

Racial Difference in Human Platelet PAR4 Reactivity Reflects Expression of *PCTP* and *miR-376c*

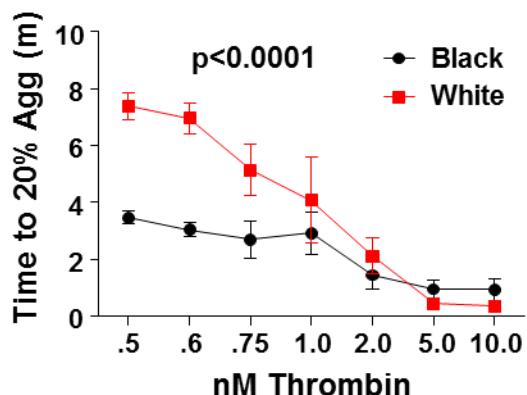

Leonard C. Edelstein¹, Lukas M. Simon², Raúl Teruel Montoya¹, Michael Holinstat¹, Edward S. Chen², Angela Bergeron³, Xianguo Kong¹, Srikanth Nagalla¹, Narla Mohandas⁴, David E. Cohen⁵, Jing-fei Dong⁶, Chad Shaw^{2,7*} and Paul F. Bray^{1*}

Supplementary Item & Number	Title or Caption
Supplementary Figure 1	Pilot study of racial differences in platelet response to thrombin.
Supplementary Figure 2	Probability density plots of all mRNAs and all miRNAs
Supplementary Figure 3	Affy Gene ST 1.0 array oligonucleotide probe level data by race.
Supplementary Figure 4	Effect of miR-376c transfection on related miRNAs.
Supplementary Figure 5	RT-PCR validation of miRNAs differentially expressed by race and identified by Nanostring technology.
Supplementary Table 1	Demographics and platelet parameters by race
Supplementary Table 2	Summary of light transmission aggregometry statistics in PRAX1.
Supplementary Table 3a	Set of mRNAs positively correlated with PAR4-mediated platelet reactivity.
Supplementary Table 3b	Set of mRNAs negatively correlated with PAR4-mediated platelet reactivity.
Supplementary Table 4	List of miRNAs differentially expressed by race.
Supplementary Table 5	List of miRNAs located in DLK1-DIO3.

Supplementary Fig 1. Pilot study of racial differences in platelet response to thrombin. LTA was measured in washed platelets following addition of multiple concentrations of thrombin in the absence (a) or presence (b) of 20 μM BMS-200261 (BMS, PAR1-specific antagonist) for 4 black subjects and 3 white subjects. (c,d) Cumulative quantitative results of (a) and (b) Time to both 20% (c) and 50% (d) aggregation was faster in black subjects than in white at low doses. Statistical tests: (c) 2-way ANOVA, (d) 2-sided t-test. (e) Representative LTA demonstrating BMS-200261 inhibits PAR1-AP, but not PAR4-AP mediated platelet aggregation using standard agonist concentrations to elicit maximal aggregation.

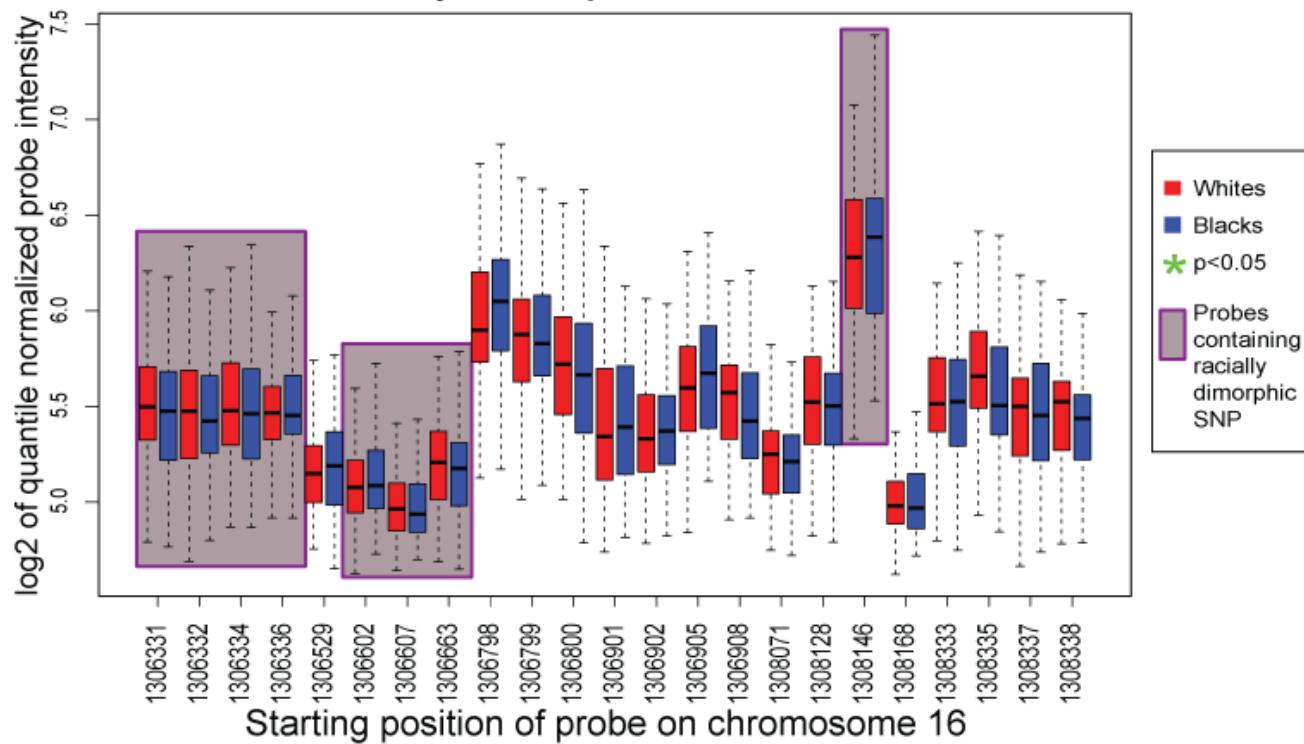

Supplementary Figure 2. Probability density plots of all mRNAs and miRNAs. Probability density plots of all mRNAs (Panel A) and all miRNAs (Panel B) plotted by the average \log_2 expression. The vertical red line indicates the arbitrary threshold for the most abundantly expressed RNAs based on the shape of the curve. We defined “most commonly expressed” RNAs as those mRNAs expressed above 1.5 in at least 75% (115/154) of subjects and miRNAs expressed above 5.8 in at least 65% (100/154) of subjects.

A

PCTP probe-level intensities divided by race
Affy TranscriptID: 8008598

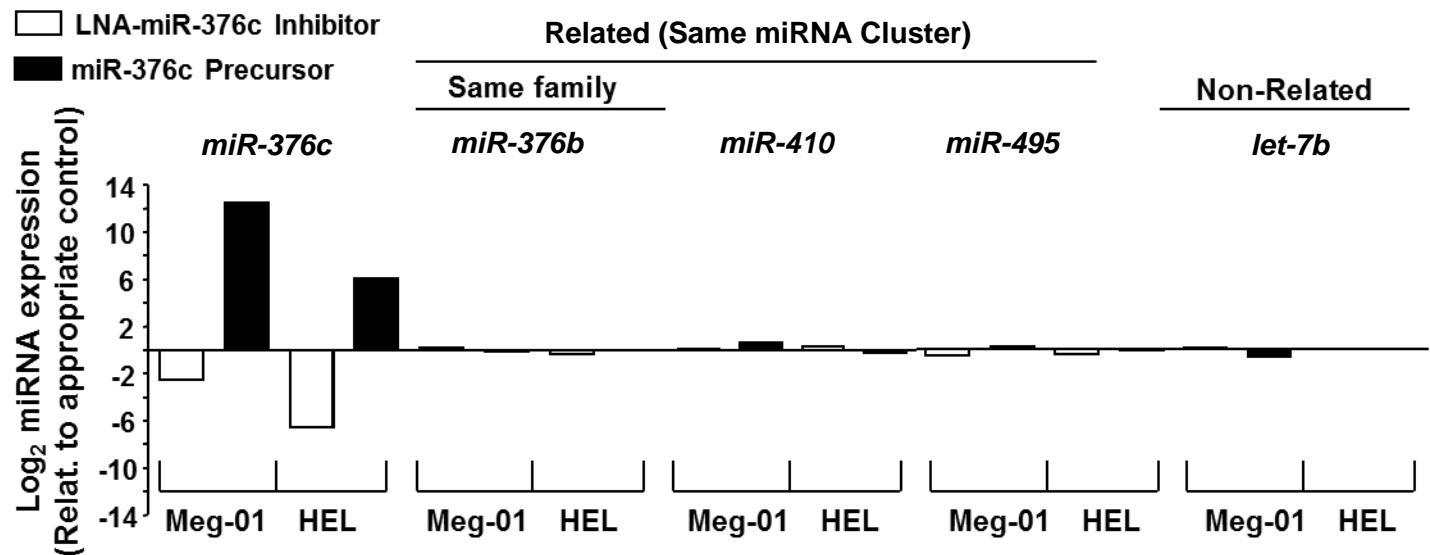

**B**

TPSD1 probe-level intensities divided by race
Affy TranscriptID: 7992191

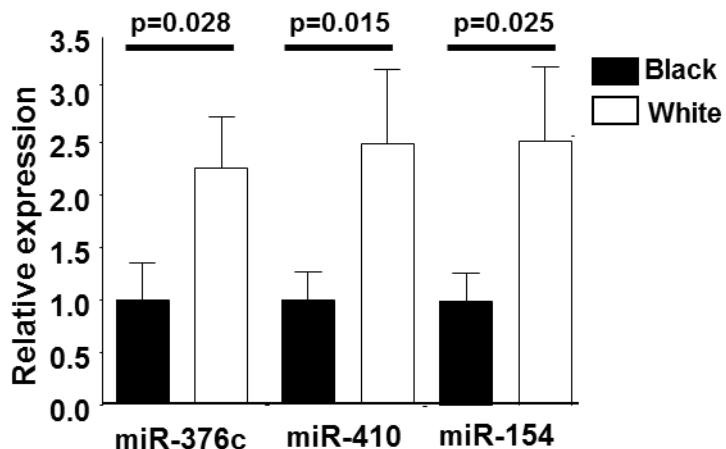

Supplementary Figure 3. Affy Gene ST 1.0 array oligonucleotide probe level data by race.

Panel **A** shows probe-level intensities for the probeset annotated to *PCTP*; panel **B** shows probe-level intensities for the probeset annotated to *TPSD1* (based on Affymetrix). Data for all black and white subjects for each individual oligo probe are shown in side-by-side boxplots, with whites denoted in red and blacks in blue. Oligo probes that harbor a racially dimorphic SNV are contained within the grey rectangles in the plot. The data in panel **A** demonstrate that probes containing racially dimorphic SNVs show a similar level of racial difference compared to what is observed for almost all of the other probes that are not racially dimorphic. Similar results were obtained for the other 160 probesets that were DE by PAR4. In addition, panel **B** shows an example probeset not differentially expressed between races but containing multiple racially dimorphic SNVs with no differential intensities between any of the probes. Thus the differences in racially dimorphic SNV variation do not drive the gene-level racial difference we observed. See **Supplementary Note 1**.

Supplementary Figure 4. Effect of *miR-376c* transfection on related miRNAs. Transfection of *miR-376c* precursor or LNA inhibitor resulted in the expected alterations in *miR-376c* levels while not affecting the level of miRNAs in the same family (*miR-376b*), genetic locus (*miR-410* and *miR-495*), or other unrelated miRNAs (*let-7b*).

Supplementary Figure 5. RT-PCR validation of miRNAs differentially expressed by race and identified by Nanostring technology. Y-axis shows expression relative to platelet RNA from black subjects. P-values calculated by t-test.

Supplementary Table 1. Demographics and platelet parameters by race

Characteristic	Black (n=70)	White (n=84)	P-Value
Age, years	29.7± 7.2	27.7 ± 5.8	0.060
% Female	55.7	46.4	0.262
Body mass index, kg/m ²	26.24 ± 5.9	24.53 ± 3.96	0.041
% with hypertension	4.2	1.1	0.330
% Current Smokers	4.2	5.9	0.729
Platelet count, (10 ⁴ /µl)	222 ± 74.3	198 ± 49.5	0.025
Mean platelet fL	7.27 ± 0.77	7.26 ± 0.70	0.921
Fibrinogen (mg/dL)	250 ± 52.9	251 ± 55.1	0.944
VWF activity (%)	108 ± 45.3	99 ± 35.6	0.176

Data are expressed as mean±SD or percentages.

Statistical tests were 2-sided t-test for numerical variables and Fisher's Exact for nominal parameters.

Supplementary Table 2. Summary of light transmission aggregometry statistics in PRAX1.

Agonist	Black		White		Fold difference (Black/White)	p Value (Mann Whitney)

*Percent maximal aggregation

Supplementary Table 3a. Set of mRNAs positively correlated with PAR4-mediated platelet reactivity.

Using a simple linear regression at FDR q<.25; this FDR cutoff corresponds to a maximum p-value of 0.0028. The table shows 93 mRNAs in the same order as in the heatmap in Fig. 3a. Symbols were obtained using Affymetrix probeset annotation file. The p-value for race describes the T-test of black vs white. The coefficient and p-value for PAR4 describe the correlation between the PAR4 agonist score and mRNA expression across 154 individuals. The q-values represent the p-value accounting for multiple testing using the Benjamini & Hochberg False Discovery Rate (1995).

Supplementary Table 3b. Set of mRNAs negatively correlated with PAR4-mediated platelet reactivity.

Set of 20 mRNAs negatively correlated with PAR4-mediated platelet reactivity using a simple linear regression at FDR q<.25; this FDR cutoff corresponds to a maximum p-value of 0.0028. Symbols were obtained using Affymetrix probeset annotation file. The p-value for race describes the T-test of black vs white. The coefficient and p-value describe the correlation between the PAR4 agonist score and mRNA expression across 154 individuals. The q-value represents the p-value adjusted for multiple testing using the Benjamini & Hochberg False Discovery Rate (1995).

Affymetrix Transcript Cluster ID	Symbol	Mean	Race p-value	Race q-value	PAR4 Coefficient	PAR4 p-value	PAR4 q-value	Significant by race

* Annotation provided by Nanostring Technologies

† P-value is calculated using T-test.

‡ The q-value represents the p-value adjusted for multiple testing using the Benjamini & Hochberg False Discovery Rate (1995).
