## CLEANED – Validation Workshop

### Dairy Value Chain Tanzania

**Walter Mangesho, Birthe Paul, Jessica Mukiri, David Ngunga, Beatus Nzogela, Godfrey Ngoteya, An Notenbaert, Amos Omoro**

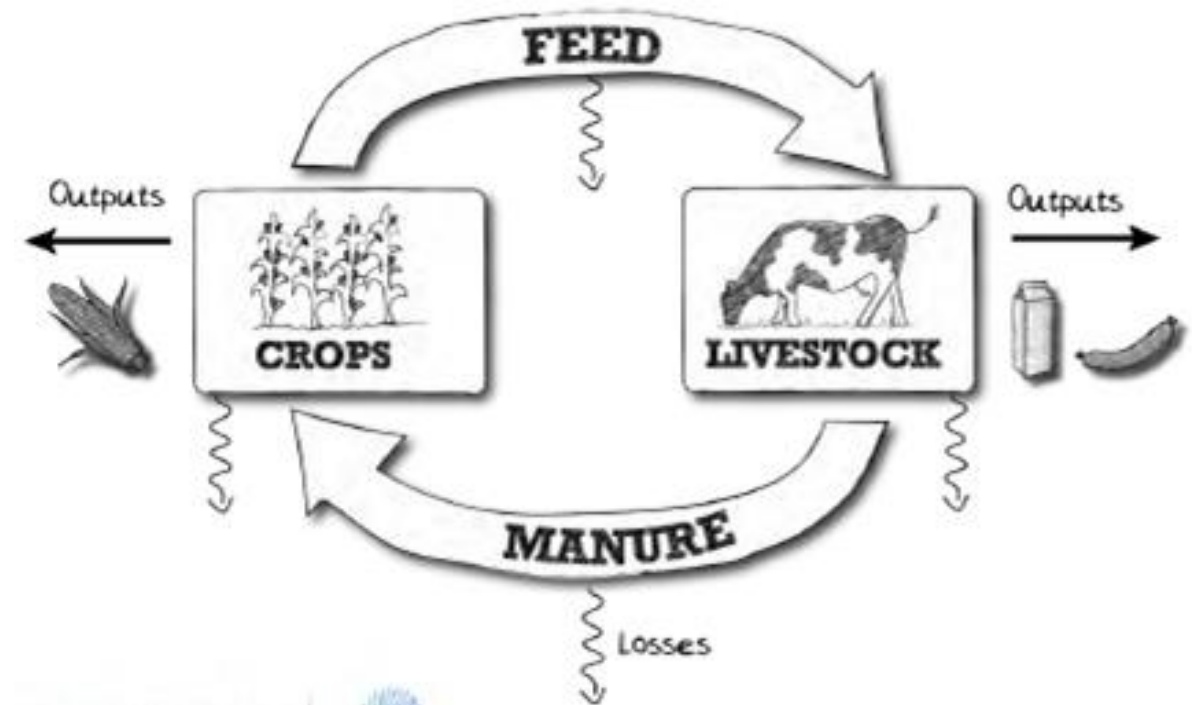

Email: [cleaned@cgiar.org](mailto:cleaned@cgiar.org)

CLEANED Validation Workshop: 25<sup>th</sup> – 26<sup>th</sup> March 2021

# Welcome

- Introduction and Objectives – Jess
- Opening remarks – Godfrey
- Program overview
- Introduction + Expectations
- Start of Workshop

# Objectives

**Verify** and discuss preliminary model results of the model CLEANED model to reflect intensive dairy livestock systems

To **assess** the relevance of CLEANED results and key decision **identify** makers/experts

**Develop** future best-bet integrated packages and scenarios to be modelled in CLEANED

# Opening Remarks

# MAZIWA ZAIDI PROJECT: About Phase I

- Maziwa Zaidi project is implemented under the CGIAR Research Program on Livestock (hereafter Livestock CRP)
- In a nutshell, the Livestock CRP is piloting integrated interventions in “**Priority Countries**”, which are intended to serve as ‘**field laboratories**’ where the Livestock CRP can test its ‘Products; and take them to scale and contribute to designing integrated livestock interventions.
- The CRP Country priority program for Tanzania was branded as “Maziwa Zaidi (More Milk)
- The implementation of MZ phase I in Tanzania started in 2012-2018 to test multi-stakeholder processes (hubs and innovation platforms)
- The focus of Maziwa Zaidi Phase I was on establishing market linkages targeting farmer groups as an entry point to overcome market barriers, increase participation, improve revenue/income and livelihoods.
- It mainly targeted pre-commercial marginalized cattle keeping men and women in Tanga and Morogoro regions.
- From MZ I, it was observed that;
  - ✓ The hubs were found useful for intended purposes and progress towards sustainability.
  - ✓ Linkages starting with farmer groups are slow in terms of process and it’s quicker to start with agripreneurs, who are service providers.
  - ✓ Skills training has proven effective and would scale-up by focusing more on personal self-starting entrepreneurial initiatives as well as future-oriented and proactive mindsets.

# MAZIWA ZAIDI PROJECT: About Phase II

- In early 2019, the CGIAR's Livestock CRP provided additional resources to extend the work of the Maziwa Zaidi phase I to a second phase i.e., Maziwa Zaidi phase II.
- MZ Phase II entitled, "Agri-entrepreneurship, technology uptake and inclusive dairy development in Tanzania was designed to take place in between 2019 and 2021 in four districts of Kilimanjaro and Tanga region in Tanzania.
- The overall objective of the project is to pilot uptake of dairy technology packages through institutional approaches that involve inclusive agribusiness models for improved livelihoods of smallholders and environmental sustainability in Tanzania.
- This phase focuses on agribusinesses as an entry point in the dairy value chain
- The project will promote intervention packages that bundle and combine proven genetics, health and feeds technologies within institutional arrangements that not only have the potential to be profitably leveraged in various combinations by agribusinesses (depending on their demand and interest) but also that allow farmers to utilize and benefit from these bundles.

# About Phase II cont'd.....

- The **delivery packages** to be profitably leveraged by agribusiness targeting producers will be: **Brachiaria grass (or other forage options), manure management, East coast fever vaccine, and AI.**
- These will be delivered through capacitated agripreneurs and agribusinesses, using **digital platforms for farmer profiling and e-extension**, and capacity development supporting market access, safer products and effective collective action.
- i.e., the project will support agribusiness skills development and embed proven dairy technologies in the portfolio of products and services that agribusinesses and Agri-entrepreneurs deliver hence enhancing uptake of dairy technologies and innovations.
- Women- and youth-led dairy agribusinesses will be targeted with business development services (BDS) and other support services to overcome barriers to entry into lucrative nodes of the dairy value chain.
- Generally, The key assumptions that will be tested in MZ phase II are:
  1. Inclusive agribusiness approach will enhance the uptake of technology packages.
  2. Incubation/acceleration/mentorship of agripreneurs will contribute to improved business performance.
  3. Integrated technology packages will contribute to increased productivity, income and consumption of safe milk.

NB: For more information on Maziwa Zaidi kindly visit <https://maziwazaidi.org>

# Part 1: Intensive livestock enterprise

# Why is the livestock Dairy value chain is important in Tanzania: The facts

**>200,000**  
Smallholder  
dairy farmers

The estimated total number of  
livestock dairy cattle **680,000**

Milk produced

# 2.4 Billion

*70% from traditional systems, 30% improved cattle systems.*

The value of livestock  
accounts for

# 5.4%

# GDP

**30% of 5.4% is from dairy**

that accounts for some jobs

# 4.6 Million

# House Holds

Increased demand  
for milk and dairy  
products

*Current milk consumption 45 kg/annum, expected  
to increase to 100 kg/annum.*

# Current Environmental impacts

## Negative environmental impacts:

### EMISSIONS

of greenhouse gases

### LAND

degradation and deforestation

### WATER

pollution and depletion

### DEFORESTATION

### BIODIVERSITY

threatened

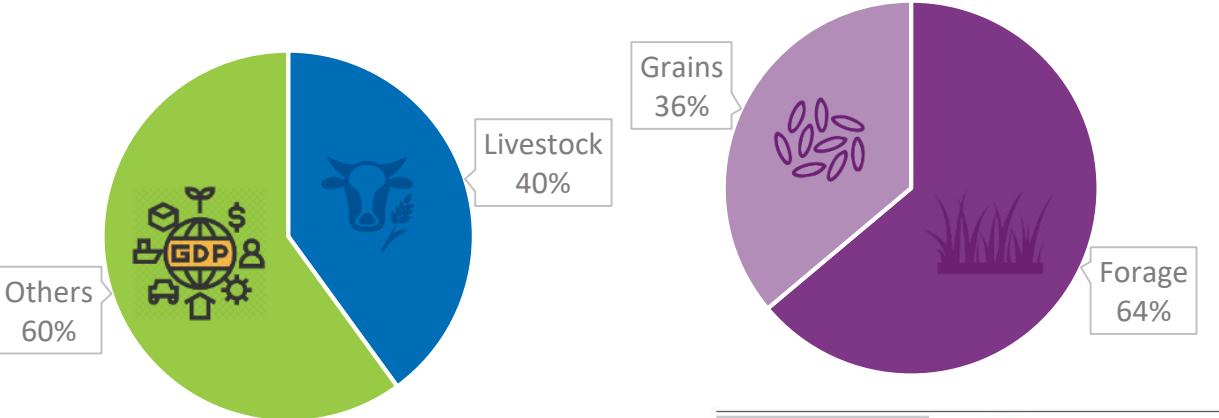

### Global fresh water use

### Global crop land

### Global agricultural GDP

# Part 2: CLEANED

# What is CLEANED?

**C** omprehensive  
**L** ivestock  
**E** nvironmental  
**A** ssessment for Improved  
**N** utrition, a Secured  
**E** nvironment and Sustainable  
**D** evelopment along Livestock  
and Fish Value Chains.

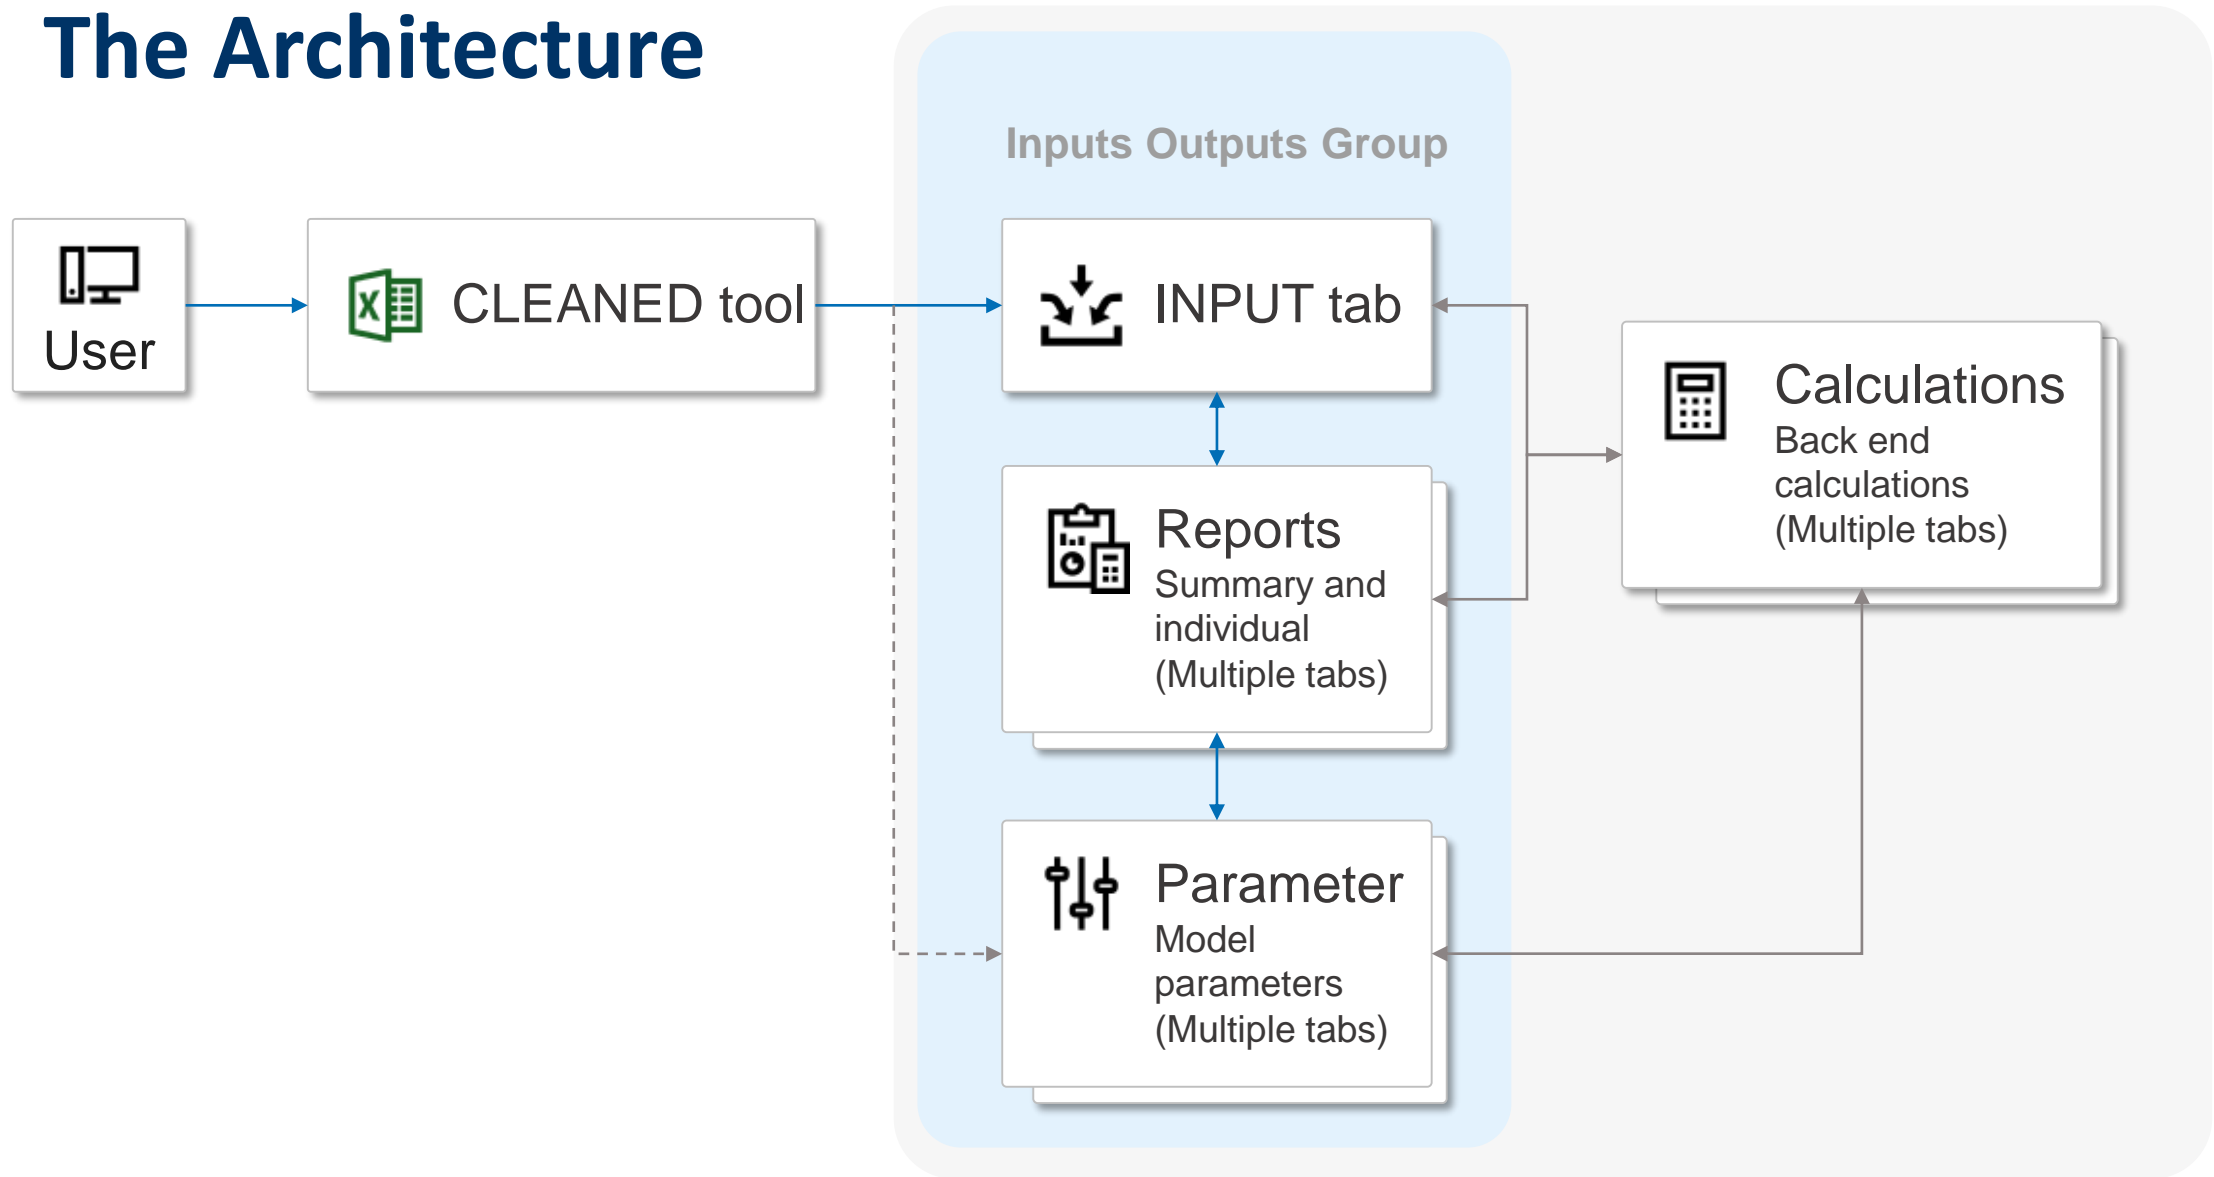

*“A rapid ex-ante  
environmental impact  
assessment tool that allows  
users to explore multiple  
impacts of developing  
livestock value chains.”*

# What is CLEANED

The CLEANED tool lets users explore **multiple** impacts of developing livestock value chains in explicit ways. It models the impact of intensifying livestock along multiple pathways:

-  Land requirements
-  Productivity
-  Economics
-  Soil Impacts
-  Water impacts
-  GHG emissions

# The Architecture

# CLEANED Calculations

Land Requirement =

Feed requirement + Feed quality ==> feed amount

Feed amount + crop yields ==> land size

RUSLE (Revised Universal Soil Loss Equation) is widely used for estimating the rate of soil loss by [water](#).

$$A = R \times K \times L \times S \times C \times P$$

A: annual soil loss per acre

R: [rainfall erosivity](#)

K: [soil erodibility](#)

L: [slope length](#)

S: [slope steepness](#)

C: [vegetative cover](#)

P: [erosion control practices](#)

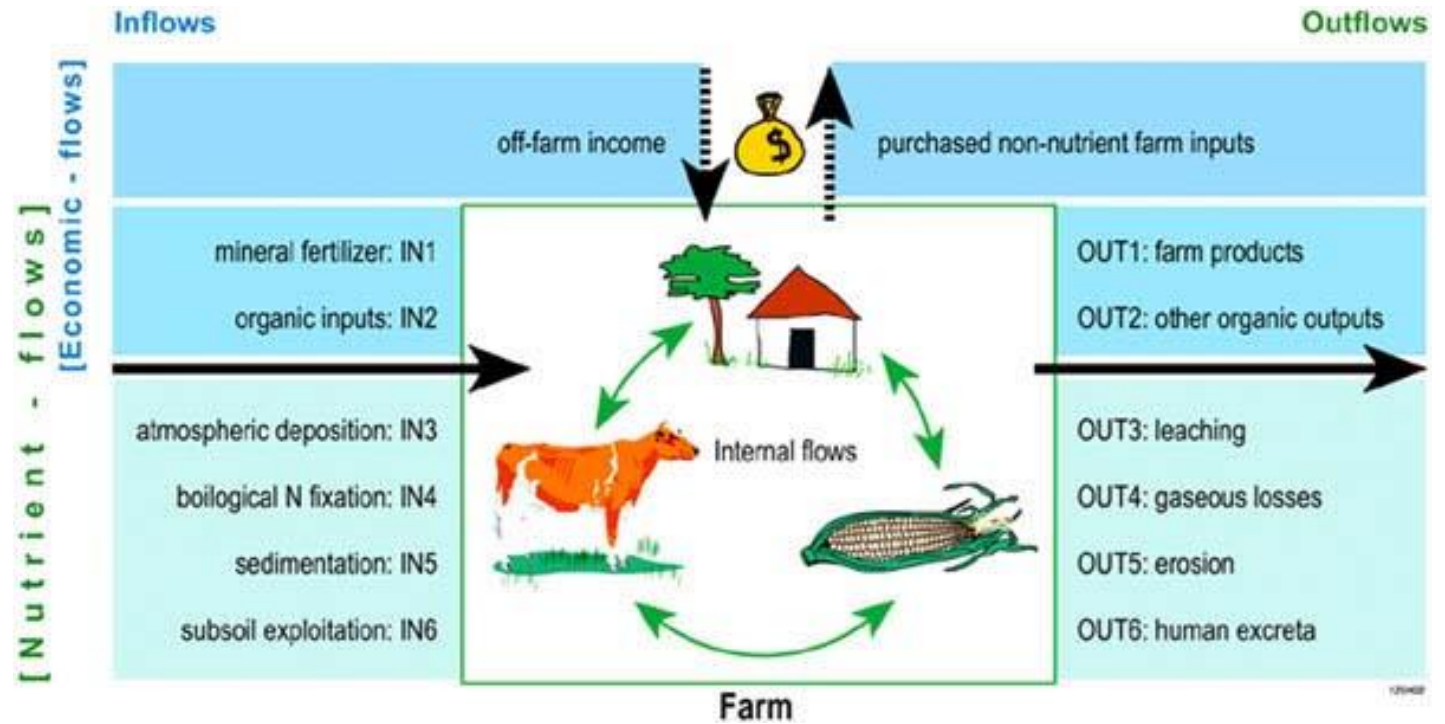

# Water Using -> Evapotranspiration (ET)

# N Balance → NUTMON

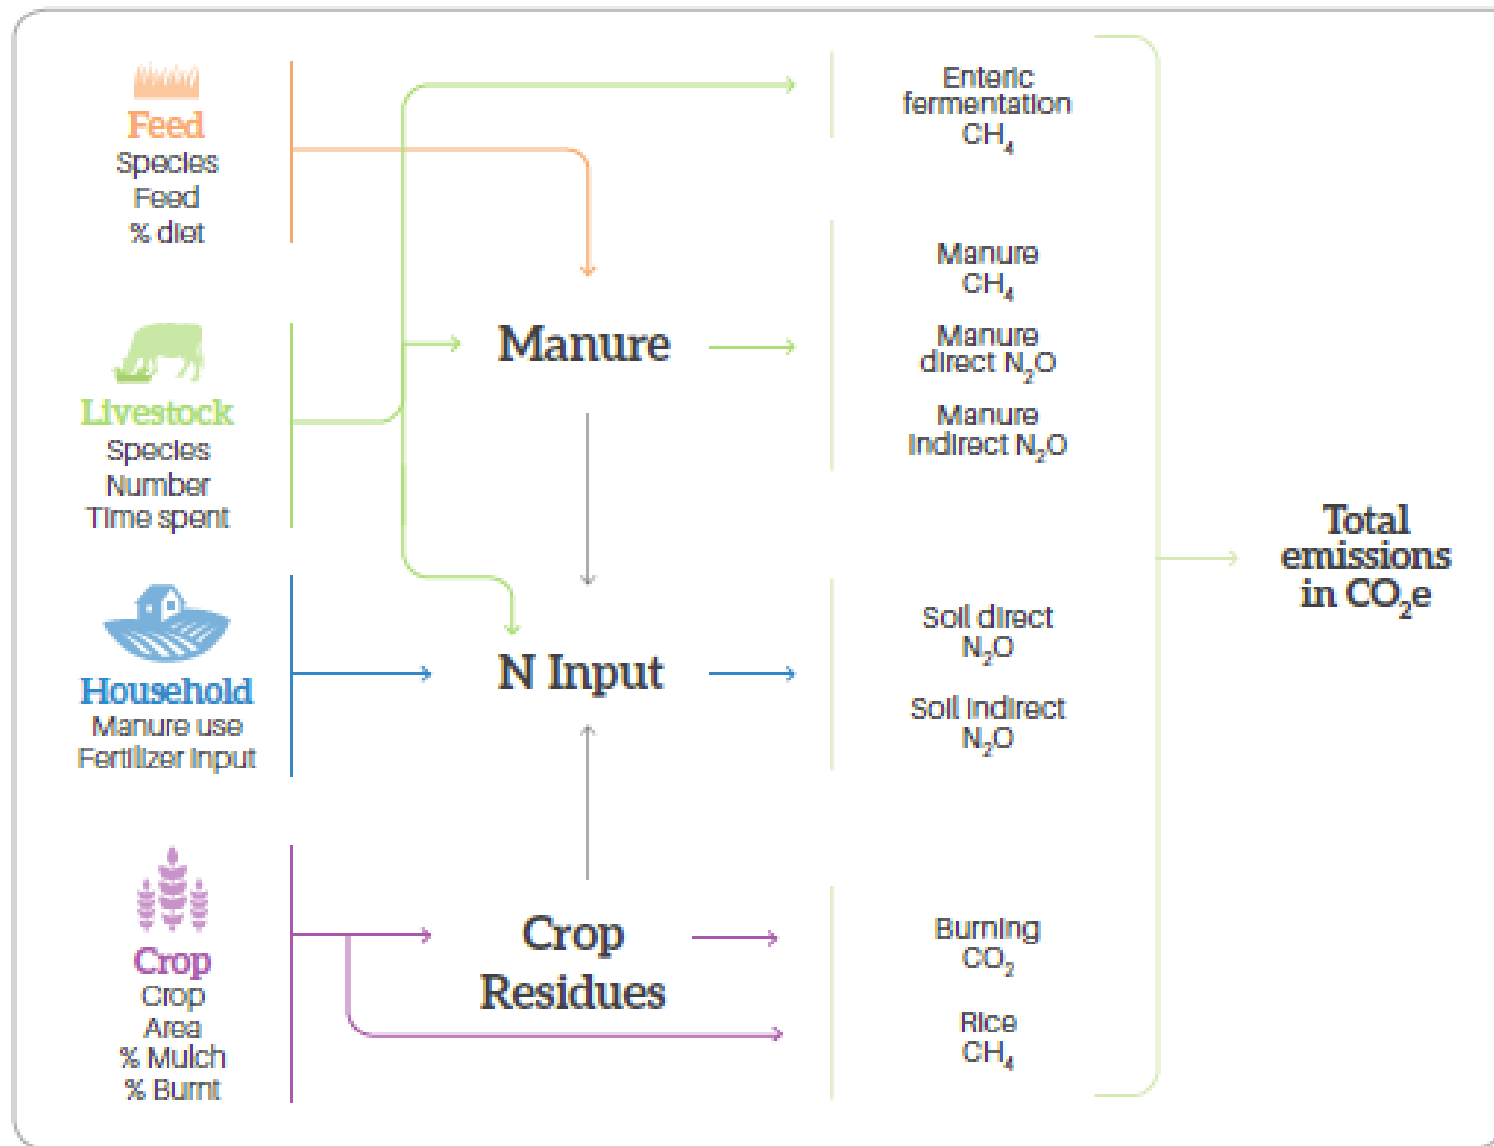

CLEANED

# GHG

## 2006 IPCC Guidelines for National Greenhouse Gas Inventories.

### Tier 1 and 2

# The process

The CLEANED tool process comprises of 2 stages:

1. Collect and input the baseline data
2. Generate reports for different scenarios of how the livestock production systems might change

Step 1

 Location Define location

 Livestock Describe system

 Describe Practices and Value Chain e.g. grazing

 Calculate environmental baselines

Step 2

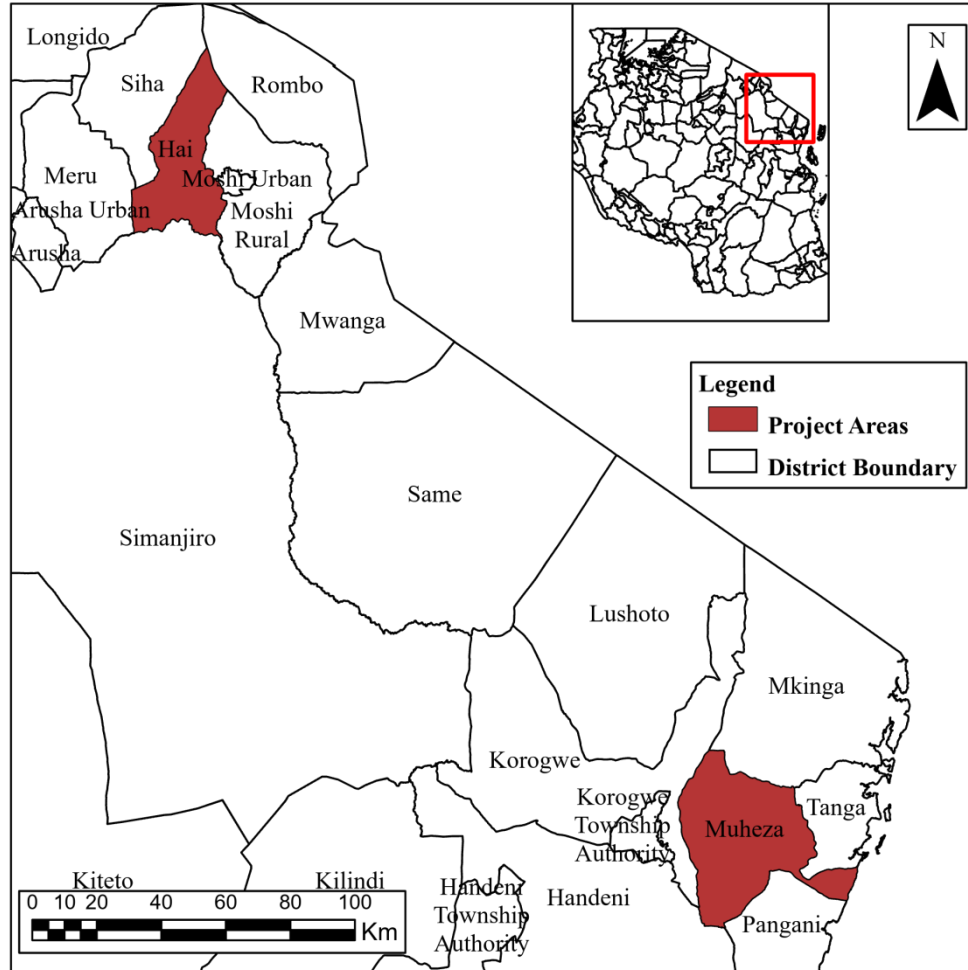

**Describe interventions**

-  Describe likely changes in inputs and parameters and
-  Calculate environmental impacts
-  Water
-  Land
-  Greenhouse gases
-  Economic

# Methodology

# Study Area

# Types

Site	GPS coordinates (Lat; Long)	Mean Annual Rainfall (mm)	Mean Annual Temperature (°C)	Land area (sq. km)	Reference

# CLEANED Results

# Results overview

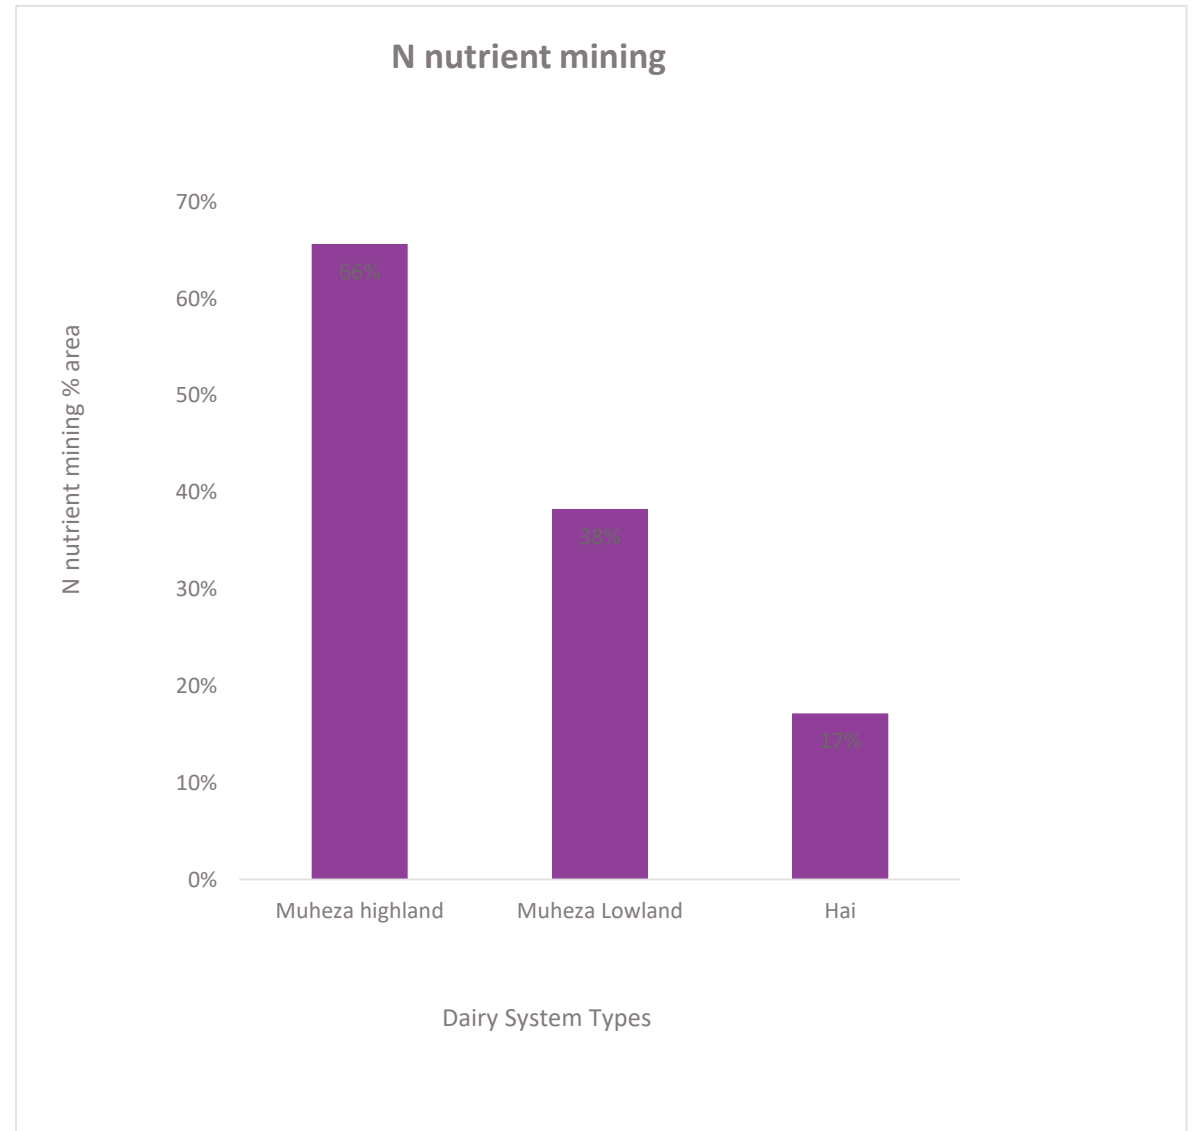

# Land

- High dependence of crop residues in Hai than in Muheza therefore high land requirement
- Less usage of planted grass in Hai than Muheza

# Soil Impacts

Minimum N addition to the soil coupled with high crop cultivation leads to high N nutrient mining in Muheza

# Soil Impacts

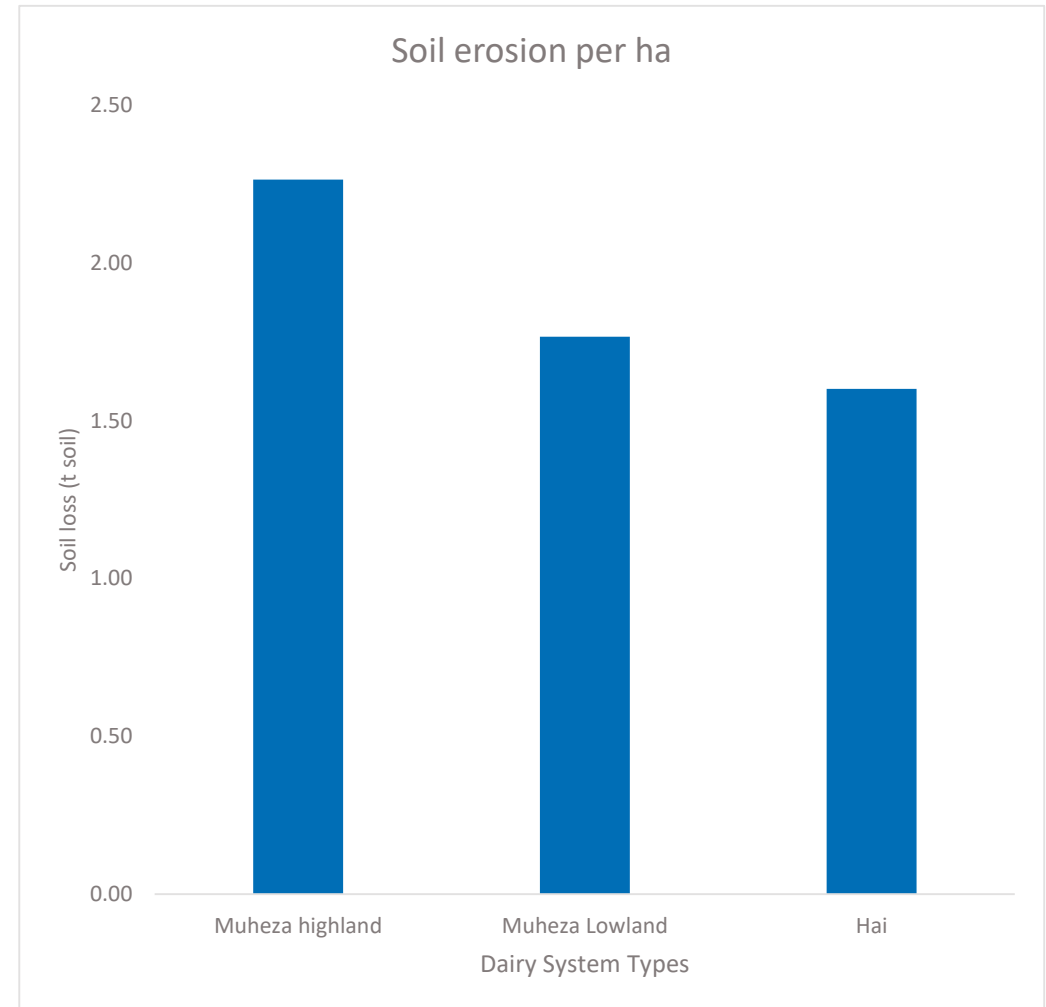

High soil erosion per kg FPCM in Muheza lowland due to high usage of livestock feeds from natural sources

# Soil Impacts

High level of soil erosion in Muheza highland due to;

- Topographical nature of the area
- High crop cultivation activities
- Less soil conservation practices

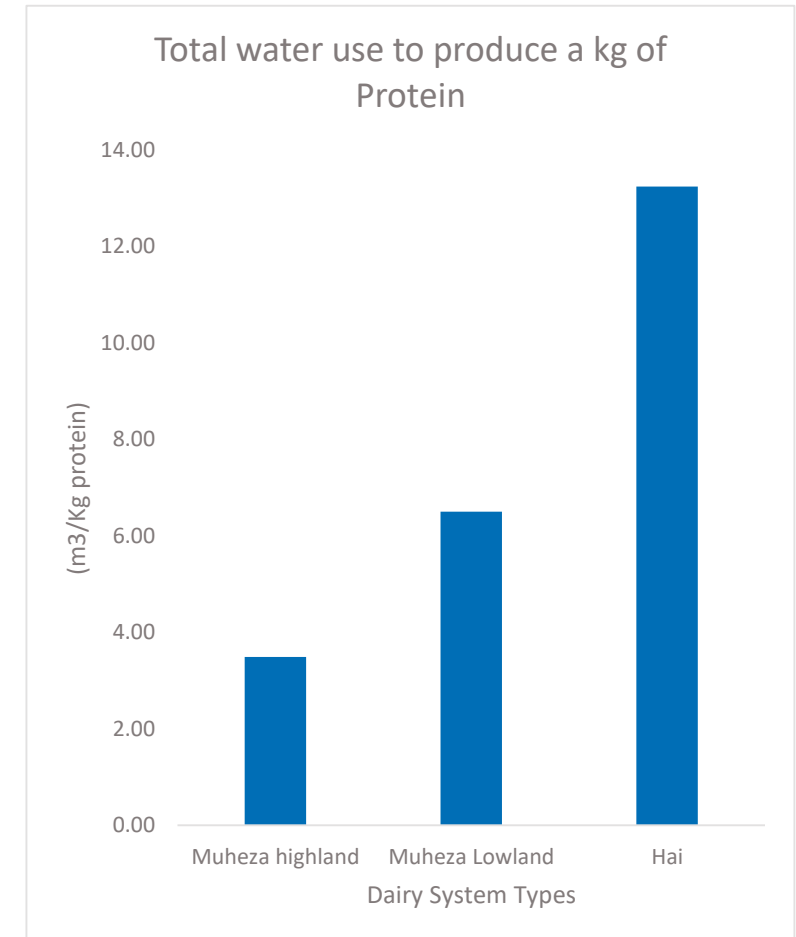

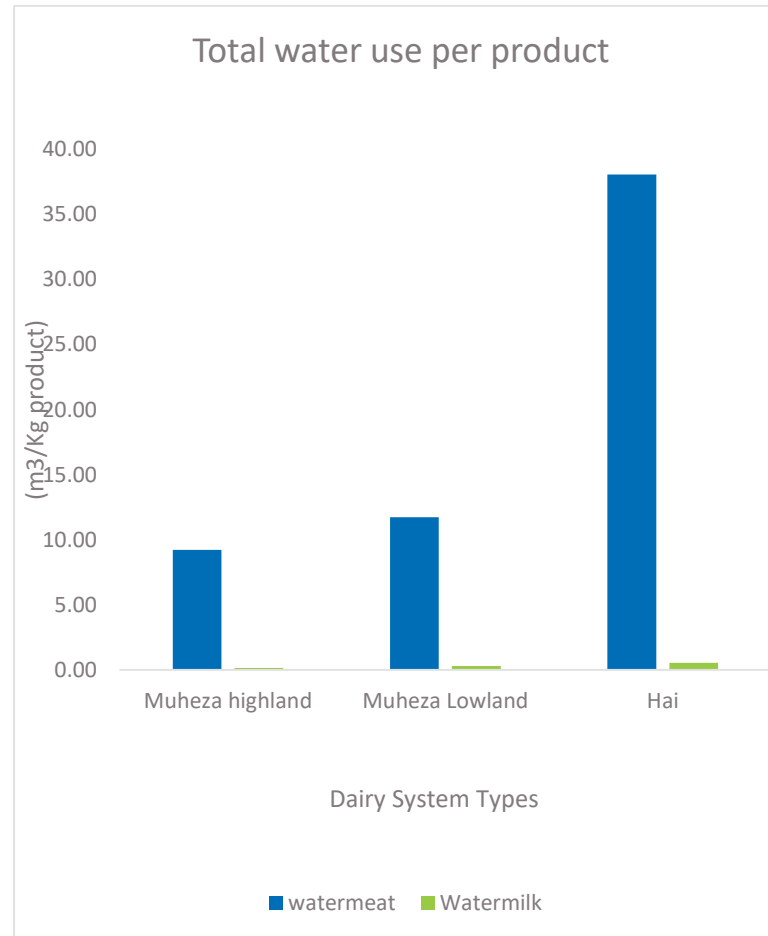

# Water Impacts

- Much usage of water in Hai due to much usage of crop residues which needs much precipitation for crops growth
- Increase production of high quality forage would reduced relative water resource use and improve efficiency of intensive dairy production system

# Water Impacts

- Water loss through evapotranspiration by the portion of the crops that is used for feed and fodder
- Production of high yielding crops can reduce the loss

# GHG Emissions

- High milk production correlates positively with enteric fermentation especially when low quality feeds are used
- Poor manure management also increases emissions
- Production and use of improved forages and proper manure management is highly recommended

# GHG Emissions

# Results Verification

Environmental Impact: CLEANED results	Validate Is this what is expected on the ground		Reasons for yes/no answer What information is needed to further verify the results
	Yes	No	
Total area under feed production			
N nutrient mining			
Soil erosion per kg FPCM			
Soil erosion per ha			
Total water Use m3/ha/yr			
Total water use per product			
Total water use to produce a kg of Protein			
Sources and Sinks of CO2			
GHG emission intensity			
GHG emission intensity per kg protein			
GHG emission intensity per product			

# Type Verification

Type	Validate Is this what is expected on the ground		Population involved in VC* in Project Area	Reasons for yes/no answer What information is needed to further verify the results
	Yes	No	Percentage (%) Low / Medium / High (0 -29 / 30 -60 / 61 - 100)	

# Input and Parameters Verification

INPUT and Parameters	Validate Is this what is expected on the ground		Reasons for yes/no answer
	Yes	No	
Herd composition (nr)			
Average annual milk (kg)			
Average annual growth per animal (kg)			
Average Body weight (kg) - Cow			
Average Body weight (kg)- Heifers			
Average Body weight (kg) - Calves			
Parturition interval (years)			
Feed basket/ Diet			
Animal Whereabouts			
Natural pasture /DM Yield tonne/ha			
Pennisetum purpureum/ DM Yield tonne/ha			
Maize/DM Yield tonne/ha			
Manure application tonne/ha			

# CLEANED Application

# Who will be using CLEANED?

- What is their job?
- Where does it fit into the job role?
- Who will be *their* audience?

# What questions do you want to answer?

- Implementing technologies
- Soil impacts in an area
- Alternative processes or practices
- GHG emissions
- Land use
- Water impacts

Feeding a productive dairy cow  
in western Kenya: environmental  
and socio-economic impacts

<https://hdl.handle.net/10568/97557>

# Who are the stakeholders?

# Use of Results for stakeholder x

Environmental Impact: CLEANED results	Importance of Results to xxx 1 = very low; 2 = low; 3 = medium; 4 = high; 5 = very high; 0 = non-existent; N/D = no data; N/A = not applicable	Reasons for answer
Total area under feed production		
N nutrient mining		
Soil erosion per kg FPCM		
Soil erosion per ha		
Total water Use m3/ha/yr		
Total water use per product		
Total water use to produce a kg of Protein		
Sources and Sinks of CO2		
GHG emission intensity		
GHG emission intensity per kg protein		
GHG emission intensity per product

# DAY 2: CLEANED Scenarios

# Recap

# Program for the day

# CLEANED Scenarios

# Challenges and for dairy value chain

## Challenges

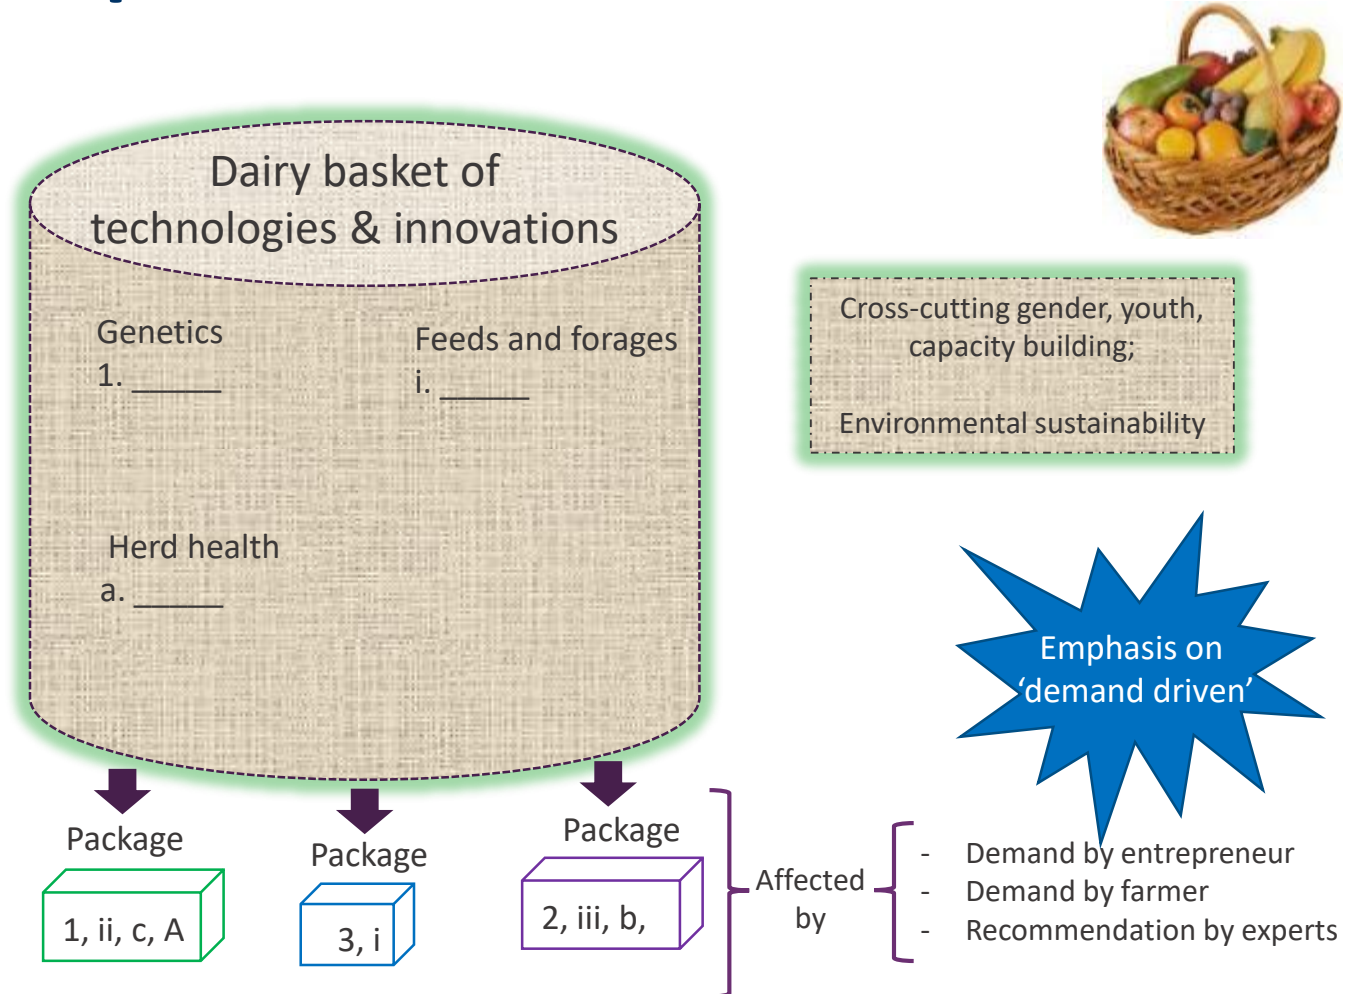

- Disease control
- Low quality forage
- Low performance of A.I
- Inbreeding
- Poor Manure Management

# The Interventions

*Proven genetics, health and feeds technologies:*

- 1. Brachiaria grass (or other forage options),**
- 2. Manure management,**
- 3. East coast fever vaccine**
- 4. Artificial Insemination**

# Example of Scenario/ Intervention

- **Packaging technical components**

# Mapping challenges to the location

Production Challenges	Is the production challenge affecting your dairy type		If Yes How important is this production challenge in dairy type and location Percentage (%) Mildly important/ Important / Very Important (0 -29 / 30 -60 / 61 -100)	Reasons for answer
	Yes	No		
Feeding				
Health				
Genetics				
Environment/Manure mgmt.				

# Formulating the Package

Type	<b>The Package</b> Brachiaria grass (or other forage options) / Manure management/ East coast fever vaccine, and /Artificial Insemination
A	

# How do this(these) package(s) affect the production and input and parameters in your dairy type?

% increase of production from baseline Milk yield	Input	Parameters
	<ul style="list-style-type: none"> <li>- Feeding basket what proportion of the basket will change?</li> <li>- Which feed item will be utilized less</li> <li>- What feed it item will be introduced</li> <li>- Does this intervention change the wet and dry season basket?</li> </ul>	<ul style="list-style-type: none"> <li>- What are the yields for the introduced feed items in the location?</li> <li>- What are the nutritional values for introduced feed items in the location?</li> <li>- Will there be any inorganic/organic fertilizer use? How much?</li> </ul>
	<ul style="list-style-type: none"> <li>- If the intervention package is successful, does the herd composition change or remain the same?</li> <li>- If a change, is there an increase or decrease in animal numbers? Specify</li> </ul>	<ul style="list-style-type: none"> <li>- Do the weights of the animal change or remain the same?</li> <li>- Does the birthing interval change?</li> </ul>
	<ul style="list-style-type: none"> <li>- How would the manure be managed if intervention is successful?</li> <li>- Will collection and use of manure change</li> </ul>	N/A
