

Determination of use value and informant consensus factor on ethnobotanic knowledge about wild legumes used by natives of Wayanad district, Kerala

V Aswathi*[†] & A K Abdussalam

Department of Post Graduate studies and Research in Botany, Sir Syed College, Taliparamba, Kannur 670 142, Kerala, India
E-mail: [†]aswathybotany@rediffmail.com

Received 27 September 2019; revised 24 June 2020

The present work is aimed to document the traditional knowledge about the various usages of leguminous plants (Fabaceae), by tribals of Wayanad district and its nearer places such as Vanimel and Vilangad villages of Kozhikkode district, Kerala. Ethnobotanical surveys/ interviews/ discussions were carried out in few randomly selected tribal hamlets for the data collection. Among these visits the plants used by tribal communities *Paniya* and *Kattunaikka* were focused for documentation. This study reports the data of 80 plants from the family Fabaceae. This report also observed that the tribal communities were deeply depending on various wild legumes for making infrastructures, agricultural utilities, making food/ fuel/ timber/manure and they solve their health issues to a large extent also by using some wild legume species. Among the eighty species, fifty were used in various medicinal preparations and thirty species were used for dietary needs in combination or alone. At the same time major group of plants are unable to demarcate between food and medicine. Use Value analysis shows that the tree legume species *Tamarindus indica* is relatively more important with 64 use reports (UV 0.98). Analysis of *Informant consensus factor* reveals that the homogeneity of knowledge is more for the plants with medicinal properties (F_{ic} 0.97); whereas maximum heterogeneity (F_{ic} 0.92) was found about agricultural utilities of plants. According to the results of DMR analysis *Dalbergia latifolia* ranked first, so that this species is getting more exploited, because it is highly preferable for all five categories studied under DMR analysis. Moreover the present documentation of ethnic knowledge about wild legumes is an attempt to serve as indigenous information for future sustainable utilization and conservation.

Keywords: DMR, Ethnic knowledge, Fabaceae, Informant consensus factor, Traditional uses, Use Value, Wayanad

IPC Code: Int. Cl.²¹: A61K 35/78, A61K 36/185, A61K 36/00, A61K 36/48

Forest dwellers are dealing with huge amount of traditional knowledge and ethnic diversity. Wild edible plants are important in the livelihood strategies of tribal populations¹. Various forms of wild edible food reserves play a crucial role in suppressing their hunger as well as supplementing their nutritional needs. The relationship between humans, plant and animal has been since time immemorial and of course, the legumes are been cultivated and used for food for centuries all over the world². Ancient men had discovered natural products to satisfy his needs, including relief from his personal ailments as well as of his fellow domestic animals³.

Legumes are consumed primarily as seed foods; but pods, leaves and roots or tubers of various species are also eaten⁴. The nitrogen fixing ability of many legumes provides an important source of biological nitrogen in agriculture and natural ecosystem, benefitting sustainable agricultural productivity and

providing essential ecosystem services⁵. So that legumes used prominently in crop rotations and in the mixed cropping commonly practiced in Indian agriculture². Studies done by Nair and Volga *et al.* reveal several timber yielding tree legumes^{6,7}, found in and around the study area. Apart from all these well-known uses many legumes possess local household utilities, those were also focused in this study.

Wayanad has the highest percentage of tribals in Kerala and it forms 17.1% of the total population of the district⁸. The ethnic diversity of the district is very impressive as evidenced by ten different tribal groups⁹, in which five of them were major and large communities such as *Kurichya*, *Kuruma*, *Adiya*, *Paniya* and *Kattunaikka*¹⁰. Two among the major five, *Paniya* and *Kattunaikka* were focused in this present study (Fig. 1). All the tribal communities are homogenous ethnic groups with a specific sense of identity based on common language and culture¹¹.

Documentation of indigenous knowledge through ethnobotanical studies is important for the

*Corresponding author

conservation^{12,13} and utilization of biological resources¹⁴. The present study was devised to document the details of leguminous plants used by tribals of this area for various domestic needs. Many plants used in industrialized countries today were originally identified and developed through indigenous knowledge¹⁵.

Materials and Methods

Study area

Wayanad district is with a hilly terrain on the southern Western Ghats and located in the northeast part of Kerala state¹⁶ and is considered one of the world's biodiversity hotspots, since it hosts great richness of flora and fauna. It has an area of 2136 km², where 37% of the land area is forest covered and 55% cultivated by agriculture. It lies between North latitude 11° 26' to 12° 00' and East longitudes 75° 75' to 76° 56' and it lies at an altitude of 700 to 2100 M above the sealevel¹⁷. The altitudinal difference within the district results in climatic variations, which in turn determines the vegetation patterns¹⁸. This area is bounded on the north by Kodagu district (Karnataka) and on the east by Mysore district (Karnataka) and Nilgiri district (Tamilnadu). The south and west margins are lined by Malappuram, Kozhikkode and Kannur districts of Kerala state. The windward and leeward sides of Western Ghats contribute major

vegetation types of Wayanad district, such as semi-ever green forests, evergreen forests, moist deciduous forest, dry deciduous forest, temperate forests (shola), grass lands etc¹⁹. The traditional culture and the natural ecosystem of these regions have been relatively well conserved²⁰.

Field survey

Basic information about the distribution of tribes was collected from Tribal Development Office at Kalpetta, Bathery, Mananthavady and an NGO 'Sreyas' at Bathery. All the information gathered from various sources were analysed and summarized at famous agro biodiversity center, M. S. Swaminathan Research Foundation (MSSRF), Kalpetta. Field surveys were carried out in the study locations of Wayanad and Calicut districts of Kerala, during the year 2017 (May)– 2019 (April). After gaining the confidence from the tribal people transect walk were conducted to explore the diversity and ethnobotanical uses. Then detailed data in addition to the vernacular name, medicinal and culinary uses, were collected by conducting surveys/interviews/discussion using a semi structured questionnaire with person/groups and with traditional healers (Table 1). In addition to major and minor uses, detailed information about the preparation of decoction, paste, powder, juice and preprocessing etc., were also collected. The plant specimens were documented by preparing herbarium and by taking photographs.

The collected plants were identified taxonomically by using the flora of Presidency of Madras and handbook of flowering plants published by KFRI²¹. The identified plant specimens were then confirmed with the herbaria of Calicut University and MSSRF - CAbC, Kalpetta. Web based taxonomic database 'The Plant List' (www.theplantlist.org), Kew Botanical Garden (www.mpns.kew.org) and keralaplants.in (<http://keralaplants.in/>) were also referred for proper and correct identification and updated nomenclature. The herbarium specimens were deposited in the Herbarium, Research Department of Botany, Sir Syed College, Taliparamba, Kannur, Kerala.

Table 1 — Demography of informants in the study

Age group	Paniya community			Age group	Kattunaikka community		
	Male	Female	Total		Male	Female	Total
Group I(20-35)	2(20%)	8(80%)	10(38%)	Group I(20-35)	7(53%)	6(46%)	13(33%)
Group II(36-50)	5(41%)	7(58%)	12(46%)	Group II(36-50)	4(40%)	6(60%)	10(25%)
Group III (50 Above)	3(75%)	1(25%)	4(15%)	Group III (50 Above)	5(31%)	11(68%)	16(41%)
Total 26(40% informants from Paniya community)				Total 39(60% informants from Kattunaikka community)			

Data analysis

The data collected from 65 informants from two major tribal communities were statistically analysed as below.

Use Value (UV)

According to Philips and Gentry²² UV is used to determine the relative importance of a particular species with respect to other species; and it is obtained as sum of total use reports of a particular species divided by total number of informants. Equation is given below,

$$UV = \sum U/N$$

High value of UV indicates that the plant is relatively important for their life²³ and the lower value shows the lesser importance of the plant species with respect to others²⁴.

Factor informant consensus (F_{ic})

F_{ic} is one of the most widely used statistical tool to determine the level of homogeneity of knowledge among informants²⁵, as well as to study total usage of plant species according to cultural applicability²⁶. F_{ic} was first introduced by Trotten and Logan in 1986²⁷, later it was modified by Heinrich *et al.*²⁸ and then gained more popularity. F_{ic} was originally designed to analyze medicinal plants with intercultural relevance related to three populations in Mexico²⁹. To analyse F_{ic} on our data it is necessary to classify utilities of the plants into broad categories. The categories are as follows,

1. Agricultural uses
2. Household utility
3. Food/Fodder/Forage/Grazing
4. Timber/Shade providing/Fuel
5. Medicinal plant

The F_{ic} was calculated as the number of use citations in each category (N_{ur}) minus the number of species used (N_t), whole divided by the number of use citations in each category minus one³⁰.

$$F_{ic} = (N_{ur} - N_t) / (N_{ur} - 1)$$

F_{ic} value ranges between 0.00 and 1.00. F_{ic} becomes high when only one or few plant species are reported to be used by a high proportion of informants for a particular category, whereas low F_{ic} value obtained because of the disagreement of informants over which plant should be used for which purpose^{31,32}.

Direct Matrix Ranking (DMR)

Direct Matrix Ranking (DMR) was calculated on the data collected from informants from the study area. It was to identify multipurpose plant species of that locality²⁶. Total fifteen Informants were selected on the basis of their strong knowledge about plants and asked for giving values such as 0= not used, 1= least used, 2= less, 3= good, 4= very good, 5= best³³. The average scores given to each plant were summed up and ranked.

Results

The present study observed that the tribal communities suppress their hunger by deeply depending on various wild edible plants. And they solve their health issues to a large extent also by wild plants itself. The tribal people knew what to eat, how to collect, how to prepare and how to eliminate the toxicity exclusively. So they can avoid poisoning issues due to high deposition of some secondary metabolites; especially on eating some wild legumes.

Total 65 local informants [26 men (40%) and 39 women (60%)] from two major tribal communities Paniya and Kattunaikka contributed to the study. Among the 26 (40%) informants of Paniya, 2 (20%) males and 8 (80%) females belong to group I, 5 (41%) males and 7 (58%) females belong to group II and 3 (75%) men and 1 (25%) female belong to group III. Then among the 39 (60%) informants from Kattunaikka, 7 (53%) males and 6 (46%) females belong to group I, 4 (40%) males and 6 (60%) female belong to group II and 5 (31%) males and 11 (68%) female belong to group III (Table 1).

Out of the eighty species of leguminous plants selected from the study site (Table 2), majority of them (47) are from the sub family Papilionoideae (P), and 16 from sub family Caesalpinioideae (C) and 17 from Mimosoideae (M). In which Papilionoideae contains 29 genera whereas Caesalpinioideae and Mimosoideae contain 8 genera each (Fig. 2). Among the eighty species, fifty were used in various medicinal preparations and thirty species were used for dietary needs in combination or alone. At the same time major group of plants are unable to demarcate between food and medicine, because these are used for both edible and medicinal purposes. The plants such as *Cajanus cajan*, *Mucuna gigantia*, *Peuraria phaseoloides*, *Terramnus labialis*, *Senna tora*, *Tamarindus indica*, *Xylixlo carpa* are few from the above specified category. In some genus like *Vigna*, *Senna* and *Mucuna* were having more than one edible

Fig. 2 — Number of legume genera under respective sub families.

Table 2 — List of Leguminosae species recorded from the study area

SI No	Plant Name (Accession No.)	Sub family	Local name	Habit	Traditional uses	TUR*	Use value (UV)
1	<i>Abrus precatorius</i> L. (1261)	P	Kunni	Climbing shrub	The red seeds with a black end are used for making ear ornaments (13). The leaves are cut in to pieces and boiled in coconut oil. This oil is used to reduce hair loss (2). Seeds were used against gonorrhoea (3).	18	0.27
2	<i>Acacia caesia</i> (L.) Willd. (1011)	M	Incha	Prickly climbing shrub	The stem juice is administered internally in respiratory troubles (8). Stem fibers are used to make bathing scrub (11). The juice extracted from the stem is also applied on skin before bathing as a natural herbal medicine (2).	21	0.32
3	<i>Acacia catechu</i> (L. f.) Willd. (956)	M	Karingali	Tree	A very strong combination of <i>Acacia catechu</i> extract and milk can relieve complaints of cough as well as bronchitis (13) and used as a forage crop (5). Pieces of bark are boiled in drinking water because of its anti-microbial activity (10).	28	0.43
4	<i>Acacia farnesiana</i> (L. f.) Willd. (3507)	M	Vahni	Prickly climbing shrub	Gum is rarely used for skin infections (7); wood is used for agricultural implements (18).	25	0.38
5	<i>Acacia nilotica</i> (L.) Delile. (1556)	M	Karuvellam	Prickly herb	Used as forage and as a shade tree (7).	7	0.10
6	<i>Acacia pennata</i> (L.) Willd. (1262)	M	Kattucheenikka/ Mala-incha	Prickly climbing shrub	It is used in asthma, allergic disorders, body pain etc (6).	6	0.09
7	<i>Acacia sinuata</i> (Lour.) Merr. (1263)	M	Cheenikka	Woody climber	Leaves and tender parts are used against hair fall and dandruff (8). Water extract of fruit is used to repel leech (16).	24	0.36
8	<i>Acacia torta</i> (Roxb.) Craib. (955)	M	Incha/Kallinja	Prickly climbing shrub	Used in treatment of menstrual disorders (22). The fiber from bark is used for bathing (4).	26	0.4
9	<i>Adenanthera pavonina</i> L. (957)	M	Manjadi	Tree	Cooked/roasted seeds are eaten with rice (the seed may require additional steps to neutralize toxicity) (13). Young leaves are used as a vegetable and seeds are used to make ornaments (3).	16	0.24
10	<i>Aeschynomene indica</i> L. (958)	P	Jeluga/Nellithali	Under shrub	The decoction of leaves along with other ingredients is taken internally for 40 days to treat snakebites and the decoction is also mixed with bathing water (15) & it is a green manure (4).	19	0.29

80	<i>Xylia xylocarpa</i> (Roxb.) Taub. (3433)	M	Irul	Tree	Very young fruits were consumed directly (16) and the seeds are used as pulse (18). The oil from the seeds is used in the treatment of rheumatism (3).	37	0.56

* Total use reports

part, such as leaves, flowers, pods, seeds etc. Major Medicinal uses of these plants are related to problems with digestive system, skin itching/inflammations, rheumatic joint pain, fever, cough, allergic disorders, gonorrhoea, hair fall etc. Many plants such as *Abrus precatorius*, *Kingiodendron pinnatum* were popularly used in some problems of reproductive system and seeds of *Abrus precatorius* are also used to prevent pregnancy.

Dalbergia sissoides, *Dalbergia lanceolaria*, *Dalbergia latifolia*, *Erythrina variegata*, *Albizia odoratissima*, *Albizia amara*, *Archidendron monadelphum* are some of the timber yielding members of Leguminosae. While the plants such as *Bouhinia purpurea*, *Clitoria ternatea*, *Bouhinia phoenicea*, *Bauhinia variegata* etc., were used to increase beauty of home gardens. At the same time ornamental trees like *Delonix regia*, *Cassia fistula* and many species of *Acacia* were extensively used for

providing shade. Apart from providing shade and ornamental beauty, many members of the family leguminosae were extensively used for forage and grazing and many are known for manuring purposes. Since ancient times plants from leguminosae were accepted for crop rotations because of its nitrogen fixing capacity and their immense role in increasing soil fertility.

Use value (UV)

Tamarindus indica possessed the highest use value (UV) equal to 0.98 with 64 use reports. Hence it is relatively more important species followed by *Vigna vexillata* (UV= 0.96), *Mucuna gigantea* (UV= 0.95) and *Canavalia cathartica* (UV= 0.90). Use value of *Alysicarpus bupleurifolius*, *Crotalaria calycina* and *Tephrosia purpurea* are least among the selected species of legumes, that is 0.03; indicates that these plant species are not popularly used by the tribal communities (Table 2).

Factor informant consensus (F_{ic})

In order to determine the total usage of plant species according to cultural applicability and to calculate the F_{ic} value of relatively important plants, several interviews had been conducted with informants from two major tribal communities of the study area. A total of 3620 actual use reports were recorded though interviews/discussions conducted with 65 informants. Actually people of this region use hundreds of plants from the family fabaceae, but here tabulated the details of only eighty plants (Table 2) in order to consider the homogeneity of usage of the plants.

Major utility concerns of the plant species were categorized into five groups for convenience and also for calculating the F_{ic} on our data. High F_{ic} value are obtained when only restricted number of plants are reported to be used by a high proportion of informants under a specific category, whereas low F_{ic} value indicates that informants disagree over which plant is to be used. So that, by knowing the F_{ic} value, it's easy to understand whether the informants are having a homogenous or heterogenous knowledge about the plants under study. Analysis of *Informant consensus factor* reveals that the homogeneity of knowledge is more for the plants with medicinal importance (Table 3) (F_{ic} 0.97); whereas maximum heterogeneity (F_{ic} 0.92) was found in the opinion among the informants about agricultural utilities of plants.

Direct Matrix Ranking (DMR)

Direct Matrix Ranking (DMR) was calculated only on plants that are having a high demand and relative importance among the people. Hence the plants selected for *DMR* are having a *Use Value* above 0.74 (Table 4). *DMR* implemented on the data revealed that timber yielding trees with medicinal properties were facing more threat due to exploitation.

According to the results *Dalbergia latifolia* ranked first, *Dalbergia lanceolaria* ranked second and *Tamarindus indica* reached on the third rank. This results showed that these plants coming on top ranks were actually been more exploited, because these were highly preferable for all five categories studied under *DMR* analysis. Edible herbs are also under pressure in the study site, because most of them are also used for forage/grazing and manuring purposes widely.

Table 3 — Informant consensus factor (F_{ic}) by various utilities of plants

S.No.	Category	No. of taxa used	No. of total use reports	F_{ic}
1	Agricultural uses	8	98	0.92
2	Household utility	26	365	0.93
3	Food/Fodder/Forage/ Grazing	56	1125	0.95
4	Timber/Shade providing/Fuel	7	153	0.96
5	Medicinal plant	48	1879	0.97

<i>Vigna vexillata</i> (L.) A. Rich.	5	0	5	0	0	10

Discussion

In general, the collection and consumption of wild edible foods are increasingly stigmatized as symbols of poverty and 'tribalness'³⁴. Since ancient times, plants and its derivatives have been traditionally used as medicine for the treatment of various diseases³⁵. Many plants such as *Teramnus labialis*, *Pseudarthria viscida*, *Pongamia pinnata*, *Erythrina variegata* etc. are used for the treatment of common health problems such as fever, cold, joint pain etc. A wide range of herbal traditional medicines are used to regulate the menstrual cycle and to enhance fertility or as either abortifacients/anti abortifacients³⁶.

Tribal people infer us, how to utilize the wild food reserves and how to eliminate the toxins from various plant species. The tribals have established their own pharmacopoeia of their traditional information³⁷ about the medicinal uses of plants by trial and error methods³⁸. For example the preparation of food stuffs from *Mucuna gigantea*, *Pueraria phaseoloides* and *Adenantha pavonina* really need exclusive expertise; otherwise this may cause poisoning. Even the washing, cleaning and cutting also require special training³⁹.

Among the tribal communities focused in this study, the Paniya community is really successful in exploring all the available edible plant groups from all types of vegetation ranging from dense forest to even on plain grazing land areas⁴⁰. But the actual forest dwellers are Kattunaikkas⁴¹. They were residing and forage completely inside the forest. The other major communities like Adiya, Kuruma and Kurichya were forage outside the forest areas and they are more exposed than Kattunaikkas and have access for plantations⁴².

Conclusion

Actually hundreds of legume species were directly or indirectly related to the daily life of tribal man. But the present study summarized with the popular and most homogenous data of eighty plants. Majority of the plants included in this study were collected from the exact wild habitats, while some edibles like *Lablab purpureus*, *Cajanus cajan*, *Arachis hypogea* were collected from the homestead gardens. All the data about the plants were gathered through interviews/discussions with randomly selected 65 local informants (40% from Paniya community and 60% from Kattunaikka community). *Tamarindus indica* possessed highest Use Value followed by

Vigna vexillata, *Mucuna gigantea* and *Canavalia cathartica*. High UV indicates the high acceptance or relative importance of those plants among the local people. Then the plants with lowest UV are *Alysicarpus bupleurifolius*, *Crotalaria calycina* and *Tephrosia purpurea*. According to F_{ic} analysis, it is found that apart from edible properties plants with medicinal properties are getting more exploited. Then DMR Rank determines that dependence on tree species were getting emphasized more among the tribals under this present investigation.

Several documentations were previously done by eminent researchers about the traditional knowledge and diversity of wild plants⁴³ used for food, fodder, medicine, timber etc.^{44,45} by the major tribal communities of Wayanad district, Kerala. This present study may also serve as indigenous information for future sustainable utilization and conservation.

Conflict of Interest

No potential conflict of interest was reported by the authors.

Author Contributions

VA: Conceptualization, Methodology, Investigation, Data curation and Original draft; AKA: Supervision, Resources and Formal analysis.

Acknowledgement

The authors would like to thank the local people of the study site for their valuable indigenous knowledge transfer. We are also thankful to Dr. V. Balakrishnan; former Director of M S Swaminathan Research foundation, Kalpetta and Dr. N. Anilkumar; former Head of the institution of M S Swaminathan Research foundation, Kalpetta for providing infrastructure and support to carry out major part of the research work successfully and the authors are extremely thankful to the Council of Scientific and Industrial Research for providing financial assistance.
