Common rust, northern leaf blight (NLB), Stewart's bacterial wilt, southern leaf blight (SLB), maize dwarf mosaic (MDM), and gray leaf spot (GLS) can reduce yields of susceptible and moderately susceptible sweet corn hybrids. Resistance and susceptibility to these diseases differ among commercial hybrids (2). Disease management can be improved if reactions of hybrids are known.

Resistance and susceptibility are the two extremes of a continuum of host reactions to diseases. Resistance is a measure of the ability of the host to reduce the growth, reproduction and/or disease-producing abilities of the pathogen, thus resulting in less severe symptoms of disease. Major genes for resistance (such as *Rp*, *HtN*, *Mdm1*, or *Rpp*) prevent or substantially limit disease development. In the absence of major gene resistance, disease reactions can range from partially resistant to susceptible.

Hybrids with major gene resistance usually are identified by specific phenotypes. Other hybrids can be grouped into broad classes such as: resistant (R), moderately resistant (MR), moderate (M), moderately susceptible (MS), and susceptible (S) based on severity of disease symptoms. This procedure produces statistically “overlapping” groups without clear-cut differences between classes (e.g., the hybrid with least severe symptoms in the MR class does not differ significantly from the hybrid with the most severe symptoms in the R class). Consistent responses over several trials give a good indication of hybrid performance relative to other hybrids, and they can be used to assess the potential for diseases to become severe.

This report summarizes the reactions of 296 sweet corn hybrids to common rust, NLB, Stewart's wilt, SLB, MDM, and GLS based on performance in the 1999 University of Illinois sweet corn disease nursery.

Materials and Methods

Hybrids: Two-hundred-and-ninety-six hybrids were evaluated in 1999 including 170 *sh2* hybrids, 90 *se* hybrids, 35 *su* hybrids, and 1 *bt1* hybrid. Maturity ranged from about 60 to 90 days. Standard hybrids with relatively consistent reactions to rust, Stewart's wilt, and NLB (Table 2) were included to compare the results from the 1999 nursery to those from previous nurseries.

Experimental design and procedures: Each disease was a separate trial with three replicates of hybrids arranged in randomized complete blocks. Each trial was split into two main blocks of *sh2* or *su* and *se* hybrids. Each experimental unit was a single 12-ft. row with about 6 to 20 plants. Five trials (common rust, NLB, Stewart's wilt, SLB, and GLS) were planted May 11 at Champaign, IL. Late trials were planted June 22 (late Stewart's wilt) and July 6 (MDM).

Table 1. Summary statistics for common rust, NLB, Stewart's wilt, MDM, SLB, and GLS ratings.

Disease	n	mean	std. dev.	Range	BLSD	CV (%)
Common rust (w/ <i>Rp</i> hybrids)	296	18 %	13.4 %	0 - 40 %	4.5 %	17.7
Common rust (w/o <i>Rp</i> hybrids)	196	27 %	5.2 %	10 - 40 %	5.8 %	13.3
NLB	296	28 %	6.5 %	4 - 60 %	4.9 %	11.5
Stewart's wilt - seedling ratings	296	3.7	0.74	1.9 - 5.8	1.00	11.0
Stewart's wilt - adult plant ratings	296	5.6	1.32	2.5 - 8.5	1.01	16.7
Stewart's wilt - (incidence)	296	34 %	17.4 %	0 - 87 %	15.1 %	29.6
SLB	294	3.1	0.79	1.5 - 6	0.95	17.8
MDM (incidence)	296	42 %	19.4 %	0 - 91 %	63.1 %	62.4
GLS	286	3.9	0.62	2 - 6	1.06	13.7

Inoculation and disease assessment: Five of the seven trials were inoculated with one of five pathogens: *Puccinia sorghi* (common rust), *Exserohilum turcicum* (NLB), *Erwinia stewartii* (Stewart's wilt), *Bipolaris maydis* (SLB), or *Cercospora zeae-maydis* (GLS). Urediniospore suspensions of *P. sorghi* were sprayed into

plant whorls on June 9, 11, 15, 17, 21 and 25. Plants were inoculated with a mixture of races 0 and 1 of *E. turcicum* on June 9, 11, 15, 18, and 21 by spraying conidial suspensions into whorls. Plants were inoculated with *E. stewartii* on June 8, 11, and 17 by wounding leaves in the whorl and introducing bacteria into wounds. Conidial suspensions of *B. maydis* were sprayed into whorls on June 9, 16, and 18. Conidial suspensions of *C. zeae-maydis* prepared from cultures produced on clarified V-8 agar were sprayed into whorls and on undersides of leaves on June 10, 16, and 18. Plants in the MDM trial were infected naturally by aphids vectoring MDM viruses. Plants in the late Stewart's wilt and MDM trials were infected naturally with *E. stewartii* vectored by corn flea beetles.

Disease symptoms were rated in each row by at least two of the co-authors. The percentage of the leaf area infected by common rust was rated from 0 to 100% on July 23-26. Leaf area infected by NLB was rated from 0 to 100% on July 21-22. Stewart's wilt was rated in the inoculated trial on June 23-28 (seedling wilt phase) and August 5-6 (adult plant phase) using a 1 to 9 scale. SLB and GLS were rated from 1 (small, chlorotic lesions; little secondary spread) to 9 (large, necrotic lesions; abundant secondary spread) on July 26-28 and July 29-31, respectively. The number of plants per row with MDM symptoms was counted in the MDM trial on August 12 and converted to a percentage. The number of plants systemically infected with *E. stewartii* were counted in the late Stewart's wilt trial on July 22 and in the MDM trial on August 16 and converted to a percentage.

Data analysis: Disease ratings were analyzed by ANOVA. Hybrid reactions were classified according to standard deviations from the mean (z-scores), Bayesian least significant difference (BLSD) separations (k=100), and the FASTCLUS procedure of SAS using various groupings of 4 to 12 clusters.

Results and Discussion

Hybrid reactions ranged from very little disease to severe symptoms (Table 1). Reactions of standard hybrids to rust, NLB, Stewart's wilt, SLB, and MDM were generally within the expected ranges (Table 2). The criteria for classifying hybrid reactions are listed in Table 3. Table 4 lists reactions and actual ratings of the 296 hybrids **based solely on the 1999** trial. This is the only data available to us for some of these hybrids. For hybrids that we have evaluated in previous years, a more complete assessment of reactions of is presented in another report, "Reactions of sweet corn hybrids to prevalent diseases - 1999" (1).

Table 2. Reactions of sweet corn hybrids included as standards in the 1999 disease nursery

MDM	Common rust			NLB			Stewart's wilt			SLB				
	Prior	99	Rating	Prior	99	Rating	Prior	99	Early	Late	%	Prior	99	Rating

Summer Sweet 7710	6	6	27	2	2	18	2	3	2.6	4.0	21	2	6	3.8
Ultimate	5	6	27	2	5	26	2	3	3.1	3.8	15	1	3	2.3

Prior - reaction in previous years (1984-1998).

99 - reaction in 1999: 1 - resistant, 3 - moderately resistant, 5- moderate, 7 - moderately susceptible, 9 - susceptible.

Rating - mean rating in 1999: 0 to 100% for severity of rust and NLB, and incidence of MDM, and Stewart's wilt; 1 to 9 for early (seedling) and late (adult plant) Stewart's wilt ratings and SLB.

Table 3. Criteria for classifying hybrid reactions to diseases in the 1999 nursery

	Classification of reaction								
	1	2	3	4	5	6	7	8	9
Common rust (%)	0	<15	<19	<23	<26	<29	<32	≤35	>35
NLB (%)	<8	<15	<21	≤24	<28	<31	<35	≤40	>40

SLB	<2	<2.5	<3	≤ 3.5	≤ 4	≤ 4.5	≤ 5.5	≥ 5.5
GLS		<2.5	<3	≤ 3.8		≤ 4.8	≤ 5.5	≥ 5.5
MDM (%)	<5	<10	<15		≤ 30		≥ 30	

Classification: 1 - resistant, 3 - moderately resistant, 5- moderate, 7 - moderately susceptible, 9 - susceptible.
Stewart's wilt classifications based on a cluster analysis of early and late severity ratings and incidence ratings.

Common rust: Rust ratings ranged from 0 to 40% leaf area infected. Rust pustules were not observed on 100 hybrids which had *Rp*-resistant reactions; however, Rp-resistant hybrids were infected in a greenhouse trial in October 1999 when they were inoculated with a biotype of *P. sorghi* collected in September 1999 from Illinois, Wisconsin and Minnesota. This is the first widespread occurrence in North America of a biotype of *P. sorghi* that is virulent on Rp-resistant sweet corn (3). Of the hybrids that were not *Rp*-resistant, five had less than 15% leaf area infected, including Green Giant Code 27, GG Code 61, GG Code 74, Sugar 73, and Sugar 74bt. Nine hybrids with 15 to 19% leaf area infected were classified as moderately resistant (rxn = 3), including BSS 8142, Esteem, GH 0934 A, GH 2783, GH 3054, GG Code 24, GG Code 75, Merlin, and XP 3123.

Northern leaf blight: NLB ratings ranged from 4 to 60% with a mean of 28%. Four *sh2* hybrids (Day Star, HMX 6364 BS, HMX 8343 BS, and Morning Star) had less than 7% leaf area infected and appeared to have *HtN*-resistance to NLB. Development of NLB lesions on *HtN*-hybrids usually is delayed until after pollination. Three other hybrids (BSS 8142, GH 3054, and Sugar 74bt) had less than 15% NLB severity and were classified as resistant. Nineteen hybrids with NLB severity from 15 to 21% were classified as moderately resistant, including two *su* hybrids (GG Code 62 and HMX 8390) and seventeen *sh2* hybrids (BSS 0977 VP, Chieftan BC, GSS 0954 A, GSS 0966 A, GSS 3381, GSS 5771, GSS 5786, GSS 5859, Headliner, Peter 445B, Prime Plus VP, Sch 65145, Sch 98015, Summer Sweet 7630, Summer Sweet 7631, Summer Sweet 7710, and Trigger).

Stewart's wilt: Stewart's wilt ratings in the inoculated trial ranged from 1.9 to 5.8 at the seedling stage and from 2.5 to 8.5 at the adult plant stage. Means were 3.7 and 5.6, respectively. Incidence of systemically infected plants in the two naturally-infected, late-planted trials (Stewart's wilt and MDM) ranged from 0 to 92% with a mean of 42%. Severity of Stewart's wilt (means of seedling and adult plant ratings) was highly correlated with incidence of systemically infected plants (Fig. 1). All three ratings were used in a cluster analysis to classify hybrid reactions. Fourteen hybrids formed the most resistant group (Buckeye, Eliminator, GH 0937 A, GG Code 27, GG Code 59, GG Code 67, GG Code 75, HMX 8389, Miracle, Seneca Nation, Sugar 74bt, Trigger, Xtra Tender 179A, and 20242). These hybrids had ratings below 3.0 at the seedling stage except for Xtra Tender 179A which was rated 3.0. They were rated below 3.5 at the adult plant stage except for Miracle, Xtra Tender 179A, and Trigger that were rated 3.7. Incidence of systemically infected plants was less than 15% in this group except for Eliminator for which incidence was 17%. Twenty-two hybrids formed a group that was resistant to moderately resistant (rxn = 2). Seedling ratings for this group were below 3.3, adult plant ratings were below 4.5, and incidence of systemically infected plants was less than 20%.

Southern leaf blight: SLB ratings ranged from 1.5 to 6 with a mean of 3.1. Twelve hybrids with SLB ratings below 2 were classified as resistant, including one *su* hybrid (GG Code 61), three *se* hybrids (EX 8410017, Seneca Sensation, and XP 8410347) and eight *sh2* hybrids (Assure, Crisp n Sweet 711, Morning Star, Seneca Sugarburst, Summer Sweet 7901, Summer Sweet 8100, Summer Sweet 8100R, and Summer Sweet 8102). Forty hybrids with ratings between 2 and 2.5 were classified as moderately resistant, including 25 *sh2* hybrids, 8 *se* hybrids, 6 *su* hybrids, and 1 *brittle* hybrid.

Maize dwarf mosaic: Incidence of MDM-infected plants averaged 42% for the entire trial and ranged from 0 to 92% among hybrids. Incidence varied considerably among replicates. The coefficient of variation for this trial and the mean separation value (BLSD) were 63 and 62%, respectively. Five hybrids with fewer than 2% infected plants (GH 3054, HMX 8343BS, Swift, Sugar 74bt, and Topacio) were classified as resistant. Thirteen hybrids with fewer than 10% infected plants (Bonus, Candy Corner, El Toro, Eliminator, GG Code 59, HMX 5371, HMX 6364 BS, HMX 6383 S, HMX 8344 BS, Ice Queen, Sugar 73, Suregold, and Xtra Tender 171A) were classified as resistant/moderately resistant. These hybrids probably carry the gene *Mdm1*

or other major genes for MDM-resistance. Nine hybrids with 10 to 15% incidence of MDM-infected plants were classified as moderately resistant. Some of these 9 hybrids also may carry MDM-resistance genes, including seven that were classified as resistant or moderately resistant in previous trials (Esteem, GH 0934 A, GH 0937 A, GH 2783, HMX 3392 S, HMX 5348 BES, and Snow White).

Gray leaf spot: This is the first year that hybrids in the disease nursery have been screened for GLS. Ratings ranged from 2 to 6 with a mean of 3.9. Four hybrids with ratings below 2.5 were classified as resistant (BSS 8142, Day Star, Morning Star, and Sugar 73). Eleven hybrids with ratings between 2.5 and 3 were classified as moderately resistant (Crisp n Sweet 710A, GH 0990, GH 3054, GG Code 27, GSS 3381, HMX 8343 BS, Precious Gem, Sugar 74bt, Summer Sweet 8100, Summer Sweet 8100 R, and Xtra Tender 182A). While these hybrids had less severe symptoms in this nursery, additional trials are necessary to confirm reactions of hybrids to GLS and to determine if these reactions will control GLS adequately.

Endo = endosperm type: su = sugary, se = sugary enhancer, sesu = heterozygous sugary enhancer, sb = sweet bred, sh2 - shrunken-2, bt = brittle

KC = kernel color: B = bicolor, W = white, Y = yellow, R = red

SdCo = seed source: AC = Abbott & Cobb, Agw = Agway, Asg = Asgrow, Cr = Crookham, GG = Green Giant,

HM = Harris Moran, HS = Harris Seeds, IFS = Illinois Foundation Seeds, Mes = Mesa Maize,

Rog = Rogers Novartis, Sak = Sakata, Sen = Seneca Hybrids (Seminis)

Rate = Disease rating: 0 to 100% leaf area infected (rust, NLB), 0 to 100% systemically infected plants (Stewart's wilt incidence, MDM), 1 to 9 (Stewart's wilt severity, SLB and GLS leaf symptoms)

Rxn = classification of hybrid disease reaction: 0 - Rp-resistant
 1 - resistant
 3 - moderately resistant
 5 - moderate
 7 - moderately susceptible
 9 - susceptible.
