Accepted 30 August, 2010

Somatic chromosome numbers of 45 *Trigonella* L. (*Fabaceae*), collected from different localities in Turkey was examined. Chromosome numbers were determined as  $2n = 14, 16, 30$  and  $46$ . B chromosome was also observed in somatic cells of some taxa (*Trigonella arcuata* C.A. Meyer and *Trigonella procumbens* (Besser) Reichb.). In addition, one or two satellites were observed in some taxa (*Trigonella lunata* Boiss., *Trigonella velutina* Boiss., *Trigonella strangulata* Boiss., *Trigonella crassipes* Boiss. and *Trigonella cariensis* Boiss.).

**Key words:** Chromosome number, Leguminosae, *Trigonella*.

### INTRODUCTION

*Trigonella* L. (*Fabaceae*) includes about 135 species worldwide, and most of the species are distributed in the dry regions around Mediterranean, West Asia, Europe, North and South Africa, North America, and with only two species being present in South Australia (Mabberly, 1997). The genus *Trigonella* has 13 sections and 50 taxa in Turkey (Huber-Morath, 1970). *Trigonella* taxa are localized in different phytogeographical regions in Turkey with 21 endemic species showing 42% endemism rate (Huber-Morath, 1970; Akan et al., 2005; Akan et al., Unpublished data, 2006). All the members of the genus in Turkey are annual.

The somatic chromosome numbers of some taxa in the genus *Trigonella* have also been reported (Darlington and Wylie, 1955; Ghosh, 1980; Astanova, 1981; Agarwal and Gupta, 1983; Ladizinsky and Vosa, 1986; Danin and Small, 1989; Kumari and Bir, 1990; Bidak and Amin, 1996; Pavlova, 1996; Martin et al., 2008; Yilmaz et al., 2009). The aim of this study is to verify or establish the chromosome numbers of taxa *Trigonella* in Turkey. In this contribution, we reported the somatic chromosome numbers of 45 taxa of *Trigonella* belonging to 13

sections. Also, chromosome numbers are determined for the first time in 17 taxa of *Trigonella* which grows naturally.

### MATERIALS AND METHODS

#### Plant material

Seedlings were collected between 2002 and 2005. Voucher specimens have been deposited in the Biology Department of Harran and Gazi Universities, Turkey. Section, chromosome number, province and voucher number, chromosome numbers reported and references are given in Table 1.

#### Chromosome analysis

The surface of seeds was abraded with emery paper to accelerate germination. Seeds were humidified in the laboratory and germinated in a very short time in Petri dishes at room temperature. Root tips were pretreated with  $\alpha$ -monobromonaphthalene at  $4^{\circ}\text{C}$  for 16 h and fixed with Carnoy for 24 h at  $4^{\circ}\text{C}$ . Before staining, the material was hydrolyzed with 1 N HCl for 13 min at room temperature. The chromosomes were stained with 2% acetic orcein and mounted in 45% acetic acid. Permanent slides were made by using the standard liquid nitrogen method.

The somatic chromosome number of each taxon was counted by the use of permanent preparations containing chromosomes in the

preparations on the same plane. The somatic chromosome numbers were counted with measurements taken on enlarged micrographs of ten well spread metaphase plates. The karyological characteristics (number of somatic chromosomes, number of B chromosomes and existence of satellites) were determined from the photographs (Figures 1 - 3).

## RESULTS AND DISCUSSION

The somatic chromosome numbers were determined for the first time in 17 taxa of *Trigonella* which grows naturally. Cytological results obtained from our study are

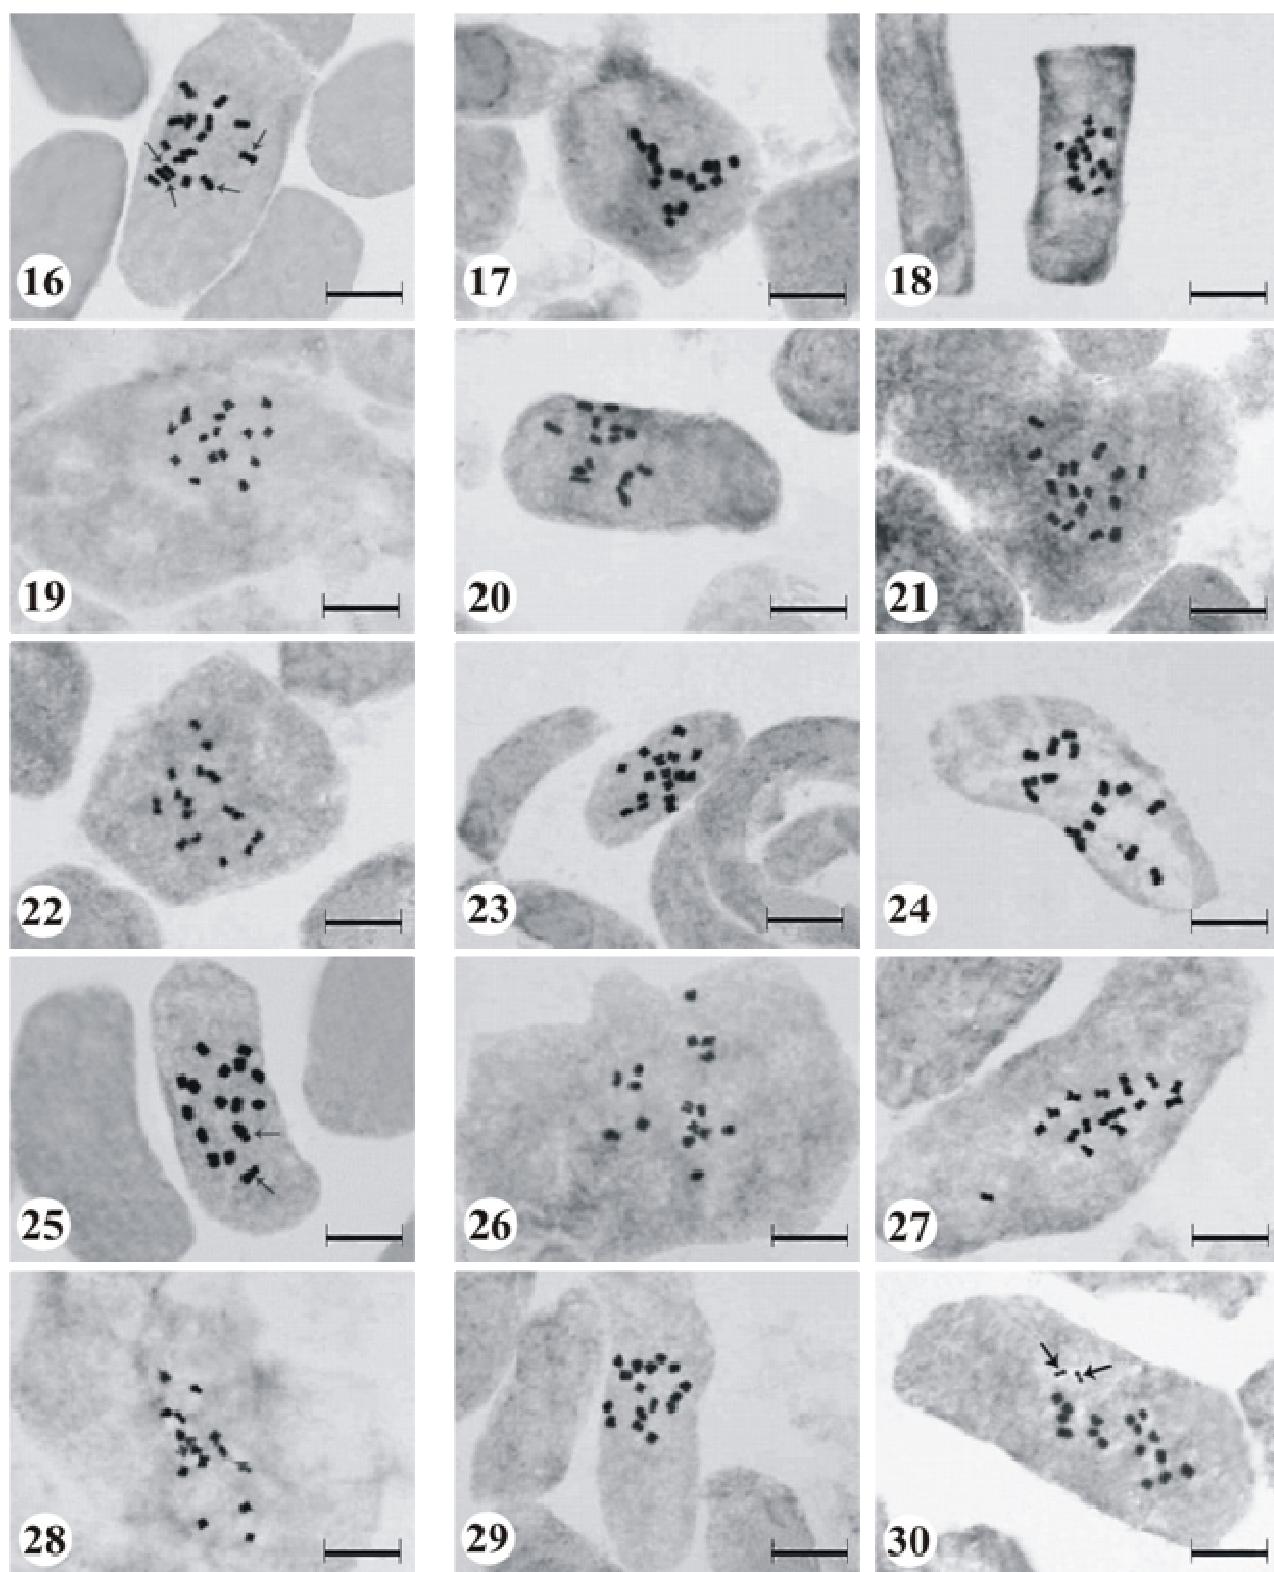

**Figure 1.** 1, *Trigonella cretica*; 2, *Trigonella plicata*; 3, *Trigonella brachycarpa*; 4, *Trigonella rostrata*; 5, *Trigonella lunata*, arrow shows the satellites; 6, *Trigonella corniculata*; 7, *Trigonella spinosa*; 8, *Trigonella spruneriana*; 9, *Trigonella sibthorpii*; 10, *Trigonella kotschyii*; 11, *Trigonella mesopotamica*; 12, *Trigonella cylindracea*; 13, *Trigonella cilicica*; 14, *Trigonella filipes*; 15, *Trigonella velutina*, arrow shows the satellites. Scale bar: 10  $\mu\text{m}$ .

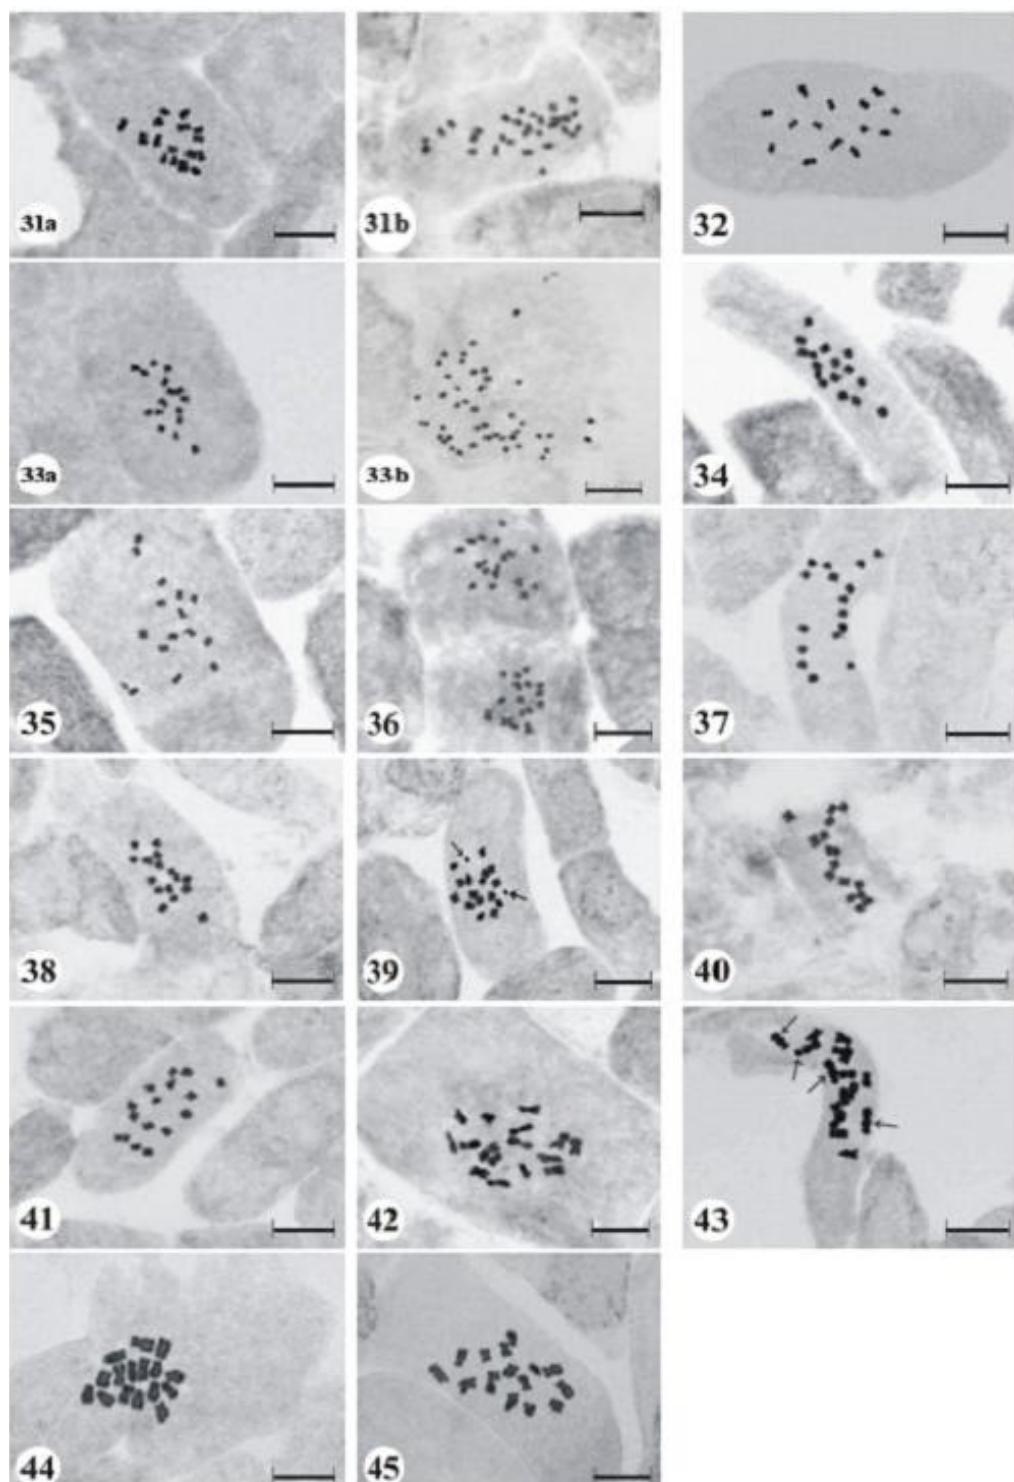

arranged based on the order in the Flora of Turkey.

In this karyological study of *Trigonella* taxa, somatic chromosome numbers were observed as  $2n = 14$  (*Trigonella plicata* (Boiss. and Bal.) Boiss., *Trigonella rostrata* (Boiss. and Bal.) Boiss., *Trigonella fischeriana* Ser. And *Trigonella monantha* C.A. Meyer

subsp. *noeana* (Boiss.) Hub.-Mor.),  $2n = 16$  (for 41 taxa),  $2n = 16$  and 30 (*T. monantha* C.A. Meyer subsp. *monantha* Verz.) and  $2n = 16$  and 46 (*Trigonella orthoceras* Kar. and Kir.). B chromosomes were observed in *Trigonella arcuata* C.A. Meyer and *Trigonella procumbens* (Besser) Reichp., and satellite chromosome pairs are

found in *Trigonella lunata* Boiss., *Trigonella crassipes* Boiss., *Trigonella strangulata* Boiss., *Trigonella cariensis* Boiss. and *Trigonella velutina* Boiss.

The section *Samaroideae* Boiss. is represented in Turkey by *Trigonella cretica* (L.) Boiss. The diploid chromosome number for this species is  $2n = 16$  in good agreement with literature (Agarwal and Gupta, 1983; Yilmaz et al., 2009). The section *Pectinatae* Boiss. is represented in Turkey by *T. plicata* (Boiss. and Bal.) Boiss. The diploid chromosome number for *T. plicata* is  $2n = 14$ . The section *Lunatae* Boiss. is represented in Turkey by *Trigonella brachycarpa* (Fisch.) Moris, *T. rostrata* (Boiss. and Bal.) Boiss., *T. lunata* Boiss. and *Trigonella sirjaevii*. By evaluation of the general characteristics of the section, it was determined that two species, *T. brachycarpa* and *T. rostrata* gathered from the same locality have different diploid chromosome numbers. The diploid chromosome number for *T. brachycarpa* is  $2n = 16$  and for *T. rostrata*, it is  $2n = 14$ , respectively. One pair of satellite chromosomes was observed for *T. lunata*, but none for the other members of the section.

The section *Falcatulae* Boiss. is represented in Turkey by *Trigonella corniculata* L., *Trigonella spinosa* L. *T. corniculata* is collected from two different localities (Izmir Province and Muğla Province). These two species have the same diploid chromosome number  $2n = 16$ . The same chromosome numbers in both species confirms the results of earlier karyological studies. Bidak and Amin (1996) reported that *Trigonella gladiata* has  $2n = 16$  and 18, *Trigonella ornithopodioides* has  $2n = 16$ , *T. spinosa* has  $2n = 16$  and *Trigonella stellata* has  $2n = 18$ . Ghosh (1980) reported that the somatic chromosome number for *T. spinosa* is  $2n = 16$ .

The *Cylindraceae* Boiss. section comprises of 14 species worldwide, and 10 of these are found in Turkey: *Trigonella spruneriana* Boiss., *Trigonella sibthorpii* Boiss., *Trigonella kotschyii* Fenzl., *Trigonella mesopotamica* Hub.-Mor., *Trigonella cylindraceae* Desv., *Trigonella cilicina* Hub.-Mor., *Trigonella filipes* Boiss., *Trigonella velutina* Boiss., *T. strangulata* Boiss. and *Trigonella smyrnea* Boiss. Members of this section have been collected from different parts of Turkey, and the somatic chromosome number has been determined as  $2n = 16$ . In addition, it is determined that *Trigonella velutina* has one satellite metaphase chromosome, while *T. strangulata* has two satellite metaphase chromosomes. According to the literature, the chromosome numbers of only two taxa (*T. sibthorpii* and *T. velutina*), have been studied (Danin and Small, 1989; Yilmaz et al., 2009).

The *Bucerates* Boiss. section is represented in Turkey by 16 taxa, namely: *Trigonella aurantiaca* Boiss., *Trigonella arenicola* Hub.-Mor., *Trigonella fischeriana* Ser., *Trigonella tenuis* Fisch., *Trigonella cancellata* Desf., *Trigonella astroites* Fisch. and Mey., *Trigonella halophila* Boiss., *Trigonella crassipes* Boiss., *Trigonella polycarpa* Boiss. and Heldr., *Trigonella rigida* Boiss. and Bal., *Trigonella*

*pamphylica* Hub.-Mor. and Sirj., *Trigonella carica* Hub.-Mor., *T. arcuata* C.A. Meyer, *Trigonella monantha* C.A. Meyer subsp. *monantha* Verz., *Trigonella monantha* C.A. Meyer subsp. *noeana* (Boiss.) Hub.-Mor. and *Trigonella orthoceras* Kar. and Kir. The chromosome number is  $2n = 16$  for 14 of these taxa,  $2n = 14$  for *T. fischeriana* and *T. monantha* subsp. *Noeana*,  $2n = 16$  and 30 for *T. monantha* subsp. *monantha* and  $2n = 16$  and 46 for *T. orthoceras*. The presence of B chromosomes is observed in *T. arcuata*. There are two chromosomes with a satellite in *T. crassipes*, *T. fischeriana* and *T. astroites*, counts in mitotic cells are in agreement with the chromosome numbers determined here for the same species (Yilmaz et al., 2009; Martin et al., 2008). For *T. astroites*, the chromosome number of  $2n = 16$  determined in this species agrees with literature by Yilmaz et al., (2009).

The *reflexae* (Şirj.) Vass. section is represented in Turkey by *Trigonella monspeliaca* L., which was collected from two different localities. The diploid chromosome number is  $2n = 16$  for *Trigonell monspeliaca* for both specimens. According to literature, cytological investigations showed that the members of the *Trigonella* have diploid chromosome numbers from  $2n = 16$  to  $2n = 32$ . For example, *T. gladiata* has  $2n = 16$ , *T. monspeliaca* has  $2n = 16$ , and *Trigonella polycerata* has  $2n = 28$ , 30 and 32. The somatic chromosome numbers reported here agree with those reported by literature (Darlington and Wylie, 1955; Ladizinsky and Vosa, 1986; Bidak and Amin, 1996). The *Isthmocarpae* Boiss. section is represented in Turkey by *Trigonell isthmocarpa* Boiss. and Bal. and *Trigonell rhytidocarpa* Boiss. and Bal. The diploid chromosome number is observed as  $2n = 16$  for these taxa. The *Uncinatae* Boiss. section is represented in Turkey by *Trigonella spicata* Sibth. and Sm. and *Trigonella cephalotes* Boiss. and Bal. The somatic chromosome number is observed as  $2n = 16$  in these species. The *Capitatae* Boiss. section is represented in Turkey by *T. procumbens* (Besser) Reichp., *Trigonella capitata* Boiss. and *Trigonella pseudocapitata*. The diploid chromosome number of the two species is  $2n = 16$ , and *T. procumbens* has B chromosomes. The chromosome number of *T. procumbens* has been determined as  $2n = 18$  (Yilmaz et al., 2009) in the same locality, but the presence of B chromosomes was not reported.

The *Biebersteinianae* (Şirj.) section is represented in Turkey by *Trigonella coeruleascens* (Bieb.) Hal. This species is collected from two different localities. The diploid chromosome number is  $2n = 16$  for *T. coeruleascens* from two different localities, in agreement with the chromosome number of  $2n = 16$  for this species determined by Yilmaz et al., (2009). The *Foenum-graecum* Ser. section is represented in Turkey by *T. gladiata* Stev. Fischer, *Trigonella cariensis* Boiss., *Trigonella foenum-graecum* L., *Trigonella macrorryncha* Boiss. and *Trigonella cassia*. Four species of the section have been studied and the somatic chromosome number is  $2n = 16$ . The chromosome

number is determined as  $2n = 16$  for *T. gladiata* in this study, but two different somatic chromosome numbers have been reported as  $2n = 16$  and  $2n = 18$  for this species in literature (Bidak and Amin, 1996). According to Darlington and Wylie (1955), members of the genus *Trigonella* may have a diploid chromosomes change from  $2n = 16$  to 32. For example, *T. gladiata* has  $2n = 16$ , *Trigonella monspeliaca* has  $2n = 16$  and *Trigonella polyceratia* has  $2n = 28, 30$  and 32 and our findings are in agreement with them. The specimens from Antalya Province have two pairs of satellite chromosomes, which is unique among the members of this section. Like the other members of this section, *T. foenum-graecum* has diploid chromosome number  $2n = 16$  and the same results have been determined elsewhere in Europe Flora (Tutin and Heywood, 1964). *T. macrorrhyncha* has the diploid chromosome number  $2n = 16$  like all other members of the section. In an earlier study of six member of this section (*T. gladiata*, *T. cariensis*, *T. foenum-graecum*, *T. berythea*, *T. macrorrhyncha* and *T. cassia*), the mitotic chromosome number is reported as  $2n = 16$  and our results are in agreement with them (Ladizinsky and Vosa, 1986).

The genera *Trigonella*, *Medicago*, *Trifolium* and *Melilotus* belong to the subtribe *Trigonellinae*, tribe *Trifolieae* in the *Fabaceae* family. Several studies on the taxonomical relationship among these genera have been conducted (Small et al., 1987). Generic circumscription has long been a problematic question in the tribe *Trifolieae* subtribe *Trigonellinae* (which contains the genera *Trifolium*, *Melilotus*, *Trigonella* and *Medicago*). In particular, many studies have been undertaken to ascertain the proper relationships between the genera *Medicago* and *Trigonella* (Tutin and Heywood, 1964; Bena, 2001). However, no strict delimitation could be proposed.

The genus *Trigonella* according to Hutchinson (1964) is one of the six genera of the tribe *Trifolieae*, subtribe *Trigonellinae*. The genus is divided into three subgenera, according to the form and shape of calyx and pod by Tutin and Heywood (1964), as follows:

- a: Subgenus *Trigonella*: Calyx usually campanulate and pod not inflated.
- b: Subgenus *Trifoliastrum*: Calyx campanulate and pod inflated.
- c: Subgenus *Foenum-graecum*: Calyx tubular and pod not inflated.

Several investigators have attempted to employ the taxonomy of the genus *Trigonella*; Sirjaev (1935) has given in Latin an elaborate and systematic account of its taxonomy. Vasil'chenko (1953) has published a synopsis in Russian discussing the position of the genus within the family *Leguminosae* and gave keys, synonyms and descriptions of the morphological characters of the different series, their economic importance and geographical distribution. Hutchinson (1964) and Tutin and

Heywood (1964) have also given detailed descriptions of its taxonomic characters. According to these authors, the genus *Trigonella* includes mostly annual or perennial species.

With the help of new observations on the population during this study, it is determined that some endemic species of *Trigonella* are widespread such as *T. plicata*, *T. kotschyii*, *T. rigida* and *T. macrorrhyncha*, while the other endemics are only restricted to a few localities such as *T. sirjaevii*, *T. rostrata*, *T. lycica*, *T. cilicica*, *T. smyrnea*, *T. arenicola*, *T. halophila*, *T. polycarpa*, *T. pamphylica*, *T. isthmocarpa*, *T. carica*, *T. rhytidocarpa*, *T. cephalotes*, *T. cassia*, *T. raphanina* and *Trigonella pseudocapitata*.

In the present study, somatic chromosome numbers of *Trigonella* taxa from the family of *Fabaceae* were determined. We believe this study will play a positive role in enlightening this taxonomically complex genus with cytological features.

## ACKNOWLEDGEMENTS

We would like to thank TUBITAK (Project no. TBAG-2099 (101T142) and Scientific Investigation Project Coordinate of Selcuk University (project no: 05401046) for financial support.
