Abstract

Purpose of the study: The purpose of the study is to find out the complex relationship between psychological capital (PsyCap), workplace wellbeing (WWB), and employee engagement (E.E.) among the working class of Saudi Arabia.

Methodology: The study which used a cross-sectional quantitative research design made use of three structured, validated questionnaires to collect the required data. Data were randomly collected online from a sample of 395 respondents. The respondents belonged to varying demographics. The data so collected was analyzed using Structural Equation Modeling (SEM) with the help of the Python program.

Main Findings: The study has found a significant positive relationship between the three constructs of Psychological capital (PsyCap), workplace wellbeing (WWB), and employee engagement (E.E.) in the workplace. A similar significant relationship was also observed between workplace wellbeing and employee engagement.

Applications of this study: The constructs identified for the study are those that help organizations to elicit effective performance from their employees. In the present uncertain world, only a band of engaged, happy, and psychologically strong employees will be capable of facing the multiple challenges of the corporate world. The findings of the study provide directions in this regard to social scientists and researchers.

Novelty/Originality of this study: Though studies have been conducted in the western world about the antecedents and consequences of Psychological Capital (PsyCap), only limited studies have been done in Saudi Arabia and its neighbouring countries. The study has succeeded in enriching social science literature in this regard. There is ample scope for further research in this regard by including certain other constructs.

Keywords: *Psychological Capital, PsyCap, Workplace Wellbeing, Employee Engagement, Saudi Arabia.*

INTRODUCTION

Positive organizational behavior (POB), which originated over a decade back strives to understand workplace attitudes and behaviors through a positive lens (Bakker and Schaufeli, 2008). Ample empirical evidence exists to suggest that psychologically positive employees can overcome any form of challenges (Gupta and Shaheen, 2018). According to Luthans (Luthans, Norman, Avolio, and Avey 2008a; Luthans, Youssef, Sweetman, and Harms, 2013), individuals who are capable psychologically have high levels of psychological capital (PsyCap). PsyCap, one of the core constructs in POB, has been identified as capable of enhancing organizational commitment, organizational citizenship behavior, and engagement; reduce absenteeism and turnover intentions; and bring in better work performances (Al-Kahtani, Sulphey, Delany, and Adow, 2020; Avey, Luthans, and Jensen, 2009; Avey, Luthans, Smith, and Palmer, 2010; Luthans, Youssef, and Avolio, 2007a; Walumbwa et al., 2010). PsyCap also enables employees to cope with all forms of life pressures and help in dedicating their energies towards their work roles (Nguyen and Nguyen, 2012). It is defined by Luthans et al (2007a, p. 3) as:

"An individual's positive psychological state of development that is characterized by: having confidence (self-efficacy) to take on and put in the necessary effort to succeed at challenging tasks; making a positive attribution (optimism) about succeeding now and in the future; persevering toward goals and, when necessary, redirecting paths to goals (hope) in order to succeed; and when beset by problems and adversity, sustaining and bouncing back and even beyond (resilience) to attain success."

Evidence suggests that being a higher-order concept that combines multiple concepts, PsyCap is capable of positively influencing the work and life outcomes of employees (Choi and Lee, 2014). Wright (2003) believes that PsyCap is not merely a functional variable that enhances performance, but is broad enough to be an indispensable psychological capacity essential for human life. Luthans, Luthans, and Palmer, (2016) identify the concept as a personal resource that helps employees to be "positive, confident, hopeful, optimistic, and resilient at the workplace".

Literature about PsyCap is still evolving, and there is a definite need to further examine its unique effects on the employees across different cultures. The fecundity of the concept of PsyCap suggests that it can contribute more to Social Sciences literature than what has been contributed so far. Literature can be further enriched, and human

knowledge widened by exploring the nature and functions of PsyCap by including its diverse range of outcomes. The other constructs that are considered for the present study are workplace wellbeing (WWB) and employee engagement (E.E.).

Work and life happiness are vital components that ensure the psychological and psychical health of employees (Diener, 2000). It helps in solving problems associated with intra and interpersonal relationships, task competence and accomplishment, etc. (Lyubomirsky, King, and Diener, 2005), and aids in creating WWB. A few studies have identified the positive relationship between PsyCap and WWB (Chawla and Sharma, 2019; Chen et al., 2019; Choi and Lee, 2014; Gibson and Hicks, 2018; Imran and Shahanawaz, 2020; Kun and Gadanez, 2019; Sabaitytė and Diržytė, 2016; Virgá et al., 2020).

There are multiple components that impact the health, workplace behavior, and performance of employees. Indicators exist to understand the relationship between WWB from the perspective of PsyCap. According to Kun and Gadanez (2019), PsyCap has the quality of malleability, and is hence open to further development. This, according to Avey et al. (2010) opens up multiple opportunities for leaders in organizations to enhance WWB. This is inferred from the aspect that identifying and promoting inner resources and strengths of individuals will facilitate the improvement of the overall wellbeing and happiness. Kun and Gadanez (2019) investigated the relationship between PsyCap, workplace happiness, and WWB and found the relationship between them.

The present study attempts to find out the relationship that PsyCap, WWB, and employee engagement (E.E.) in the Saudi context. The paper is divided into the following sections. The first section reviews the relevant literature about PsyCap, WWB, and E.E.; followed by a brief presentation of the methods adopted for the study. The next section provides the results of the data collected. The last section consists of implications, limitations, and suggestions for further research.

LITERATURE REVIEW

This section reviews the related literature about Psychological Capital(PsyCap), Wellbeing (WWB), and Employee Engagement (E.E.).

PsyCap

PsyCap is a "higher-order construct", that goes beyond human and social capital. It is defined as "positive appraisal of circumstances and probability for success based on motivated effort and perseverance" (Luthans, Avolio, Avey and Norman, 2007, p. 550). It is also "an individual's positive psychological state of development" (Luthans, Luthans, and Avey, 2014). Empirical studies show that PsyCap is having a significant and enduring influence on employees and their attitude towards work environments (Gibson and Hicks, 2018; Grover, Teo, Pick, Roche, and Newton, 2018; Kun and Gadanez, 2019). It has the capability to reduce burnout (Virgá et al., 2020), enhance wellbeing, and resultant performance (Imran and Shahanawaz, 2020). Related to the "best self", PsyCap comprises of four components – hope, efficacy, Optimism, and Resilience (Luthans and Youssef, 2004). According to Stajkovic (2006, p. 1212), these four components overlap, and they "share a common confidence core that exists at a higher level of abstraction".

It is imperative to have a short discussion about the four components. Hope, according to Snyder, Irving, and Anderson (1991, p. 287) is the "positive motivational state that is based on an interactively derived sense of successful (a) agency (goal-directed energy) and (b) pathways (planning to meet goals)." Efficacy is "the employee's conviction or confidence about his or her abilities to mobilize the motivation, cognitive resources, or courses of action needed to successfully execute a specific task within a given context." (Stajkovic and Luthans, 1998, p. 66). Luthans (2002) identified Optimism as "a positive outcome outlook or attribution of events, which includes positive emotions and motivation and has the caveat of being realistic". Resiliency is the "positive psychological capacity to rebound, to 'bounce back' from adversity, uncertainty, conflict, failure, or even positive change, progress, and increased responsibility" (Luthans, 2002, p. 702).

The biggest strength of PsyCap, according to Luthans & Youssef (2004), is that it is capable of being developed and managed. It is a "psychological resource" that has the scope for being objectively assessed and can secure improved performance at the workplace through positive cognition and motivational processes (Luthans et al., 2007a). PsyCap is the "positive appraisal of circumstances and probability for success based on motivated effort and perseverance" (Luthans et al., 2007a, p.550). Employees having high levels of PsyCap, according to Luthans et al., (2016), are capable of exercising better control over their work-related outcomes. This is made possible since they are effectual and are persistent in their goals.

WWB

The wellbeing and happiness at the workplace can be highly beneficial for organizations (Chawla and Sharma, 2019; Lups et al., 2019; Seligman 2002, 2011). Wellbeing is associated with the general feeling of happiness and life satisfaction (Lee, Singhapakdi, and Sirgy, 2007). Various researchers have attempted to examine the relationship between PsyCap and workplace wellbeing (Luthans, Lebsack, and Lebsack, 2008c; Nguyen and Nguyen, 2012). A study by Choi & Lee (2014) found PsyCap to be related to turnover intention, workplace happiness, and subjective wellbeing.

It was also found associated with employee outcomes. [Avey et al. \(2010\)](#) found employees with high levels of PsyCap to be satisfied with their works and have general contentment with their life, which could result in general wellbeing. [Gupta and Shaheen \(2018\)](#) identified PsyCap to mediate with different constructs, including engagement and general wellbeing. A significant positive relationship between PSyCap and wellbeing was observed by Rani (2015).

[Luthans, Lebsack and Lebsack, \(2008c\)](#) and [Luthans, Youssef, Sweetman, and Harms \(2013\)](#) observed PsyCap enabling employees to cope with pressures and helping them to dedicate all their energies in their work roles. [Nguyen and Nguyen, \(2012\)](#) and [Polatci and Akdogan \(2014\)](#) found PsyCap to enhance the WWB of employees. Multiple studies have found a positive association between PsyCap and WWB ([Culbertson, Fullagar, and Mills, 2010](#); [Murray, Pirola-Merlo, Sarros, and Islam, 2010](#); [Wahyuningsih and Wulansari, 2016](#)). Recent studies by [Grover, Teo, Pick, Roche, and Newton \(2018\)](#), [Imran and Shahanawaz \(2020\)](#), and [Lups et al., \(2019\)](#) found PsyCap to have a direct influence on WWB. [Rivaldi and Sadeli \(2020\)](#) found PsyCap to mediate turnover intentions through engagement and WWB. The focus of most of these studies, however, were on subjective wellbeing. [Al-Kahtani, Sulphrey, Delany, and Adow \(2020\)](#) proposed that PsyCap has a "yin and yang" relationship with WWB. However, this was only a theoretical proposition and was not tested empirically. Only a few studies have attempted to focus on the relationship with WWB.

Based on the above literature, the first hypothesis is set as under:

H1: There is a positive relationship between PsyCap and Workplace wellbeing.

Engagement

E.E. is defined as the "positive, fulfilling, work-related state of mind that is characterized by vigor, dedication, and absorption" ([Schaufeli, Salanova, Gonzalez-Roma, and Bakker, 2002, p. 74](#)). It is also defined as "a measure of the levels of vigor, dedication, and absorption in work among employees" ([Bakker, 2011](#)). It is associated with employee performance ([Knight, Patterson, and Dawson, 2017](#)). Engaged employees can achieve individual and organizational outcomes as are emotionally strong and have better wellbeing ([Fredrickson, 2009](#)).

A positive relationship between PsyCap and engagement have found by [Datu, King, and Valdez \(2018\)](#); [Simons and Buitendach \(2013\)](#), and many others. A study by [Grover, Teo, Pick, Roche, and Newton \(2018\)](#) found PsyCap to have direct influence engagement. They found that employees with high levels of PsyCap perceive that they have more job resources. This keeps them motivational and engaged. The positive association of PsyCap with academic engagement have also been found by [Datu, King, and Valdez \(2018\)](#); [Datu and Valdez \(2016\)](#); and [Siu et al., 2014](#)). Based on these, the next hypothesis is formulated as:

H2: There is a positive relationship between PsyCap and Employee engagement.

A review of the literature about E.E. and WWB has presented inconsistent results. Engagement is the psychological connection of employees with their work' ([Bakker, Albrecht, and Leiter, 2011](#)). It captures the physical, cognitive as well as emotional experiences in the workplace. (Khan, 1990). [Rivaldi and Sadeli \(2020\)](#) found PsyCap to influence both E.E. and WWB. [Grover, Teo, Pick, Roche, and Newton \(2018\)](#) analyzed the influence of PsyCap on the outcomes related to wellbeing and engagement and found a positive relationship. A strong connection between wellbeing and WE have been observed by [Bakker and Demerouti \(2016\)](#). A different result was found by [Schaufeli, Bakker, and Salanova \(2006\)](#). They found engagement to be positively related to employee wellbeing. A few other studies, for instance, [Brunetto, Teo, Shacklock, and Farr-Wharton, 2012](#); [Judge and Watanabe, 1993](#); [Wright and Cropanzano, 2000](#)) found a positive association between employee wellbeing and engagement. Thus, the third hypothesis is formulated as under:

H3: There is a positive relationship between Workplace wellbeing and Employee engagement.

As can be seen from the review of literature that most of the studies have been undertaken in the western world. The significance of the present study is that it is undertaken in Saudi Arabia. The country has a unique culture; which is based in Islamic, Arab, and tribal systems ([Razzak, 2016](#); [Sulphrey and Al-Kahtani, 2018](#)). These systems are having a profound impact on members of the society. These systems also have major impacts at workplaces, too (Al-Shehery et al., 2006; [Faridi and Sulphrey, 2019](#)). Irrespective of the social standing of any individual, family bonds enjoy significantly higher value, and self-interests are subsidiary to family-interests ([Kabasakal and Bodur, 2002](#)). Members of Saudi society are found to share a number of common attributes, cultural habits, and traditions. Additionally, there exist ultra-conservatism and collectivist values in the society with leaders having a strong paternalistic culture ([Razzak, 2016](#)). These aspects do have a profound influence and impact on the workplace environment, including WWB and PsyCap. Further, no earlier study has attempted to examine the relationship between the concepts as envisaged here. As such, it is expected that the findings of the study would be a significant contribution to social sciences literature.

METHODOLOGY

Since the study was envisioned to answer certain explicit research questions, the authors used a type of cross-sectional quantitative research design. This design is ideal for addressing the hypotheses that were formulated for the study.

Data collecting instruments

The data for the present study was collected from gainfully employed samples from Saudi Arabia, using the following three structured questionnaires.

1. **PsyCap:** To measure PsyCap, the extensively used PsyCap Questionnaire (PCQ 12) was used ([Luthans, Avolio, Avey, and Norman, 2007b](#)). The PCQ 12 has four dimensions – Self-efficacy with 3, Hope with 4, Resilience with 3, and Optimism with 2 items. While hope had four items, Self-efficacy and Resilience had three items each. The questionnaire had a five-point scale. The 12 items contained in the four factors averaged to form PsyCap, which is considered a higher-order construct. The scale had a Cronbach's alpha of 0.90. A sample item is "I can think of many ways to reach my current work goals".
2. **Workplace wellbeing:** This variable was measured using the Workplace Wellbeing Scale developed by [Bartels, Peterson, and Reina, \(2019\)](#). It is a two factor, eight-item scale. The two factors, which have four items each are Intrapersonal and Interpersonal dimensions. The questionnaire had a five-point scale. The Cronbach's alpha ranged between .87 and .90. A sample item of the scale is "Among the people I work with. I feel there is a sense of brotherhood/sisterhood."
3. **Employee engagement:** The UWES-3 scale ([Schaufeli, Shimazu, Hakanen, Salanova, and De Witte, 2017](#)), which has been standardized on populations from across the globe, was used to collect data about work engagement. The scale enjoys robust cross-national reliability as well as validity (all the alphas across nationalities was above .90). A sample item is "At my work, I feel bursting with energy". The scale also had a five-point scale.

The alphas of all the tools used for the study meets the liberal stipulation of [Lyberg et al. \(1997\)](#) as well as the conservative stipulation of [Nunnally and Bernstein \(1994\)](#).

In addition to the three scales, there was a separate section that solicited the demographics particulars of the respondents like age, gender, experience, etc. The questionnaires were translated into Arabic using the back-translation method ([Brislin, 1980](#)). The first author translated the original items from English to Arabic. The fourth author translated the Arabic version back to English. The final translations were compared with the original versions and discrepancies resolved. The questionnaires were then prepared in Google docs, and its link was posted on various social media groups, the membership of which was limited to employees of Saudi Arabia. 395 responses were received in three months. Since all the items were made compulsory on the Google docs, there was no missing information. As such, all the 395 responses were ideal to be used for analysis.

Adequacy of the sample can be assumed as evidence suggest that 384 would be a representative sample for a population of one million ([Krejcie and Morgan, 1970](#), [Bartlett, Kotlik, and Higgins, 2001](#)). They opined that as the population increase, the "sample size increases at a diminishing rate and remains eventually constant at slightly more than 380 cases". [Suskie \(1996\)](#) believes that for a sampling error of 5%, a sample size of 364 is sufficient. Simon and Goes (2013) identified this as the "golden standard", which has been accepted in multiple instances. The adequacy of the sample was also assessed through assessing the Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy ([Kaiser 1970](#)). The KMO measure of sample adequacy was .835, and Bartlett's Test of Sphericity was 1714.455 (Sig. of .000). In light of these discussions, it can be assumed that the collected sample of 395 can be considered as adequate.

The sample enjoyed wide diversity, which can be observed from the demographics. It included 176 (44.6%) males and 219 (55.4%) females. 300 (75.9%) were married, 77 (19.5) unmarried and 18 (4.6%) were divorced. The age of the respondents ranged from 19 to 61 years, with the average being 40.9 years. The overall experience varied between less than a year to 40 years. The mean years of experience were 13.5. The descriptive statistics can be found in Table 1.

Table 1: Descriptive statistics

	Minimum	Maximum	Mean	SD
Efficacy	7.0	15.0	13.241	1.6861
Hope	9.0	20.0	16.509	2.4457
Resilience	8.0	15.0	13.119	1.6101
Optimism	3.0	10.0	8.841	1.3030
PsyCap	30.0	60.0	51.709	5.2514
Interpersonal	4.0	20.0	16.889	2.8566
Intrapersonal	10.0	20.0	17.919	2.1096
WWB	14.0	40.0	34.808	4.2883
EE	6.0	15.0	13.284	1.8444

N = 395

Measurement of reliability and validity

The reliability and validity were examined using confirmatory factor analysis (CFA) as proposed by (Byrne, 2013). The initial CFA model is presented in the following sections.

Confirmatory factor analyses

The nature of the different constructs used for the study was reflective. CFA was done to examine the factor structure of all the constructs – PsyCap, workplace wellbeing, and employee engagement. The CFA results show all the indexes are as per the rule of the thumb. It can thus be seen that the data fits perfectly (Table 2).

Table 2: Model fit indices

Index	Recommended value	Model value	Citation
Goodness of fit index (GFI)	>0.90	0.937	Hair, Black, Babin, and Anderson (2010)
Adjusted goodness of fit index (AGFI)	>0.80	0.818	Gefen, Karahanna, and Straub (2003)
Normed fit index (NFI)	>0.95	0.907	Hooper, Coughlan, and Mullen. (2008)
Incremental fit index (IFI)	>0.90	0.919	Davey and Savla (2010)
Comparative fit index (CFI)	>0.90	0.988	Bentler (1992), Hair et al. (2010)
Root mean square error of approximation (RMSEA)	<0.05	0.0434	Diamantopoulos and Siguaw (2000), Hu and Bentler (1999)

Table 2 presents the details of convergent validity. Convergent validity is considered as the extent of a measure correlating positively with measure(s) within the same construct. Convergent validity is assessed using the average variance extracted (AVE) and item loadings ([Hair, Hult, Ringle, and Sarstedt, 2013](#)). AVE is the average variance shared between a construct and its measures. A value equal to or higher than 0.50 is the prescribed rule of the thumb for AVE ([Hair et al., 2013](#); [Barclays et al., 1995](#)). It can be observed from Table 2 that all the AVEs are above the prescribed value of 0.05.

Composite reliability (C.R.) is considered as a better reliability estimate than Cronbach Alpha. It helps in assessing the internal consistency of the variables studied ([Fornell and Larcker, 1981](#)). Any value over 0.70 is considered ideal for C.R. ([Hair, Ringle, and Sarstedt, 2011](#); [Hair, Hult, Ringle, and Sarstedt, 2017](#); [Henseler and Sarstedt, 2013](#)). In the present case, all the C.R. values are well above the prescribed 0.07, thereby ensuring reliability. The details are presented in Table 3.

Table 3: Convergent Validity – Standardized Regression Weights

Items	Factors	Estimate	Item reliability	AVE	Sum of estimate	C.R.
H1	-	0.765	0.585	0.679	3.287	0.894
H2	-	0.788	0.621			
H3	-	0.811	0.658			
H4	-	0.923	0.852			
E1	-	0.76	0.578	0.630	2.373	0.835
E2	-	0.734	0.539

R1	-	0.865	0.748	0.582	2.277	0.805
R2	-	0.678	0.460			
R3	-	0.734	0.539			
O1	-	0.734	0.539	0.787	1.763	0.879
O2	-	0.981	0.962			
IN1	-	0.714	0.510	0.719	3.376	0.910
IN2	-	0.894	0.799			
IN3	-	0.845	0.714			
IN4	-	0.923	0.852			
IR1	-	0.748	0.560	0.610	3.113	0.861
IR2	-	0.711	0.506			
IR3	-	0.883	0.780			
IR4	-	0.771	0.594			
EE1	-	0.863	0.745	0.751	2.599	0.900
EE2	-	0.865	0.748			
EE3	-	0.871	0.759			

The CFA model is presented in Figure 1.

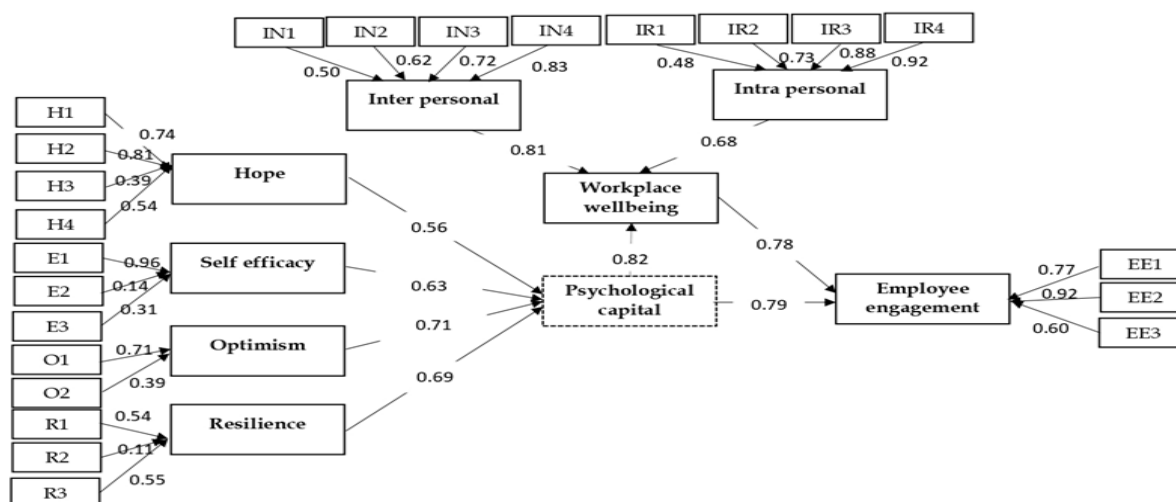

Figure 1: CFA model

Discriminant validity deals with the uniqueness of a construct, and that it is in no way comprehensive of other constructs within the given model (Hair et al., 2013). It is an indication that a particular construct is sharing more variance than with any other construct within the model (Hulland, 1999).

To assess the discriminant validity, a comparison is made between the square root of the AVE and the correlations of latent variables (Fornell & Larcker, 1981). To have discriminant validity, the squared root of AVE needs to be higher than the highest correlation value of other constructs (Hair et al., 2013). The square roots of AVE coefficients are presented in the correlation matrix along the diagonal. It can be observed from the matrix that no construct has an r value higher than 0.70 (Anderson and Gerbing, 1988). Further, all r values of the constructs are less than the square roots of AVE, as stipulated by Fornell and Larcker (1981). These results are in line with the rule of thumb, and hence evidencing discriminant validity (Fornell & Larcker, 1981; Hair et al., 2013). Further, all the Alpha values are well above the stipulated 0.70 (Nunnally and Bernstein, 1994), thereby confirming reliability. Table 4 presents the convergent and discriminant validities and the reliabilities.

Table 4: Convergent and discriminant validities

	Convergent validity		Discriminant validity								Alpha	
	CR	AVE	Squared Intercorrelations									
	H	SE	R	O	P	IP1	IP2	WWB	EE			
H	0.894	0.679	0.824								0.811	
SE	0.835	0.630	0.247	0.794							0.765	
R	0.805	0.582	0.094	0.066	0.763						0.891	
O	0.879	0.787	0.306	0.316	0.095	0.887					0.761	
P	0.811	0.715	0.044	0.059	0.003	0.053	0.846				0.894	
IP1	0.910	0.719	0.034	0.145	0.065	0.004	0.056	0.848			0.811

WWB	0.940	0.664	0.011	0.078	0.007	0.017	0.073	0.052	0.276	0.815	0.824	
WE	0.900	0.751	0.098	0.089	0.098	0.035	0.098	0.072	0.123	0.087	0.867	0.807

RESULTS/FINDINGS

The analysis of the data to test the tenability of the hypothesis was done using SEM. It was done using the package *Semopy*, in the *Python* platform (Igolkina & Meshcheryakov, 2020), to assess the relationship between the variables and test the hypothesis.

Structural Equation Modeling

The analysis was done using SEM as it is comprehensive, and tests the complete and simultaneous relationships in social sciences research (Tabachnick and Fidell, 2007). It also assesses the measurement and structural models for predictive validity (Becker et al., 2013). Further SEM is also helpful in testing theories that involve multiple equations for dependence relationships (Hair et al., 2010). Since the present study involves multiple variables, SEM is ideal for addressing the research questions framed for the study.

Path analysis

The estimated structure model arrived at based on the analysis is presented in Figure 2. It presents the inter-relationship between the constructs. The results of the SEM, and the path coefficients are presented in Table 4. The path analysis estimates the β coefficients of the independent variables on the dependent variables as well as the t-statistic. Sufficiently higher β values imply a strong effect of the independent variable on the dependent variables (Aibinu and Al-Lawati, 2010). The t-statistic tests the level of significance of β values, the path coefficients are considered to be significant at 1% if the t-value is greater than 2.58 (Hair et al., 2011).

H3	Workplace wellbeing -> Employee engagement	0.811***	9.01	Supported

Note: ** Supported at 0.05 level *** Supported at 0.01 level

From table 5 it can be observed that all the hypotheses formulated for the study are supported, and the respective constructs have significant positive relationships. The two hypotheses, other than H1, are accepted with a confidence level of 0.01 level. H1 is accepted at 0.05 level. Further, the corresponding t-values are above the critical value of 2.58 as stipulated by Hair et al., (2011). The robust t-values shows the strong effect of the paths in the model, and the strengths of the relationship between the constructs (Hair et al., 2011).

The β for the constructs (PsyCap and Workplace wellbeing is 0.781, $p < 0.005$; PsyCap and employee engagement is 0.281, $p < 0.001$; and that of Workplace wellbeing and employee engagement is 0.811, $p < 0.001$. All these values indicate fairly good acceptable levels (Akter, D'Ambra, and Ray, 2011; Lleras, 2005; Lu, 2014). It is thus concluded that PsyCap has a significant positive relationship with workplace wellbeing and employee engagement. The same relationship is also observed between workplace wellbeing and employee engagement.

DISCUSSION/ANALYSIS

Though there is adequate literature about the antecedents of PsyCap (Al-Kahtani et al., 2020), there are scarce and inconsistent evidence about its consequences (Costa & Neves, 2017). This dearth of empirical evidence is compelling in the MENA regions in general, and KSA in particular (Al-Kahtani et al., 2020). Despite globalization opening the floodgates of Social Sciences and Business research across the globe in culturally diverse organizational backgrounds, very few empirical examinations have been done about the nature, antecedents, consequences, and functions of PsyCap in KSA. As KSA has a unique and distinct culture, which is based on strong patriarchal and collectivist culture (Sulphrey and Al-Kahtani, 2018; Sulphrey and Salim, 2020), the interrelation between the constructs considered in the present study is highly relevant and is sure to be a novel addition to Social Sciences research. It has also identified the value and importance of PsyCap and its consequences in the unique Saudi context. To the best of the knowledge, this is one of the few studies undertaken in Saudi Arabia regarding the consequences of PsyCap.

The present study has contributed to the literature in multiple ways. It has succeeded in bringing PsyCap to a broader and comprehensive domain, thereby contributing to the knowledge about making life at the workplace more worthwhile, meaningful, and thriving. Of particular importance is the contribution of this study towards the external validity of PsyCap and its different functions. It has facilitated wider recognition of PsyCap as a novel approach that can aid management practices, as it has investigated the role of PsyCap in making the workplace more meaningful and

enhancing the level of employee engagement. The study also extends the findings of [Choi and Lee \(2014\)](#) that developing PsyCap organizations could transform the work and workplace to a significant source of happiness, satisfaction, and overall wellbeing. In addition to this, the present study has found that the combined effect of PsyCap and WWB could lead to employee engagement.

The study has also highlighted its importance and applicability across various cultural milieus. In this regard, it is of high significance to note that the present study was conducted in Saudi Arabia, which has a unique cultural milieu. Further, though multiple studies have been conducted in the western world involving the constructs examined here, the present study is the first of its kind in Saudi Arabia, thus bridging a major gap in the literature.

The finding that PsyCap has a relationship with WWB is in partial agreement with the study by [Gupta and Shaheen \(2018\)](#). However, this study was more about general wellbeing and not strictly about WWB. While earlier studies examined the role of PsyCap in a broader milieu ([Choi and Lee, 2014](#)), the present study is unique as it has focused its attention more specifically on workplace WWB and engagement in the Saudi context. This study has thus succeeded in demonstrating the hitherto unexplored unique relationship among PsyCap, WWB, and employee engagement in Saudi Arabia. For a better understanding, the major findings of the study are presented here:

- PsyCap has a significant positive relationship with WWB,
- PsyCap has a significant positive relationship with employee engagement, and
- WWB has a significant positive relationship with employee engagement.

While the first relationship was significant at 0.05 level the other two were significant at 0.01 level.

IMPLICATIONS

PsyCap has been identified as a psychological resource that can be effectively developed with the help of short interventions ([Luthans, et al., 2008a](#); [Luthans et al., 2010](#)). Further, [Luthans et al. \(2008b\)](#) have found that an appropriate precondition could enable the development of PsyCap. This study has identified that PsyCap can positively influence engagement. Thus, a positive organizational climate could have the advantage of enhancing many indispensable O.B. constructs like PsyCap, WWB, engagement, and the like. In the new normal, these are conditions that are required to trigger the employees to be malleable and help in rebuilding the overall organizational climate in a manner ideal to face the emerging harsh business environment.

This study provides ample practical implications and directions for leaders and organizations towards enhancing the engagement levels of employees. The study provided evidence to the effect that enhancing the physical and psychological wellbeing will have a positive and healthy impact on the engagement of employees. This, in turn, will help managers to make their organizations effective and productive constructively and healthily. Further, organizational leaders can play a significant role in developing a positive organizational climate, including PsyCap and WWB ([Choi and Lee, 2014](#)). Leadership programs can be realigned such that it can stimulate positive O.B. including PsyCap and psychological strengths of members. Now employee wellbeing is accorded top priority due to their long-term positive implications on physical and mental health, which in turn organizational effectiveness ([Danna and Griffin, 1999](#)). The findings of the study also lend support to this. The post-COVID-19 new normal has brought in such a situation that enhancing the physical and mental wellbeing of employees is of paramount importance since work and life are now increasingly becoming blurred or intertwined, and are reciprocal in their influence.

LIMITATION AND STUDY FORWARD

Various personality traits are likely to influence the variables examined in the study. Individuals could vary drastically in their personality ([Barrick, Mount, and Judge, 2001](#)), self-evaluations ([Judge and Bono, 2001](#)), work and family balance ([Leung, Cheung and Liu, 2011](#)), general outlook associated with positive traits ([Avey et al., 2010](#); [Bakker and Schaufeli, 2008](#)), attitude towards organizational outcomes, empowerment ([Jose and Mampilly, 2014](#)), psychological contract ([Naidoo, Abarantyne, and Rugimbana, 2019](#)), turnover intend ([Sandhya and Sulphrey, 2020](#)), etc. Through exercising control over variables that could have individual differences, future researchers could attempt to increase the internal validity of the findings of this study for the effects of PsyCap.

This study was conducted in KSA and has contributed to the literature for the contextual applicability of PsyCap. However, the generalizability of the findings and their implications in other cultural settings need to be ascertained. There is ample scope for future researchers to replicate it in diverse cultures. It is expected that the present study will act as a trigger for further researches in this area.

ACKNOWLEDGEMENT
