Abstract

Noncommunicable diseases and injuries (NCDIs) account for nearly 70% of deaths worldwide, with an estimated 75% of these deaths occurring in low- and middle-income countries. Globally, the burden of disease from noncommunicable diseases (NCDs) is most often caused by the “big 4,” namely: diabetes, cardiovascular diseases, cancer, and chronic lung diseases. However, in Malawi, these 4 conditions account for only 29% of the NCDI disease burden.

The Malawi National NCDI Poverty Commission was launched in November 2016 and will describe and evaluate the current NCDI situation in Malawi, with a focus on the poorest populations. The National Commission will investigate which NCDIs cause the biggest burden, which are more present in the young, and which interventions are available to avert death and disability from NCDIs in Malawi, particularly among the poorest segments of the population.

The evidence gained through the work of this Commission will help inform research, policy, and programme interventions, all through an advocacy lens, as we strive to address the impact of NCDIs among all populations in Malawi.

Why a Commission on NCDIs?

Noncommunicable diseases and injuries (NCDIs) account for nearly 70% of deaths worldwide, with an estimated 75% of these deaths occurring in low- and middle-income countries.¹ NCDIs are usually associated with the rich, the elderly, or urban populations.² Furthermore, the interventions aimed around NCDIs often follow the behavioural change model, based on 4 common risk factors: unhealthy diets, harmful use of alcohol, smoking, and physical inactivity.¹ Yet while global and national policies tend to focus on these populations and this model, is this reflecting the lived realities of all populations? For those that suffer from NCDIs not related to behavioural risk factors, is this focus missing significant disease burdens? In 2013, Malawi participated in an international forum discussing precisely these questions and signed on to commit to address NCDIs in impoverished settings, with a focus on the young, described by Binagwaho et al. in *The Lancet* in 2014.³

The Malawi National NCDI Poverty Commission, 1 of 11 National NCDI Poverty Commissions, was launched in November 2016 and will describe and evaluate the current NCDI situation in Malawi, with a focus on the poorest populations. The National Commission is investigating which NCDIs cause the biggest burden, which are more prevalent in the young, and which interventions are available to avert death and disability from NCDIs in Malawi, particularly among the poorest segments of the population. It is anticipated that the results from these analyses will help guide Malawian policy and set priorities to inform efforts to reduce the NCDI burden in a comprehensive way across all sectors of the population.

Malawi's National NCDI Poverty Commission is contributing data and expertise to the Global Commission: the *Lancet* Commission on Reframing NCDIs for the Poorest Billion (see: www.ncdipoverty.org). This Global *Lancet* Commission is working with 11 different countries that encompass the majority of the world's poorest, with the goal to elucidate the global burden of NCDIs among the world's poorest billion and to describe and evaluate the current interventions aimed at addressing them. In doing so, the Commissions will refocus our understanding of the NCDI burden to ensure it encompasses all those suffering from NCDIs.

NCDIs in Malawi

In Malawi, according to Global Burden of Disease (GBD) study estimates, 38% of the burden of disease from noncommunicable diseases (NCDs) is caused by the “big 4,” namely: diabetes, cardiovascular diseases (CVD), cancer, and chronic lung diseases.⁴ This is in stark contrast to high-income countries, where these same 4 conditions comprise 48% of the disease burden (Figure 1).⁴ These 4 conditions are generally thought to be related to modifiable and shared risk factors: tobacco use, unhealthy diets, physical inactivity, and the harmful use of alcohol.¹ In fact, only 17% of the NCD disability-adjusted life years (DALYs) in Malawi are from the big 4 categories with any behavioural or metabolic attribution, compared to 30% for high-income countries.⁴ Furthermore, the majority of the NCD burden—62%—is caused by other conditions outside of these 4 classic NCDs,⁴ which do not necessarily share the same risk factors. This includes a large set of conditions, such as rheumatic heart disease, mental illness, road traffic injuries, and type 1 diabetes. In Malawi, our analysis with GBD data also shows that the burden of NCDIs falls disproportionately on the young, with 82% of

the injury burden and 60% of the NCD burden occurring in those less than 40 years of age, compared to 40% and 18% in high-income countries, respectively.⁴ This is consistent with data from sub-Saharan Africa generally, where the probability of dying from or living with a disability related to an NCDI is highest for persons aged between 30 and 70 years.⁵ These NCDI conditions outside of the big 4—those that have different risk factors and disproportionately affect the young—are an important and significant piece of the NCDI burden in Malawi, presenting a critical and complementary set of conditions to address in policy and interventions.

Current interventions in Malawi

Much of what is currently known in Malawi about NCDIs, as well as the interventions targeting them, centres around hypertension and diabetes. According to the 2009 STEPS Survey, it was estimated that 33% of Malawian adults had high blood pressure and 6% had diabetes.⁶ These results, coupled with the global call for action against NCDs, led to the national response: the government of Malawi, through the Ministry of Health, included NCDs in the Health Sector Strategic Plan.⁷ This was followed by the establishment of a National Coordinating Unit—the NCDs and Mental Health Unit. In collaboration with partners and stakeholders, the Unit has since developed plans and interventions to address NCDIs.

The first National Action Plan for the Prevention and Management of NCDs (2012–2016) was launched in December 2013 during the World Diabetes Day commemoration. The Unit has further initiated a number of projects to improve prevention and enhance care for some NCDs. The first was the adaptation and launch of the Package of Essential NCD (PEN) interventions⁸ by the World Health Organization (WHO) in 2012, with pilot implementation at Kasungu District Hospital. The WHO PEN interventions, which include improving primary care capacity for early diagnosis, appropriate management for chronic NCDs, as well as health promotion, are currently being scaled up through a World Diabetes Foundation supported project that was launched in September 2015 to improve access, care, and prevention of hypertension and diabetes.⁹

Other interventions include: a Sports for Health initiative that aims to raise awareness about prevention and control of NCDs through physical activities; the introduction of a Human Papillomavirus (HPV) vaccine for adolescent girls for primary cervical cancer prevention in Zomba and Rumphi Districts; the development of the National Alcohol Policy, which aims to reduce the harmful use of alcohol; and the further implementation of One Stop Centres for gender-based violence, including sexual, physical, and emotional abuse. Further programmess are being implemented by nongovernmental organisations across the country, with many focusing on the integration of HIV and NCD care.

These represent encouraging steps towards reducing deaths and disabilities related to NCDIs, and the National Commission posits that complementary approaches are needed in order to tackle the broader burden of NCDIs, particularly among Malawi’s poorest. For those living in absolute or extreme poverty, the risk factors for NCDs are much more likely to relate to genetics, infections, and harmful environments,² rather than behavioural risk factors, such as diet and exercise. This communication,

therefore, focuses on the question of whether the current understanding of NCDIs in Malawi is truly reflecting the reality of the poorest, and whether the subsequent policies and interventions currently in place are helpful to those who suffer from NCDIs unrelated to lifestyle factors. Is there more that should be considered, beyond what is already being addressed?

Overview of the *Lancet* NCDI Poverty Commission

NCDIs afflicting the poorest billion do not individually reflect a major cause of death or disability worldwide, but put together, “they could account for more than a third of the disease burden among those living in extreme poverty, with more than two-thirds of this burden concentrated among individuals younger than 40 years.”² The types of NCDIs affecting these populations could include conditions, such as type 1 diabetes, rheumatic heart disease, cervical cancer, epilepsy, mental health disorders, and injuries from multiple sources, including domestic violence and road traffic injuries.² With the acknowledgment that there may be an unnoticed burden affecting the poor, the Global *Lancet* Commission was launched to directly describe this problem among the “poorest billion”.

The *Lancet* Commission defines the poorest billion, or those classified as being in “severe poverty”, as anyone deprived in 50% or more of the 10 indicators in the Multidimensional Poverty Index (MPI) (Table 1).¹⁰

Table 1: Multidimensional poverty index

Dimensions of poverty	Indicators
Education	Years of schooling
	Child school attendance
Health	Child mortality
	Nutrition
Living standards	Electricity
	Improved sanitation
	Improved drinking water
	Flooring
	Cooking fuel
	Assets ownership

Overview of the Malawi National NCDI Poverty Commission

Led by the Ministry of Health, the Malawi National NCDI Poverty Commission consists of country representatives working with the Global Commission, with membership from the NCD Unit, Kamuzu Central Hospital, Queen Elizabeth Central Hospital, Mzuzu Central Hospital, the University of Malawi College of Medicine, Partners In Health, Dignitas International, Malawi Epidemiology and Intervention Research Unit (MEIRU), Lighthouse Trust, Partners in Hope, and Baobab Health Trust. The team will analyse epidemiologic and other nationally available data, explore current interventions, leverage expert opinions in Malawi, and describe the lived reality of NCDIs through patient and provider perspectives. The analysis will start with an in-depth look at the Global Burden of Disease data

Percent of DALYs in Broad NCD Categories

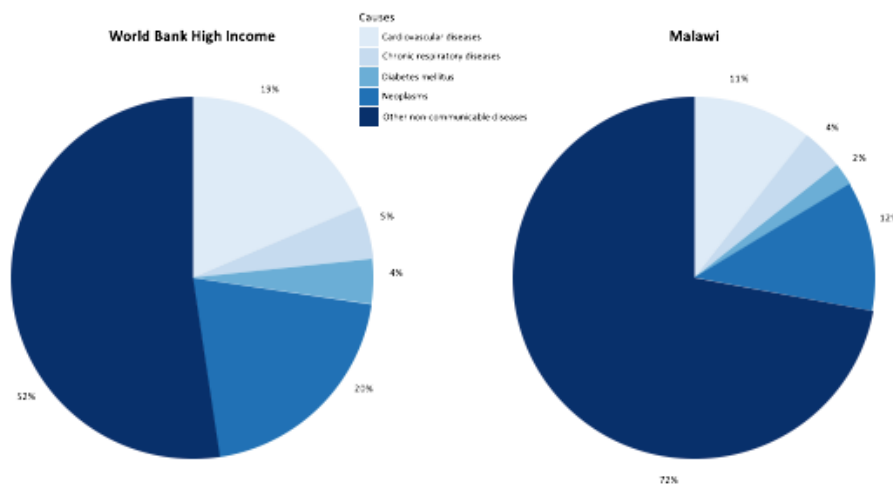

Figure 1: The contributing disease categories for noncommunicable disease (NCD) disability-adjusted life years (DALYs) in Malawi, compared to high-income countries³

Figure 2: The geographic distribution of Malawi’s population considered to be living in severe poverty¹⁰

from the Institute for Health Metrics and Evaluation—a set of tools that draws on an extensive set of data available from over 2000 researchers in more than 130 countries—allowing comparison of prevalence as well as harm for more than 300 diseases and injuries by age and sex, and over time since 1990.¹¹ Complementing this analysis, the Commission will leverage local researchers and datasets, as well as a comprehensive literature review. This will position the Malawi National Commission to support the analysis of the Global Commission on the NCDI burden among the poorest, ensuring that the burden of disease in Malawi is accurately described and national priorities set based on available evidence.

Using 2013–2014 Multiple Indicator Cluster Survey (MICS) data to determine MPI, 56% of Malawi’s population is considered multidimensionally poor.¹⁰ On average, the population is deprived in just over 47% of weighted indicators. However, looking at the MPI more closely reveals that 64.8% of Malawi’s population is considered deprived in 50% or more of the indicators—the *Lancet* Commission’s definition of the “poorest billion”. Further breakdown of this figure shows that those in severe poverty vary geographically (Figure 2), with 71.6% of the population in rural areas and only 22.6% of urban

populations being deprived in 50% or more of indicators.¹⁰ It is this population that the National Commission will address for the burden of and interventions for NCDIs—the almost 65% of the Malawian population living in extreme poverty.

Goals of the Malawi National NCDI Poverty Commission

The overall goals of national-level Commissions are:

1. Analyse the burden of NCDIs among the world’s poorest billion people in terms of fatal and nonfatal outcomes, as well as risk factor attribution;
2. Determine priority strategies to address this burden in specific countries; and
3. Identify the gap in resources that will need to be addressed leading up to 2030 in order to implement those strategies in terms of finances, human resources, and governance.¹²

Within each national Commission are 4 working groups, each tasked with a specific aim that will contribute to these overall goals: (1) establish the baseline NCDI epidemiologic and socioeconomic situation; (2) describe the current state of NCDI interventions and set priorities for NCDI interventions; (3) describe the current financing for NCDIs and quantify resource needs for priorities; and (4) describe past and current governance of NCDIs and highlight the patient experience of those affected by NCDIs.¹²

By participating in this Commission, Malawi will be able to not only better understand the NCDI burden within the nation, but will also be able to learn from and help others identify the most effective interventions to address NCDI burden among the poorest. It is a knowledge building and sharing platform, and the team is currently participating in World Bank Knowledge Exchanges and contributing to biweekly newsletters shared among the 10 other national Commissions.

By determining the socioeconomic and geographic burden of NCDIs within Malawi, the Commission will be able to inform government and donor priorities based on epidemiologic, financial, and governance evidence.

Ultimately, the results from the analyses performed at the global and national scales will help inform NCDI policy development and refinement. As the Malawian National Action Plan on NCDs ended in 2016, it is hoped that the outputs from this Commission will be able to contribute to the new action plan. Additionally, given the inclusion of NCDs in the Essential Health Package (EHP) in Malawi's Health Sector Strategic Plan, the Commission's findings around the broader set of important NCDI conditions, particularly among the young, can help guide important steps and interventions toward realisation of the EHP. By integrating with national policies and strategies in the NCD space, the Commission will pursue mechanisms to integrate the findings into ongoing interventions and monitoring and evaluation processes, in order to track progress for NCDIs in Malawi's impoverished population over time. The Commission aims to disseminate a complete report on NCDIs of the poor in Malawi—encompassing burden, interventions and their cost, and economic landscape—by September 2017.

The focus of this Commission is on the poorest, with a goal to build upon the current efforts to address NCDIs in Malawi and to help reframe the global and national agenda around noncommunicable diseases to ensure that it includes the comprehensive burden of disease, as well as the poorest of the poor. The process undertaken by the Malawi National NCDI Poverty Commission is an evidence-driven effort to inform research, policy, and programme interventions—one that is rooted in advocacy as we collectively strive to address the impact of NCDIs in Malawi.
