## Supplementary Methods

General Considerations (Synthesis) Reagents and solvents were obtained from commercial sources and were used without further purification unless otherwise stated (including anhydrous solvents). Heptane was dried with and kept over activated $3 \AA$ MS. All reactions were performed in dried glassware (flame-dried or oven-dried overnight) under an argon atmosphere unless otherwise stated and monitored by TLC on silicacoated plates using solvent mixtures appropriate to each reaction. All column chromatography was performed on silica gel $(40-63 \mu \mathrm{~m})$. For compounds containing a basic nitrogen, $\mathrm{Et}_{3} \mathrm{~N}$ was often used in the mobile phase in order to provide better resolution. In these cases, TLC plates were pre-soaked in the $\mathrm{Et}_{3} \mathrm{~N}$ containing solvent and then allowed to dry briefly before use in analysis, such that an accurate representation of $R_{f}$ was obtained. Nuclear magnetic resonance spectra were recorded on 400 or 500 MHz instruments as indicated and collected via the Bruker Topspin software (Bruker Topspin 3.5 pl 6 ). The NMR spectra were analyzed using Mestronova 14.2 .0 software. Chemical shifts are reported as $\delta$ values in ppm referenced to $\mathrm{CDCl}_{3}\left({ }^{1} \mathrm{H} \mathrm{NMR}=7.26\right.$ and ${ }^{13} \mathrm{C}$ NMR $\left.=77.16\right)$ and $\mathrm{CD}_{3} \mathrm{OD}\left({ }^{1} \mathrm{H} \mathrm{NMR}=3.31\right.$ and ${ }^{13} \mathrm{C}$ NMR = 49). Multiplicity is indicated as follows: $s$ (singlet); $d$ (doublet); $t$ (triplet); $q$ (quartet); dd (doublet of doublets); dt (doublet of triplets); td (triplet of doublets); m (multiplet); br (broad). In some cases, spectra are complicated by the presence of multiple conformers, resulting in peak broadening or additional splitting. As a result of these effects, multiple peaks may correspond to the same proton group or carbon atom. When possible, this is indicated by an "and" joining two listed peaks or spectral regions. All carbon peaks are rounded to one decimal place unless such rounding would cause two close peaks to become identical. In these cases, two decimal places are retained. Low resolution mass spectra (LRMS) were recorded on a quadrupole mass spectrometer (ionization mode: APCI + or ESI + ). High-resolution mass spectra (HRMS) were recorded on a quadrupole time-of-flight mass spectrometer (ionization mode: ESI + ). Reactions in vials at elevated temperature were performed in an aluminum heating block and the temperature was regulated by a thermometer immersed in a vial containing silicon oil. Mitragynine (MG) was obtained by extraction and purification from commercially available kratom (Mitragyna speciosa) leaf powder as previously described. ${ }^{1,2}$

## Synthetic procedures:

Optimization of C12-selective borylation reactions of MG and subsequent transformations
Supplementary Figure 1: Known C10/C12 derivatization versus unknown C11 derivatization

Supplementary Table 1: A comprehensive overview of borylation optimization reactions

| temperature | boron source | NMR conv. / <br> reaction time |
| :---: | :---: | :---: | :---: | :---: | :---: |
| [Ir(COD)OMe] <br> (mol\%) | (igand (mol\%) |  |

| (10 mol\%) | Me4-phen $30 \mathrm{~mol} \%$ | dry heptane | 80 | $\begin{gathered} \mathrm{B}_{2} \mathrm{Pin}_{2} \\ (4 \text { equiv) } \end{gathered}$ | $\begin{gathered} 100 \% \\ (\mathrm{C} 11: \mathrm{C} 123: 2) \\ / 24 \mathrm{~h} \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |

Where noted "not specified" for the amount of metal pre-catalyst and ligand in the Table S1, the exploratory experiments were run on $3-5 \mathrm{mg}$ scale of substrate and the smallest amount of pre-catalyst and ligand that can be obtained on a tip of spatula (without weighing) was added. Use of $\mathrm{B}_{2} \mathrm{Pin}_{2}$ is advantageous since it is a solid easily handled. Thus, in reactions with $\mathrm{B}_{2} \mathrm{pin}_{2}$, all solids were balanced at once into the reaction vial, flushed with argon and solvent added last (also the case for C 11 borylation below). In comparison, reactions with liquid HBPin gave identical results. C12 borylated MG was observed to undergo slow protodeborylation in contact with humidity and air and decomposed rapidly on silica gel (back to starting MG).

Compound 1: both procedures provide identical results
General Procedure A: MG ( $25 \mathrm{mg}, 62 \mu \mathrm{~mol})$, $\left[\mathrm{Ir}(\mathrm{COD}) \mathrm{OMe}_{2}(4 \mathrm{mg}, 6.2 \mu \mathrm{~mol})\right.$, dtbpy ( $\left.5 \mathrm{mg}, 18.8 \mu \mathrm{~mol}\right)$ and $\mathrm{B}_{2} \operatorname{Pin}_{2}(64 \mathrm{mg}, 250 \mu \mathrm{~mol})$ were balanced into an oven dried vial. The vial was purged with argon, dry heptane ( 1 mL ) was added under argon, and the vial was sealed with a Teflon-lined screw cap and heated to $80^{\circ} \mathrm{C}$. The reaction mixture (RM) became a dark-brown solution after 5-15 min of heating. After 24 h , when LR-MS and TLC (on alumina) indicated complete consumption of starting material (SM), the RM was concentrated to dryness. This crude intermediate was immediately used to prepare the $-\mathrm{Cl} \mathbf{2}$ and $-\mathrm{Br} \mathbf{3}$ derivatives without further purification.

General Procedure B: Catalyst $[\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}(4 \mathrm{mg}, 6.0 \mu \mathrm{~mol})$ was dissolved in dry heptane $(2.8 \mathrm{~mL})$ in an oven dried vial under argon and $\operatorname{HBPin}(73 \mu \mathrm{~L}, 500 \mu \mathrm{~mol})$, dtbpy ( $3.1 \mathrm{mg}, 12 \mu \mathrm{~mol}$ ) and MG ( 49 mg , $120 \mu \mathrm{~mol}$ ) were added consecutively under a stream of argon, with a 2 min stirring period at RT between each addition. The vial was sealed with a Teflon-lined screw cap and heated to $65^{\circ} \mathrm{C}$. RM was a dark redbrown color. After 24 h , when LR-MS and TLC (on alumina) indicated complete consumption of SM, the RM was concentrated to dryness. This crude intermediate was immediately used to prepare the $-\mathrm{Cl} \mathbf{2}$ and $-\mathrm{Br} \mathbf{3}$ derivatives without further purification.

Compound 2 (12-Cl-MG). To the dark residue 1 (from Procedure A) was added $\mathrm{CuCl}_{2} \cdot \mathrm{H}_{2} \mathrm{O}(37 \mathrm{mg}, 217$ $\mu \mathrm{mol})$ and a mixture of $\mathrm{MeOH}+\mathrm{H}_{2} \mathrm{O}(2+0.5 \mathrm{~mL})$. The vial was sealed and the RM was heated to $80^{\circ} \mathrm{C}$ with vigorous stirring (slower stirring will cause incomplete conversion due to a precipitation of reactants during the reaction). After 12 h , TLC (EtOAc:Hex $1: 1+2 \% \mathrm{Et}_{3} \mathrm{~N}$ ) and LR-MS indicated complete conversion of the intermediate. Crude reaction mixture was adsorbed on silica and purified by column chromatography using EtOAc:Hex $1: 9+5 \% \mathrm{Et}_{3} \mathrm{~N}$. Product 2 was obtained as a yellow, amorphous solid ( $16 \mathrm{mg}, 70 \%$ for 2 steps).
${ }^{1} \mathbf{H}$ NMR ( $400 \mathbf{~ M H z}$, CDCl $_{3}$ ) $\delta 7.84(\mathrm{~s}, 1 \mathrm{H}), 7.44(\mathrm{~s}, 1 \mathrm{H}), 6.97(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.38(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H})$, $3.86(\mathrm{~s}, 3 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 3.72(\mathrm{~s}, 3 \mathrm{H}), 3.16(\mathrm{dt}, J=11.8,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.13-2.99(\mathrm{~m}, 3 \mathrm{H}), 2.97-2.88(\mathrm{~m}$, $2 \mathrm{H}), 2.58-2.42(\mathrm{~m}, 3 \mathrm{H}), 1.85(\mathrm{dt}, J=13.0,3.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.82-1.72(\mathrm{~m}, 1 \mathrm{H}), 1.67-1.59(\mathrm{~m}, 1 \mathrm{H}), 1.25-$ $1.16(\mathrm{~m}, 1 \mathrm{H}), 0.88(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $\mathbf{1 0 1} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ) $\delta 169.3,160.7,153.5,134.6,134.0$, $120.8,118.9,111.6,109.4,108.8,100.7,77.2,61.7,61.4,57.9,55.7,53.7,51.5,40.8,40.0,30.0,23.9,19.3$, 13.0. LR-MS (APCI+) calcd. for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{ClN}_{2} \mathrm{O}_{4}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 433.2$, found 433.3.

Compound 3 (12-Br-MG). To the dark residue 1 (from Procedure B) was added $\mathrm{CuBr}_{2}(41 \mathrm{mg}, 186 \mu \mathrm{~mol})$ and a mixture of $\mathrm{MeOH}+\mathrm{H}_{2} \mathrm{O}(2+0.5 \mathrm{~mL})$. The vial was sealed and the RM was heated to $80^{\circ} \mathrm{C}$ with vigorous stirring (slower stirring will cause incomplete conversion due to a precipitation of reactants during the reaction). After 12 h , TLC (EtOAc:Hex 1:1 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ ) and LR-MS indicated complete conversion of the intermediate. Crude reaction mixture was adsorbed on silica and purified by column chromatography using EtOAc:Hex 1:9+5\% Et ${ }_{3} \mathrm{~N}$. Product $\mathbf{3}$ was obtained as an amorphous, pale-yellow solid ( $21 \mathrm{mg}, 65 \%$ for 2 steps).
${ }^{1} \mathbf{H}$ NMR ( $\left.500 \mathbf{~ M H z}, \mathbf{C D C l}_{3}\right) \delta 7.78(\mathrm{~s}, 1 \mathrm{H}), 7.45(\mathrm{~s}, 1 \mathrm{H}), 7.11(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H}), 6.36(\mathrm{~d}, J=8.3 \mathrm{~Hz}, 1 \mathrm{H})$, $3.85(\mathrm{~s}, 3 \mathrm{H}), 3.75(\mathrm{~s}, 3 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.16(\mathrm{dd}, J=11.3,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.13-2.99(\mathrm{~m}, 3 \mathrm{H}), 2.96-2.88$ (m, 2H), $2.57-2.43(\mathrm{~m}, 3 \mathrm{H}), 1.85(\mathrm{dt}, J=13.0,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.82-1.72(\mathrm{~m}, 1 \mathrm{H}), 1.63(\mathrm{dd}, J=8.8,5.5 \mathrm{~Hz}$, $1 \mathrm{H}), 1.28-1.17(\mathrm{~m}, 1 \mathrm{H}), 0.87(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathbf{C}$ NMR ( $\mathbf{1 2 6} \mathbf{~ M H z}, \mathbf{C D C l}_{3}$ ) $\delta 169.3,160.7,154.1$, $135.3,134.5,123.7,118.8,111.5,109.6,101.4,96.2,61.8,61.4,57.9,55.7,53.7,51.5,40.9,40.0,30.0$, 24.0, 19.3, 13.0. LR-MS (APCI+) calcd. for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{BrN}_{2} \mathrm{O}_{4}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 477.2$, found 477.4.

## Compound 3 (12-Br-MG): Preparation using NBS.

MG $(35 \mathrm{mg}, 88 \mu \mathrm{~mol})$ and $\mathrm{NBS}(15 \mathrm{mg}, 88 \mu \mathrm{~mol})$ were taken in a vial and dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ under argon. ${ }^{3}$ The reaction mixture was cooled to $0{ }^{\circ} \mathrm{C}$ and TFA ( $0.20 \mathrm{~mL}, 11.4 \mu \mathrm{~mol}$ ) was added. The reaction was continued for 2 h at $0^{\circ} \mathrm{C}$ until LR-MS and TLC indicated complete consumption of SM. The reaction mixture was quenched with saturated aq. $\mathrm{NaHCO}_{3}$ and extracted with EtOAc ( $3 \times 5 \mathrm{~mL}$ ). Combined EtOAc extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The product was purified by PTLC using EtOAc:Hex 1:4 + 2\% $\mathrm{Et}_{3} \mathrm{~N}$ and obtained as an amorphous yellow powder ( $25 \mathrm{mg}, 60 \%$ ).

Note: Reaction was repeated three times. Out of three repeats, two gave only $12-\mathrm{Br}-\mathrm{MG} 3$ and once we obtained a minor amount of 10-Br-MG (C12 : C10 = 19:5).
The spectral properties of the product were identical to material obtained through the borylation procedure.

Supplementary Figure 2: General strategy for C11 derivatization

As the iridium-catalyzed borylation reactions are typically sterically controlled, one potential strategy to access the C 11 position was to install a PG on the indole nitrogen to shield the C 12 position Accordingly, we attempted the Ir-catalyzed borylation reaction on MG bearing both electron-donating and electron-withdrawing protecting groups.
Supplementary Figure 3: N-protected mitragynine derivatives and subsequent borylation reactions

Boc-MG: MG (200 mg, 0.502 mmol$)$ was dissolved in dry $\mathrm{DCM}(5 \mathrm{~mL})$ and $\mathrm{Boc}_{2} \mathrm{O}(120 \mathrm{mg}, 0.552 \mathrm{mmol})$ followed by DMAP ( $6 \mathrm{mg}, 0.0502 \mathrm{mmol}$ ) were added in one portion. The mixture was stirred for 12 h at RT and directly poured on column for separation (EtOAc:Hex $1: 5+5 \% \mathrm{Et}_{3} \mathrm{~N} ; \mathrm{R}_{\mathrm{f}}=0.48$ ). The pure product ( $190 \mathrm{mg}, 76 \%$ ) was obtained as a yellowish, foamy solid.
${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.76(\mathrm{~d}, J=0.7 \mathrm{~Hz}, 1 \mathrm{H}), 7.41(\mathrm{~s}, 1 \mathrm{H}), 7.16(\mathrm{t}, J=8.2 \mathrm{~Hz}, 1 \mathrm{H}), 6.65(\mathrm{dd}, J=$ $8.1,0.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.89(\mathrm{~s}, 3 \mathrm{H}), 3.72(\mathrm{~s}, 3 \mathrm{H}), 3.71(\mathrm{~s}, 3 \mathrm{H}), 3.65-3.52(\mathrm{~m}, 1 \mathrm{H}), 3.13(\mathrm{dt}, J=13.2,3.5 \mathrm{~Hz}$, $1 \mathrm{H}), 3.06(\mathrm{dd}, J=12.0,2.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.96-2.84(\mathrm{~m}, 2 \mathrm{H}), 2.76-2.61(\mathrm{~m}, 2 \mathrm{H}), 2.33-2.16(\mathrm{~m}, 1 \mathrm{H}), 1.98$ $(\mathrm{dt}, J=13.0,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.83-1.71(\mathrm{~m}, 1 \mathrm{H}), 1.62(\mathrm{~s}, 9 \mathrm{H}), 1.59(\mathrm{~d}, J=3.9 \mathrm{~Hz}, 1 \mathrm{H}), 1.25-1.21(\mathrm{~m}, 1 \mathrm{H})$, $0.89(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.6,160.8,154.3,150.9,139,135.5,124.6,119.2$, $116.9,111.9,108.6,103.8,83.8,62.9,61.8,58.0,55.7,51.59,51.57,41.0,40.8,31.5,28.5,25.7,20.0,13.6$. LR-MS (APCI+) calcd. for $\mathrm{C}_{28} \mathrm{H}_{39} \mathrm{~N}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 499.3$, found 499.4.

Supplementary Figure 4: In situ C11 borylation of Boc-MG and subsequent chlorination step

When attempting chlorination of the crude material obtained by borylation of Boc-MG, a mixture of two products, MG and 11-Cl-MG (one spot on TLC) was obtained after column chromatography. We observed significant protodeborylation as well as boc-deprotection under the reaction conditions. Preliminary exploration showed that the halogenation step was strongly concentration and temperature dependent. This process was not further optimized as another protected MG derivative, mitragynine-ethylene glycol adduct MG-EG (4), was found to be a superior substrate for C11-borylation compared to Boc-MG.

Dihydromitragynine $(\mathrm{DHM})$ : $\mathrm{MG}(100 \mathrm{mg}, 251 \mu \mathrm{~mol})$ was dissolved in neat TFA $(1.5 \mathrm{~mL})$. To the solution $\mathrm{NaBH}_{4}(37.9 \mathrm{mg}, 1.00 \mathrm{mmol})$ was added and made to dissolve. The vial was left open for some time to let the $\mathrm{H}_{2}$ gas formed during the reaction to let off and then the reaction was made to continue overnight at room temperature. After the consumption of starting material, the reaction mixture was
quenched with 1 M NaOH solution and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 25 \mathrm{~mL})$. The combined extract was washed with brine, dried over $\mathrm{MgSO}_{4}$, and evaporated. The product was purified by PTLC using EtOAc:Hex 1:4 + 2\% Et ${ }_{3} \mathrm{~N}$. DHM was obtained as a yellow solid ( $50 \mathrm{mg}, 50 \%$ ).
${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41(\mathrm{~s}, 1 \mathrm{H}), 6.96(\mathrm{t}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.37(\mathrm{~d}, J=7.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.29(\mathrm{dd}, J=$ $8.2,0.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.79$ (d, $J=1.2 \mathrm{~Hz}, 6 \mathrm{H}$ ), 3.69 (s, 3H), 3.52 (dd, $J=6.6,3.2 \mathrm{~Hz}, 1 \mathrm{H}), 3.05(\mathrm{dt}, J=12.4$, $6.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.00-2.82(\mathrm{~m}, 2 \mathrm{H}), 2.69(\mathrm{dt}, J=11.6,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.54(\mathrm{td}, J=13.0,11.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.19-$ $2.07(\mathrm{~m}, 1 \mathrm{H}), 2.00(\mathrm{dt}, J=11.6,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.96-1.75(\mathrm{~m}, 4 \mathrm{H}), 1.62-1.48(\mathrm{~m}, 2 \mathrm{H}), 1.44-1.34(\mathrm{~m}$, $1 \mathrm{H}), 1.29-1.11(\mathrm{~m}, 1 \mathrm{H}), 0.84(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.5,160.7,156.0$, 152.1, 128.4, 121.6, 112.1, 104.8, 102.1, 64.9, 64.7, 61.9, 59.1, 55.5, 55.0, 51.6, 41.1, 40.7, 37.9, 29.6, 27.9, 19.5, 13.4. LR-MS (APCI+) calcd. for $\mathrm{C}_{23} \mathrm{H}_{33} \mathrm{~N}_{2} \mathrm{O}_{4}[\mathrm{M}+\mathrm{H}]^{+}: 401.2$, found 401.4 .

Supplementary Figure 5: Borylation of MG analogs with oxidized (7OH), reduced (DHM), rearranged indole nucleus (MP) and subsequent bromination step.

A/ 7 OH was synthesized from MG as described in general procedure E. ${ }^{4} 7 \mathrm{OH}(25 \mathrm{mg}, 60 \mu \mathrm{~mol})$, $[\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}(5 \mathrm{~mol} \%)$, ligand (dtbpyl or $\left.\mathrm{Me}_{4}-\mathrm{phen}\right)\left(15 \mathrm{~mol} \%\right.$ ) and $\mathrm{B}_{2} \mathrm{Pin}_{2}$ (4 equiv) was balanced into an oven dried vial. The vial was purged with argon, dry heptane ( 1 mL ) was added under argon, and the vial was sealed with a Teflon-lined screw cap and heated to $65^{\circ} \mathrm{C}$. The reaction was heated for 24 h and then was concentrated in vacuo. No borylation was observed with either ligands as indicated by LR-MS and ${ }^{1} \mathrm{H}$-NMR.

B/ DHM ( $25 \mathrm{mg}, 62 \mu \mathrm{~mol}$ ), $[\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}(5 \mathrm{~mol} \%)$, ligand (dtbpyl or $\mathrm{Me}_{4}$-phen) $(15 \mathrm{~mol} \%)$ and $\mathrm{B}_{2} \mathrm{Pin}_{2}$ (4 equiv) was balanced into an oven dried vial. The vial was purged with argon, dry heptane ( 1 mL ) was added under argon, and the vial was sealed with a Teflon-lined screw cap and heated to $65^{\circ} \mathrm{C}$. The reaction was heated for 24 h and then was concentrated in vacuo. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ of the crude material showed a partial conversion ( $50 \%$ conversion) to the C11-borylated product along with unreacted SM. To the crude dark residue of intermediate was added $\mathrm{CuBr}_{2}\left(4\right.$ equiv) and a mixture of $\mathrm{MeOH}(2.4 \mathrm{~mL})+\mathrm{H}_{2} \mathrm{O}(0.6 \mathrm{~mL})(4: 1)$. The vial was sealed, and the RM was then heated to $80^{\circ} \mathrm{C}$ with vigorous stirring. After 24 h a complex and inseparable mixture of MG and DHM as the major products ( $\sim 60 \%$ by ${ }^{1} \mathrm{H}$ NMR), and $11-\mathrm{Br}-$ mitragynine and $11-\mathrm{Br}-2,3$-dihydromitragynine as the minor products ( $\sim 30 \%$ by ${ }^{1} \mathrm{H} \mathrm{NMR}$ ) was formed.

C/ MP was synthesized according to published procedure. ${ }^{5} \mathrm{MP}(25 \mathrm{mg}, 60 \mu \mathrm{~mol}),[\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}$ (5 $\mathrm{mol} \%$ ), ligand (dtbpyl or $\mathrm{Me}_{4}$-phen $)\left(15 \mathrm{~mol} \%\right.$ ) and $\mathrm{B}_{2} \mathrm{Pin}_{2}$ (4 equiv) were balanced into an oven dried vial. The vial was purged with argon, dry heptane ( 1 mL ) was added under argon, and the vial was sealed with a Teflon-lined screw cap and heated to $65^{\circ} \mathrm{C}$. The reaction was heated for 24 h and then was concentrated in vacuo. Complete conversion of SM to C12-borylated product was determined through LR-MS and ${ }^{1} \mathrm{H}$ NMR. To the resulting dark residue of intermediate was added $\mathrm{CuBr}_{2}$ (4 equiv) and a mixture of MeOH (2 $\mathrm{mL})+\mathrm{H}_{2} \mathrm{O}(0.5 \mathrm{~mL})(4: 1)$. The vial was sealed, and the RM was then heated to $80^{\circ} \mathrm{C}$ with vigorous stirring for 24 h . No conversion to brominated product was seen.

Compound 4 (MG-EG). Reaction was performed according to a published procedure. ${ }^{2}$ To a solution of MG ( $600 \mathrm{mg}, 1.51 \mathrm{mmol}$ ) in dry $\mathrm{MeCN}(12 \mathrm{~mL})$ were added dry ethylene glycol ( 12 mL ) and PIFA (649 $\mathrm{mg}, 1.51 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$ and the RM was stirred for 1 h at $0^{\circ} \mathrm{C}$ under argon atmosphere. After adding chilled saturated aqueous $\mathrm{NaHCO}_{3}$ solution $(120 \mathrm{~mL})$, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 40 \mathrm{~mL})$. The combined extract was washed with brine, dried over $\mathrm{MgSO}_{4}$, and evaporated. The product was purified by column chromatography using 1:9 to $2: 8 \mathrm{EtOAc}: \mathrm{Hex}+2 \% \mathrm{Et}_{3} \mathrm{~N}$ gradient. Product 4 was obtained as a light green solid ( $485 \mathrm{mg}, 70 \%$ ) (The green color is due to the residual chlorophyll in the batch of MG extracted from the plant material).

MG-EG crystals were grown by dissolving 4 in hot MeOH and allowing it to slowly cool to room temperature. After the solution was cooled down sufficiently (in less than 1 hour), 4 formed crystals
suitable for an X-ray crystallography. The absolute stereochemistry was assigned based on literature. ${ }^{6,7}$ Xray crystal structure for $\mathbf{4}$ is deposited in the Cambridge Crystallographic Data Centre CCDC 1905559.

Supplementary Figure 6. ORTEP representation of the X-ray crystal structure of MG-EG (4)
${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41(\mathrm{~s}, 1 \mathrm{H}), 7.07(\mathrm{dd}, J=8.3,7.7 \mathrm{~Hz}, 1 \mathrm{H}), 6.43-6.26(\mathrm{~m}, 2 \mathrm{H}), 4.25(\mathrm{~s}$, $1 \mathrm{H}), 3.92(\mathrm{td}, J=11.6,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.86-3.81(\mathrm{~m}, 4 \mathrm{H}$, signal overlap), $3.78(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.67$ $(\mathrm{dd}, J=11.3,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.46-3.38(\mathrm{~m}, 1 \mathrm{H}), 2.98(\mathrm{dd}, J=11.6,2.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{dt}, J=13.0,3.6 \mathrm{~Hz}$, $1 \mathrm{H}), 2.53-2.42(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.30(\mathrm{~m}, 2 \mathrm{H}), 2.28-2.23(\mathrm{~m}, 1 \mathrm{H}), 2.15(\mathrm{dt}, J=14.4,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.87-$ $1.69(\mathrm{~m}, 3 \mathrm{H}), 1.56(\mathrm{~d}, J=11.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.24-1.21(\mathrm{~m}, 1 \mathrm{H}), 0.84(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 169.2,160.6,157.1,149.1,130.0,115.9,111.9,105.4,102.9,90.9,81.5,62.5,61.8,61.4,61.0$, $58.7,55.5,51.4,50.4,40.6,40.3,35.6,24.3,19.3,13.2$. ## Ligand Screening:

General procedure: Compound $4(30 \mathrm{mg}, 65 \mu \mathrm{~mol}),[\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}(5 \mathrm{~mol} \%)$, ligand ( $15 \mathrm{~mol} \%$ ) and $\mathrm{B}_{2} \mathrm{Pin}_{2}$ (4 equiv) were balanced into an oven dried vial. The vial was purged with argon, dry heptane ( 1 mL ) was added under argon, and the vial was sealed with a Teflon-lined screw cap and heated to $65^{\circ} \mathrm{C}$. The reaction was heated for $15-24 \mathrm{~h}$ and then was concentrated in vacuo. To the resulting dark residue of intermediate was added $\mathrm{CuBr}_{2}$ (4 equiv) and a mixture of $\mathrm{MeOH}(2.4 \mathrm{~mL})+\mathrm{H}_{2} \mathrm{O}(0.6 \mathrm{~mL})(4: 1)$. The vial was sealed, and the RM was then heated to $80^{\circ} \mathrm{C}$ with vigorous stirring. After 12 h , brine ( 10 ml ) was added and the mixture was extracted with DCM $(3 \times 5 \mathrm{~mL})$. The combined DCM extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The product was purified by PTLC using EtOAc:Hex $1: 4+2 \% \mathrm{Et}_{3} \mathrm{~N}$ (the plate
was developed twice to improve resolution). After PTLC, the product was obtained as an inseparable mixture of $\mathbf{5}$ and $\mathbf{6}$ and the ratio was analyzed by ${ }^{1} \mathrm{H}-\mathrm{NMR}$ (see Supplementary Table 2)

Supplementary Table 2. Ligand screening of MG-EG (4) borylation/bromination for product distribution
Entry

C-H borylation reaction (selectivity C11:C12 = 1.3-1.1:1) of 4 and subsequent bromination [Entry 3, Supporting Table 2]

Starting material 4 ( $25 \mathrm{mg}, 55 \mu \mathrm{~mol}$ ), [ $\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}(1.8 \mathrm{mg}, 2.7 \mu \mathrm{~mol})$, dtbpy ( $2.2 \mathrm{mg}, 8.1 \mu \mathrm{~mol}$ ) and $\mathrm{B}_{2} \mathrm{Pin}_{2}(55 \mathrm{mg}, 0.22 \mathrm{mmol})$ were balanced into an oven dried vial. The vial was purged with argon, dry heptane ( 1 mL ) was added under argon, and the vial was sealed with a Teflon lined screw cap and heated to $65^{\circ} \mathrm{C}$. The RM became a dark brown solution after $5-15$ minutes of heating. After $15-24 \mathrm{~h}$, when LRMS indicated complete consumption of SM, the RM was concentrated to dryness. This intermediate was immediately used for further transformation.

To the dark residue of borylated intermediate was added $\mathrm{CuBr}_{2}(37 \mathrm{mg}, 0.17 \mathrm{mmol})$ and a mixture of MeOH $+\mathrm{H}_{2} \mathrm{O}(2+0.5 \mathrm{~mL})$. The vial was sealed, and the RM was then heated to $80^{\circ} \mathrm{C}$ with vigorous stirring
(slower stirring will cause incomplete conversion due to a precipitation of reactants during the reaction). After 15 h , TLC (EtOAc:Hex $1: 1+2 \% \mathrm{Et}_{3} \mathrm{~N}$ ) and LR-MS indicated complete conversion of the intermediate. The RM was diluted with brine $(15 \mathrm{~mL})$ and extracted with $\mathrm{DCM}(3 \times 5 \mathrm{~mL})$. The combined DCM extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The product was purified by PTLC using EtOAc:Hex 1:4+2\% $\mathrm{Et}_{3} \mathrm{~N}$ (the plate was developed twice to improve resolution). Products 5 and 6 were obtained as a mixture ( $\mathrm{C} 11: \mathrm{C} 12-1.3-1.1: 1$ ) in the form of a pale-yellow solid (20-24 $\mathrm{mg}, 60-83 \%$ ).

## C-H borylation reaction (selectivity $\mathrm{C} 11: \mathrm{C} 12=16-20: 1$ ) of 4 and subsequent transformations

General procedure C: Compound $4(50 \mathrm{mg}, 0.11 \mathrm{mmol}),[\operatorname{Ir}(\mathrm{COD}) \mathrm{OMe}]_{2}(3.6 \mathrm{mg}, 5.5 \mu \mathrm{~mol})$, Me $\mathrm{e}_{4}$-phen $(3.9 \mathrm{mg}, 16 \mu \mathrm{~mol})$ and $\mathrm{B}_{2} \operatorname{Pin}_{2}(111 \mathrm{mg}, 0.44 \mathrm{mmol})$ were balanced into an oven dried vial. The vial was purged with argon, dry heptane $(2.5 \mathrm{~mL})$ was added under argon, and the vial was sealed with a Teflonlined screw cap and heated to $65^{\circ} \mathrm{C}$. The RM became a dark red-brown solution after $5-15$ minutes of heating. After 17-24 h, when LR-MS indicated complete consumption of SM, the RM was concentrated to give the crude boronate ester. This intermediate was immediately used to prepare the $-\mathrm{Cl}(\mathbf{1 3}),-\mathrm{Br}(\mathbf{5})$, and - OH (14) derivatives without further purification.

Up to 100 mg of $\mathbf{4}$ can be used in one reaction vial ( 8 mL volume) to prepare the boronate ester intermediate using only 1.5 mL of dry heptane. It is however necessary to divide the crude intermediate into multiple reaction vessels for the subsequent reaction (the reactions are very sensitive to the ratio of $\mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}$ and total reaction volume). The intermediate boronate ester is air and moisture sensitive and unstable during a silica gel column purification. Other solvents than those used for further reactions (mainly chlorinated, e.g. DCM and $\mathrm{CHCl}_{3}$ ) can lead to a significant protodeborylation. Compounds prepared from the boronate ester intermediate are sometimes contaminated with decomposition products from excess of $\mathrm{B}_{2} \mathrm{Pin}$ (like pinacol). These can be removed either by repeated chromatography purification (preferably PTLC) or after further reaction steps.

Compound 5 (11-Br-MG-EG). The boronate ester intermediate was prepared from 4 ( $50 \mathrm{mg}, 0.11 \mathrm{mmol}$ ) as described in the general procedure C . To the dark residue of borylated intermediate was added $\mathrm{CuBr}_{2}$ ( 73 $\mathrm{mg}, 0.33 \mathrm{mmol})$ and a mixture of $\mathrm{MeOH}+\mathrm{H}_{2} \mathrm{O}(4+1 \mathrm{~mL})$. The vial was sealed and the RM was then heated to $80^{\circ} \mathrm{C}$ with vigorous stirring (slower stirring will cause incomplete conversion due to precipitation of reactants during the reaction). After 15 h , TLC (EtOAc:Hex 1:1 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ ) and LR-MS indicated complete conversion of the intermediate. The RM was diluted with brine ( 15 mL ), extracted with DCM (3
$\times 10 \mathrm{~mL}$ ), and the combined DCM extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The product was purified by PTLC using EtOAc:Hex 1:4 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ (the plate was developed twice to improve resolution). Product 5 (along with 3-5\% of inseparable C12 isomer) was obtained as a pale-yellow solid ( $35 \mathrm{mg}, 60 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.40(\mathrm{~s}, 1 \mathrm{H}), 6.54(\mathrm{~s}, 2 \mathrm{H}), 4.29(\mathrm{~s}, 1 \mathrm{H}), 3.91(\mathrm{td}, J=11.6,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.82$ (s, 3H), $3.82-3.74(\mathrm{~m}, 4 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.66(\mathrm{dd}, J=11.6,2.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.41(\mathrm{dd}, J=11.6,2.5 \mathrm{~Hz}, 1 \mathrm{H})$, $2.98(\mathrm{dd}, J=11.5,2.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.91(\mathrm{dt}, J=13.0,3.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.49-2.40(\mathrm{~m}, 2 \mathrm{H}), 2.38-2.29(\mathrm{~m}, 2 \mathrm{H})$, $2.29-2.22(\mathrm{~m}, 1 \mathrm{H}), 2.13(\mathrm{dd}, J=14.4,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.83-1.69(\mathrm{~m}, 3 \mathrm{H}), 1.56(\mathrm{~d}, J=15.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.24-$ $1.21(\mathrm{~m}, 1 \mathrm{H}), 0.84(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.2,160.5,157.3,150.0,122.8$, $115.0,111.7,108.7,106.7,91.0,81.1,62.5,61.8,61.3,60.9,58.6,55.7,51.4,50.2,40.6,40.2,35.4,24.2$, 19.3, 13.2. HRMS (ESI+) calcd. for $\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{BrN}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 539.1584$, found 539.1592

Compound 14a (11-OTf-MG-EG). To a solution of $\mathbf{1 4}(115 \mathrm{mg}, 0.24 \mathrm{mmol})$ in dry DMF ( 3 mL ) at RT was added DIPEA ( $2 \mathrm{~mL}, 1.2 \mathrm{mmol}$ ) and $N$-phenyl-bis(trifluoromethanesulfonimide) ( $173 \mathrm{mg}, 0.48 \mathrm{mmol}$ ). After the RM was stirred at $50^{\circ} \mathrm{C}$ overnight, it was quenched by the addition of saturated aqueous $\mathrm{NaHCO}_{3}$ and extracted with DCM $(3 \times 15 \mathrm{~mL})$. The combined organic phases were washed with brine, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The product was purified by column chromatography using EtOAc:Hex 3:7+2\% $\mathrm{Et}_{3} \mathrm{~N}$. Product $\mathbf{1 4 a}$ was obtained as a yellow powder ( $101 \mathrm{mg}, 70 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.41(\mathrm{~s}, 1 \mathrm{H}), 6.28(\mathrm{~d}, J=3.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.46(\mathrm{~s}, 1 \mathrm{H}), 3.92(\mathrm{td}, J=11.7,3.1$ $\mathrm{Hz}, 1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 3.82-3.74(\mathrm{~m}, 4 \mathrm{H}), 3.73-3.65(\mathrm{~m}, 4 \mathrm{H}), 3.43(\mathrm{dd}, J=11.7,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.99$ (dd, $J=11.5,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{dt}, J=13.1,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.51-2.40(\mathrm{~m}, 2 \mathrm{H}), 2.38-2.22(\mathrm{~m}, 3 \mathrm{H}), 2.14$ (dt, $J$ $=14.4,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.81-1.74(\mathrm{~m}, 2 \mathrm{H}), 1.74-1.64(\mathrm{~m}, 1 \mathrm{H}), 1.57(\mathrm{~d}, J=11.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.22-1.15(\mathrm{~m}$, $1 \mathrm{H}), 0.85(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{19} \mathrm{~F}$ NMR ( $471 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta-72.03 .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.2$, $160.6,157.3,150.8,149.9,122.8,120.1,117.5,115.8,115.0,111.6,98.6,96.8,91.1,81.0,62.6,61.8,61.3$, 60.8, 58.6, 55.9, 51.4, 50.2, 40.5, 40.1, 35.4, 24.3, 19.3, 13.2. LR-MS (APCI+) calcd. for $\mathrm{C}_{26} \mathrm{H}_{34} \mathrm{~F}_{3} \mathrm{~N}_{2} \mathrm{O}_{9} \mathrm{~S}^{+}$ $[\mathrm{M}+\mathrm{H}]^{+}: 607.2$, found 607.9.

## Compound 14b (11-Bu3Sn-MG-EG)

## Synthesis from Bromide 5

To a solution of $5(75 \mathrm{mg}, 0.14 \mathrm{mmol})$ in dry dioxane $(0.7 \mathrm{~mL})$ at RT was added lithium chloride ( 30 mg , $0.70 \mathrm{mmol}), \mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(24.3 \mathrm{mg}, 0.021 \mathrm{mmol}, 10 \mathrm{~mol} \%)$ and bis(tributyltin) ( $350 \mu \mathrm{~L}, 0.70 \mathrm{mmol}$ ). After stirring for 24 h at $100^{\circ} \mathrm{C}$, the RM was cooled to RT and concentrated in vacuo. The residue was dissolved in hexanes and then filtered through a pad of celite. After washing the filter cake several times with hexanes, the combined washings were evaporated. The product was purified by column chromatography using Hex $+5 \% \mathrm{Et}_{3} \mathrm{~N}$. The intermediate $\mathbf{1 4 b}$ was obtained as a yellow liquid ( $63 \mathrm{mg}, 60 \%$ ).

Synthesis from Triflate 14a: To a solution of $\mathbf{1 4 a}(85 \mathrm{mg}, 0.14 \mathrm{mmol})$ in dry dioxane $(0.7 \mathrm{~mL})$ at RT was added lithium chloride ( $30 \mathrm{mg}, 0.70 \mathrm{mmol}$ ), $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(24.3 \mathrm{mg}, 0.021 \mathrm{mmol}, 10 \mathrm{~mol} \%)$ and bis(tributyltin) $(350 \mu \mathrm{~L}, 0.70 \mathrm{mmol})$. After stirring for 24 h at $100^{\circ} \mathrm{C}$, the reaction mixture was cooled to RT and concentrated in vacuo. The residue was dissolved in hexanes and then filtered through a pad of celite. After washing the filter cake several times with hexanes, the combined washings were evaporated. The product was purified by column chromatography using $\mathrm{Hex}+5 \% \mathrm{Et}_{3} \mathrm{~N}$. The arylstannane intermediate $\mathbf{1 4 b}$ was obtained as a yellow liquid ( $74 \mathrm{mg}, 70 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.44(\mathrm{~s}, 1 \mathrm{H}), 6.80-5.74(\mathrm{~m}, 2 \mathrm{H}), 4.23(\mathrm{~s}, 1 \mathrm{H}), 3.95(\mathrm{td}, J=11.6,2.5 \mathrm{~Hz}$, $1 \mathrm{H}), 3.87(\mathrm{~s}, 4 \mathrm{H}), 3.81(\mathrm{~s}, 3 \mathrm{H}), 3.72(\mathrm{~s}, 3 \mathrm{H}), 3.69(\mathrm{dd}, J=11.4,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.45(\mathrm{dd}, J=11.4,2.3 \mathrm{~Hz}$, $1 \mathrm{H}), 3.01(\mathrm{dd}, J=11.6,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.94(\mathrm{dt}, J=13.1,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.54-2.44(\mathrm{~m}, 2 \mathrm{H}), 2.43-2.33(\mathrm{~m}$, $2 \mathrm{H}), 2.28(\mathrm{dd}, J=11.3,3.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.16(\mathrm{dt}, J=14.4,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.91-1.74(\mathrm{~m}, 3 \mathrm{H}), 1.61-1.48(\mathrm{~m}$, $6 \mathrm{H}), 1.35(\mathrm{~h}, J=7.3 \mathrm{~Hz}, 6 \mathrm{H}), 1.25-1.19(\mathrm{~m}, 1 \mathrm{H}), 1.14-0.99(\mathrm{~m}, 7 \mathrm{H}), 0.92(\mathrm{t}, J=7.3 \mathrm{~Hz}, 9 \mathrm{H}), 0.86(\mathrm{t}, J$ $=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \mathrm{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 169.2,160.4,156.3,148.4,143.9,115.9,113.0,111.7,109.9$, $90.8,81.5,62.4,61.7,61.27,60.9,58.5,55.2,51.3,50.3,40.5,40.2,35.5,29.1,27.4,24.2,19.2,13.7,13.1$, 9.7. LR-MS (APCI+) calcd. for $\mathrm{C}_{37} \mathrm{H}_{61} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{Sn}^{+}[\mathrm{M}+\mathrm{H}]^{+}: 749.4$, found 749.6.

Compound 7 (11-F-MG-EG). To a solution of $\mathbf{1 4 b}(81 \mathrm{mg}, 0.11 \mathrm{mmol})$ in dry acetone $(2.0 \mathrm{~mL})$ at RT was added silver triflate $(56 \mathrm{mg}, 0.22 \mathrm{mmol})$ and freshly prepared 1-chloromethyl-4-fluoro-1,4diazoniabicyclo[2.2.2] octane bis(hexafluorophosphate ${ }^{8}(54 \mathrm{mg}, 0.165 \mathrm{mmol})$. The RM was stirred for 20 min at RT and then concentrated in vacuo. Residue was dissolved in DCM and a few drops of 1 N HCl solution was added to the solution mixture and then extracted with DCM , dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and the purified by PTLC. MG-EG ( $\sim 20-25 \%$ formed by destannylation) is usually formed along with the desired
product, which can be purified by PTLC using EtOAc: $\operatorname{Hex} 1: 4+2 \% \mathrm{Et}_{3} \mathrm{~N}$ by developing the plate multiple times. Product 7 was obtained as a white solid ( $31 \mathrm{mg}, 60 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.40(\mathrm{~s}, 1 \mathrm{H}), 6.39-5.84(\mathrm{~m}, 2 \mathrm{H}), 4.31(\mathrm{~s}, 1 \mathrm{H}), 3.91(\mathrm{td}, J=11.7,2.7 \mathrm{~Hz}$, $1 \mathrm{H}), 3.84-3.75(\mathrm{~m}, 7 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.66(\mathrm{dd}, J=11.5,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.42(\mathrm{dd}, J=11.6,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.02$ $-2.93(\mathrm{~m}, 1 \mathrm{H}), 2.91(\mathrm{dt}, J=13.0,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.44(\mathrm{~d}, J=11.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.40-2.19(\mathrm{~m}, 3 \mathrm{H}), 2.19-2.05$ $(\mathrm{m}, 1 \mathrm{H}), 1.90-1.64(\mathrm{~m}, 3 \mathrm{H}), 1.58(\mathrm{~s}, 1 \mathrm{H}), 1.26(\mathrm{~s}, 1 \mathrm{H}), 0.84(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (fluorine decoupled) (126 MHz, $\mathrm{CDCl}_{3}$ ) $\delta 169.2,164.8,160.6,157.6,149.8,111.8,111.3,93.0,91.2,91.2,80.9$, $62.4,61.8,61.4,60.9,58.7,55.7,51.4,50.4,40.6,40.2,35.7,24.3,19.3,13.2 .{ }^{19} \mathrm{~F}$ (proton decoupled) NMR (376 MHz, $\mathrm{CDCl}_{3}$ ) $\delta-110.19$. HRMS (ESI+) calcd. for $\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{FN}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 477.2401$, found 477.2405 .

Compound 8 (11-I-MG-EG). Compound $5(20.0 \mathrm{mg}, 37.2 \mu \mathrm{~mol})$, dried $\mathrm{NaI}(15.6 \mathrm{mg}, 0.1 \mathrm{mmol})$, $\mathrm{CuI}(0.5$ $\mathrm{mg}, 2.6 \mu \mathrm{~mol})$ and $N, N^{\prime}$-dimethylethylenediamine ( $2.3 \mathrm{mg}, 26 \mu \mathrm{~mol}$ ) were balanced into an oven-dried vial. The vial was purged with argon and dry 1,4-dioxane $(0.25 \mathrm{~mL})$ was added under a stream of argon. The RM was heated to $110^{\circ} \mathrm{C}$ for 24 h . LR-MS indicated formation of product but with a low conversion (TLC is not indicative enough due to a low difference in Rf value of starting compound and product). The RM was evaporated and dried under high vacuum. More $\mathrm{NaI}(63.7 \mathrm{mg}, 0.42 \mathrm{mmol}), \mathrm{CuI}(3 \mathrm{mg}, 16 \mu \mathrm{~mol})$ and $N, N N^{\prime}$-dimethylethylenediamine ( $9.4 \mathrm{mg}, 11 \mu \mathrm{~mol}$ ) were added followed by dry 1 , 4 -dioxane ( 0.3 mL ) under Ar. The RM was heated for 22 h , after which LR-MS indicated nearly total conversion. The RM was diluted with DCM $(10 \mathrm{~mL})$ and washed $3 \times$ with diluted aq. $\mathrm{NH}_{3}\left(\mathrm{H}_{2} \mathrm{O}: 28 \%\right.$ aq. $\left.\mathrm{NH}_{3} 10: 0.1 \mathrm{~mL}\right)$, DCM was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The crude product was filtered through silica gel in EtOAc:Hex $1: 1+2 \%$ $\mathrm{Et}_{3} \mathrm{~N}$ and further purified by PTLC (EtOAc:Hex $1: 4+2 \% \mathrm{Et}_{3} \mathrm{~N}, 2 \times$ developed). Product $\mathbf{8}$ was obtained as a yellow solid ( $13 \mathrm{mg}, 59 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.40(\mathrm{~s}, 1 \mathrm{H}), 6.72(\mathrm{~d}, J=10.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.28(\mathrm{~s}, 1 \mathrm{H}), 3.91(\mathrm{td}, J=11.8,2.9$ $\mathrm{Hz}, 1 \mathrm{H}), 3.85-3.80(\mathrm{~m}, 3 \mathrm{H}), 3.80-3.74(\mathrm{~m}, 4 \mathrm{H}), 3.72-3.63(\mathrm{~m}, 4 \mathrm{H}), 3.47-3.37(\mathrm{~m}, 1 \mathrm{H}), 3.03-2.94$ $(\mathrm{m}, 1 \mathrm{H}), 2.90(\mathrm{dt}, J=13.2,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.51-2.39(\mathrm{~m}, 2 \mathrm{H}), 2.38-2.29(\mathrm{~m}, 2 \mathrm{H}), 2.28-2.21(\mathrm{~m}, 1 \mathrm{H})$, $2.11(\mathrm{dt}, J=14.5,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 1.84-1.66(\mathrm{~m}, 3 \mathrm{H}), 1.55(\mathrm{~d}, J=11.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.24-1.16(\mathrm{~m}, 1 \mathrm{H}), 0.84(\mathrm{t}$, $J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 169.2,160.6,157.4,150.2,116.0,114.7,112.7,111.7$, $94.0,90.9,81.3,62.5,61.8,61.3,60.8,58.6,55.8,51.4,50.2,40.6,40.2,35.4,24.3,19.3,13.2$. LR-MS (APCI+) calcd. for $\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{IN}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 585.1$, found 585.2.

Compound 9 (11-CH3-MG-EG). Compound 5 ( $30 \mathrm{mg}, 56 \mu \mathrm{~mol}$ ), $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(6 \mathrm{mg}, 6.7 \mu \mathrm{~mol})$, Xphos (4.4 $\mathrm{mg}, 9.2 \mu \mathrm{~mol}$ ), and bis(trimethylaluminum)-1,4-diazabicyclo[2.2.2]octane adduct (DABAL-Me $3,57 \mathrm{mg}$, $0.22 \mathrm{mmol})$ were balanced into an oven dried vial. The vial was purged with argon, dry THF ( 1.5 mL ) was added under argon, and the vial was sealed with a Teflon-lined screw cap and heated to $60^{\circ} \mathrm{C}$. After stirring for 2 h , complete conversion was observed by TLC-MS. The reaction mixture was cooled to RT and concentrated in vacuo. The product was purified by column chromatography using EtOAc:Hex $1: 4+2 \%$ $E t_{3} \mathrm{~N}$. Product 9 was obtained as a yellow solid ( $16 \mathrm{mg}, 60 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41(\mathrm{~s}, 1 \mathrm{H}), 6.21(\mathrm{~d}, J=0.8 \mathrm{~Hz}, 2 \mathrm{H}), 4.17(\mathrm{~s}, 1 \mathrm{H}), 3.91(\mathrm{td}, J=11.6,2.6$ $\mathrm{Hz}, 1 \mathrm{H}), 3.86-3.82(\mathrm{~m}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 3 \mathrm{H}), 3.78(\mathrm{~s}, 3 \mathrm{H}), 3.69(\mathrm{~s}, 3 \mathrm{H}), 3.65(\mathrm{dd}, J=11.4,2.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.47$ $-3.33(\mathrm{~m}, 1 \mathrm{H}), 2.98(\mathrm{dd}, J=11.5,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.91(\mathrm{dt}, J=13.1,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.45(\mathrm{tt}, J=9.4,2.9 \mathrm{~Hz}$, $2 \mathrm{H}), 2.40-2.28(\mathrm{~m}, 2 \mathrm{H}), 2.27(\mathrm{~s}, 3 \mathrm{H}), 2.24-2.19(\mathrm{~m}, 1 \mathrm{H}), 2.13(\mathrm{dt}, J=14.9,2.8 \mathrm{~Hz}, 1 \mathrm{H}), 1.85-1.71(\mathrm{~m}$, $3 \mathrm{H}), 1.55(\mathrm{~d}, J=11.3 \mathrm{~Hz}, 1 \mathrm{H}), 1.25-1.16(\mathrm{~m}, 1 \mathrm{H}), 0.83(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.2,160.4,156.7,149.1,140.3,113.0,111.7,106.0,103.8,90.9,81.2,62.3,61.6,61.3,60.9,58.5,55.2$, 51.3, 50.3, 40.5, 40.1, 35.6, 24.2, 22.1, 19.2, 13.1. LR-MS (APCI+) calcd. for $\mathrm{C}_{26} \mathrm{H}_{37} \mathrm{~N}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 473.3$, found 473.8 .

Compound 10 (11-Ph-MG-EG). Compound $5(20 \mathrm{mg}, 37 \mu \mathrm{~mol})$, phenylboronic acid ( $9.8 \mathrm{mg}, 80 \mu \mathrm{~mol}$ ), $\mathrm{CsOAc}(16.1 \mathrm{mg}, 84 \mu \mathrm{~mol}$, thoroughly dried under high vacuum while heating until melted) and $\operatorname{Pd}(\mathrm{dppf}) \mathrm{Cl}_{2} \cdot \mathrm{CH}_{2} \mathrm{Cl}_{2}(2.0 \mathrm{mg}, 2.4 \mu \mathrm{~mol})$ were balanced into an oven-dried vial. The vial was purged with argon, dry THF $(0.3 \mathrm{~mL})$ was added under a stream of argon, and the vial was closed with a Teflon-lined solid screw cap and heated to $70^{\circ} \mathrm{C}$. After 7 h , LR-MS and TLC indicated full consumption of starting material. The RM was diluted with brine $(5 \mathrm{~mL})$ and extracted with DCM $(3 \times 5 \mathrm{~mL})$. The combined DCM extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, evaporated, and the crude residue was purified by PTLC (EtOAc:Hex 1:4 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ and $\mathrm{Et}_{2} \mathrm{O}+1 \% \mathrm{Et}_{3} \mathrm{~N}$ ). Product 10 was obtained as a pale-yellow solid ( $16 \mathrm{mg}, 81 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.57-7.50(\mathrm{~m}, 2 \mathrm{H}), 7.44-7.37(\mathrm{~m}, 3 \mathrm{H}), 7.35-7.29(\mathrm{~m}, 1 \mathrm{H}), 6.62-6.56$ $(\mathrm{m}, 2 \mathrm{H}), 4.33(\mathrm{~s}, 1 \mathrm{H}), 3.98-3.81(\mathrm{~m}, 5 \mathrm{H}), 3.79(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 4 \mathrm{H}), 3.49-3.42(\mathrm{~m}, 1 \mathrm{H}), 3.00(\mathrm{dd}, J=$ $11.5,2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.93(\mathrm{dt}, J=13.0,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.56-2.43(\mathrm{~m}, 2 \mathrm{H}), 2.43-2.32(\mathrm{~m}, 2 \mathrm{H}), 2.32-2.23(\mathrm{~m}$, $1 \mathrm{H}), 2.19(\mathrm{dt}, J=14.3,2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.92-1.69(\mathrm{~m}, 3 \mathrm{H}), 1.58(\mathrm{~d}, J=11.1 \mathrm{~Hz}, 1 \mathrm{H}), 1.28-1.21(\mathrm{~m}, 1 \mathrm{H})$,
$0.85(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.3,160.6,157.1,149.5,143.9,142.0,128.7$, $127.3,115.1,111.8,104.5,102.6,91.1,81.4,62.6,61.8,61.4,61.0,58.6,55.5,51.4,50.4,40.6,40.3,35.7$, 24.3, 19.3, 13.2. Overlap between carbon signals for phenyl CH and acrylic CH. LR-MS (APCI+) calcd. for $\mathrm{C}_{31} \mathrm{H}_{39} \mathrm{~N}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 535.3$, found 536.0.

## Compound 11 (11-CONH2-MG-EG)

Synthesis from Bromide 5. Compound $5(20.0 \mathrm{mg}, 37 \mu \mathrm{~mol}), \mathrm{Pd}(\mathrm{OAc})_{2}(0.5 \mathrm{mg}, 2.2 \mu \mathrm{~mol})$, dppf ( 2.6 mg , $4.7 \mu \mathrm{~mol})$, imidazole ( $2.6 \mathrm{mg}, 38 \mu \mathrm{~mol}$ ), $\mathrm{Co}_{2}(\mathrm{CO})_{8}(7.6 \mathrm{mg}, 22 \mu \mathrm{~mol})$ and $\mathrm{NH}_{4} \mathrm{Cl}(8.0 \mathrm{mg}, 0.15 \mathrm{mmol})$ were balanced into an oven-dried vial. The vial was purged with argon and dry 1,4-dioxane ( 0.8 mL ) was added followed by DIPEA ( $26 \mu \mathrm{~L}, 0.15 \mathrm{mmol}$ ) under a stream of argon. The vial was sealed with a Teflon-lined screw cap and the RM was heated to $90^{\circ} \mathrm{C}$. After 15 h , TLC (EtOAc:Hex $1: 1+2 \% \mathrm{Et}_{3} \mathrm{~N}$ ) indicated only partial conversion, so additional $\mathrm{Co}_{2}(\mathrm{CO})_{8}(8.0 \mathrm{mg}, 23 \mu \mathrm{~mol}), \mathrm{NH}_{4} \mathrm{Cl}(8.0 \mathrm{mg}, 0.15 \mathrm{mmol})$ and DIPEA ( 26 $\mu \mathrm{L}, 0.15 \mathrm{mmol}$ ) were added. Heating was continued for another 24 h (no further conversion was observed). The RM was diluted with MeOH and adsorbed on celite. The compound was purified by column chromatography with a gradient of EtOAc:Hex $1: 1+2 \% \mathrm{Et}_{3} \mathrm{~N}$ with 5 to $10 \% \mathrm{MeOH}$. The product was further purified on PTLC in acetone:Hex $1: 1+2 \% \mathrm{Et}_{3} \mathrm{~N}$ and coeluting $\mathrm{Et}_{3} \mathrm{~N}$ salts were removed by washing of its $\mathrm{CHCl}_{3}$ solution with $2 \mathrm{M} \mathrm{Na}_{2} \mathrm{CO}_{3}$. Product 11 was obtained as a pale-yellow solid ( $6.5 \mathrm{mg}, 35 \%$ ).

Synthesis from Triflate 14a. Compound 14a ( $25 \mathrm{mg}, 41 \mu \mathrm{~mol}$ ), $\operatorname{Pd}(\mathrm{OAc})_{2}(0.8 \mathrm{mg}, 3.6 \mu \mathrm{~mol})$, dppf ( 2.7 $\mathrm{mg}, 4.9 \mu \mathrm{~mol})$, imidazole ( $0.9 \mathrm{mg}, 13 \mu \mathrm{~mol}), \mathrm{Co}_{2}(\mathrm{CO})_{8}(9.7 \mathrm{mg}, 28 \mu \mathrm{~mol})$ and $\mathrm{NH}_{4} \mathrm{Cl}(9.3 \mathrm{mg}, 0.17 \mathrm{mmol})$ were balanced into an oven-dried vial. The vial was purged with argon and dry 1,4-dioxane ( 0.9 mL ) was added followed by DIPEA ( $30 \mu \mathrm{~L}, 0.17 \mathrm{mmol}$ ) under a stream of argon. The vial was sealed with a Teflonlined screw cap and the RM was heated to $90^{\circ} \mathrm{C}$. After 21.5 h , TLC (EtOAc:Hex 1:1+2\% $\mathrm{Et}_{3} \mathrm{~N}$ ) indicated full conversion, so the RM was diluted with MeOH and adsorbed on celite. The product was partially separated by column chromatography in $\mathrm{EtOAc}+2 \% \mathrm{Et}_{3} \mathrm{~N}$ to acetone $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ (compound spread and did not separate very well). Product was further purified on PTLC in EtOAc:acetone 2:1 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ (developed $2 \times$ to improve resolution). Finally, the compound was eluted from $\mathrm{SiO}_{2}$ with acetone ( $\mathrm{no}_{\mathrm{Et}}^{3} \mathrm{~N}$ ) to remove $\mathrm{Et}_{3} \mathrm{~N}$ salts. Product $\mathbf{1 1}$ was obtained as a pale-yellow solid ( $11.7 \mathrm{mg}, 57 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.39(\mathrm{~s}, 1 \mathrm{H}), 6.93(\mathrm{~s}, 1 \mathrm{H}), 6.65(\mathrm{~s}, 1 \mathrm{H}), 5.97(\mathrm{~s}, 1 \mathrm{H}), 5.73(\mathrm{~s}, 1 \mathrm{H}), 4.44(\mathrm{~s}$, $1 \mathrm{H}), 3.98$ - 3.84 (m, 4H), 3.79 (s, 4H), 3.70 ( $\mathrm{s}, 4 \mathrm{H}$ ), 3.43 (dd, J = 11.8, $2.5 \mathrm{~Hz}, 1 \mathrm{H}$ ), $3.05-2.95$ (m, 1H), $2.91(\mathrm{dt}, \mathrm{J}=13.1,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.47(\mathrm{t}, \mathrm{J}=9.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.35(\mathrm{td}, \mathrm{J}=12.0,5.3 \mathrm{~Hz}, 2 \mathrm{H}), 2.26(\mathrm{dd}, \mathrm{J}=11.9$, 3.3 Hz, 1H), 2.21 - 2.11 (m, 1H), $1.87-1.64$ (m, 3H), 1.56 (d, J = $11.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.26-1.18$ (m, 1H), 0.84
$(\mathrm{t}, \mathrm{J}=7.3 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 169.7,169.2,160.6,157.2,149.3,135.7,120.1,111.8$, 103.7, 103.3, $91.2,81.3,62.7,61.8,61.4,60.8,58.6,55.8,51.4,50.2,40.6,40.2,35.3,24.3,19.3,13.2$ LRMS (APCI+) calcd. for $\mathrm{C}_{26} \mathrm{H}_{36} \mathrm{~N}_{3} \mathrm{O}_{7}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 502.3$, found 502.6.

Compound 12 (11-CN-MG-EG). Compound 5 ( $30 \mathrm{mg}, 0.05 \mathrm{mmol}$ ), $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(30.5 \mathrm{mg}, 0.033 \mathrm{mmol}), \mathrm{Zn}$ dust ( $5.4 \mathrm{mg}, 0.08 \mathrm{mmol}), \mathrm{Zn}(\mathrm{CN})_{2}(11.5 \mathrm{mg}, 0.09 \mathrm{mmol})$ and $\left[\mathrm{HP}\left({ }^{( } \mathrm{Bu}\right)_{3}\right] \mathrm{BF}_{4}(19.1 \mathrm{mg}, 0.06 \mathrm{mmol})$ were balanced into an oven-dried vial. The vial was purged with argon, dry DMF ( 1.6 mL ) was added under a stream of argon, and the vial was closed with a Teflon-lined solid screw cap and reacted at RT for 1 h . After 1 h , LR-MS and TLC indicated full consumption of starting material. The RM was diluted with brine ( 5 mL ) and extracted with EtOAc ( $3 \times 5 \mathrm{~mL}$ ). The combined EtOAc extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, evaporated, and the crude residue was purified by PTLC (EtOAc:Hex 1:4 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$ and $\mathrm{Et}_{2} \mathrm{O}+1 \% \mathrm{Et}_{3} \mathrm{~N}$ ). The product could not be purified as the free base and so was converted to its HCl salt. After the HCl salt was formed it was washed with hexane for several times to purify it. Product $\mathbf{1 2}$ was then obtained as the HCl salt as a pale-yellow solid ( $14 \mathrm{mg}, 60 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) ( HCl salt of 12 ) $\delta 7.63(\mathrm{~s}, 1 \mathrm{H}), 6.92(\mathrm{~d}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H}), 6.79(\mathrm{~d}, J=1.1 \mathrm{~Hz}$, $1 \mathrm{H}), 3.98-3.94(\mathrm{~m}, 1 \mathrm{H}), 3.92(\mathrm{~s}, 3 \mathrm{H}), 3.90(\mathrm{~s}, 3 \mathrm{H}), 3.79-3.76(\mathrm{~m}, 2 \mathrm{H}), 3.73(\mathrm{~s}, 3 \mathrm{H}), 3.64-3.49(\mathrm{~m}, 2 \mathrm{H})$, 3.46 - 3.37 (m, 2H), 3.37 (s, 1H), 3.31 - 3.20 (m, 2H), 2.65 (dt, $J=14.8,12.8 \mathrm{~Hz}, 1 \mathrm{H}$ ), 2.41 (dt, $J=15.4$, $2.5 \mathrm{~Hz}, 1 \mathrm{H}), 2.14(\mathrm{~d}, J=14.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.09-1.92(\mathrm{~m}, 2 \mathrm{H}), 1.69-1.45(\mathrm{~m}, 2 \mathrm{H}), 1.34(\mathrm{t}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H})$, $0.97(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $101 \mathrm{MHz}, \mathrm{CD}_{3} \mathrm{OD}$ ) $\delta 168.5,161.9,157.2,149.6,119.9,118.5,113.7$, 108.6, 108.5, 107.3, 88.8, 80.0, 62.4, 61.2, 60.6, 60.2, 56.1, 55.0, 50.5, 49.9, 39.1, 37.3, 32.2, 22.4, 17.7, 11.3. LR-MS (APCI+) calcd. for $\mathrm{C}_{26} \mathrm{H}_{34} \mathrm{~N}_{3} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 484.3$, found 484.6

Compound 13 (11-Cl-MG-EG). The boronate ester intermediate was prepared from 4 ( $50 \mathrm{mg}, 0.11 \mathrm{mmol}$ ) as described in the general procedure C . To the dark residue of intermediate was added $\mathrm{CuCl}_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}(53.0$ $\mathrm{mg}, 0.31 \mathrm{mmol})$ and a mixture of $\mathrm{MeOH}+\mathrm{H}_{2} \mathrm{O}(4+1 \mathrm{~mL})$. The vial was sealed, and the RM was then heated to $80^{\circ} \mathrm{C}$ with vigorous stirring (slower stirring will cause incomplete conversion due to precipitation during the reaction). After 17 h , TLC ( $\mathrm{EtOAc}: H e x ~ 1: 1+2 \% \mathrm{Et}_{3} \mathrm{~N}$ ) and LR-MS indicated complete conversion of the intermediate. The RM was diluted with brine ( 15 mL ) and extracted with DCM ( $3 \times 10$ $\mathrm{mL})$. The combined DCM extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated. The product was purified by

PTLC using EtOAc:Hex $1: 4+2 \% \mathrm{Et}_{3} \mathrm{~N}$ (the plate was developed twice to improve resolution). Product 13 was obtained as a white solid ( $32 \mathrm{mg}, 60 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.41(\mathrm{~s}, 1 \mathrm{H}), 6.38(\mathrm{~d}, J=2.7 \mathrm{~Hz}, 2 \mathrm{H}), 4.30(\mathrm{~s}, 1 \mathrm{H}), 3.91(\mathrm{dd}, J=13.0,10.4$ $\mathrm{Hz}, 1 \mathrm{H}), 3.82(\mathrm{~s}, 4 \mathrm{H}), 3.79(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.69-3.63(\mathrm{~m}, 1 \mathrm{H}), 3.49-3.36(\mathrm{~m}, 1 \mathrm{H}), 2.95(\mathrm{dd}, J=$ $27.1,12.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.54-2.38(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.22(\mathrm{~m}, 3 \mathrm{H}), 2.13(\mathrm{~d}, J=14.2 \mathrm{~Hz}, 1 \mathrm{H}), 1.86-1.72(\mathrm{~m}$, $3 \mathrm{H}), 1.61-1.52(\mathrm{~m}, 1 \mathrm{H}), 1.24-1.17(\mathrm{~m}, 1 \mathrm{H}), 0.85(\mathrm{t}, \mathrm{J}=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta$ $169.2,160.6,157.2,149.8,135.1,114.6,111.8,105.9,103.9,91.1,81.1,62.49,61.8,61.4,60.9,58.6,55.8$, $51.4,50.3,40.6,40.2,35.5,24.3,19.3,13.2 . \mathrm{HRMS}(\mathrm{ESI}+)$ calcd. for $\mathrm{C}_{25} \mathrm{H}_{34} \mathrm{ClN}_{2} \mathrm{O}_{6}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 493.2105$, found 493.2113 .

Compound 14 (11-OH-MG-EG). The boronate ester intermediate was prepared from 4 ( $50 \mathrm{mg}, 0.11 \mathrm{mmol}$ ) as described in the general procedure C . The dark residue was dissolved in THF ( 0.7 mL ) and $30 \% \mathrm{H}_{2} \mathrm{O}_{2}$ $(102 \mu \mathrm{~L}, 0.66 \mathrm{mmol})$ was added dropwise over $5-7 \mathrm{~min}$ at $0^{\circ} \mathrm{C}$. The reaction mixture was then stirred for 30 min at RT. The RM was then quenched with $5 \% \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3} \cdot 5 \mathrm{H}_{2} \mathrm{O}(1 \mathrm{ml})$ and extracted with $\mathrm{DCM}(3 \times 10$ $\mathrm{mL})$. The combined DCM extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, evaporated, and the product was purified by PTLC using EtOAc:Hex $1: 4+2 \% \mathrm{Et}_{3} \mathrm{~N}$ (the plate was developed twice to improve resolution). Product 14 was obtained as a pale-brown solid ( $26 \mathrm{mg}, 50 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.40(\mathrm{~s}, 1 \mathrm{H}), 5.96-5.83(\mathrm{~m}, 2 \mathrm{H}), 4.23(\mathrm{~s}, 1 \mathrm{H}), 3.94-3.83(\mathrm{~m}, 2 \mathrm{H}), 3.80(\mathrm{~s}$, $3 \mathrm{H}), 3.78(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.64(\mathrm{dd}, J=8.5,2.3 \mathrm{~Hz}, 1 \mathrm{H}), 3.43(\mathrm{~d}, J=9.4 \mathrm{~Hz}, 1 \mathrm{H}), 3.00(\mathrm{dd}, J=11.7$, $2.1 \mathrm{~Hz}, 1 \mathrm{H}), 2.92(\mathrm{dt}, J=12.9,3.6 \mathrm{~Hz}, 1 \mathrm{H}), 2.49-2.43(\mathrm{~m}, 2 \mathrm{H}), 2.39-2.19(\mathrm{~m}, 4 \mathrm{H}), 2.11(\mathrm{dt}, J=14.4$, $2.5 \mathrm{~Hz}, 1 \mathrm{H}), 1.85-1.70(\mathrm{~m}, 2 \mathrm{H}), 1.58(\mathrm{~d}, J=11.4 \mathrm{~Hz}, 1 \mathrm{H}), 1.31(\mathrm{~s}, 1 \mathrm{H}), 0.85(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(101 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 169.2,160.6,158.4,157.8,149.6,111.9,108.0,93.5,91.5,90.9,81.1,62.3,61.9$, $61.5,61.4,58.6,55.4,51.4,50.7,40.7,40.1,35.9,24.3,19.4,13.2$. HRMS (ESI+) calcd. for $\mathrm{C}_{25} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}_{7}{ }^{+}$ $[\mathrm{M}+\mathrm{H}]^{+}: 475.2444$, found 475.2437.

## Deprotection of MG-EG adduct derivatives

General procedure D: Reactions were performed according to a published procedure. ${ }^{2}$
Starting material (5, 7, or $\mathbf{1 3}, 0.11 \mathrm{mmol})$ was dissolved in $\mathrm{AcOH}(2.0 \mathrm{~mL})$ under argon and $\mathrm{NaBH}_{3} \mathrm{CN}$ $(13.7 \mathrm{mg}, 0.22 \mathrm{mmol})$ was added to the solution. After stirring at RT for 15 min , another portion of $\mathrm{NaBH}_{3} \mathrm{CN}(13.7 \mathrm{mg}, 0.22 \mathrm{mmol})$ was added and stirring continued for 1 h . After this time, $\mathrm{MeOH}(81 \mu \mathrm{~L})$ was added and the RM was heated to $90^{\circ} \mathrm{C}$ for 14 h . The RM was added into a cold concentrated $\mathrm{NH}_{4} \mathrm{OH}$
solution and extracted with DCM. After drying over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, the DCM extract was evaporated. Product was purified by PTLC using an appropriate solvent mixture as described for each derivative.

Compound 15 (11-F-MG). The reaction was performed according to the general procedure D except after addition of MeOH the RM was stirred for 1 h at $90^{\circ} \mathrm{C}$. The crude material was purified by PTLC using EtOAc:Hex 1:4 + 2\% $\mathrm{Et}_{3} \mathrm{~N}$. Product $\mathbf{1 5}$ was obtained as a yellow solid ( $32 \mathrm{mg}, 70 \%$ ).
${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.74(\mathrm{~s}, 1 \mathrm{H}), 7.43(\mathrm{~s}, 1 \mathrm{H}), 6.59(\mathrm{dd}, J=9.3,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.26(\mathrm{dd}, J=11.8$, $2.0 \mathrm{~Hz}, 1 \mathrm{H}), 3.84(\mathrm{~s}, 3 \mathrm{H}), 3.73(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.18-2.97(\mathrm{~m}, 4 \mathrm{H}), 2.96-2.83(\mathrm{~m}, 2 \mathrm{H}), 2.62-2.36$ $(\mathrm{m}, 3 \mathrm{H}), 1.84-1.73(\mathrm{~m}, 2 \mathrm{H}), 1.69-1.55(\mathrm{~m}, 1 \mathrm{H}), 1.29-1.16(\mathrm{~m}, 1 \mathrm{H}), 0.86(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $\left(126 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 169.3,161.1,159.9(\mathrm{~d}, J=182.0 \mathrm{~Hz}), 154.7(\mathrm{~d}, J=12.4 \mathrm{~Hz}), 136.2(\mathrm{~d}, J=15.2 \mathrm{~Hz})$, $133.8(\mathrm{~d}, J=3.3 \mathrm{~Hz}), 114.1,111.6,108.0,90.3(\mathrm{~d}, J=26.3 \mathrm{~Hz}), 90.2(\mathrm{~d}, J=28.7 \mathrm{~Hz}), 61.7,61.3,57.9$, $55.6,53.8,51.5,40.8,40.0,30.1,23.9,19.2,13.0 .{ }^{19} \mathrm{~F}$ (proton decoupled) NMR ( $376 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta-$ 119.25. HRMS (ESI+): calcd. for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{FN}_{2} \mathrm{O}_{4}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 417.2256$, found 417.2248 .

Compound 16 (11-Cl-MG). The reaction was performed according to the general procedure D . The crude material was purified by PTLC using EtOAc:Hex 1:4 $+2 \% \mathrm{Et}_{3} \mathrm{~N}$. Product 16 was obtained as a yellow solid ( $33 \mathrm{mg}, 70 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.84(\mathrm{~s}, 1 \mathrm{H}), 7.42(\mathrm{~s}, 1 \mathrm{H}), 6.89(\mathrm{~d}, J=1.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.43(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H})$, $3.85(\mathrm{~s}, 3 \mathrm{H}), 3.72(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.15-2.97(\mathrm{~m}, 4 \mathrm{H}), 2.95-2.86(\mathrm{~m}, 2 \mathrm{H}), 2.61-2.33(\mathrm{~m}, 3 \mathrm{H}), 1.85$ $-1.70(\mathrm{~m}, 2 \mathrm{H}), 1.66-1.57(\mathrm{~m}, 1 \mathrm{H}), 1.32-1.16(\mathrm{~m}, 1 \mathrm{H}), 0.86(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 101 MHz , $\left.\mathrm{CDCl}_{3}\right) \delta 169.3,160.7,154.6,137.1,134.3,127.2,116.5,111.6,108.2,104.5,101.4,61.7,61.3,57.9,55.6$, $53.8,51.5,45.7,40.8,40.0,23.8,19.3,13.0$. ## Oxidation of MG derivatives to 70H analogs

General procedure E: Starting material ( $73 \mu \mathrm{~mol}$ ) was dissolved in acetone ( 2.2 mL ), sat. aq. $\mathrm{NaHCO}_{3}$ $(1.5 \mathrm{~mL})$ was added, and the stirred suspension was cooled in an ice bath $\left(0^{\circ} \mathrm{C}\right)$. Oxone $(1.4-1.5$ equiv) in $\mathrm{H}_{2} \mathrm{O}(0.7 \mathrm{~mL})$ was added dropwise over 20 min with vigorous stirring. (Care should be taken that the RM does not form lumps and should be stirred thoroughly). The reaction was monitored during the addition of oxone by TLC. After 25 min from the first addition, the RM was diluted with $\mathrm{H}_{2} \mathrm{O}(10 \mathrm{~mL})$ and extracted with $\operatorname{EtOAc}(3 \times 10 \mathrm{~mL})$. The combined extracts were washed with brine $(10 \mathrm{~mL})$, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated. The product was purified by PTLC using an appropriate solvent mixture as described for each derivative.

Compound 22 (11-F-7OH). The reaction was performed according to the general procedure E using SM $15(30 \mathrm{mg}, 73 \mu \mathrm{~mol})$ and oxone $(22.1 \mathrm{mg}, 109 \mu \mathrm{~mol})$. The crude material was purified by PTLC (EtOAc:Hex 1:4+2\% $\mathrm{Et}_{3} \mathrm{~N}$ ). Product 22 was obtained as a yellow solid ( $16 \mathrm{mg}, 52 \%$ ).
${ }^{1} \mathrm{H} \mathrm{NMR}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 7.43(\mathrm{~s}, 1 \mathrm{H}), 6.91(\mathrm{dd}, J=8.5,2.0 \mathrm{~Hz}, 1 \mathrm{H}), 6.45(\mathrm{dd}, J=11.3,2.0 \mathrm{~Hz}, 1 \mathrm{H})$, $3.84(\mathrm{~s}, 3 \mathrm{H}), 3.80(\mathrm{~s}, 3 \mathrm{H}), 3.69(\mathrm{~s}, 3 \mathrm{H}), 3.12(\mathrm{dd}, J=11.1,2.6 \mathrm{~Hz}, 1 \mathrm{H}), 3.06-2.96(\mathrm{~m}, 2 \mathrm{H}), 2.91-2.73$ $(\mathrm{m}, 3 \mathrm{H}), 2.66-2.56(\mathrm{~m}, 2 \mathrm{H}), 2.51-2.43(\mathrm{~m}, 1 \mathrm{H}), 1.89-1.82(\mathrm{~m}, 1 \mathrm{H}), 1.73-1.53(\mathrm{~m}, 3 \mathrm{H}), 1.30-1.14$ $(\mathrm{m}, 1 \mathrm{H}), 0.82(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR (126 MHz, $\left.\mathrm{CDCl}_{3}\right) \delta 186.2,169.4,165.0(\mathrm{~d}, J=245.2 \mathrm{~Hz})$, $160.9,156.2(\mathrm{~d}, J=11.8 \mathrm{~Hz}), 156.1(\mathrm{~d}, J=13.1 \mathrm{~Hz}), 122.3,111.4,102.2(\mathrm{~d}, J=24.4 \mathrm{~Hz}), 97.1(\mathrm{~d}, J=27.4$ Hz ), 80.9, 61.9, 61.6, 58.3, 55.9, 51.5, 50.1, 40.6, 39.4, 36.1, 26.1, 19.1, 13.0. ${ }^{19} \mathrm{~F}$ (proton decoupled) NMR ( $376 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta$-108.31. HRMS (ESI+) calcd. for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{FN}_{2} \mathrm{O}_{5}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 433.2139$, found 433.2139.

Compound 23 (11-Cl-7OH). The reaction was performed according to the general procedure E using SM $16(30 \mathrm{mg}, 69 \mu \mathrm{~mol})$ and oxone ( $30 \mathrm{mg}, 97 \mu \mathrm{~mol}$ ). The crude material was purified by repeated PTLC (EtOAc:Hex 1:3+2\% $\mathrm{Et}_{3} \mathrm{~N}$ and EtOAc:Hex 3:7+2\% $\mathrm{Et}_{3} \mathrm{~N}$ ). Product 23 was obtained as a yellow solid ( $15 \mathrm{mg}, 50 \%$ ).
${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 7.44(\mathrm{~s}, 1 \mathrm{H}), 7.21(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 6.73(\mathrm{~d}, J=1.5 \mathrm{~Hz}, 1 \mathrm{H}), 3.86(\mathrm{~s}, 3 \mathrm{H})$, $3.81(\mathrm{~s}, 3 \mathrm{H}), 3.70(\mathrm{~s}, 3 \mathrm{H}), 3.14-2.97(\mathrm{~m}, 3 \mathrm{H}), 2.93(\mathrm{~d}, J=7.4 \mathrm{~Hz}, 1 \mathrm{H}), 2.87-2.72(\mathrm{~m}, 2 \mathrm{H}), 2.70-2.55$ $(\mathrm{m}, 2 \mathrm{H}), 2.48(\mathrm{dd}, J=11.5,3.0 \mathrm{~Hz}, 1 \mathrm{H}), 1.86(\mathrm{~d}, J=13.7 \mathrm{~Hz}, 1 \mathrm{H}), 1.75-1.54(\mathrm{~m}, 3 \mathrm{H}), 1.33-1.17(\mathrm{~m}$, $1 \mathrm{H}), 0.82(\mathrm{t}, J=7.3 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $\delta 185.8,169.2,160.7,155.8,135.9,125.1$, 114.9, 111.2, 109.6, 80.9, 61.8, 61.5, 58.1, 55.8, 49.9, 45.7, 40.5, 39.2, 35.8, 25.9, 18.9, 12.8. HRMS (ESI + ) calcd. for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{ClN}_{2} \mathrm{O}_{5}^{+}[\mathrm{M}+\mathrm{H}]^{+}: 449.1843$, found 449.1842.

Compound $24(11-\mathrm{Br}-7 \mathrm{OH})$. The reaction was performed according to the general procedure E using SM $17(30 \mathrm{mg}, 63 \mu \mathrm{~mol})$ and oxone ( $25 \mathrm{mg}, 82 \mu \mathrm{~mol}$ ). The crude material was purified by repeated PTLC (EtOAc:Hex 1:3+2\% $\mathrm{Et}_{3} \mathrm{~N}$ and EtOAc:Hex 3:7+2\% $\mathrm{Et}_{3} \mathrm{~N}$ ). Product 24 was obtained as a yellow solid ( $14 \mathrm{mg}, 45 \%$ ).

HRMS (ESI+) calcd. for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{BrN}_{2} \mathrm{O}_{5}{ }^{+}[\mathrm{M}+\mathrm{H}]^{+}: 493.1338$, found 493.1337.

## Activity of 11-X-7OH analogs at the human and rodent opioid receptors.

Supplementary Figure 7: Agonist activity of 11-X-7OH analogs at the human and mouse delta opioid receptor (hDOR and mDOR). hDOR and mDOR were co-expressed with $\mathrm{G} \alpha_{\mathrm{oB}}, \beta_{1}, \gamma 2$ and the BRET CAMYEL sensor. (A) Agonist activity at hDOR; positive control = [D-Pen $\left.{ }^{2,5}\right]$-enkephalin (DPDPE) (B) Agonist activity at mDOR, positive control = DPDPE; Curves represent the average of $n=3$, independent experiments with error bars representing $\pm$ SEM.

Supplementary Figure 8: Agonist activity of 11-X-70H analogs at the human and rat kappa opioid receptor (hKOR and rKOR). hKOR and rKOR were co-expressed with $\mathrm{Ga}_{\mathrm{oB}}, \beta 1, \gamma 2$ and the BRET CAMYEL sensor. (A) Agonist activity at hKOR; positive control $=\mathrm{U}-50,488$. (B) Agonist activity at rKOR, positive control $=\mathrm{U}-50,488$; Curves represent the average of $n=3$, independent experiments with error bars representing $\pm$ SEM.

Supplementary Figure 9: Antagonist activity of 11-Br-7OH (24) analog at the human and mouse delta opioid receptor (hDOR and mDOR). hDOR and mDOR were co-expressed with $\mathrm{G} \alpha_{o \mathrm{ob}}, \beta 1, \gamma 2$ and the BRET CAMYEL sensor. (A) Antagonist activity at hDOR, competitive inhibition of [D-Pen ${ }^{2,5}$ ]-enkephalin (DPDPE), positive control = TIPP-psi. (B) Antagonist activity at mDOR, competitive inhibition of DPDPE, positive control = TIPP -psi. Curves represent the average of $n=3$, independent experiments with error bars representing $\pm$ SEM.

Supplementary Figure 10: Antagonist activity of $\mathbf{1 1 - B r - 7 O H}$ (24) analog at the human and rat kappa opioid receptor (hKOR and rKOR). hKOR and rKOR were co-expressed with G $\alpha_{o \mathrm{~B}}, \beta 1, \gamma 2$ and the BRET CAMYEL sensor. (A) Antagonist activity at hKOR, competitive inhibition of U-50,488 (EC 80 ), positive control $=$ nor-binaltorphimine (nor-BNI). (B) Antagonist activity at rKOR, competitive inhibition of U$50,488\left(\mathrm{EC}_{80}\right)$, positive control $=$ TIPP-psi. Curves represent the average of $n=3$, independent experiments with error bars representing $\pm$ SEM.

## Biological Procedures:

## Mouse Receptor $\mathbf{K}_{\mathbf{i}}$ Determination.

Materials: IBNtxA and $\left[{ }^{125} \mathrm{I}\right]$ BNtxA were synthesized at MSKCC as previously described. ${ }^{9-11}$ $\mathrm{Na}^{125}$ I was purchased from Perkin-Elmer (Waltham, MA).

Radioligand Competition Binding Assays with Mouse Receptors: [ $\left.{ }^{125} \mathrm{I}\right] \mathrm{BNtxA}$ binding was carried out in membranes prepared from Chinese Hamster Ovary ( CHO ) cells stably expressing murine clones of MOR, DOR, and KOR, as previously described. ${ }^{9,10,12}$ Binding incubations were performed at 25 ${ }^{\circ} \mathrm{C}$ for 90 min in 50 mM potassium phosphate buffer, pH 7.4 , containing 5 mM magnesium sulfate. After the incubation, the reaction was filtered through glass-fiber filters (Whatman Schleicher \& Schuell, Keene, NH ) and washed three times with 3 mL of ice-cold 50 mM Tris- $\mathrm{HCl}, \mathrm{pH} 7.4$, on a semiautomatic cell harvester. Nonspecific binding was defined by addition of levallorphan $(8 \mu \mathrm{M})$ to matching samples and was subtracted from total binding to yield specific binding. $\mathrm{K}_{\mathrm{i}}$ values were calculated by nonlinear
regression analysis (GraphPad Prism, San Diego, CA). Protein concentrations were determined using the Lowry method with BSA as the standard. ${ }^{13}$

## CAMYEL BRET Assays.

Materials. HEK-293T cells were obtained from the American Type Culture Collection (Rockville, MD, USA) and were cultured in a $5 \% \mathrm{CO}_{2}$ atmosphere at $37^{\circ} \mathrm{C}$ in Dulbecco's Modified Eagle Medium (high glucose no. 11965; Life Technologies; Grand Island, NY, USA) supplemented with 10\% Fetal Bovine Serum and $100 \mathrm{U} \mathrm{ml}^{-1}$ penicillin and $100 \mu \mathrm{~g} \mathrm{ml}^{-1}$ streptomycin (Corning). DAMGO and nor-BNI were purchased from Abcam (Cambridge, United Kingdom). Coelenterazine H was purchased from Dalton Pharma Services (Toronto, ON, Canada). Polyethylenimine (PEI) was purchased from Polysciences (Warrington, PA, USA). Forskolin was purchased from Sigma-Aldrich (Saint Louis, MO, USA). DPDPE, naloxone HCl , and ( $\pm$ )-U-50488 HCl were purchased from Tocris Biosciences (Minneapolis, MN, USA). TIPP[psi] was obtained from the National Institute on Drug Abuse Drug Supply Program.

DNA Constructs. The mouse MOR (mMOR), the mouse DOR (mDOR) and the rat KOR (rKOR) were provided by Dr Lakshmi Devi at Mount Sinai School of Medicine. The human MOR (hMOR), human DOR (hDOR) and human KOR (hKOR) were obtained from the Missouri S\&T Resource Center. The human G protein constructs used here have been previously described ${ }^{14}$ and were obtained from the Missouri S\&T Resource Center unless otherwise noted. The G proteins used were: $\mathrm{G} \alpha_{0 B}\left(G \alpha_{0 B}\right), G \beta_{1}\left(\beta_{1}\right)$, $\mathrm{G} \gamma_{2}(\gamma 2)$. YFP-Epac-RLuc (CAMYEL) was obtained from ATCC (no. MBA-277). ${ }^{15}$ All constructs were sequence confirmed.

Transfection. A total of $20 \mu \mathrm{~g}$ of cDNA was transiently transfected into HEK-293T cells ( $6 \times$ $10^{6}$ cells per plate) in 10 cm dishes ( $1.25 \mu \mathrm{~g}$ receptor, $10 \mu \mathrm{~g}$ CAMYEL, $1.25 \mu \mathrm{~g}$ G $\alpha_{\mathrm{oB}}, 1.25 \mu \mathrm{~g} \beta_{1}, 1.25 \mu \mathrm{~g}$ $\gamma 2$, and $5 \mu \mathrm{~g} \mathrm{pcDNA} 3.1$ empty vector) using PEI in a 1:1 ratio (diluted in Opti-MEM, Life Technologies). Cells were maintained in the HEK-293T media described above. After 24 h , the media was changed, and the experiment was performed 24 h later ( 48 h after transfection).

Bioluminescence Resonance Energy Transfer (BRET). Experiments were performed as described previously. ${ }^{14,16-18}$ Briefly, transfected cells were dissociated and resuspended in phosphatebuffered saline. Approximately 200,000 cells per well were added to a black-framed, white well 96 -well plate (no. 60050; Perkin Elmer; Waltham, MA, USA). For agonist assays, $1 \mu \mathrm{M}$ forskolin (cAMP accumulation) was added to each well. After 5 min , the luciferase substrate coelenterazine $\mathrm{H}(5 \mu \mathrm{M})$ was added to each well. Ligands were added after 5 min , then BRET signal was measured 5 min later. For antagonist assays, ligands were added first, then allowed to incubate for 20 min . Following antagonist incubation, forskolin $(1 \mu \mathrm{M})$ was added to each well. After 5 min , coelenterazine $\mathrm{H}(5 \mu \mathrm{M})$ was added to
each well. After another 5 min , full agonist ligands (DAMGO, DPDPE, or U-50,488 at $\mathrm{EC}_{80}$ concentration) were added to each well and the BRET signal was measured 5 min later. All BRET signal measurements were done on a PHERAstar FS plate reader (BMG Labtech, Cary, NC, USA). The BRET signal was calculated as the ratio of the light emitted by the energy acceptor, mVenus ( $510-540 \mathrm{~nm}$ ), over the light emitted by the energy donor, RLuc8 ( 485 nm ). Dose-response curves were fit using a three-parameter logistic equation in GraphPad Prism 5 (Graphpad Software, La Jolla, CA, USA). All experiments were repeated in three independent trials each with triplicate determinations.

## BRET-Based Nb33 Recruitment Assays.

Materials: HEK-293T cells were obtained from the American Type Culture Collection (Rockville, MD, USA) and were cultured in a $5 \% \mathrm{CO}_{2}$ atmosphere at $37^{\circ} \mathrm{C}$ in Dulbecco's Modified Eagle Medium (DMEM, high glucose, \#11965; Life Technologies; Grand Island, NY, USA) supplemented with $10 \%$ Fetal Bovine Serum (\#35-010-CV, Corning, Corning, NY, USA) and $100 \mathrm{IU} \mathrm{ml}^{-1}$ penicillin and $100 \mu \mathrm{~g} \mathrm{ml}^{-1}$ streptomycin (\#30-002-CI; Corning, Corning, NY, USA). The following chemicals were used without further modification: DAMGO (\#78123-71-4, Abcam, Cambridge, United Kingdom), buprenorphine hydrochloride (\#B9275, Sigma-Aldrich, St. Louis, MO, USA), morphine sulfate (\#M1 167, Spectrum Chemicals, New Brunswick, NJ, USA), coelenterazine H (\#DC-001437, Dalton Pharma Services, Toronto, ON, Canada), PEI (\#NC1014320, Polysciences, Warrington, PA, USA).

DNA Constructs: The expression vector coding for mouse MOR tagged at the C-terminus with Nanoluc (mMOR-nluc) by a Gly-Ser linker was constructed using standard techniques in molecular biology and confirmed by DNA sequencing (Psomagen, Brooklyn, NY, USA). Briefly, two DNA inserts were PCR amplified, one coding for mMOR with an N terminal signal peptide followed by a FLAG tag, and the other coding for NanoLuc. The two inserts were joined by PCR amplification and the resulting insert coding mMOR-nluc was cloned into the Hind III and Xho I sites of pcDNA3.1 (+) (\#V79020, ThermoFisher Scientific, Waltham, MA, USA). The plasmid coding for human MOR-nanoluc (hMOR-nluc) was a gift from Dr. Nevin Lambert at the Medical College of Georgia. The plasmid coding for the nanobody-33Venus ( $\mathrm{Nb}-33$ ) construct ${ }^{19}$ was a gift from Dr. Meritxell Canals at the University of Nottingham.

Transfection: A total of $5 \mu \mathrm{~g}$ of cDNA was transiently transfected into HEK-293T cells ( $2 \times 106$ cells per plate) in 10 cm dishes ( $1 \mu \mathrm{~g}$ receptor-nluc, and $4 \mu \mathrm{gb}-33$-Venus), using PEI in a 6:1 ratio (diluted in DMEM). Cells were maintained in the HEK-293T media described above. Experiments were performed 48 h after transfection.

BRET: Experiments were performed as described previously. ${ }^{20}$ Briefly, transfected cells were dissociated and resuspended in phosphate-buffered saline. Cells were added to a black-framed, white well

96-well plate (no. 60050; Perkin Elmer; Waltham, MA, USA). At time zero, the luciferase substrate coelenterazine $\mathrm{H}(5 \mu \mathrm{M})$ was added to each well. Ligands were added after 5 min , then BRET signal was measured 10 min later. BRET measurements were performed using a PHERAstar FS plate reader (BMG Labtech, Cary, NC, USA). The BRET signal was calculated as the ratio of the light emitted by the mVenus acceptor ( $510-540 \mathrm{~nm}$ ) over the light emitted by the NanoLuc donor ( 475 nm ). Dose-response curves were fit using a three-parameter logistic equation in GraphPad Prism 8 (Graphpad Software, La Jolla, CA, USA). All experiments were repeated in at least three independent trials each with triplicate determinations.

## Tail Flick Mice assay.

## Mice

For analgesic dose-response experiments, male CD1 mice (20-32 g), $6-8$ weeks were obtained from Charles River Laboratories and male C57BL/6 mice (22-30 g), 8-15 weeks were obtained from Jackson Lab (Bar Harbor, ME) and housed 5 mice per cage in a vivarium following an IACUC-approved protocol. For male C57BL/6 mice temperature was kept constant at $22 \pm 2^{\circ} \mathrm{C}$, and relative humidity was maintained at $50 \pm$ $5 \%$. For male CD1 mice (20-32 g) the temperature was in the range of $20-26^{\circ} \mathrm{C}$ and relative humidity maintained within the range of $30-70 \%$. Mice were given access to food and tap water ad libitum. All mice used throughout the manuscript were opioid naïve. All mice were maintained on a 12 h light/dark cycle with Purina rodent chow and water available ad libitum and housed in groups of five until testing. For analgesic testing in knockout animals, wild-type, male C57BL/6 mice (22-33 g), 10-12 weeks were purchased from the Jackson Lab (Bar Harbor, ME). These mice were kept at a constant temperature of 22 $\pm 2^{\circ} \mathrm{C}$, and relative humidity was maintained at $40-50 \%$. Exon-1/Exon-11 MOR-1 KO mice on a C57 background were bred in the Pintar laboratory at Rutgers University. All mice were maintained on a 12hour light/dark cycle with food and water available ad libitum, and housed in groups of five until testing. All testing was done in the light cycle.
All animal studies were preapproved by the Institutional Animal Care and Use Committees of Washington University School of Medicine and Columbia University, in accordance with the 2002 National Institutes of Health Guide for the Care and Use of Laboratory Animals.

## Materials and Formulations

Compounds 70 H and the analogs were prepared as described above. Compound solutions were prepared on the same day as testing from pure solid material. For the analgesic testing with the C57BL/6 mice the solids were dissolved in UPS grade $0.85 \%$ saline with addition of 2 molar equivalents of glacial acetic acid. For the analgesic testing with the CD1 mice solids were dissolved in 10:10:80 of DMSO: solutol: saline solution. Heat and sonication were used to assist in fully dissolving the solid to obtain a clear solution. A
dilution series was prepared for the desired doses of $0.1,0.3,1,3$, and $10 \mathrm{mg} / \mathrm{kg}$ (concentrations 0.01 $\mathrm{mg} / \mathrm{mL}, 0.03 \mathrm{mg} / \mathrm{mL}, 0.1 \mathrm{mg} / \mathrm{mL}, 0.3 \mathrm{mg} / \mathrm{mL}$, and $1 \mathrm{mg} / \mathrm{mL}$ respectively). Solutions were filtered through a PTFE $0.45 \mu \mathrm{~m}$ syringe filter and administered s.c. at a max volume of $300 \mu \mathrm{~L}$.

## Tail Flick (Dose - response)

Tail flick antinociception was determined using the radiant heat tail flick technique using an Ugo Basile model 37360 instrument as previously described. ${ }^{21,22}$ The intensity was set to achieve a baseline between 2 and 3 s . Baseline latencies were determined before experimental treatments for all mice. Tail flick antinociception was assessed as an increase in baseline latency, with a maximal 15 s latency to minimize damage to the tail. Data were analyzed as percent maximal effect, $\%$ MPE, and was calculated according to the formula: \% MPE = [(observed latency - baseline latency)/(maximal latency - baseline latency) $] \times 100$. Compounds were injected subcutaneously (s.c.) and antinociception was assessed at the peak effect. Mice were tested for analgesia with cumulative subcutaneous doses of the drug until the mouse can withstand the maximal latency. Once the mouse reached the maximal latency, the mouse was no longer given higher doses. The analgesia experiments were performed by blinding the experimenter to the identity of 7 OH versus 11-F-7OH. In vivo experiments were evaluated using GraphPad Prism 8, San Diego, CA as described above.

## Tail Flick (KO animals)

Analgesia was tested in wild-type and MOR KO animals by the radiant heat tail-flick technique using an IITC Model 33 Tail Flick Analgesia Meter as previously described. ${ }^{23}$ The intensity was set to achieve a baseline between 2 and 3 s . Tail flick antinociception was assessed as an increase in baseline latency, with a maximal 10 s latency to minimize damage to the tail. Data were analyzed as percent maximal effect, \%MPE, which was calculated according to the formula: \% MPE [(observed latency - baseline latency)/(maximal latency - baseline latency)] $\times 100$. Compounds were administered subcutaneously (s.c.) as indicated in the figures, and analgesia was assessed at the peak effect ( 15 min ). Mice were tested for analgesia with cumulative subcutaneous doses of the drug until the mouse can withstand the maximal latency. Once the mouse reached the maximal latency, the mouse was no longer given higher doses. In vivo experiments were evaluated using GraphPad Prism 8, San Diego, CA as described above.
