

Introduction

- Multicomponent reactions (MCR) combine three or more substrates simultaneously for high atom economy. MCRs offer added advantages such as reduced synthetic operations, maximized functional complexity, and assembly of large compound libraries in shorter period.
- 2-Naphthol derivatives possess anticancer, antibacterial and anti-inflammatory properties.¹⁻³ Additionally, they exhibit cardiovascular properties such as antihypertensives and calcium channel blockers.^{4,5}
- Given the medicinal importance of 2-naphthol derivatives, we developed a 2-naphthol based MCR to expeditiously access various 2-naphthol analogues to uncover new molecules that possess anticancer and antibacterial properties.

Experimental Method

- A mixture of 2-naphthol (1.0 eq), different aliphatic amines (1.25 eq), and glyoxylic acid (1.25 eq) were reacted in DMF at 90 °C to furnish 2-naphthol derivatives.
- Various solvents and temperatures were evaluated to determine optimal conditions to complete the MCR transformation.

Scheme 1: Synthesis of 2-naphthol analogues

Results and Discussions

Table 1: Effect of solvent on the formation of 1-methylmorpholine-2-naphthol

| S.N | Solvent | Yield (%) |
|-----|---------|--------------|
| 1 | DMF | 76 |
| 2 | DMA | 73 |
| 3 | DMSO | 35 |
| 4 | THF | Trace Amount |
| 5 | Toluene | Trace Amount |
| 6 | EtOH | Trace Amount |
| 7 | Dioxane | Trace Amount |
| 8 | ACN | No Reaction |

Note: The reaction was carried out at 90 °C

Table 2: Effect of temperature on the formation of 1-methylmorpholine-2-naphthol

| S.N | Temperature (°C) | Yield (%) |
|-----|------------------|--------------|
| 1 | RT | No reaction |
| 2 | 90 | 76 |
| 3 | 120 | 70 |
| 4 | 150 | Trace Amount |

Note: DMF was used as the solvent

- The 2-naphthol MCR had highest yield when DMF was used as the solvent.
- Various aliphatic amines were used to afford the 1 alkyl amine derivatives.
- Yields as high as 81% were obtained.
- Temperatures greater than 90 °C reduced transformation of the MCR.
- Polar protic solvents offered improved yield over aprotic solvents.

Table 3: Synthesis of various aminoalkyl naphthol derivatives

| S.N | Products | Yield (%) |
|-----|----------|-----------|
| 1 | | 76 |
| 2 | | 71 |
| 3 | | 81 |
| 4 | | 61 |
| 5 | | 6 |
| 6 | | 55 |

Proposed Reaction Mechanism

Conclusions and Future Perspectives

Various 2-naphthol analogs were synthesized via a catalyst-free one pot process. The reaction between naphthol, aliphatic amines, and glyoxylic acid was optimized by varying solvents and temperatures to afford yield as high as 81%. Future work will include optimization of the reaction conditions for aromatic amines. The derivatives will be evaluated for their anticancer and antimicrobial properties.
