and effects of climate variability and change.

Children's unique susceptibility

Children are highly vulnerable to environmental hazards for several reasons (3, 4). Children have disproportionately heavy exposures to environmental toxicants. In relation to body weight, children drink more water, eat more food, and breathe more air than adults. Children in the first 6 months of life drink seven times as much water per kg of body weight and 1-5-year-old children eat 3-4 times more food per kg than the average adult. The air intake of a resting infant is proportionally twice that of an adult. As a result, children will have substantially heavier exposures than adults to any toxicants that are present in water, food, or air. Two additional characteristics of children further magnify their exposures: their hand-to-mouth behavior, and the fact that they live and play close to the ground.

Children's metabolic pathways, especially in the first months after birth, are immature. Children's ability to metabolize, detoxify, and excrete many toxicants is different from that of adults. In some cases, children may actually be better able than adults to deal with some toxicants, e.g. paracetamol. Commonly, however, they are less well able to deal with toxic chemicals and thus are more vulnerable to them. Children undergo rapid growth and development, and their developmental processes are easily disrupted. The organ systems of infants and children change very rapidly before birth, as well as in the first months and years of life. These developing systems are very delicate and are not able to repair adequately damage caused by environmental toxicants. Thus, if cells in an infant's brain are destroyed by chemicals such as lead, mercury, or solvents, or if false signals are sent to the developing reproductive organs by endocrine disruptors, there is a high risk that the resulting dysfunction will be permanent and irreversible. Because children generally have more future years of life than adults, they have more time to develop chronic diseases triggered by early exposures. Many diseases that are caused by toxicants in the environment require decades to develop. Many such diseases, including cancer and neurodegenerative diseases, are now thought to arise through a series of stages that require years or even decades from initiation to actual manifestation of disease. Carcinogenic and toxic exposures sustained early in life, including prenatal exposures, appear more likely to lead to disease than similar exposures encountered later.

Hygiene requirements and material basis for the establishment of kindergartens

Preschool institutions or kindergartens represent non-family form of social care for children from birth until their starting school.

But, in order to provide and meet all the necessary factors that directly or indirectly affect the growth and development of children, it is necessary to monitor both the development of society and the criteria it sets. As a consequence of this there are problems arising in kindergartens that require systematic and timely solution.

Kindergartens really exist and have a defined and important place in educating and bringing up preschool children. Regardless of their administrative (legal) status, or whether they are state, municipal (local), independent or private institutions, or they are organized in a different way, they should meet some basic requirements in order to fulfil their purpose.

Factors that determine micro climate in children's institutions

Microclimate in kindergarten premises depends on the orientation of buildings towards the sides of the world, on the winds in the region, on the type and distance of green areas and water surfaces, on the arrangement of nearby buildings etc.

Microclimate in such institutions is the sum of all the changes of climate factors, adapted to have proper impact on children's bodies. It is closely and directly connected with changes in the air, quantities of carbon dioxide (CO₂) in the air, dust, ionization, air temperature, humidity and movement of winds. Optimal conditions in kindergarten premises are improved with ventilation, purification, heating, lighting and good water supply.

It is known that there are a lot of impurities in the atmosphere, but their significance for the purity of the air in kindergarten premises is different, because some of them are formed by mixing, and others are changing during their mutual interaction indoors.

Microclimate conditions in kindergartens change along with constant and daily activities of children and adults, most often by breathing. This can be seen from the difference in the composition of atmospheric and exhaled air (where there are children in the premises, Table 1).

Table 1: Composition of	f atmospheric and exhaled air	(in percentage %)
-------------------------	-------------------------------	-------------------

Components	Atmosphericair	Exhaled air	Difference (quantities)%
O ₂	20,94	18,40	- 2,54
CO_2	0,03	2,30	+ 2,27
Н	79,03	78,90	- 0,13
H ₂ O	0,50	6,20	+ 5,57

The table shows that CO₂ (carbon dioxide) is the main air pollutant, because its volume is 70-80 times greater in the exhaled air than in the free atmospheric environment. Indeed, the exhaled volume of CO2 is small and easily diluted in the air, but indoors its quantity rapidly increases, and so does the danger of pollution. For these reasons, the amount of 0.1% (which is a three times higher value of CO₂ than that found in the atmosphere) is taken as a tolerable concentration of CO₂.

Dust also worsens the microclimate in the premises. Industrial and street dust is also created in kindergartens, as well as organic dust. In addition to solid dust, there are significant amounts of live microorganisms (so-called "live" dust) in the premises, which can also greatly worsen the microclimate in kindergartens. They are commonly transmitted among children through coughing and talking, and they can be entering the body through solid dust. It should be emphasized that microorganisms do not multiply in the air, but they can stay alive in it for weeks and months.

The determination of bacteriological air pollution is very difficult. Mostly the total number of microorganisms in 1m3 is determined and the number of streptococci and staphylococci because they most often attack the upper respiratory tract and the skin surface and are most easily transmitted in the air.

Four air sediment samples were taken for the bacteriological examination of the air.

Table 2: Results of bacteriological examination of air samples taken as aero sediment

Nursery -1	Enterobacter species and Stapylococus epidermidis – 200 colonies
Dining-room	Stapylococus aureus coagulaza neg. 200 colonies
Older group	Stapylococus aureus coagulaza neg. 50 colonies
Hallway preschool	Stapylococus aureus coagulaza neg. and bacillus subtilis – 100 colonies

According to literature, if there is any number of Enterobacteriaceae present in the air, it speaks for faecal contamination and very poor sanitary conditions in the particular room. The finding of sporogeneous bacteria indicates a strong presence of dust in the air. Such findings are indicators of direct or indirect danger to people's health, especially the most vulnerable population - children who stavin such an environment. We believe that the largest contributor to such air pollution of the premises is the presence of Sintelon carpet son the floor that cannot be completely cleaned despite mechanical and wet cleaning of the floors. Compulsory disinfection of floors which will reduce air pollution is therefore necessary.

According to the program objectives of preventive medicine in the function of protecting the health of children and staff, the Department of Hygiene of the Public Health Institution - Centre for Public Health Stip during the year 2013 re-performed a routine air hygiene control in the following premises:9 playrooms and bedrooms of Branch-1 and Branch-4 in the Kindergarten "Vera Ciriviri - Trena" and were taken 5 air sediment samples were taken for bacteriological examination of the air that the children and the staff breathe in this centre.

((Playroom - bedroom) older group Branch 1	Stapylococuscoagulaza negative – Bacillus subtilis 200 colonies
Playroom – middle group Branch 1	Stapylococus aureus 100 colonies
Bedroom – middle group Branch 1	Stapylococuscoagulaza negative – Bacillus subtilis 200 colonies
(Playroom - bedroom) younger group Branch 4	Stapylococus aureus – 80 – kolnii
Nursery – 1 Branch 4	Stapylococuscoagulaza negative – Bacillus subtilis 100 colonies

Table 3: Results of the bacteriological examination of air samples taken as aero sediment

Air sediments were taken from the premises at random during airing the same when there is no movement. Namely, at the point of setting up the plates for air sediment, the children were already asleep and "air dustiness" was less and sedimentation lasted two hours. However, in all the samples the presence of microorganisms was provides a number of colonies as follows:

Pathogenic staphylococci (Staphylococcus aureus) and conditionally pathogenic coagulase negative (Stapylococusaur. Coagulaza negative) and bacilli (Bacillus subtilis).

The presence of these microorganisms in the inhaled air in the vulnerable population - children aged 1-6 years can cause problems ranging from irritation of the nose and throat (coughing and sneezing) to respiratory infections. There can be a feeling of dryness in the eyes and a need to rub them followed by redness - conjunctivitis. With the dust that falls on tables and toys and the remaining inventory, or with touching and certainly often putting hands in their mouths and licking or sucking toys by children in the nursery and the younger group, these microorganisms are introduced into the digestive system. Therefore health problems (from mild to severe forms of enterocolitis followed by abdominal pain, vomiting and diarrhoea, especially if the food is contaminated) can occur. Outbreaks of frequent allergies and infections of the skin, especially if the skin is hurt, are possible.

Conclusion

The largest contributor to air pollution in the premises is the retention of contaminants - the source of bacteria, viruses, moulds and mites in Sintelon carpets that do not allow proper and thorough hygiene of floors despite mechanical and wet cleaning and regular and proper disinfection.
