**Undersampling Aware Learning based Fetal Health Prediction using  
Cardiocotographic Data**M. Shyamala Devi<sup>1\*</sup>, S. Sridevi<sup>2</sup>, D.Umanandhini<sup>3</sup>, A. Peter Soosai Anandaraj<sup>4</sup>,  
Sudheer Kumar Gupta<sup>5</sup>, Bhumireddy Sidhartha<sup>6</sup>**Abstract**

With the current improvement of development towards pharmaceutical, distinctive ultrasound methodologies are open to find the fetal prosperity. It is analyzed with diverse clinical parameters with 2-D imaging and other test. In any case, prosperity desire of fetal heart still remains an open issue due to unconstrained works out of the hatchling, the minor heart appraise and inadequate of data in fetal echocardiography. The machine learning strategies can find out the classes of fetal heart rate which can be utilized for earlier evaluating. With this background, we have utilized Cardiocotographic Fetal heart rate dataset removed from UCI Machine Learning Store for predicting the fetal heart rate health classes. The Prediction of fetal health rate are achieved in six ways. Firstly, the data set is preprocessed with Feature Scaling and missing values. Secondly, exploratory data investigation is done and the dispersion of target feature is visualized. Thirdly, the raw data set is fitted to all the classifiers and the performance is analysed before and after feature scaling. Fourth, the raw data set is subjected to undersampling methods like ClusterCentroids, RepeatedENN, AllKNN, CondensedNearestNeighbour, EditedNearestNeighbours, InstanceHardnessThreshold and NearMiss. Fifth, the undersampled dataset by above mentioned methods are fitted to all the classifiers and the performance is analyzed before and after feature scaling. Sixth, performance analysis is done using metrics like Precision, Recall, F-score, Accuracy and running time. The execution is done using python language under Spyder platform with Anaconda Navigator. Experimental results shows that the Decision Tree classifier tends to retain 98% before and after feature scaling for the underrrsampling with EditedNearestNeighbours, RepeatedENN and AllKNN methods.

**Keywords:** *Machine learning, scaling, undersampling, precision, accuracy, classification*

## **Introduction**

The irregular changes of the fetus must be watched through the clinical parameters in orchestrate to induce to the fetal prosperity. The passing rate of the fetal can be controlled by anticipating the changes inside the clinical parameters of the fetal prosperity. With the mechanical advancement, the ultrasound techniques are utilized for the assessment of fetal health and other changes inside the specified properties. The innate calculations can besides be utilized for the figure of any illnesses inside the fetal prosperity by decoding the discernment gotten through the parameter changes. Fetal heart rate watching may be a technique of checking the rate and cadence of the fetal beat. The typical fetal heart rate is between 120 and 160 beats per minute. This rate may alter as the fetus responds to conditions inside the uterus. The assessment of fetal prosperity has had our capable thought for various a long time. As the enhancement of developments for pre-birth symptomatic strategies has progressed, applications of such developments have backed inside the huge examination of fetal well-being. Fetal heart-rate checking remains the foremost shape of fetal assessment for high-risk pregnancies. The additional examinations overseen by the examination of ST and T-wave changes of the fetal electrocardiogram hold ensure for moving forward the prescient regard of fetal heart-rate assessments . Ultrasound has been invaluable for evaluation of fetal life frameworks, and the utilization of Doppler ultrasound has given information into fetal cardiovascular responses to such conditions as intrauterine advancement control and fetal slightness caused by reddish blood cell immunization.

### **Background**

This paper employments non-parametric Bayesian techniques to classify the fetal heart rate. They have utilized non-parametric Bayesian Procedure and SVM-based methodology to classify the FHR and result are compared to find the execution of both procedures. Bayesian methodology have predominant execution than SVM-based procedure [1]. This paper find any natural contaminations and cardiac quirks on fetal heart utilizing full convolution neural organize (FCN). They are utilizing FCN to recognize the range of heart and examination the any inconsistencies utilizing FCN. They have concluded that FCN-16 illustrate has lower botch than other traces whereas classifying [2]. This paper endeavor to accomplish productive fetal acidosis disclosure to help pros in the midst of movement. They are utilizing sparse-SVM to choose and classify highlights and calculate execution. They have concluded

that classification done by modified assurance is far off predominant than clinical sharpen[3]. The Classification and regression tree (CART) to distinguish high-risk in the midst of pregnancy. They found that accuracy gotten utilizing entropy calculation and GINI list is 88.87% and 90.12% independently[4]. This paper classify the fetal heart rate utilizing convolution neural organize (CNN) to make a neural organize which can classify heart rate subsequently. They found that accuracy is tall of CNN than of SVM and MLP. CNN is an profitable for fetal heart checking system[5]. They have utilized classification based on affiliation (CBA) to classify fetal prosperity status. They have found that the accuracy of appear was extended after utilizing highlight assurance methodology. They found out that subjective forest and XGBoost have extraordinary execution for classifying fetal prosperity status[6].

In this paper, they are advancing to find out the irregular changes to recognize sinusoidal heart rate. Unpredictable forest is utilized for the data preprocessing and sinusoidal plan is calculated utilizing soft theoretic procedure . The conclusion is that given methodology can be considered a gold standard for the discontinuous change revelation [7] . In this paper they are coming to to find within the occasion that there are any inconvenience happening in fetal and a overwhelming system utilizing significant learning is sketched out. Exploratory appear rot is utilized to break down any one-dimensional timing hail  $S(t)$  into Inborn Mode Work (IMF) with assorted frequencies. LSMT is utilized to classify the data. As a result, it is showed up that significant slanting has most precision for recognizing fetal heart inconvenience [8]. In this paper, they are pointing to anticipate fetal risk utilizing machine learning for shirking of any adolescent passing. At to start with for dataset derivation least reiteration most prominent relevance methodology is utilized . And after that the calculations like navie bayes, choice trees, irregular timberland, back vector machines are associated for classification of heart rate[9]. In this paper detail heart rate is classified utilizing two methodologies and the predominant procedure is found out between them. To utilize hybrid k-means, the incorporate extraction is done utilizing k infers clustering. CTG dataset is recorded utilizing calculation and is compared to SVM. Cross breed K-means and Bolster Vector Machine is compared and accuracy of cross breed K-means was 90.64% though ordinary exactness for SVM was 76.72 which shows up Half breed K-means has predominant exactness [10].

In this paper, they are utilizing 2D ultrasound to choose and degree the hatchling heart rate. Number of Pixel from the picture is taken care of and gives the information around fetal heart condition as each zone of the heart or parcel of heart pictures are arranged utilizing 2D

ultrasound [11]. In this paper, they classify and compare CTG data system utilizing managed SVM and choice tree to encourage which have best execution and exactness. The CTG dataset were arranged utilizing coordinated SVM and choice tree [12]. In this paper, they have utilize SVM as classifier to execute the f-score. They have utilized f-score procedure to sort the highlights. F-score have unimaginable precision in anticipating fetal status[13]. In this paper, they are centered on a formative multi objective generic algorithm (MOGA) by utilize of which the basic components causing fetal passing is removed with offer help of cardiocographic examination . Along these methods, it is found out that execution of any classifier is boosted on the off chance that genuine incorporate assurance is done [14]. In this paper, they display the function of data-driven entropy profiling to distinguish fetal arrhythmia normally. The fetal QRS extraction method is utilized to remove fetal heart rate from the data set and after that entropy highlights are associated for profiling of the data set. The proposed methodology talks to strong entropy assess that donate predominant execution than existing methodology [15-16].

### **Proposed Work**

The CTG Cardiotocographic Fetal heart rate dataset with 36 independent variables and 1 dependent variable has been used for implementation [17-20]. The prediction of fetal health is done with the following contributions.

- (i) Firstly, the data set is preprocessed with Feature Scaling and missing values.
- (ii) Secondly, exploratory data investigation is done and the dispersion of target feature is visualized.
- (iii) Thirdly, the raw data set is fitted to all the classifiers and the performance is analysed before and after feature scaling.
- (iv) Fourth, the raw data set is subjected to undersampling methods like ClusterCentroids, RepeatedENN, AllKNN, CondensedNearestNeighbour, EditedNearestNeighbours, InstanceHardnessThreshold and NearMiss.
- (v) Fifth, the undersampled dataset by above mentioned methods are fitted to all the classifiers and the performance is analyzed before and after feature scaling.
- (vi) Sixth, performance analysis is done using metrics like Precision, Recall, F-score, Accuracy and running time. Fig. 1 shows the overall workflow of this work

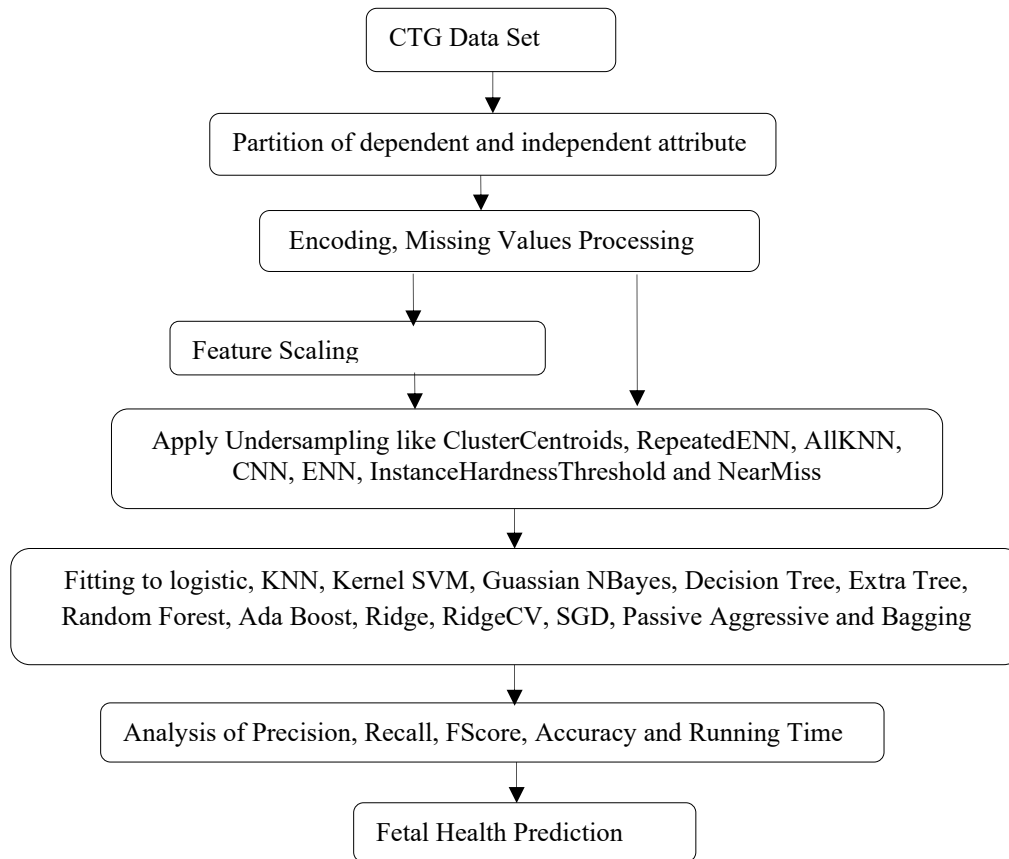

Figure 1. Overall Workflow of the system

### Exploratory Data Analysis

The CTG dataset extricated from the UCI machine learning store is utilized for usage [21]. The dataset comprises of 2127 patients information with 21 autonomous highlights (baseline value, accelerations, fetal movement, Uterine contractions, light decelerations, severe decelerations, prolonged decelerations, abnormal short term variability, mean value of short term variability, percentage of time with abnormal long term variability, mean value of long term variability, histogram width, histogram min, histogram max, histogram number of peaks, histogram number of zeroes, histogram mode, histogram mean, histogram median, histogram variance, histogram tendency) and 1 Target “Fetal Health” [22]. The code is implemented with python under Anaconda Navigator with Spyder IDE. The data set is splitted with 80:20 for training and testing dataset. Fig.2. shows the target feature analysis and found to be non-sampled [23-24].

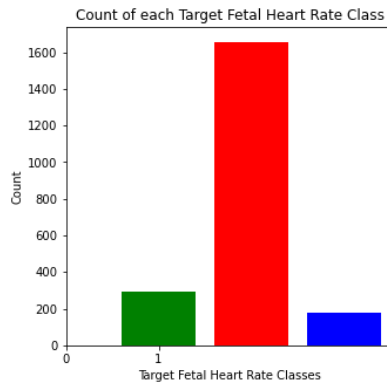

Figure 2. Target Feature Analysis of Dataset

### Implementation and Discussion

The raw data set is fitted to all the classifier like logistic regression, KNN, Kernel SVM, Decision Tree, Random Forest, Ada Boost, Ridge, RidgeCV, SGD, Passive Aggressive and Bagging classifier with and without the presence of feature scaling and performance is shown in Table 1 and Table 2, the accuracy and running time comparison is shown in Figure. 3 - 4.

### Undersampling Results and Performance Analysis

The raw data set is subjected to undersampling methods ClusterCentroids, CondensedNearestNeighbour, AllKNN, RepeatedENN, EditedNearestNeighbours, InstanceHardnessThreshold and NearMiss. The resampled dataset distribution after undersampling is shown in Figure.5. The raw data set is subjected to undersampling method namely ClusterCentroids and the resampled dataset is fitted to all the classifiers with and without the presence of feature scaling and performance is shown in Table 3 and Table 4, the accuracy and the running time comparison is shown in Figure. 6 - 7.

### Conclusion

An endeavor is done to analyze the execution of non sampled target features with tested information. The CTG dataset utilized in this paper found to have nonsampled information with Ordinary, Suspect and Pathologic. This paper endeavor to perform undersampling with ClusterCentroids, CondensedNearestNeighbour, AllKNN, RepeatedENN, EditedNearestNeighbours, InstanceHardnessThreshold and NearMiss methods. Experimental results shows that the Decision Tree classifier tends to retain 98% before and after feature scaling for the undersampling with EditedNearestNeighbours, RepeatedENN and AllKNN methods.
