## Governing equations

$$H(x, t) = h(t) + (x - x_c)\theta(t) - F(x);$$
$$H = H_x = 0 \text{ at } x = x_0(t).$$

In both gaps:

$$H_t + (uH)_x = 0,$$

$$u_t + uu_x = -p_x;$$

$$u = \dot{x}_0(t) \quad \text{at } x = x_0(t),$$

## Governing equations

$$H(x, t) = h(t) + (x - x_c)\theta(t) - F(x);$$

$$H = H_x = 0 \text{ at } x = x_0(t).$$

In both gaps:

$$H_t + (uH)_x = 0,$$

$$p + \frac{1}{2}u^2 = \frac{1}{2} \text{ at } x = 0,$$

$$u_t + uu_x = -p_x;$$

in Gap I, but in Gap II

$$u = \dot{x}_0(t) \text{ at } x = x_0(t),$$

$$p = 0 \text{ at } x = 1.$$

## $O(1)$ time, negligible fluid effects

Mass- and moment of inertia-dominated.

$$M\ddot{h}(t) = N(t) - Mg^+,$$

$$I\ddot{\theta}(t) = (x_0 - x_c)N(t),$$

$$H(x, t) = h(t) + (x - x_c)\theta(t) - F(x),$$

$$H = H_x = 0 \text{ at } x = x_0(t).$$

In subsequent analysis, a key equation:

$$\alpha\ddot{x}_0 + \beta\dot{x}_0^2 = (x_0 - x_c)g^+.$$

Here,  $\alpha, \beta$  depend on  $I, M$ , and body shape.

## Transition from rocking to lift off is smooth

With negligible flow, a key equation was:

$$\alpha \ddot{x}_0 + \beta \dot{x}_0^2 = (x_0 - x_c)g^+,$$

where  $\alpha, \beta$  depended on  $M, l$ , and body shape.

With fluid effects, the corresponding equation becomes:

$$\alpha \ddot{x}_0 + \beta \dot{x}_0^2 = (x_0 - x_c)g^+ + \frac{i_2 - (x_0 - x_c)i_1}{M},$$

where

$$i_1 = \int_0^1 p(x, t) dx \quad , \quad i_2 = \int_0^1 (x - x_c)p(x, t) dx.$$

$O(1)$  time,  
flow

Lift off

Discussion

# Transition from rocking to lift off is smooth

- The integrated flow-pressure contributions  $i_1, i_2$  move us into a part of solution space unobtainable in no-flow case.
- For small times  $t \rightarrow t_{LO-}$ , consider the elliptical body with  $x_0$  close to the leading edge, so that  $x = \epsilon X$ ,  $\epsilon \ll 1$  (similar arguments hold at trailing edge).
- Analysis shows that  $u \sim \epsilon^{\frac{5}{4}}$  leading to a pressure response being an  $O(\epsilon^{\frac{5}{2}})$  perturbation from the value  $1/2$ .

Introduction

Configuration

Small time  
properties

$O(1)$  time, no  
flow

$O(1)$  time,  
flow

Lift off

Discussion

# Transition from rocking to lift off is smooth

- The integrated flow-pressure contributions  $i_1, i_2$  move us into a part of solution space unobtainable in no-flow case.
- For small times  $t \rightarrow t_{LO-}$ , consider the elliptical body with  $x_0$  close to the leading edge, so that  $x = \epsilon X$ ,  $\epsilon \ll 1$  (similar arguments hold at trailing edge).
- Analysis shows that  $u \sim \epsilon^{\frac{5}{4}}$  leading to a pressure response being an  $O(\epsilon^{\frac{5}{2}})$  perturbation from the value  $1/2$ .
- Thus the lift-off generating mechanism of  $i_1, i_2$  — an effect of “added mass” and evolution in the fluid-body interaction — is still dominated by the  $O(1)$  global contributions.
