HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire HAL, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# HOPF ALGEBRA STRUCTURE ON PACKED SQUARE MATRICES 

HAYAT CHEBALLAH, SAMUELE GIRAUDO, AND RÉMI MAURICE

#### Abstract

We construct a new bigraded Hopf algebra whose bases are indexed by square matrices with entries in the alphabet $\{0,1, \ldots, k\}, k \geqslant 1$, without null rows or columns. This Hopf algebra generalizes the one of permutations of Malvenuto and Reutenauer, the one of $k$-colored permutations of Novelli and Thibon, and the one of uniform block permutations of Aguiar and Orellana. We study the algebraic structure of our Hopf algebra and show, by exhibiting multiplicative bases, that it is free. We moreover show that it is self-dual and admits a bidendriform bialgebra structure. Besides, as a Hopf subalgebra, we obtain a new one indexed by alternating sign matrices. We study some of its properties and algebraic quotients defined through alternating sign matrices statistics.

## Introduction

The combinatorial class of permutations is naturally endowed with two operations. One of them, called shifted shuffle product, takes two permutations as input and put these together by blending their letters. The other one, called deconcatenation coproduct, takes one permutation as input and

[^0]takes it apart by cutting it into prefixes and suffixes. These two operations satisfy certain compatibility relations, resulting in that the vector space spanned by the set of permutations forms a Hopf algebra [MR95], namely the Malvenuto-Reutenauer Hopf algebra, also known as FQSym [DHT02].

This Hopf algebra plays a central role in algebraic combinatorics for at least two reasons. On the one hand, FQSym contains, as Hopf subalgebras, several structures based on well-known combinatorial objects as e.g., standard Young tableaux [DHT02], binary trees [HNT05], and integer compositions [GKL $\left.{ }^{+} 95\right]$. The construction of these substructures revisits many algorithms coming from computer science and combinatorics. Indeed, the insertion of a letter into a Young tableau (following Robinson-Schensted [Sch61]) or in a binary search tree [Knu98] are algorithms which prove to be as enlightening as surprising in this algebraic context [DHT02, HNT02, HNT05]. On the other hand, the polynomial realization of FQSym allows to associate a polynomial with any permutation [DHT02] providing a generalization of symmetric functions, the free quasi-symmetric functions. This generalization offers alternative ways to prove several properties of (quasi)symmetric functions.

It is thus natural to enrich this theory by proposing generalizations of FQSym. In the last years, several generalizations were proposed and each of these depends on the way we regard permutations. By regarding a permutation as a word and allowing repetitions of letters, Hivert introduced in [Hiv99] (see [NT06] for a detailed study) a Hopf algebra WQSym on packed words. Additionally, by allowing some jumps for the values of the letters of permutations, Novelli and Thibon defined in [NT07] another Hopf algebra PQSym which involves parking functions. These authors also showed in [NT10] that the $k$-colored permutations admit a Hopf algebra structure FQSym ${ }^{(k)}$. Furthermore, by regarding a permutation $\sigma$ as a bijection associating the singleton $\{\sigma(i)\}$ with any singleton $\{i\}$, Aguiar and Orellana constructed [AO08] a Hopf algebra structure UBP on uniform block permutations, i.e., bijections between set partitions of [ $n$ ], where each part has the same cardinality as its image. Finally, by regarding a permutation within its permutation matrix, Duchamp, Hivert and Thibon introduced in [DHT02] a Hopf algebra MQSym which involves some kind of integer matrices.

In this paper we propose a new generalization of FQSym by regarding permutations as permutation matrices. For this purpose, we consider the set of 1-packed matrices that are square matrices with entries in the alphabet $\{0,1\}$ which have at least one 1 by row and by column. By equipping these matrices with a product and a coproduct, we obtain a bigraded Hopf algebra, denoted by $\mathbf{P M}_{1}$. By only considering the gradation offered by the size (resp. the number of nonzero entries) of matrices, we obtain a simply graded Hopf algebra denoted by $\mathbf{P M} \mathbf{N}_{1}$ (resp. $\mathbf{P M L}_{1}$ ). Note that since permutation matrices form a Hopf subalgebra of $\mathbf{P M} \mathbf{N}_{1}$ (and $\mathbf{P M L} \mathbf{L}_{1}$ ) isomorphic to $\mathbf{F Q S y m}$, $\mathbf{P M N} \mathbf{N}_{1}$ (and $\mathbf{P M L}_{1}$ ) provides a generalization of $\mathbf{F Q S y m}$. Now, by allowing the entries different from 0 of a packed matrix to belong to the alphabet $\{1, \ldots, k\}$ where $k$ is a positive integer, we obtain the notion of a $k$-packed matrix. The definition of $\mathbf{P} \mathbf{M}_{1}$ (and $\mathbf{P M} \mathbf{N}_{1}$ and $\mathbf{P} \mathbf{M L}_{1}$ ) obviously extends to these matrices and leads to the Hopf algebra $\mathbf{P} \mathbf{M}_{k}$ (and $\mathbf{P} \mathbf{M} \mathbf{N}_{k}$ and $\mathbf{P M L}{ }_{k}$ ) involving $k$-packed matrices. Besides, since any $k$-packed matrix is also a $k+1$-packed matrix, $\left(\mathbf{P} \mathbf{M}_{k}\right)_{k \geqslant 1}$ is an increasing infinite sequence of Hopf algebras for inclusion.

Our results are presented as follows. We give in Section 1 some elementary definitions about $k$-packed matrices, enumerate them according to their size, and then define the Hopf algebra of $k$-packed matrices by describing its product and its coproduct. Section 2 is devoted to the study of the algebraic properties of $\mathbf{P} \mathbf{M}_{k}$. In order to show that $\mathbf{P} \mathbf{M}_{k}$ is free as an algebra, we define, by introducing a partial order relation on the $k$-packed matrices, two multiplicative bases: the bases of the elementary and homogeneous elements. We then describe the dual Hopf algebra $\mathbf{P} \mathbf{M}_{k}{ }^{*}$ of $\mathbf{P} \mathbf{M}_{k}$ in explaining the product and the coproduct and show that $\mathbf{P} \mathbf{M}_{k}$ is self-dual. In Section 3, we show how several well-known Hopf algebras are linked with $\mathbf{P M}_{k}$. In particular, we show that the Hopf
algebra of the $k$-colored permutations $\mathbf{F Q S y m}{ }^{(k)}$ embeds into $\mathbf{P M N}{ }_{k}$ (and $\mathbf{P M L}{ }_{k}$ ) and that the dual $\mathbf{U B P}^{\star}$ of the Hopf algebra of uniform block permutations embeds into $\mathbf{P M} \mathbf{N}_{1}$. We also exhibit an injective algebra morphism from $\mathbf{P M L}_{1}{ }^{\star}$ to $\mathbf{M Q S y m}$. We conclude this section by providing a method to construct Hopf subalgebras of $\mathbf{P} \mathbf{M}_{k}$, analogous to the construction of Hopf subalgebras of FQSym by good congruences [HN07, Gir11]. The analogs of the sylvester [HNT02, HNT05], plactic [LS81, Lot02], hypoplactic [KT97, KT99], Bell [Rey07], and Baxter [Gir12] congruences are still good congruences in our context and give rise to Hopf subalgebras of $\mathbf{P} \mathbf{M}_{k}$. We end this article by Section 4 where we show that $\mathbf{P M N} \mathbf{N}_{1}$ contains a Hopf subalgebra whose bases are indexed by alternating sign matrices, denoted by ASM. We consider then some well-known statistics on the six-vertex model with domain wall boundary conditions [Kor82], that are combinatorial objects in bijection with alternating sign matrices [Kup96,Bre99]. We study these statistics from the algebraic point of view offered by the Hopf algebra ASM. This section is concluded with a complete study of quotients of ASM by equivalence relations defined through these statistics.

Acknowledgements. This work is based on computer exploration and the authors used, for this purpose, the open-source mathematical software Sage $\left[\mathrm{S}^{+} 12\right]$ and one of its extensions, SageCombinat [SCc08]. The authors would like to thank the anonymous referees which, by their suggestions, greatly improved Sections 3.2, 4.2, and 4.3.

## 1. Packed matrices

1.1. Definitions. Let $k \geqslant 1$ be an integer. We denote by $\mathcal{M}_{k, n, \ell}$ the set of $n \times n$ matrices with exactly $\ell$ nonzero entries in the alphabet $A_{k}:=\{0,1, \ldots, k\}$ and by $\mathrm{N}_{\mathrm{r}}(M)$ (resp. $\left.\mathrm{N}_{\mathrm{c}}(M)\right)$ the set of the indices of the zero rows (resp. columns) of $M \in \mathcal{M}_{k, n, \ell}$. For example, consider the matrix

$$
M:=\left[\begin{array}{lllllll}
0 & 1 & 0 & 0 & 1 & 0  \tag{1.1.1}\\
0 & 0 & 0 & 1 & 0 & 1 \\
0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 1 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 1
\end{array}\right] .
$$

We have

$$
\begin{equation*}
\mathrm{N}_{\mathrm{r}}(M)=\{5\} \quad \text { and } \quad \mathrm{N}_{\mathrm{c}}(M)=\{1,3\} \tag{1.1.2}
\end{equation*}
$$

A $k$-packed matrix $M$ of size $n$ is a matrix in $\bigcup_{\ell \geqslant 0} \mathcal{M}_{k, n, \ell}$ in which each row and each column contains at least one entry different from 0 , that is to say if the subsets $\mathrm{N}_{\mathrm{r}}(M)$ and $\mathrm{N}_{\mathrm{c}}(M)$ are empty.

We shall denote in the sequel by $\mathcal{P}_{k, n, \ell}$ the set of $k$-packed matrices of size $n$ with exactly $\ell$ nonzero entries, by $\mathcal{P}_{k, n,-}$ the set of all $k$-packed matrices of size $n$, by $\mathcal{P}_{k,-, \ell}$ the set of all $k$-packed matrices with exactly $\ell$ nonzero entries, and by $\mathcal{P}_{k}$ the set of all $k$-packed matrices. The $k$-packed matrix of size 0 is denoted by $\emptyset$. For instance, the seven 1 -packed matrices of size 2 are

$$
\left[\begin{array}{ll}
1 & 0  \tag{1.1.3}\\
0 & 1
\end{array}\right], \quad\left[\begin{array}{ll}
0 & 1 \\
1 & 0
\end{array}\right], \quad\left[\begin{array}{ll}
1 & 1 \\
1 & 0
\end{array}\right], \quad\left[\begin{array}{ll}
1 & 1 \\
0 & 1
\end{array}\right], \quad\left[\begin{array}{ll}
1 & 0 \\
1 & 1
\end{array}\right], \quad\left[\begin{array}{ll}
0 & 1 \\
1 & 1
\end{array}\right], \quad\left[\begin{array}{ll}
1 & 1 \\
1 & 1
\end{array}\right] .
$$

Besides, the ten 1 -packed matrices of $\mathcal{P}_{1,-, 3}$ are

$$
\left[\begin{array}{ll}
1 & 1  \tag{1.1.4}\\
1 & 0
\end{array}\right],\left[\begin{array}{ll}
1 & 1 \\
0 & 1
\end{array}\right],\left[\begin{array}{ll}
1 & 0 \\
1 & 1
\end{array}\right],\left[\begin{array}{ll}
0 & 1 \\
1 & 1
\end{array}\right],\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 0 \\
0 & 0 & 1
\end{array}\right],\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 0 & 1 \\
0 & 1 & 0
\end{array}\right],\left[\begin{array}{lll}
0 & 1 & 0 \\
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right],\left[\begin{array}{lll}
0 & 0 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right],\left[\begin{array}{lll}
0 & 1 & 0 \\
0 & 0 & 1 \\
1 & 0 & 0
\end{array}\right],\left[\begin{array}{lll}
0 & 0 & 1 \\
0 & 1 & 0 \\
1 & 0 & 0
\end{array}\right] .
$$

Let us now define some operations on packed matrices. We shall denote by $Z_{n}^{m}$ the $n \times m$ null matrix. Given $M_{1}$ and $M_{2}$ two $k$-packed matrices of respective sizes $n_{1}$ and $n_{2}$, set

$$
M_{1} / M_{2}:=\left[\begin{array}{c|c}
M_{1} & Z_{n_{1}}^{n_{2}}  \tag{1.1.5}\\
\hline Z_{n_{2}}^{n_{1}} & M_{2}
\end{array}\right] \quad \text { and } \quad M_{1} \backslash M_{2}:=\left[\begin{array}{c|c}
Z_{n_{1}}^{n_{2}} & M_{1} \\
\hline M_{2} & Z_{n_{2}}^{n_{1}}
\end{array}\right]
$$

Note that these two matrices are $k$-packed matrices of size $n_{1}+n_{2}$. We shall respectively call / and $\backslash$ the over and under operators. These two operators are obviously associative.

Given a matrix $M$ whose entries are elements of the alphabet $A_{k}$, the compression of $M$ is the matrix $\operatorname{cp}(M)$ obtained by deleting in $M$ all null rows and columns. Let $M$ be a $k$-packed matrix. The tuple $\left(M_{1}, \ldots, M_{r}\right)$ is a column decomposition of $M$, and we write $M=M_{1} \bullet \cdots \bullet M_{r}$, if for all $i \in[r]$ the $\mathrm{cp}\left(M_{i}\right)$ are square matrices (and not necessarily column matrices) and

$$
\begin{equation*}
M=\left[M_{1}|\ldots| M_{r}\right] \tag{1.1.6}
\end{equation*}
$$

Similarly, the tuple $\left(M_{1}, \ldots, M_{r}\right)$ is a row decomposition of $M$, and we write $M=M_{1} \circ \cdots \circ M_{r}$, if for all $i \in[r]$ the $\mathrm{cp}\left(M_{i}\right)$ are square matrices (and not necessarily row matrices) and

$$
M=\left[\begin{array}{c}
\frac{M_{1}}{\ldots}  \tag{1.1.7}\\
\frac{\ldots}{M_{r}}
\end{array}\right] .
$$

For instance, here are a 1-packed matrix of size 5 , one of its column decompositions and one of its row decompositions:

$$
\left.\left[\begin{array}{lllll}
0 & 1 & 1 & 0 & 0  \tag{1.1.8}\\
0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 & 1 \\
1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 1
\end{array}\right]=\left[\begin{array}{lll}
0 & 1 & 1 \\
0 & 0 & 1 \\
0 & 0 & 0 \\
1 & 0 & 0 \\
0 & 0 & 0
\end{array}\right] \bullet\left[\begin{array}{lll}
0 & 0 \\
0 & 0 \\
1 & 1 \\
0 & 0 \\
1 & 1
\end{array}\right]=\left[\begin{array}{llll}
0 & 1 & 1 & 0
\end{array}\right] \begin{array}{ll}
0 & 0
\end{array} 10000\right]\left[\begin{array}{lllll}
0 & 0 & 0 & 1 & 1 \\
1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 1
\end{array}\right]
$$

These two decompositions have the following property.
Lemma 1.1. Let $M$ be a packed square matrix and $\left(M_{1}, M_{2}\right)$ be a column (resp. row) decomposition of $M$. Then, there is no integer $i$ such that the ith rows (resp. columns) of $M_{1}$ and $M_{2}$ contain both a nonzero entry.

Proof. We prove here the lemma only when $\left(M_{1}, M_{2}\right)$ is a column decomposition of $M$. The case of a row decomposition can be proven in an analogous way.

Let us denote by $n$ the size of $M$ and assume that $M_{1}$ (resp. $M_{2}$ ) has $n_{1}$ (resp. $n_{2}$ ) columns. The lemma follows from the fact that since $\left(M_{1}, M_{2}\right)$ is a column decomposition of $M$, there are $n_{1}$ nonzero rows in $M_{1}, n_{2}$ nonzero rows in $M_{2}$, and $n=n_{1}+n_{2}$.

Lemma 1.1 provides a sufficient condition to ensure that a given pair ( $M_{1}, M_{2}$ ) of matrices cannot be a column (resp. row) decomposition of a matrix $M$. Nevertheless, it is not a necessary condition. Indeed, let

$$
M:=\left[\begin{array}{lll}
1 & 1 & 0  \tag{1.1.9}\\
0 & 0 & 1 \\
0 & 0 & 1
\end{array}\right] \quad \text { and } \quad\left(M_{1}, M_{2}\right):=\left(\left[\begin{array}{ll}
1 & 1 \\
0 & 0 \\
0 & 0
\end{array}\right],\left[\begin{array}{l}
0 \\
1 \\
1
\end{array}\right]\right) .
$$

Then, even if there is no nonzero entry on the same row in $M_{1}$ and $M_{2},\left(M_{1}, M_{2}\right)$ is not a column decomposition of $M$.
1.2. Enumeration. Using the sieve principle, we obtain the following enumerative result.

Proposition 1.2. For any $k \geqslant 1, n \geqslant 0$, and $\ell \geqslant 0$, the number $\# \mathcal{P}_{k, n, \ell}$ of $k$-packed matrices of size $n$ with exactly $\ell$ nonzero entries is

$$
\begin{equation*}
\# \mathcal{P}_{k, n, \ell}=\sum_{0 \leqslant i, j \leqslant n}(-1)^{i+j}\binom{n}{i}\binom{n}{j}\binom{i j}{\ell} k^{\ell} . \tag{1.2.1}
\end{equation*}
$$

Proof. For any subsets $R$ and $C$ of $[n]$ let us define the set

$$
\begin{equation*}
\mathcal{S}(R, C):=\left\{M \in \mathcal{M}_{k, n, \ell}: \mathrm{N}_{\mathrm{r}}(M)=R \text { and } \mathrm{N}_{\mathrm{c}}(M)=C\right\} \tag{1.2.2}
\end{equation*}
$$

Since $\# \mathcal{P}_{k, n, \ell}=\# \mathcal{S}(\emptyset, \emptyset)$, we shall compute $\# \mathcal{S}(\emptyset, \emptyset)$ to prove (1.2.1).
For that, let us consider the order relation $\leqslant$ defined on the set of pairs $(R, C)$ of subsets of $[n]$ by

$$
\begin{equation*}
\left(R_{1}, C_{1}\right) \leqslant\left(R_{2}, C_{2}\right) \quad \text { if and only if } \quad R_{1} \subseteq R_{2} \text { and } C_{1} \subseteq C_{2} \tag{1.2.3}
\end{equation*}
$$

We have, by setting $r:=\# R$ and $c:=\# C$,

$$
\begin{equation*}
\sum_{(R, C) \leqslant\left(R^{\prime}, C^{\prime}\right)} \# \mathcal{S}\left(R^{\prime}, C^{\prime}\right)=\binom{(n-r)(n-c)}{\ell} k^{\ell} \tag{1.2.4}
\end{equation*}
$$

since (1.2.4) is the number of matrices $M \in \mathcal{M}_{k, n, \ell}$ such that $R \subseteq \mathrm{~N}_{\mathrm{r}}(M)$ and $C \subseteq \mathrm{~N}_{\mathrm{c}}(M)$. Then, by Möbius inversion on the Boolean lattice, we obtain

$$
\begin{equation*}
\# \mathcal{S}(\emptyset, \emptyset)=\sum_{(\emptyset, \emptyset) \leqslant(R, C)}(-1)^{r+c}\binom{(n-r)(n-c)}{\ell} k^{\ell} \tag{1.2.5}
\end{equation*}
$$

and (1.2.1) follows.

Table 1 shows the first few values of $\# \mathcal{P}_{k, n, \ell}$. The enumeration in the case $k=1$ is Sequence A055599 of [Slo].
(a) Number of 1-packed matrices.

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 1 |  |  |  |  |  |  |  |  |  |
| 1 |  | 1 |  |  |  |  |  |  |  |  |
| 2 |  |  | 2 | 4 | 1 |  |  |  |  |  |
| 3 |  |  |  | 6 | 45 | 90 | 78 | 36 | 9 | 1 |

(b) Number of 2-packed matrices.

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | 1 |  |  |  |  |  |  |  |  |  |
| 1 |  | 2 |  |  |  |  |  |  |  |  |
| 2 |  |  | 8 | 32 | 16 |  |  |  |  |  |

TABLE 1. The number of $k$-packed matrices of size $n$ (vertical values) with exactly $\ell$ nonzero entries (horizontal values).

Notice that for any $n \geqslant 0$, since

$$
\begin{equation*}
\mathcal{P}_{k, n,-}=\biguplus_{n \leqslant \ell \leqslant n^{2}} \mathcal{P}_{k, n, \ell} \tag{1.2.6}
\end{equation*}
$$

the set $\mathcal{P}_{k, n,-}$ is finite. Hence, by using Proposition 1.2, we obtain

$$
\begin{equation*}
\# \mathcal{P}_{k, n,-}=\sum_{0 \leqslant i, j \leqslant n}(-1)^{i+j}\binom{n}{i}\binom{n}{j}(k+1)^{i j} \tag{1.2.7}
\end{equation*}
$$

Sequences $\left(\# \mathcal{P}_{1, n,-}\right)_{n \geqslant 0}$ and $\left(\# \mathcal{P}_{2, n,-}\right)_{n \geqslant 0}$ respectively start with

$$
\begin{equation*}
1,1,7,265,41503,24997921,57366997447, \quad[\text { Slo, A048291] } \tag{1.2.8}
\end{equation*}
$$

and
$1,2,56,16064,39156608,813732073472,147662286695991296$.

Similarly, since for any $\ell \geqslant 0$,

$$
\begin{equation*}
\mathcal{P}_{k,-, \ell}=\biguplus_{\lceil\sqrt{\ell}\rceil \leqslant n \leqslant \ell} \mathcal{P}_{k, n, \ell} \tag{1.2.10}
\end{equation*}
$$

the set $\mathcal{P}_{k,-, \ell}$ is finite. Hence, by using Proposition 1.2, we obtain

$$
\begin{equation*}
\# \mathcal{P}_{k,-, \ell}=\sum_{0 \leqslant i, j \leqslant n \leqslant \ell}(-1)^{i+j}\binom{n}{i}\binom{n}{j}\binom{i j}{\ell} k^{\ell} . \tag{1.2.11}
\end{equation*}
$$

Sequences $\left(\# \mathcal{P}_{1,-, \ell}\right)_{\ell \geqslant 0}$ and $\left(\# \mathcal{P}_{2,-, \ell}\right)_{\ell \geqslant 0}$ respectively start with

$$
\begin{equation*}
1,1,2,10,70,642,7246,97052,1503700, \quad[\text { Slo, A104602] } \tag{1.2.12}
\end{equation*}
$$

and

$$
\begin{equation*}
1,2,8,80,1120,20544,463744,12422656,384947200 \tag{1.2.13}
\end{equation*}
$$

1.3. Hopf algebra structure. In the sequel, all the algebraic structures have a field $\mathbb{K}$ of characteristic zero as ground field.

Let for any $k \geqslant 1$

$$
\begin{equation*}
\mathbf{P M}_{k}:=\bigoplus_{n \geqslant 0} \bigoplus_{\ell \geqslant 0} \operatorname{Vect}\left(\mathcal{P}_{k, n, \ell}\right) \tag{1.3.1}
\end{equation*}
$$

be the bigraded vector space spanned by the set of all $k$-packed matrices. The elements $\mathbf{F}_{M}$, where the $M$ are $k$-packed matrices, form a basis of $\mathbf{P} \mathbf{M}_{k}$. We shall call this basis the fundamental basis of $\mathbf{P} \mathbf{M}_{k}$.

Given $M_{1}$ and $M_{2}$ two $k$-packed matrices of respective sizes $n_{1}$ and $n_{2}$, set

$$
\begin{equation*}
M_{1} \circ n_{2}:=\left[\frac{M_{1}}{Z_{n_{2}}^{n_{1}}}\right] \quad \text { and } \quad n_{1} \circ M_{2}:=\left[\frac{Z_{n_{1}}^{n_{2}}}{M_{2}}\right] . \tag{1.3.2}
\end{equation*}
$$

The column shifted shuffle $M_{1} \bar{\amalg} M_{2}$ of $M_{1}$ and $M_{2}$ is the set of all matrices obtained by shuffling the columns of $M_{1} \circ n_{2}$ with the columns of $n_{1} \circ M_{2}$.

Let us endow $\mathbf{P M}_{k}$ with a product • linearly defined, for any $k$-packed matrices $M_{1}$ and $M_{2}$, by

$$
\begin{equation*}
\mathbf{F}_{M_{1}} \cdot \mathbf{F}_{M_{2}}:=\sum_{M \in M_{1} \bar{W} M_{2}} \mathbf{F}_{M} . \tag{1.3.3}
\end{equation*}
$$

For instance, in $\mathbf{P M}_{1}$ one has

$$
\left.\begin{array}{rl}
\mathbf{F}_{[l l}^{0} \begin{array}{l}
1 \\
1
\end{array} & 1
\end{array}\right] \cdot \mathbf{F}_{\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]}=\mathbf{F}\left[\begin{array}{llll}
0 & 1 & 0 & 0  \tag{1.3.4}\\
1 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 0 & 1 \\
1 & 0 & 0 & 1 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0
\end{array}\right] .
$$

Moreover, we endow $\mathbf{P M}_{k}$ with a coproduct $\Delta$ linearly defined, for any $k$-packed matrix $M$, by

$$
\begin{equation*}
\Delta\left(\mathbf{F}_{M}\right):=\sum_{M=M_{1} \bullet M_{2}} \mathbf{F}_{\mathrm{cp}\left(M_{1}\right)} \otimes \mathbf{F}_{\mathrm{cp}\left(M_{2}\right)} \tag{1.3.5}
\end{equation*}
$$

For instance, in $\mathbf{P M}_{1}$ one has

$$
\Delta \mathbf{F}\left[\begin{array}{llll}
1 & 1 & 0 & 0  \tag{1.3.6}\\
0 & 0 & 0 & 1 \\
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 0
\end{array}\right]=\mathbf{F}\left[\begin{array}{llll}
1 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 \\
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 0
\end{array}\right] \otimes \mathbf{F}_{\emptyset}+\mathbf{F}_{\left[\begin{array}{lll}
1 & 1 & 0 \\
1 & 0 & 1 \\
0 & 1 & 0
\end{array}\right] \otimes \mathbf{F}_{[1]}+\mathbf{F}_{\emptyset} \otimes \mathbf{F}\left[\begin{array}{llll}
1 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 \\
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 0
\end{array}\right] . . . . ~}^{\text {. }}
$$

Note that by definition, the product and the coproduct of $\mathbf{P} \mathbf{M}_{k}$ are multiplicity free.

Theorem 1.3. The vector space $\mathbf{P M}_{k}$ endowed with the product • and the coproduct $\Delta$ is a bigraded and connected bialgebra where homogeneous components are finite-dimensional.

Proof. First, it is plain that the product of $\mathbf{P} \mathbf{M}_{k}$ respects the bigradation. Moreover, Lemma 1.1 implies that it is also the case for its coproduct. Since $\emptyset$ is the only packed matrix of size 0 without nonzero entries, $\mathbf{P M}_{k}$ is connected. Besides, since for all $n, \ell \geqslant 0$, the sets $\mathcal{P}_{k, n, \ell}$ are finite, homogeneous components of $\mathbf{P} \mathbf{M}_{k}$ are finite-dimensional.

The associativity of • arises from the associativity of the shifted shuffle operation on words on a totally ordered alphabet. Indeed, a packed matrix $M$ can be seen as a word $u$ where the $i$ th letter of $u$ is the $i$ th column of $M$. Moreover, the coassociativity of $\Delta$ comes from the fact that $\left(M_{1} \bullet M_{2}\right) \bullet M_{3}$ is a column decomposition of a packed matrix $M$ if and only if $M_{1} \bullet\left(M_{2} \bullet M_{3}\right)$ also is.

It remains to show that $\Delta$ is an algebra morphism. Let $M_{1}$ and $M_{2}$ be two packed matrices. The obvious fact that $(L, R)$ is a column decomposition of a matrix $M$ appearing in the shifted shuffle of $M_{1}$ and $M_{2}$ if and only if $L$ (resp. $R$ ) appears in the shifted shuffle of $L_{1}$ and $L_{2}$ (resp. $R_{1}$ and $R_{2}$ ) where ( $L_{1}, R_{1}$ ) is a column decomposition of $M_{1}$ and $\left(L_{2}, R_{2}\right)$ is a column decomposition of $M_{2}$, ensures that $\Delta$ is an algebra morphism.

Since $\mathbf{P M}_{k}$ is, by Theorem 1.3, a bigraded and connected bialgebra, it admits an antipode and hence, is a Hopf algebra. The antipode $S$ of $\mathbf{P} \mathbf{M}_{k}$ satisfies, for any $k$-packed matrix $M$,

$$
\begin{equation*}
S\left(\mathbf{F}_{M}\right)=\sum_{\substack{\ell \geqslant 1 \\ M=M_{1} \bullet \cdots \bullet M_{\ell} \\ M_{i} \neq \emptyset, i \in[\ell]}}(-1)^{\ell} \mathbf{F}_{\mathrm{cp}\left(M_{1}\right)} \cdot \ldots \cdot \mathbf{F}_{\mathrm{cp}\left(M_{\ell}\right)} . \tag{1.3.7}
\end{equation*}
$$

For instance, in $\mathbf{P M}_{1}$ one has

$$
\begin{align*}
& S \mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right]}=-\mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right]}+\mathbf{F}_{[1]} \cdot \mathbf{F}_{\left[\begin{array}{ll}
1 & 1 \\
1 & 0
\end{array}\right]} \\
& =\mathbf{F}_{\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 1 \\
0 & 1 & 0
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 0 \\
1 & 0 & 1 \\
1 & 0 & 0
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{lll}
0 & 0 & 1 \\
1 & 1 & 0 \\
1 & 0 & 0
\end{array}\right]}-\mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right] .} \tag{1.3.8}
\end{align*}
$$

Note besides that $S$ is not an involution. Indeed,

$$
\begin{align*}
S^{2} \mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right]}=\mathbf{F}_{\left[\begin{array}{lll}
1 & 1 & 0 \\
1 & 0 & 0 \\
0 & 0 & 1
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{lll}
1 & 0 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 1 \\
0 & 1 & 0 \\
1 & 0 & 0
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 1 \\
1 & 0 & 0 \\
0 & 1 & 0
\end{array}\right]}^{\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 1 \\
0 & 1 & 0
\end{array}\right]} \mathbf{F}_{\left[\begin{array}{lll}
0 & 1 & 0 \\
1 & 0 & 1 \\
1 & 0 & 0
\end{array}\right]}-\mathbf{F}\left[\begin{array}{lll}
0 & 0 & 1 \\
1 & 1 & 0 \\
1 & 0 & 0
\end{array}\right] \tag{1.3.9}
\end{align*}
$$

Notice that since any $k$-packed matrix is also a $k+1$-packed matrix, the vector space $\mathbf{P} \mathbf{M}_{k}$ is included in $\mathbf{P} \mathbf{M}_{k+1}$. Hence, and by Theorem 1.3,

$$
\begin{equation*}
\mathbf{P M}_{1} \hookrightarrow \mathbf{P M}_{2} \hookrightarrow \cdots \tag{1.3.10}
\end{equation*}
$$

is an increasing infinite sequence of Hopf algebras for inclusion. The first few dimensions of $\mathbf{P} \mathbf{M}_{1}$ and $\mathbf{P M}_{2}$ are given by Table 1.

Let us now set

$$
\begin{equation*}
\mathbf{P M N}_{k}:=\bigoplus_{n \geqslant 0} \operatorname{Vect}\left(\mathcal{P}_{k, n,-}\right) \quad \text { and } \quad \mathbf{P M L}_{k}:=\bigoplus_{\ell \geqslant 0} \operatorname{Vect}\left(\mathcal{P}_{k,-, \ell}\right) \tag{1.3.11}
\end{equation*}
$$

the vector spaces of $k$-packed matrices respectively graded by the size and by the number of nonzero entries of matrices. By Theorem 1.3, and since each homogeneous component of these vector spaces is finite-dimensional (see Section 1.2), $\mathbf{P M N}{ }_{k}$ and $\mathbf{P M L}{ }_{k}$ are Hopf algebras. Besides,

$$
\begin{equation*}
\mathbf{P M N}_{1} \hookrightarrow \mathbf{P M N}_{2} \hookrightarrow \cdots \quad \text { and } \quad \mathbf{P M L}_{1} \hookrightarrow \mathbf{P M L}_{2} \hookrightarrow \cdots \tag{1.3.12}
\end{equation*}
$$

are increasing infinite sequences of Hopf algebras for inclusion. The first few dimensions of $\mathbf{P M} \mathbf{N}_{1}$ and $\mathbf{P M N} \mathbf{N}_{2}$ are given by (1.2.8) and (1.2.9), and the first few dimensions of $\mathbf{P} \mathbf{M L}_{1}$ and $\mathbf{P M L} \mathbf{M}_{2}$ are given by (1.2.12) and (1.2.13). In the sequel, we shall denote by $\mathcal{H}_{k, n}(t)$ (resp. $\mathcal{H}_{k, \ell}(t)$ the Hilbert series of $\mathbf{P M} \mathbf{N}_{k}$ (resp. $\mathbf{P} \mathbf{M L}_{k}$ ).

## 2. Algebraic properties

### 2.1. Multiplicative bases and freeness.

2.1.1. Poset structure. We endow the set $\mathcal{P}_{k}$ with a binary relation $\rightarrow$ defined in the following way. If $M_{1}$ and $M_{2}$ are two $k$-packed matrices of size $n$, we have $M_{1} \rightarrow M_{2}$ if there is an index $i \in[n-1]$ such that, denoting by $s$ the number of 0 ending the $i$ th column of $M_{1}$, and by $p$ the number of 0 starting the $(i+1)$ st column of $M_{1}$, one has $s+p \geqslant n$ and $M_{2}$ is obtained from $M_{1}$ by exchanging its $i$ th and $(i+1)$ st columns (see Figure 1).

We now endow $\mathcal{P}_{k}$ with the partial order relation $\leqslant_{M}$ defined as the reflexive and transitive closure of $\rightarrow$. Figure 2 shows an interval of this partial order.

Notice that by regarding a permutation $\sigma$ of $\mathfrak{S}_{n}$ as its permutation matrix (i.e., the 1-packed matrix $M$ of size $n$ satisfying $M_{i j}=1$ if and only if $\sigma_{j}=i$ ), the poset $\left(\mathcal{P}_{k, n,-}, \leqslant_{\mathrm{M}}\right)$ restricted to permutation matrices is the right weak order on permutations [GR63].

Lemma 2.1. Let $M, A$ and $B$ be three packed matrices. Then,

Figure 1. The condition for swapping the $i$ th and $(i+1)$ st columns of a packed matrix according to the relation $\rightarrow$. The darker regions contain any entries and the white ones, only zeros.

Figure 2. The Hasse diagram of an interval for the order $\leqslant_{m}$ on packed matrices.
(1) $A / B \leqslant_{\mathrm{m}} M$ if and only if there are two packed matrices $A^{\prime}$ and $B^{\prime}$ such that $A \leqslant_{\mathrm{m}} A^{\prime}$, $B \leqslant_{\mathrm{m}} B^{\prime}$, and $M \in A^{\prime} \bar{\varpi} B^{\prime} ;$
(2) $M \leqslant_{\mathrm{m}} A \backslash B$ if and only if there are two packed matrices $A^{\prime}$ and $B^{\prime}$ such that $A^{\prime} \leqslant_{\mathrm{M}} A$, $B^{\prime} \leqslant \mathrm{m} B$, and $M \in A^{\prime} \bar{\varpi} B^{\prime}$.

Proof. Assume that $A / B \leqslant_{\mathrm{M}} M$. By definition of the order $\leqslant_{\mathrm{M}}, M$ can be obtained from $A / B$ by swapping columns coming from $A$ to obtain a matrix $A^{\prime}$ satisfying $A \leqslant_{\mathrm{m}} A^{\prime}$, by swapping columns coming from $B$ to obtain a matrix $B^{\prime}$ satisfying $B \leqslant_{\mathrm{m}} B^{\prime}$, and then, by swapping columns coming from $A^{\prime}$ and from $B^{\prime}$ together. Thereby, $M \in A^{\prime} \varpi B^{\prime}$.

Conversely assume that $A \leqslant_{\mathrm{M}} A^{\prime}, B \leqslant_{\mathrm{m}} B^{\prime}$, and $M \in A^{\prime} \bar{\nabla} B^{\prime}$. Then, by definition of the shifted shuffle product and the over operator, $A^{\prime} / B^{\prime} \leqslant_{\mathrm{M}} M$. This implies $A / B \leqslant_{\mathrm{M}} M$.

By very similar arguments, (2) is established.
2.1.2. Multiplicative bases. By mimicking definitions of the bases of symmetric functions, for any $k$ packed matrix $M$, the elementary elements $\mathbf{E}_{M}$ and the homogeneous elements $\mathbf{H}_{M}$ are respectively defined by

$$
\begin{equation*}
\mathbf{E}_{M}:=\sum_{M \leqslant \mu M^{\prime}} \mathbf{F}_{M^{\prime}} \quad \text { and } \quad \mathbf{H}_{M}:=\sum_{M^{\prime} \leqslant M M} \mathbf{F}_{M^{\prime}} \tag{2.1.1}
\end{equation*}
$$

By triangularity, these two families are bases of $\mathbf{P} \mathbf{M}_{k}$. For instance, in $\mathbf{P} \mathbf{M}_{1}$ one has

$$
\mathbf{E}_{\left[\begin{array}{llll}
1 & 0 & 0 & 0  \tag{2.1.2}\\
1 & 0 & 0 & 1 \\
0 & 0 & 1 & 1 \\
0 & 1 & 0 & 0
\end{array}\right]=\mathbf{F}\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
1 & 0 & 0 & 1 \\
0 & 0 & 1 & 1 \\
0 & 1 & 0 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 1 & 0 & 1 \\
0 & 0 & 1 & 1 \\
1 & 0 & 0 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 0 & 1 & 1 \\
0 & 1 & 0 & 1 \\
1 & 0 & 0 & 0
\end{array}\right],, ~(, ~}^{l}
$$

and

$$
\mathbf{H}_{\left[\begin{array}{llll}
0 & 1 & 0 & 0  \tag{2.1.3}\\
0 & 1 & 0 & 1 \\
1 & 0 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right]=\mathbf{F}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 1 & 0 & 1 \\
1 & 0 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 1 & 1 & 0 \\
1 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
1 & 0 & 0 & 1 \\
0 & 1 & 0 & 1 \\
0 & 0 & 1 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
1 & 0 & 0 & 0 \\
1 & 0 & 1 & 0 \\
0 & 1 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right] . . . ~}^{\text {. }}
$$

Proposition 2.2. The elements appearing in a product of $\mathbf{P M}_{k}$ expressed in the fundamental basis form an interval for the $\leqslant_{\mathrm{m}}$-partial order. More precisely, for any $k$-packed matrices $M_{1}$ and $M_{2}$,

$$
\begin{equation*}
\mathbf{F}_{M_{1}} \cdot \mathbf{F}_{M_{2}}=\sum_{M_{1} / M_{2} \leqslant M M \leqslant M M_{1} \backslash M_{2}} \mathbf{F}_{M} \tag{2.1.4}
\end{equation*}
$$

Proof. It is plain that the left and right-hand side of (2.1.4) are multiplicity-free. Then, it is enough to show that the sets $M_{1} \bar{\varpi} M_{2}$ and $\left[M_{1} / M_{2}, M_{1} \backslash M_{2}\right]$ are equal. This is a consequence of Lemma 2.1.

Proposition 2.3. The product of $\mathbf{P} \mathbf{M}_{k}$ satisfies, for any $k$-packed matrices $M_{1}$ and $M_{2}$,

$$
\begin{equation*}
\mathbf{E}_{M_{1}} \cdot \mathbf{E}_{M_{2}}=\mathbf{E}_{M_{1} / M_{2}} \quad \text { and } \quad \mathbf{H}_{M_{1}} \cdot \mathbf{H}_{M_{2}}=\mathbf{H}_{M_{1} \backslash M_{2}} \tag{2.1.5}
\end{equation*}
$$

Proof. We shall prove the product rule for the elementary basis by expanding $\mathbf{E}_{M_{1}} \cdot \mathbf{E}_{M_{2}}$ and $\mathbf{E}_{M_{1} / M_{2}}$ over the fundamental basis. First, since any element $\mathbf{F}_{N}$, where $N$ is a packed matrix, appearing in $\mathbf{E}_{M_{1}} \cdot \mathbf{E}_{M_{2}}$ is obtained by shifting and shuffing two matrices $N_{1}$ and $N_{2}$ such that $M_{1} \leqslant N_{1}$ and $M_{2} \leqslant_{\mathrm{M}} N_{2}, \mathbf{E}_{M_{1}} \cdot \mathbf{E}_{M_{2}}$ is multiplicity-free over the fundamental basis. Moreover, by definition of the elementary basis, $\mathbf{E}_{M_{1} / M_{2}}$ is multiplicity-free over the fundamental basis.

Therefore, it is enough to prove that the sets

$$
\begin{equation*}
\left\{N \in N_{1} \bar{\amalg} N_{2}: M_{1} \leqslant_{\mathrm{M}} N_{1} \text { and } M_{2} \leqslant_{\mathrm{M}} N_{2}\right\} \tag{2.1.6}
\end{equation*}
$$

and

$$
\begin{equation*}
\left\{N \in \mathcal{P}_{k}: M_{1} / M_{2} \leqslant_{\mathrm{M}} N\right\} \tag{2.1.7}
\end{equation*}
$$

are equal. This is exactly (1) of Lemma 2.1.
The proof for the homogeneous basis is analogous.
2.1.3. Freeness. Given a $k$-packed matrix $M \neq \emptyset$, we say that $M$ is connected (resp. anti-connected) if, for all $k$-packed matrices $M_{1}$ and $M_{2}, M=M_{1} / M_{2}\left(\right.$ resp. $\left.M=M_{1} \backslash M_{2}\right)$ implies $M_{1}=M$ or $M_{2}=M$.

Theorem 2.4. The Hopf algebra $\mathbf{P M}_{k}$ is freely generated as an algebra by the elements $\mathbf{E}_{M}$ (resp. $\mathbf{H}_{M}$ ) where the $M$ are connected (resp. anti-connected) $k$-packed matrices.

Proof. Since any packed matrix $M$ can be written as

$$
\begin{equation*}
M=M_{1} / \ldots / M_{r} \tag{2.1.8}
\end{equation*}
$$

where the $M_{i}$ are connected packed matrices, by Proposition 2.3, we have

$$
\begin{equation*}
\mathbf{E}_{M}=\mathbf{E}_{M_{1}} \cdot \ldots \cdot \mathbf{E}_{M_{r}}, \tag{2.1.9}
\end{equation*}
$$

showing that the $\mathbf{E}_{M}$, where $M$ is a connected packed matrix, generate $\mathbf{P} \mathbf{M}_{k}$ as an algebra. Besides, the obvious unicity of the factorization (2.1.8) shows that this family is free.

The proof for the homogeneous basis is analogous.

Theorem 2.4 also implies that $\mathbf{P M N}{ }_{k}$ and $\mathbf{P M L}{ }_{k}$ are freely generated by the $\mathbf{E}_{M}\left(\right.$ resp. $\left.\mathbf{H}_{M}\right)$ where the $M$ are connected (resp. anti-connected) $k$-packed matrices. Hence, the generating series $\mathcal{G}_{k, n}(t)$ and $\mathcal{G}_{k, \ell}(t)$ of algebraic generators of $\mathbf{P M} \mathbf{N}_{k}$ and $\mathbf{P M L}{ }_{k}$ satisfy respectively

$$
\begin{equation*}
\mathcal{G}_{k, n}(t)=1-\frac{1}{\mathcal{H}_{k, n}(t)} \quad \text { and } \quad \mathcal{G}_{k, \ell}(t)=1-\frac{1}{\mathcal{H}_{k, \ell}(t)} \tag{2.1.10}
\end{equation*}
$$

The first few numbers of algebraic generators of $\mathbf{P M N} \mathbf{N}_{1}$ and $\mathbf{P M} \mathbf{N}_{2}$ are respectively
$0,1,6,252,40944,24912120,57316485000$
and

$$
\begin{equation*}
0,2,52,15848,39089872,813573857696,147659027604370240 \tag{2.1.12}
\end{equation*}
$$

The first few numbers of algebraic generators of $\mathbf{P M L} L_{1}$ and $\mathbf{P M L} L_{2}$ are respectively

$$
\begin{equation*}
0,1,1,7,51,497,5865,81305,1293333 \tag{2.1.13}
\end{equation*}
$$

and
$0,2,4,56,816,15904,375360,10407040,331093248$.

### 2.2. Self-duality.

2.2.1. Dual Hopf algebra. Let us denote by $\mathbf{P M}_{k}{ }^{\star}$ the bigraded dual vector space of $\mathbf{P} \mathbf{M}_{k}$, by $\mathbf{F}_{M}^{\star}$, where the $M$ are $k$-packed matrices, the adjoint basis of the fundamental basis of $\mathbf{P M}_{k}$, and by $\langle-,-\rangle$ the associated duality bracket.

Let $M_{1}$ and $M_{2}$ be two $k$-packed matrices of respective sizes $n_{1}$ and $n_{2}$. By duality, the product in $\mathbf{P M}_{k}{ }^{\star}$ satisfies

$$
\begin{equation*}
\mathbf{F}_{M_{1}}^{\star} \cdot \mathbf{F}_{M_{2}}^{\star}=\sum_{M \in \mathcal{P}_{k}}\left\langle\Delta\left(\mathbf{F}_{M}\right), \mathbf{F}_{M_{1}}^{\star} \otimes \mathbf{F}_{M_{2}}^{\star}\right\rangle \mathbf{F}_{M}^{\star} \tag{2.2.1}
\end{equation*}
$$

Let us set

$$
\begin{equation*}
M_{1} \bullet n_{2}:=\left[M_{1} \mid Z_{n_{1}}^{n_{2}}\right] \quad \text { and } \quad n_{1} \bullet M_{2}:=\left[Z_{n_{2}}^{n_{1}} \mid M_{2}\right] \tag{2.2.2}
\end{equation*}
$$

The row shifted shuffle $M_{1} * M_{2}$ of $M_{1}$ and $M_{2}$ is the set of all matrices obtained by shuffling the rows of $M_{1} \bullet n_{2}$ with the rows of $n_{1} \bullet M_{2}$. By a routine computation, we obtain the following expression for the product of $\mathbf{P M}_{k}{ }^{\star}$ :

$$
\begin{equation*}
\mathbf{F}_{M_{1}}^{\star} \cdot \mathbf{F}_{M_{2}}^{\star}=\sum_{M \in M_{1} * M_{2}} \mathbf{F}_{M}^{\star} \tag{2.2.3}
\end{equation*}
$$

For instance, in $\mathbf{P} \mathbf{M}_{1}{ }^{\star}$ one has

$$
\begin{align*}
\mathbf{F}^{\star}\left[\begin{array}{ll}
0 & 1 \\
1 & 1
\end{array}\right] \cdot \mathbf{F}^{\star}\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right] & =\mathbf{F}^{\star}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
1 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}^{\star}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
1 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}^{\star}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
1 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]  \tag{2.2.4}\\
& +\mathbf{F}^{\star}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1 \\
1 & 1 & 0 & 0
\end{array}\right]+\mathbf{F}^{\star}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 \\
1 & 1 & 0 & 0
\end{array}\right]+\mathbf{F}^{\star}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1 \\
0 & 1 & 0 & 0 \\
1 & 1 & 0 & 0
\end{array}\right]
\end{align*}
$$

Let $M$ be a $k$-packed matrix. By duality, the coproduct in $\mathbf{P} \mathbf{M}_{k}{ }^{\star}$ satisfies

$$
\begin{equation*}
\Delta\left(\mathbf{F}_{M}^{\star}\right)=\sum_{M_{1}, M_{2} \in \mathcal{P}_{k}}\left\langle\mathbf{F}_{M_{1}} \cdot \mathbf{F}_{M_{2}}, \mathbf{F}_{M}^{\star}\right\rangle \mathbf{F}_{M_{1}}^{\star} \otimes \mathbf{F}_{M_{2}}^{\star} \tag{2.2.5}
\end{equation*}
$$

By a routine computation, we obtain the following expression for the coproduct of $\mathbf{P} \mathbf{M}_{k}{ }^{\star}$ :

$$
\begin{equation*}
\Delta\left(\mathbf{F}_{M}^{\star}\right)=\sum_{M=M_{1} \circ M_{2}} \mathbf{F}_{\mathrm{cp}\left(M_{1}\right)}^{\star} \otimes \mathbf{F}_{\mathrm{cp}\left(M_{2}\right)}^{\star} \tag{2.2.6}
\end{equation*}
$$

For instance, in $\mathbf{P M}_{1}{ }^{\star}$ one has

Let us denote by $M^{T}$ the transpose of $M$.
Proposition 2.5. The map $\phi: \mathbf{P M}_{k} \rightarrow \mathbf{P M}_{k}{ }^{\star}$ linearly defined for any $k$-packed matrix $M$ by

$$
\begin{equation*}
\phi\left(\mathbf{F}_{M}\right):=\mathbf{F}_{M^{T}}^{\star} \tag{2.2.8}
\end{equation*}
$$

is a Hopf isomorphism.
Proof. The product and the coproduct of $\mathbf{P M}_{k}$ in the fundamental basis handle the columns of the matrices while the product and the coproduct of $\mathbf{P M}_{k}{ }^{\star}$ in the adjoint basis of the fundamental basis handle the rows. Since the transpose of a matrix swaps its rows and its columns, $\phi$ is a Hopf isomorphism.

Since the transpose of any packed matrix of $\mathcal{P}_{k, n, \ell}$ also belongs to $\mathcal{P}_{k, n, \ell}$, Proposition 2.5 also implies that $\mathbf{P M N}{ }_{k}$ and $\mathbf{P M L}{ }_{k}$ are self-dual for the isomorphism $\phi$.
2.2.2. Primitive elements. For any $k$-packed matrix $M$, define

$$
\begin{equation*}
\mathbf{W}^{M}:=\mathbf{F}_{M_{1}}^{\star} \cdot \ldots \cdot \mathbf{F}_{M_{r}}^{\star} \tag{2.2.9}
\end{equation*}
$$

where the $M_{i}$ are connected packed matrices (see Section 2.1.3) and $M=M_{1} / \ldots / M_{r}$. Then, we have

$$
\begin{equation*}
\mathbf{W}^{M}=\mathbf{F}_{M}^{\star}+\sum_{M^{\prime} \in R} \mathbf{F}_{M^{\prime}}^{\star} \tag{2.2.10}
\end{equation*}
$$

where any matrix $M^{\prime}$ of $R$ satisfies $M^{T} \leqslant_{\mathrm{M}} M^{\prime T}$ since the product in $\mathbf{P M}_{k}{ }^{\star}$ consists in shifting and shuffling rows of matrices. Thus, by triangularity, the $\mathbf{W}^{M}$ form a basis of $\mathbf{P} \mathbf{M}_{k}{ }^{\star}$. Moreover, for any $k$-packed matrices $M_{1}$ and $M_{2}$, the product of $\mathbf{P} \mathbf{M}_{k}{ }^{\star}$ is expressed as

$$
\begin{equation*}
\mathbf{W}^{M_{1}} \cdot \mathbf{W}^{M_{2}}=\mathbf{W}^{M_{1} / M_{2}} \tag{2.2.11}
\end{equation*}
$$

Let us denote by $\mathbf{V}_{M}$, where the $M$ are $k$-packed matrices, the adjoint elements of the $\mathbf{W}^{M}$.
Proposition 2.6. The elements $\mathbf{V}_{M}$, where $M$ are connected $k$-packed matrices, form a basis of the vector space of primitive elements of $\mathbf{P} \mathbf{M}_{k}$.
Proof. Since $\mathbf{W}^{M}$ is indecomposable, by duality, $\mathbf{V}_{M}$ is primitive. Moreover, let $X$ be a primitive element of $\mathbf{P} \mathbf{M}_{k}$. Then, $X$ is expressed as

$$
\begin{equation*}
X=\sum_{M \in \mathcal{P}_{k}} c_{M} \mathbf{V}_{M} \tag{2.2.12}
\end{equation*}
$$

Let $M$ be a nonconnected $k$-packed matrix and $M=M_{1} / M_{2}$ be a nontrivial factorization. Then, by duality, the coefficient of $\mathbf{V}_{M_{1}} \otimes \mathbf{V}_{M_{2}}$ in $\Delta(X)$ is $c_{M}$. Since $X$ is primitive, $c_{M}=0$, showing that $X$ is a sum of $\mathbf{V}_{M}$ where $M$ are connected $k$-packed matrices.

By Proposition 2.6, the $\mathbf{V}_{M}$, where $M$ are connected $k$-packed matrices, generate the Lie algebra of primitive elements of $\mathbf{P} \mathbf{M}_{k}$. The first few dimensions of the Lie algebras of primitive elements of $\mathbf{P M N} \mathbf{N}_{1}, \mathbf{P M N} \mathbf{N}_{2}, \mathbf{P M L}_{1}, \mathbf{P M L}_{2}$ are respectively given by (2.1.11), (2.1.12), (2.1.13), and (2.1.14).

### 2.3. Bidendriform bialgebra structure.

2.3.1. Dendriform algebra structure. An algebra $(\mathcal{A}, \cdot)$ admits a dendriform algebra structure [Lod01] if its product can be split into two operations

$$
\begin{equation*}
\cdot=\prec+\succ, \tag{2.3.1}
\end{equation*}
$$

where $\prec, \succ: \mathcal{A} \otimes \mathcal{A} \rightarrow \mathcal{A}$ are non-degenerated linear maps such that, by denoting by $\mathcal{A}^{+}$the augmentation ideal of $\mathcal{A}$, for all $x, y, z \in \mathcal{A}^{+}$, the following relations hold

$$
\begin{align*}
(x \prec y) \prec z & =x \prec(y \cdot z),  \tag{2.3.2a}\\
(x \succ y) \prec z & =x \succ(y \prec z),  \tag{2.3.2b}\\
(x \cdot y) \succ z & =x \succ(y \succ z) . \tag{2.3.2c}
\end{align*}
$$

For any nonempty matrix $M$, we shall denote by $\operatorname{last}_{c}(M)$ its last column. Let us endow $\mathbf{P M}_{k}{ }^{+}$ with two products $\prec$ and $\succ$ linearly defined, for any nonempty $k$-packed matrices $M_{1}$ and $M_{2}$ of respective sizes $n_{1}$ and $n_{2}$, by

$$
\begin{equation*}
\mathbf{F}_{M_{1}} \prec \mathbf{F}_{M_{2}}:=\sum_{\substack{M \in M_{1} \overline{\omega_{2}} M_{2} \\ \operatorname{last}_{c}(M)=\operatorname{last}_{\mathrm{c}}\left(M_{1} \circ n_{2}\right)}} \mathbf{F}_{M} \tag{2.3.3}
\end{equation*}
$$

and

$$
\begin{equation*}
\mathbf{F}_{M_{1}} \succ \mathbf{F}_{M_{2}}:=\sum_{\substack{M \in M_{1} \bar{\omega} M_{2} \\ \operatorname{last}_{c}(M)=\operatorname{last}_{c}\left(n_{1} \circ M_{2}\right)}} \mathbf{F}_{M} \tag{2.3.4}
\end{equation*}
$$

In other words, the matrices appearing in a $\prec$-product (resp. $\succ$-product) in the fundamental basis involving $M_{1}$ and $M_{2}$ are the matrices $M$ obtained by shifting and shuffling the columns of $M_{1}$ and $M_{2}$ such that the last column of $M$ comes from $M_{1}$ (resp. $M_{2}$ ). For example,

$$
\begin{align*}
& \mathbf{F}_{\left[\begin{array}{ll}
0 & 1 \\
1 & 1
\end{array}\right]} \prec \mathbf{F}_{\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]}=\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 0 & 1 \\
1 & 0 & 0 & 1 \\
0 & 1 & 0 & 0 \\
0 & 0 & 1 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 0 & 1 \\
0 & 1 & 0 & 1 \\
1 & 0 & 0 & 0 \\
0 & 0 & 1 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 0 & 1 \\
0 & 0 & 1 & 1 \\
1 & 0 & 0 & 0 \\
0 & 1 & 0 & 0
\end{array}\right],  \tag{2.3.5}\\
& \mathbf{F}_{\left[\begin{array}{ll}
0 & 1 \\
1 & 1
\end{array}\right]} \succ \mathbf{F}_{\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]=\mathbf{F}\left[\begin{array}{llll}
0 & 1 & 0 & 0 \\
1 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
1 & 0 & 1 & 0 \\
0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{F}\left[\begin{array}{llll}
0 & 0 & 1 & 0 \\
0 & 1 & 1 & 0 \\
1 & 0 & 0 & 0 \\
0 & 0 & 0 & 1
\end{array}\right] .} . \tag{2.3.6}
\end{align*}
$$

Since the last column of any matrix appearing in the shifted shuffle of two matrices comes from one of the two operands, for any nonempty packed matrices $M_{1}$ and $M_{2}$, one obviously has

$$
\begin{equation*}
\mathbf{F}_{M_{1}} \cdot \mathbf{F}_{M_{2}}=\mathbf{F}_{M_{1}} \prec \mathbf{F}_{M_{2}}+\mathbf{F}_{M_{1}} \succ \mathbf{F}_{M_{2}} \tag{2.3.7}
\end{equation*}
$$

Proposition 2.7. The Hopf algebra $\mathbf{P M}_{k}$ admits a dendriform algebra structure for the products $\prec$ and $\succ$.

Proof. We have to prove that (2.3.2a), (2.3.2b), and (2.3.2c) hold. Let $M_{1}, M_{2}$, and $M_{3}$ be three packed matrices of respective sizes $n_{1}, n_{2}$ and $n_{3}$.

By definition of $\prec$ and $\succ$, and since $\bar{\varpi}$ is associative, the set $S$ of matrices indexing the support of $\left(\mathbf{F}_{M_{1}} \succ \mathbf{F}_{M_{2}}\right) \prec \mathbf{F}_{M_{3}}$ satisfies

$$
\begin{align*}
S & =\left\{M \in\left(M_{1} \bar{Ш} M_{2}\right) \bar{\amalg} M_{3}: \operatorname{last}_{\mathrm{c}}(M)=\operatorname{last}_{\mathrm{c}}\left(n_{1} \circ M_{2} \circ n_{3}\right)\right\} \\
& =\left\{M \in M_{1} \bar{\amalg}\left(M_{2} \bar{Ш} M_{3}\right): \operatorname{last}_{\mathrm{c}}(M)=\operatorname{last}_{\mathrm{c}}\left(n_{1} \circ M_{2} \circ n_{3}\right)\right\} . \tag{2.3.8}
\end{align*}
$$

Hence, $S$ also is the set of matrices indexing the support of $\mathbf{F}_{M_{1}} \succ\left(\mathbf{F}_{M_{2}} \prec \mathbf{F}_{M_{3}}\right)$. Since the shifted shuffle of packed matrices is multiplicity-free, (2.3.2b) holds.

By definition of $\prec$ and $\succ$, and since $\bar{\varpi}$ is associative, the set $T$ of matrices indexing the support of $\left(\mathbf{F}_{M_{1}} \prec \mathbf{F}_{M_{2}}\right) \prec \mathbf{F}_{M_{3}}$ satisfies

$$
\begin{align*}
T & =\left\{M \in\left(M_{1} \bar{\amalg} M_{2}\right) \bar{Ш} M_{3}: \operatorname{last}_{\mathrm{c}}(M)=\operatorname{last}_{\mathrm{c}}\left(M_{1} \circ\left(n_{2}+n_{3}\right)\right)\right\} \\
& =\left\{M \in M_{1} \bar{Ш}\left(M_{2} \bar{\amalg} M_{3}\right): \operatorname{last}_{\mathrm{c}}(M)=\operatorname{last}_{\mathrm{c}}\left(M_{1} \circ\left(n_{2}+n_{3}\right)\right)\right\} . \tag{2.3.9}
\end{align*}
$$

Hence, by (2.3.7), $T$ also is the set of matrices indexing the support of $\mathbf{F}_{M_{1}} \prec\left(\mathbf{F}_{M_{2}} \cdot \mathbf{F}_{M_{3}}\right)$. Since the shifted shuffle of packed matrices is multiplicity-free, (2.3.2a) holds. By a very similar argument, (2.3.2c) also holds.
2.3.2. Codendriform coalgebra structure. By dualizing the notion of dendriform algebra structure, one obtains the notion of codendriform coalgebra structure [Foi07]. A coalgebra ( $\mathcal{C}, \Delta$ ) admits a codendriform coalgebra structure if its coproduct can be split into two operations

$$
\begin{equation*}
\Delta=1 \otimes I+\Delta_{\prec}+\Delta_{\succ}+I \otimes 1 \tag{2.3.10}
\end{equation*}
$$

where $\Delta_{\prec}, \Delta_{\succ}: \mathcal{C} \rightarrow \mathcal{C} \otimes \mathcal{C}$ are non-degenerated linear maps such that following relations hold

$$
\begin{align*}
\left(\Delta_{\prec} \otimes I\right) \circ \Delta_{\prec} & =(I \otimes \bar{\Delta}) \circ \Delta_{\prec},  \tag{2.3.11a}\\
\left(\Delta_{\succ} \otimes I\right) \circ \Delta_{\prec} & =\left(I \otimes \Delta_{\prec}\right) \circ \Delta_{\succ},  \tag{2.3.11b}\\
(\bar{\Delta} \otimes I) \circ \Delta_{\succ} & =\left(I \otimes \Delta_{\succ}\right) \circ \Delta_{\succ},
\end{align*}
$$

where $\bar{\Delta}:=\Delta_{\prec}+\Delta_{\succ}$.
For any nonempty matrix $M$, we shall denote by $\operatorname{last}_{r}(M)$ its last row. Let us endow $\mathbf{P} \mathbf{M}_{k}$ with two coproducts $\Delta_{\prec}$ and $\Delta_{\succ}$ linearly defined, for any nonempty $k$-packed matrix $M$, by

$$
\begin{equation*}
\Delta_{\prec}\left(\mathbf{F}_{M}\right):=\sum_{\substack{M=L \bullet R \\ \operatorname{last}_{\mathbf{r}}(L \bullet r)=\operatorname{last}_{\mathbf{r}}(M)}} \mathbf{F}_{\mathrm{cp}(L)} \otimes \mathbf{F}_{\mathrm{cp}(R)} \tag{2.3.12}
\end{equation*}
$$

and

$$
\begin{equation*}
\Delta_{\succ}\left(\mathbf{F}_{M}\right):=\sum_{\substack{M=L \bullet R \\ \text { last }_{\mathrm{r}}(\ell \bullet R)=\operatorname{last}_{\mathrm{r}}(M)}} \mathbf{F}_{\mathrm{cp}(L)} \otimes \mathbf{F}_{\mathrm{cp}(R)} \tag{2.3.13}
\end{equation*}
$$

where $r$ (resp. $\ell$ ) is the number of columns of $R$ (resp. $L$ ). In other words, the pairs of matrices appearing in a $\Delta_{\prec}$-coproduct (resp. $\Delta_{\succ}$-coproduct) in the fundamental basis are the pairs $(L, R)$ of packed matrices such that the last row of $L$ (resp. $R$ ) comes from the last row of $M$. For example,

$$
\begin{align*}
& \Delta_{\prec} \mathbf{F}\left[\begin{array}{llllll}
1 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 1 \\
0 & 0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 & 1 & 0 \\
0 & 0 & 1 & 0 & 0 & 0
\end{array}\right]=\mathbf{F}_{\left[\begin{array}{lll}
1 & 0 & 0 \\
0 & 1 & 1 \\
0 & 0 & 1
\end{array}\right] \otimes \mathbf{F}^{2}\left[\begin{array}{llll}
0 & 0 & 1 \\
1 & 0 & 0 \\
1 & 1 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{llllll}
1 & 0 & 0 & 0 & 0 \\
0 & 1 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 \\
0 & 0 & 0 & 1 & 1 \\
0 & 0 & 1 & 0 & 0
\end{array}\right] \otimes \mathbf{F}_{[1]},}^{\Delta_{\succ} \mathbf{F}^{1}}\left[\begin{array}{llllll}
1 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 1 \\
0 & 0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 & 1 & 0 \\
0 & 0 & 1 & 0 & 0 & 0
\end{array}\right]=\mathbf{F}_{[1]} \otimes \mathbf{F}\left[\begin{array}{lllll}
1 & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 1 \\
0 & 0 & 1 & 0 & 0 \\
0 & 0 & 1 & 1 & 0 \\
0 & 1 & 0 & 0 & 0
\end{array}\right] \tag{2.3.14}
\end{align*}
$$

Since by Lemma 1.1, one cannot vertically split a packed matrix by separating two nonzero entries on a same row, for any nonempty packed matrix $M$, one has

$$
\begin{equation*}
\Delta\left(\mathbf{F}_{M}\right)=1 \otimes \mathbf{F}_{M}+\Delta_{\prec}\left(\mathbf{F}_{M}\right)+\Delta_{\succ}\left(\mathbf{F}_{M}\right)+\mathbf{F}_{M} \otimes 1 \tag{2.3.16}
\end{equation*}
$$

Proposition 2.8. The Hopf algebra $\mathbf{P M}_{k}$ admits a codendriform coalgebra structure for the coproducts $\Delta_{\prec}$ and $\Delta_{\succ}$.

Since the proof of this statement is similar to that of Proposition 2.7 it has been omitted.
2.3.3. Bidendriform bialgebra structure. A bialgebra $(\mathcal{B}, \cdot, \Delta)$ admits a bidendriform bialgebra structure [Foi07] if $\mathcal{B}$ admits both a dendriform algebra $(\mathcal{B}, \prec, \succ)$ and a codendriform coalgebra $\left(\mathcal{B}, \Delta_{\prec}, \Delta_{\succ}\right)$ structure with some extra compatibility relations between $(\prec, \succ)$ and $\left(\Delta_{\prec}, \Delta_{\succ}\right)$.

Theorem 2.9. The Hopf algebra $\mathbf{P M}_{k}$ admits a bidendriform bialgebra structure for the products $\prec$, $\succ$ and the coproducts $\Delta_{\prec}, \Delta_{\succ}$.

Proof. By Propositions 2.7 and 2.8, $\mathbf{P M}_{k}$ admits a dendriform algebra and a codendriform coalgebra structure.

The required extra compatibility relations (see [Foi07]) between $(\prec, \succ)$ and $\left(\Delta_{\prec}, \Delta_{\succ}\right)$ are established by arguments similar to the ones used in the proofs of Propositions 2.7 and 2.8.

Theorem 2.9 also implies that $\mathbf{P M N}_{k}$ and $\mathbf{P M L}_{k}$ admit a bidendriform bialgebra structure. Recall that an element $x$ of a Hopf algebra admitting a bidendriform bialgebra structure is totally primitive if $\Delta_{\prec}(x)=0=\Delta_{\succ}(x)$. Following [Foi07], the generating series $\mathcal{T}_{k, n}(t)$ and $\mathcal{T}_{k, \ell}(t)$ of totally primitive elements of $\mathbf{P M} \mathbf{N}_{k}$ and $\mathbf{P M L}{ }_{k}$ satisfy respectively

$$
\begin{equation*}
\mathcal{T}_{k, n}(t)=\frac{\mathcal{H}_{k, n}(t)-1}{\mathcal{H}_{k, n}(t)^{2}} \quad \text { and } \quad \mathcal{T}_{k, \ell}(t)=\frac{\mathcal{H}_{k, \ell}(t)-1}{\mathcal{H}_{k, \ell}(t)^{2}} \tag{2.3.17}
\end{equation*}
$$

The first few dimensions of totally primitive elements of $\mathbf{P} \mathbf{M} \mathbf{N}_{1}$ and $\mathbf{P} \mathbf{M} \mathbf{N}_{2}$ are respectively

$$
\begin{equation*}
0,1,5,240,40404,24827208,57266105928 \tag{2.3.18}
\end{equation*}
$$

and

$$
\begin{equation*}
0,2,48,15640,39023776,813415850016,147655768992433664 \tag{2.3.19}
\end{equation*}
$$

The first few dimensions of totally primitive elements of $\mathbf{P M L} L_{1}$ and $\mathbf{P M L} L_{2}$ are respectively

$$
\begin{equation*}
0,1,0,5,36,381,4720,67867,1109434 \tag{2.3.20}
\end{equation*}
$$

and
$0,2,0,40,576,12192,302080,8686976,284015104$.

## 3. Related Hopf algebras

In this section, we list some already known Hopf algebras and describe their links with $\mathbf{P M}_{k}$. Next, we provide a method to construct Hopf subalgebras of $\mathbf{P} \mathbf{M}_{k}$.

### 3.1. Links with known algebras.

3.1.1. Hopf algebra of colored permutations. Recall that a $k$-colored permutation is a pair $(\sigma, c)$ where $\sigma$ is a permutation of size $n$ and $c$ is a word of length $n$ on the alphabet $A_{k} \backslash\{0\}$.

In [NT10], the authors endowed the vector spaces FQSym ${ }^{(k)}$ spanned by the set of all $k$-colored permutations with a Hopf algebra structure. The elements $\mathbf{F}_{(\sigma, c)}$, where the $(\sigma, c)$ are $k$-colored permutations, form the fundamental basis of $\mathbf{F Q S y m}{ }^{(k)}$. These Hopf algebras provide a generalization of $\mathbf{F Q S y m}$ since $\mathbf{F Q S y m}=$ FQSym $^{(1)}$.

Proposition 3.1. The map $\alpha_{k}: \mathbf{F Q S y m}^{(k)} \rightarrow \mathbf{P M N}_{k}$ linearly defined, for any $k$-colored permutation $(\sigma, c)$ by

$$
\begin{equation*}
\alpha_{k}\left(\mathbf{F}_{(\sigma, c)}\right):=\mathbf{F}_{M^{(\sigma, c)}} \tag{3.1.1}
\end{equation*}
$$

where $M^{(\sigma, c)}$ is the $k$-packed matrix satisfying $M_{i j}^{(\sigma, c)}=c_{j} \delta_{i, \sigma_{j}}$ is an injective Hopf morphism.

In particular, Proposition 3.1 shows that $\mathbf{P M N} \mathbf{N}_{1}$ contains FQSym. Notice that the map $\alpha_{k}$ is still well-defined on the codomain $\mathbf{P M L}{ }_{k}$ instead of $\mathbf{P M N}{ }_{k}$.
3.1.2. Hopf algebra of uniform block permutations. Recall that a uniform block permutation, or a $U B P$ for short, of size $n$ is a bijection $\pi: \pi^{d} \rightarrow \pi^{c}$ where $\pi^{d}$ and $\pi^{c}$ are set partitions of $[n]$, and, for any $e \in \pi^{d}, e$ and $\pi(e)$ have same cardinality.

For instance, the map $\pi$ defined by

$$
\begin{equation*}
\pi(\{1,4,5\}):=\{2,5,6\}, \quad \pi(\{2\}):=\{1\}, \quad \text { and } \quad \pi(\{3,6\}):=\{3,4\} \tag{3.1.2}
\end{equation*}
$$

is a UBP of size 6 .
In [AO08], the authors endowed the vector space UBP spanned by the set of all UBPs with a Hopf algebra structure. The elements $\mathbf{F}_{\pi}$, where the $\pi$ are UBPs, form the fundamental basis of UBP. The dimensions of UBP form Sequence A023998 of [Slo] and the first few terms are

$$
\begin{equation*}
1,1,3,16,131,1496,22482,426833,9934563,277006192,9085194458 \tag{3.1.3}
\end{equation*}
$$

Proposition 3.2. The map $\beta: \mathbf{U B P}^{\star} \rightarrow \mathbf{P M N}_{1}$ linearly defined, for any $U B P \pi$ by

$$
\begin{equation*}
\beta\left(\mathbf{F}_{\pi}^{\star}\right):=\mathbf{F}_{M^{\pi}} \tag{3.1.4}
\end{equation*}
$$

where $M^{\pi}$ is the 1-packed matrix satisfying

$$
M_{i j}^{\pi}:= \begin{cases}1 & \text { if there is } e \in \pi^{d} \text { such that } j \in e \text { and } i \in \pi(e)  \tag{3.1.5}\\ 0 & \text { otherwise } .\end{cases}
$$

is an injective Hopf morphism.
For example, with the UBP $\pi$ defined in (3.1.2), we have

$$
\beta\left(\mathbf{F}_{\pi}^{\star}\right)=\mathbf{F}\left[\begin{array}{llllll}
0 & 1 & 0 & 0 & 0 & 0  \tag{3.1.6}\\
1 & 0 & 0 & 1 & 1 & 0 \\
0 & 0 & 1 & 0 & 0 & 1 \\
0 & 0 & 1 & 0 & 0 & 1 \\
1 & 0 & 0 & 1 & 1 & 0 \\
1 & 0 & 0 & 1 & 1 & 0
\end{array}\right]
$$

Corollary 3.3. The Hopf algebra $\mathbf{U B P}^{\star}$ is a free, cofree, and self-dual Hopf algebra which admits a bidendriform bialgebra structure.
Proof. By Proposition 3.2 and the definition of the product on the fundamental basis of $\mathbf{U B P}^{\star}$ (see [AO08]), we can see $\mathbf{U B P}{ }^{\star}$ as a Hopf subalgebra of $\mathbf{P M} \mathbf{N}_{1}$ restricted on the elements $\mathbf{F}_{M}$ where the $M$ are 1-packed matrices such that there are UBPs $\pi$ satisfying $M^{\pi}=M$. This shows that $\mathbf{U B P}{ }^{\star}$ inherits from the bidendriform bialgebra structure of $\mathbf{P M N}_{1}$ (see Theorem 2.9). Now, since $\mathbf{U B P}^{\star}$ admits a bidendriform bialgebra structure, by [Foi07], it is free, cofree, and self-dual.

By using same arguments as those used in Section 2.1, one can build multiplicative bases of UBP ${ }^{\star}$ by setting, for any UBP $\pi$,

$$
\begin{equation*}
\mathbf{E}_{M^{\pi}}^{\star}:=\sum_{M^{\pi} \leqslant M M^{\pi^{\prime}}} \mathbf{F}_{M^{\pi^{\prime}}} \quad \text { and } \quad \mathbf{H}_{M^{\pi}}^{\star}:=\sum_{M^{\pi^{\prime} \leqslant M} M^{\pi}} \mathbf{F}_{M^{\pi^{\prime}}} \tag{3.1.7}
\end{equation*}
$$

This gives another way to prove the freeness of $\mathbf{U B P}^{\star}$ by using same arguments as those of Theorem 2.4. Hence, $\mathbf{U B P}^{\star}$ is freely generated by the elements $\mathbf{E}_{M^{\pi}}$ (resp. $\mathbf{H}_{M^{\pi}}$ ) where the $\pi$ are UBPs such that the $M^{\pi}$ are connected (resp. anti-connected) 1-packed matrices. The first few numbers of algebraic generators of $\mathbf{U B P}{ }^{\star}$ are

$$
\begin{equation*}
0,1,2,11,98,1202,19052,375692,8981392,255253291,8488918198 \tag{3.1.8}
\end{equation*}
$$

and the first few dimensions of totally primitive elements are

$$
\begin{equation*}
0,1,1,7,72,962,16135,330624,8117752,235133003,7929041828 . \tag{3.1.9}
\end{equation*}
$$

Moreover, since for any UBP $\pi$, there exists a UBP $\pi^{-1}$ such that the transpose of $M^{\pi}$ is $M^{\pi^{-1}}$, by Proposition 2.5, the map $\phi: \mathbf{U B P}^{\star} \rightarrow \mathbf{U B P}$ linearly defined for any UBP $\pi$ by

$$
\begin{equation*}
\phi\left(\mathbf{F}_{M^{\pi}}^{\star}\right):=\mathbf{F}_{M^{\pi T}} \tag{3.1.10}
\end{equation*}
$$

is an isomorphism.
3.1.3. Algebra of matrix quasi-symmetric functions. In [DHT02] (see also [Hiv99]), the authors defined the vector space MQSym spanned by the set of the (not necessarily square) matrices with entries in $\mathbb{N}$, and such that each row and each column contains at least one nonzero entry. In this section, we simply call matrices such sort of matrices. The elements $\mathbf{M S} \mathbf{S}_{M}$ such that $M$ is a matrix form the quasi-multiword basis of MQSym. The degree of a $\mathbf{M S} \mathbf{S}_{M}$ is given by the sum of the entries of $M$.

This vector space is endowed with an algebra structure where the product of two basis elements is provided by the augmented shuffle $\amalg$. Let $M_{1}$ and $M_{2}$ be two matrices. Any matrix $M$ of $M_{1} \amalg M_{2}$ is obtained by concatenating $N_{1}$ and $N_{2}$ where $N_{1}$ (resp. $N_{2}$ ) is obtained from $M_{1}$ (resp. $M_{2}$ ) by inserting some null rows and so that $N_{1}$ and $N_{2}$ have both a same number of rows and each row of $M$ has at least one nonzero entry. For example,
$\mathbf{M S}_{\left[\begin{array}{ll}2 & 1 \\ 0 & 1\end{array}\right]} \cdot \mathbf{M S}\left[\begin{array}{ll}1 & 3\end{array}\right]=\mathbf{M S}\left[\begin{array}{llll}2 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 3\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}2 & 1 & 0 & 0 \\ 0 & 1 & 1 & 3\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}2 & 1 & 0 & 0 \\ 0 & 0 & 1 & 3 \\ 0 & 1 & 0 & 0\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}2 & 1 & 1 & 3 \\ 0 & 1 & 0 & 0\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}0 & 0 & 1 & 3 \\ 2 & 1 & 0 & 0 \\ 0 & 1 & 0 & 0\end{array}\right]$.

Let us endow the set of matrices indexing MQSym with a binary relation $\rightharpoonup$ defined in the following way. If $M_{1}$ and $M_{2}$ are two matrices such that $M_{1}$ has $n$ rows and $m$ columns, we have $M_{1} \rightharpoonup M_{2}$ if there is an index $i \in[n-1]$ such that, denoting by $s$ the number of 0 which end the $i$ th row of $M_{1}$, and by $p$ the number of 0 which start the $(i+1)$ st row of $M_{1}$, one has $s+p \geqslant m$ and $M_{2}$ is obtained from $M_{1}$ by overlaying its $i$ th and $(i+1)$ st rows (see Figure 3).

Figure 3. The condition for overlaying the $i$ th and $(i+1)$ st rows of a not necessarily square) packed matrix according to the relation $\rightarrow$. The darker regions contain any entries and the white ones, only zeros.

We now endow the set of matrices that index MQSym with the partial order relation $\leqslant_{\text {mQ }}$ defined as the reflexive and transitive closure of $\rightharpoonup$. Figure 4 shows an interval of this partial order.

Lemma 3.4. Let $A$ and $B$ be two $k$-packed matrices. Then,

$$
\begin{equation*}
\left\{C^{\prime}: C \leqslant_{\text {мQ }} C^{\prime}, C \in A * B\right\}=\left\{C^{\prime} \in A^{\prime} \amalg B^{\prime}: A \leqslant_{\text {мQ }} A^{\prime}, B \leqslant_{\text {мQ }} B^{\prime}\right\}, \tag{3.1.12}
\end{equation*}
$$

where * is the row shifted shuffle of $k$-packed matrices and $\amalg$ is the augmented shuffle of matrices.

Figure 4. The Hasse diagram of an interval for the order $\leqslant_{\text {mq }}$ on (not necessarily square) packed matrices.

Proof. Let $C^{\prime}$ be a matrix such that $C \leqslant_{\text {MQ }} C^{\prime}$ and $C \in A * B$. By definition of the order $\leqslant_{\text {mQ }}$ and the product $*, C^{\prime}$ can be obtained from $C$ by overlaying rows coming from $A$, rows coming from $B$, or rows coming from $A$ and $B$. Let us denote by $A^{\prime}$ (resp. $B^{\prime}$ ) the matrix obtained from $A$ (resp. $B$ ) by overlaying some of its rows. Then, we have $A \leqslant_{\text {MQ }} A^{\prime}$ and $B \leqslant_{\text {MQ }} B^{\prime}$, and, by definition of the augmented shuffle, $C^{\prime} \in A^{\prime} \amalg B^{\prime}$.

Conversely, let $C^{\prime}$ be a matrix such that $C^{\prime} \in A^{\prime} \amalg B^{\prime}$ where $A^{\prime}$ and $B^{\prime}$ are matrices satisfying $A \leqslant_{\text {мq }} A^{\prime}$ and $B \leqslant_{\text {мq }} B^{\prime}$. Then, by definition of the augmented shuffle of matrices, $C^{\prime}$ can be obtained from a matrix $C$ of $A * B$ by overlaying rows coming from $A$, rows coming from $B$, or rows coming from $A$ and $B$. Hence, $C \leqslant \leqslant_{\text {мq }} C^{\prime}$.

Proposition 3.5. The map $\gamma: \mathbf{P M L}_{1}{ }^{\star} \rightarrow \mathbf{M Q S y m}$ linearly defined, for any 1-packed matrix $M$ by

$$
\begin{equation*}
\gamma\left(\mathbf{F}_{M}^{\star}\right):=\sum_{M \leqslant{ }_{\mathrm{MQ}} M^{\prime}} \mathbf{M S}_{M^{\prime}}, \tag{3.1.13}
\end{equation*}
$$

is an injective algebra morphism.
Proof. Let $M_{1}$ and $M_{2}$ be two 1-packed matrices. By definition of $\gamma, \gamma\left(\mathbf{F}_{M_{1}}^{\star} \cdot \mathbf{F}_{M_{2}}^{\star}\right)$ is multiplicity-free over the quasi-multiword basis of MQSym. Moreover, since the augmented shuffle is multiplicityfree, $\gamma\left(\mathbf{F}_{M_{1}}^{\star}\right) \cdot \gamma\left(\mathbf{F}_{M_{2}}^{\star}\right)$ also is. Lemma 3.4 implies that these two elements are equal and then, that $\gamma$ is an algebra morphism. The injectivity of $\gamma$ follows by triangularity.

For instance, one has

$$
\gamma \mathbf{F}^{\star}\left[\begin{array}{llll}
1 & 1 & 0 & 0  \tag{3.1.14}\\
0 & 0 & 1 & 0 \\
0 & 1 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]=\mathbf{M S}\left[\begin{array}{llll}
1 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 1 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}
1 & 1 & 1 & 0 \\
0 & 1 & 1 & 0 \\
0 & 0 & 0 & 1
\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}
1 & 1 & 0 & 0 \\
0 & 0 & 1 & 0 \\
0 & 1 & 1 & 1
\end{array}\right]+\mathbf{M S}\left[\begin{array}{llll}
1 & 1 & 1 & 0 \\
0 & 1 & 1 & 1
\end{array}\right] .
$$

Notice that $\gamma$ is not a Hopf morphism since it is not a coalgebra morphism. Indeed, we have

$$
\Delta \gamma \mathbf{F}_{\left[\begin{array}{ll}
\star & 1  \tag{3.1.15}\\
1 & 0
\end{array}\right]}=1 \otimes \mathbf{M S}\left[\begin{array}{ll}
1 & 1 \\
1 & 0
\end{array}\right]+\mathbf{M S}\left[\begin{array}{ll}
1 & 1 \\
1 & 0
\end{array}\right] \otimes 1
$$

but

$$
\left.(\gamma \otimes \gamma) \Delta \mathbf{F}_{\left[\begin{array}{ll}
1 & 1  \tag{3.1.16}\\
1 & 0
\end{array}\right]}^{\star}=1 \otimes \mathbf{M} \mathbf{S}_{\left[\begin{array}{ll}
1 & 1 \\
1 & 0
\end{array}\right]}+\mathbf{M} \mathbf{S}_{[1}^{1} 11\right] \otimes \mathbf{M} \mathbf{S}_{[1]}+\mathbf{M} \mathbf{S}_{\left[\begin{array}{ll}
1 & 1 \\
1 & 0
\end{array}\right] \otimes 1 .}
$$

3.1.4. Diagram of embeddings. The following diagram summarizes the relations between known Hopf algebras related to $\mathbf{P} \mathbf{M}_{k}$ and, more specifically, to its simple gradations $\mathbf{P M N} \mathbf{N}_{k}$ and $\mathbf{P M L} \mathbf{M}_{k}$. Plain arrows are Hopf algebra morphisms and the dotted arrow is an algebra morphism. The Hopf algebra ASM is the subject of Section 4.

3.2. Equivalence relations and Hopf subalgebras. Several Hopf algebras can be constructed as Hopf subalgebras of the Malvenuto-Reutenauer Hopf algebra FQSym [MR95, DHT02]. The main examples are the Hopf algebra PBT based on planar binary trees, first defined by Loday and Ronco [LR98] and reconstructed by Hivert, Novelli, and Thibon [HNT05], and FSym based on standard Young tableaux, first discovered by Poirier and Reutenauer [PR95] and reconstructed by Duchamp, Hivert, and Thibon [DHT02].

The starting point of these constructions is to define a congruence $\equiv$ on the free monoid $A^{*}$ where $A$ is a totally ordered infinite alphabet. Then, when $\equiv$ satisfies some properties [HN07,Gir11], the elements

$$
\begin{equation*}
\mathbf{P}_{[\sigma]_{\equiv}}:=\sum_{\sigma \in[\sigma]_{\equiv}} \mathbf{F}_{\sigma} \tag{3.2.1}
\end{equation*}
$$

span a Hopf subalgebra of FQSym indexed by the $\equiv$-equivalence classes restricted to permutations. We shall show in this section that an analogous construction works to construct Hopf subalgebras of $\mathbf{P} \mathbf{M}_{k}$.
3.2.1. The sylvester and the plactic congruences. Recall that the congruence allowing to reconstruct PBT is the sylvester congruence (see [HNT02, HNT05]). It is denoted by $\equiv_{\mathrm{S}}$ and is the reflexive and transitive closure of the sylvester adjency relation $\longleftrightarrow \mathrm{S}$ defined for $u \in A^{*}$ and $\mathrm{a}, \mathrm{b}, \mathrm{c} \in A$ by

$$
\begin{equation*}
\mathrm{ac} u \mathrm{~b} \longleftrightarrow \mathrm{~S}_{\mathrm{S}} \mathrm{ca} u \mathrm{~b} \quad \text { where } \quad \mathrm{a} \leqslant \mathrm{~b}<\mathrm{c} . \tag{3.2.2}
\end{equation*}
$$

For example, the $\equiv_{\text {S }}$-equivalence class of the permutation 15423 (see Figure 5) is
$\{12543,15243,15423,51243,51423,54123\}$.

Figure 5. The sylvester equivalence class of the permutation 15423. Edges represent sylvester adjacency relations.

Besides, recall that the congruence allowing to reconstruct FSym is the plactic congruence (see [LS81, Lot02]). It is denoted by $\equiv_{\mathrm{P}}$ and is the reflexive and transitive closure of the plactic adjacency relation $\longleftrightarrow_{\mathrm{P}}$ defined for $\mathrm{a}, \mathrm{b}, \mathrm{c} \in A$ by

$$
\begin{array}{ll}
\mathrm{acb} \longleftrightarrow_{\mathrm{P}} \mathrm{cab} & \text { where } \quad \mathrm{a} \leqslant \mathrm{~b}<\mathrm{c} \\
\mathrm{bac} \longleftrightarrow_{\mathrm{P}} \text { bca } & \text { where } \mathrm{a}<\mathrm{b} \leqslant \mathrm{c} \tag{3.2.4b}
\end{array}
$$

3.2.2. The monoid of words of columns. Let $C_{k}^{*}$ be the free monoid generated by the set $C_{k}$ of all $n \times 1$-matrices with entries in $A_{k}$, for all $n \geqslant 1$. In other words, the elements of $C_{k}^{*}$ are words whose letters are columns and its product • is the concatenation of such words. When all the letters of an element $M \in C_{k}^{*}$ have, as columns, a same number of rows, $M$ is a matrix and we shall denote it as such in the sequel.

The alphabet $C_{k}$ is naturally equipped with the total order $\leqslant$ where, for any $c_{1}, c_{2} \in C_{k}, c_{1} \leqslant c_{2}$ if and only if the bottom to top reading of the column $c_{1}$ is lexicographically smaller than the bottom to top reading of $c_{2}$. For instance,

$$
\left[\begin{array}{l}
1  \tag{3.2.5}\\
0 \\
0
\end{array}\right] \leqslant\left[\begin{array}{l}
0 \\
0 \\
1
\end{array}\right], \quad\left[\begin{array}{l}
0 \\
0 \\
1 \\
0 \\
1
\end{array}\right] \leqslant\left[\begin{array}{l}
0 \\
0 \\
1 \\
1
\end{array}\right], \quad\left[\begin{array}{l}
1 \\
0
\end{array}\right] \leqslant\left[\begin{array}{l}
0 \\
1 \\
1 \\
0
\end{array}\right], \quad\left[\begin{array}{l}
2 \\
1 \\
0
\end{array}\right] \leqslant\left[\begin{array}{l}
1 \\
2 \\
0
\end{array}\right]
$$

Since $C_{k}$ is then totally ordered and $C_{k}^{*}$ is a free monoid, one can consider the previous two congruences on $C_{k}^{*}$ instead on $A^{*}$. For instance, Figure 6 represents a $\equiv_{\mathrm{S}}$-equivalence class and a $\equiv_{\mathrm{P}}$-equivalence class of packed matrices.

The order relation $\leqslant$ on $C_{k}$ is compatible with the shifted shuffle of packed matrices in the following sense. Let $M_{1}$ and $M_{2}$ be two nonempty packed matrices and $M$ be a matrix appearing in $M_{1} Ш M_{2}$. Then, if $c_{1}$ (resp. $c_{2}$ ) is a column of $M$ coming from $M_{1}$ (resp. $M_{2}$ ), we necessarily have $c_{1} \leqslant c_{2}$ and $c_{1} \neq c_{2}$. The obvious analogous property holds for words of $A^{*}$ and the shifted shuffle of words.
3.2.3. Properties of equivalence relations. An equivalence relation $\equiv$ on $C_{k}^{*}$ is a monoid congruence if for all $u, v, u^{\prime}, v^{\prime} \in C_{k}^{*}$,

$$
\begin{equation*}
u \equiv u^{\prime} \quad \text { and } \quad v \equiv v^{\prime} \quad \text { imply } \quad u \bullet v \equiv u^{\prime} \bullet v^{\prime} \tag{3.2.6}
\end{equation*}
$$

Figure 6. Two equivalence classes of packed matrices.

Besides, we say that $\equiv$ is compatible with the restriction to alphabet intervals if for any interval $I$ of $C_{k}$ and for all $u, v \in C_{k}^{*}$,

$$
\begin{equation*}
u \equiv v \quad \text { implies } \quad u_{\mid I} \equiv v_{\mid I}, \tag{3.2.7}
\end{equation*}
$$

where $u_{\mid I}$ denotes the word obtained by erasing in $u$ the letters that are not in $I$.
Finally, we say that $\equiv$ is compatible with the decompression process if for all $u, v \in C_{k}^{*}$ such that $u$ and $v$ are matrices,

$$
\begin{equation*}
u \equiv v \quad \text { if and only if } \quad \operatorname{cp}(u) \equiv \operatorname{cp}(v) \text { and } \operatorname{ev}(u)=\operatorname{ev}(v) \tag{3.2.8}
\end{equation*}
$$

where $\operatorname{ev}(u)$ denotes the commutative image of $u$.
3.2.4. Construction of Hopf subalgebras. Given an equivalence relation $\equiv$ on the words of $C_{k}^{*}$ and a

$$
\begin{equation*}
\mathbf{P}_{[M]_{\equiv}}:=\sum_{M^{\prime} \in[M]_{\equiv}} \mathbf{F}_{M^{\prime}} \tag{3.2.9}
\end{equation*}
$$

of $\mathbf{P} \mathbf{M}_{k}$.
One has for instance
(3.2.10)
$\left[\left[\begin{array}{lllll}1 & 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 0\end{array}\right]\right]_{\equiv_{P}}\left[\begin{array}{lllll}1 & 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 0\end{array}\right]+\mathbf{F}\left[\begin{array}{lllll}1 & 1 & 0 & 1 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 1 & 1 \\ 1 & 0 & 0 & 1 & 0\end{array}\right]+\mathbf{F}\left[\begin{array}{lllll}1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 \\ 0 & 1 & 1 & 0 & 0\end{array}\right]+\mathbf{F}\left[\begin{array}{lllll}1 & 1 & 1 & 0 & 0 \\ 1 & 1 & 0 & 0 & 1 \\ 1 & 0 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 1 \\ 1 & 0 & 1 & 0 & 0\end{array}\right]+\mathbf{F}\left[\begin{array}{lllll}1 & 1 & 1 & 0 & 0 \\ 1 & 0 & 1 & 0 & 1 \\ 1 & 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 & 1 \\ 1 & 1 & 0 & 0 & 0\end{array}\right]$.

In particular, if $\equiv$ is compatible with the decompression process, any $\equiv$-equivalence class of a packed matrix only contains packed matrices. The family $\mathbf{P}_{[M]_{\equiv}}$, where the $[M]_{\equiv}$ are $\equiv$-equivalence classes of packed matrices, forms then a basis of a vector subspace of $\mathbf{P} \mathbf{M}_{k}$ denoted by $\mathbf{P} \mathbf{M}_{k}{ }^{\equiv}$.

Theorem 3.6. Let $\equiv$ be an equivalence relation on the words of $C_{k}^{*}$ such that $\equiv$
(1) is a monoid congruence on $C_{k}^{*}$;
(2) is compatible with the restriction to alphabet intervals;
(3) is compatible with the decompression process.

Then, $\mathbf{P M}_{k}{ }^{\equiv}$ is a Hopf subalgebra of $\mathbf{P} \mathbf{M}_{k}$.
Proof. Let us show that the product is well-defined on $\mathbf{P M}_{k} \equiv$. Let $\left[M_{1}\right]_{\equiv}$ and $\left[M_{2}\right]_{\equiv}$ be two $\equiv$ equivalence classes of $k$-packed matrices. We have

$$
\begin{equation*}
\mathbf{P}_{\left[M_{1}\right]_{\equiv}} \cdot \mathbf{P}_{\left[M_{2}\right]_{\equiv}}=\sum_{\substack{M_{1} \in\left[M_{1}\right] \equiv \\ M_{2} \in\left[M_{2}\right]_{\equiv}}} \sum_{M \in M_{1} \bar{\omega} M_{2}} \mathbf{F}_{M} \tag{3.2.11}
\end{equation*}
$$

Let $M$ be a $k$-packed matrix such that $\mathbf{F}_{M}$ appears in (3.2.11) and $M^{\prime}$ be a $k$-packed matrix such that $M^{\prime} \equiv M$. Then, there is a pair of $k$-packed matrices $\left(M_{1}, M_{2}\right)$ such that $M_{1} \in\left[M_{1}\right]_{\equiv}$, $M_{2} \in\left[M_{2}\right]_{\equiv}$, and $M \in M_{1} \bar{\amalg} M_{2}$. By definition of the shifted shuffle, this pair is unique. Let $m_{1}$ (resp. $m_{2}$ ) be the size of $M_{1}$ (resp. $M_{2}$ ). Let $c_{1}$ (resp. $d_{1}$ ) be the smallest (resp. greatest) column of $M_{1} \circ m_{2}$ and $c_{2}$ (resp. $d_{2}$ ) be the smallest (resp. greatest) column of $m_{1} \circ M_{2}$. Then, since all columns of $M_{1} \circ m_{2}$ are strictly smaller than the ones of $m_{1} \circ M_{2}$, the intervals $\left[c_{1}, d_{1}\right]$ and $\left[c_{2}, d_{2}\right]$ are disjoint. By (2), $M \equiv M^{\prime}$ implies $M_{\mid\left[c_{1}, d_{1}\right]} \equiv M_{\left[\left[c_{1}, d_{1}\right]\right.}^{\prime}$ and $M_{\left[\left[c_{2}, d_{2}\right]\right.} \equiv M_{\mid\left[c_{2}, d_{2}\right]}^{\prime}$. Moreover, by (3) and by definition of $\circ$, we have

$$
\begin{equation*}
M_{1}=\operatorname{cp}\left(M_{\mid\left[c_{1}, d_{1}\right]}\right) \equiv \operatorname{cp}\left(M_{\left[\left[c_{1}, d_{1}\right]\right.}^{\prime}\right)=: M_{1}^{\prime} \tag{3.2.12}
\end{equation*}
$$

and

$$
\begin{equation*}
M_{2}=\operatorname{cp}\left(M_{\mid\left[c_{2}, d_{2}\right]}\right) \equiv \operatorname{cp}\left(M_{\mid\left[c_{2}, d_{2}\right]}^{\prime}\right)=: M_{2}^{\prime} \tag{3.2.13}
\end{equation*}
$$

Thus, we have $M^{\prime} \in M_{1}^{\prime} \Phi M_{2}^{\prime}$, showing that $\mathbf{F}_{M^{\prime}}$ also appears in (3.2.11) and that the product is well-defined on $\mathbf{P M}_{k} \equiv$.

Let us now show that the coproduct is well-defined on $\mathbf{P M}_{k} \equiv$. Let $[M]_{\equiv}$ be a $\equiv$-equivalence class of $k$-packed matrices. We have

$$
\begin{equation*}
\Delta\left(\mathbf{P}_{[M]_{\equiv}}\right)=\sum_{M \in[M]_{\equiv}} \sum_{M=L \bullet R} \mathbf{F}_{\mathrm{cp}(L)} \otimes \mathbf{F}_{\mathrm{cp}(R)} \tag{3.2.14}
\end{equation*}
$$

Let $M_{1}$ and $M_{2}$ be two $k$-packed matrices such that $\mathbf{F}_{M_{1}} \otimes \mathbf{F}_{M_{2}}$ appears in (3.2.14) and $M_{1}^{\prime}$ and $M_{2}^{\prime}$ two $k$-packed matrices such that $M_{1}^{\prime} \equiv M_{1}$ and $M_{2}^{\prime} \equiv M_{2}$. Then, there is a $k$-packed matrix $M \in$ $[M]_{\equiv}$ such that $M=L \bullet R, \operatorname{cp}(L)=M_{1}$, and $\operatorname{cp}(R)=M_{2}$. By (3), $M_{1}^{\prime}$ (resp. $M_{2}^{\prime}$ ) is a permutation of $M_{1}$ (resp. $M_{2}$ ). Thus, there exist two elements $L^{\prime}$ and $R^{\prime}$ of $C_{k}^{*}$ that are respectively permutations of $L$ and $R$ which satisfy $\operatorname{cp}\left(L^{\prime}\right)=M_{1}^{\prime}$ and $\operatorname{cp}\left(R^{\prime}\right)=M_{2}^{\prime}$. Again by (3), we have $L^{\prime} \equiv L$ and $R^{\prime} \equiv R$. Now, by (1),

$$
\begin{equation*}
M=L \bullet R \equiv L^{\prime} \bullet R^{\prime}=: M^{\prime} \tag{3.2.15}
\end{equation*}
$$

Hence, $M^{\prime} \equiv M$ and $\mathbf{F}_{M_{1}^{\prime}} \otimes \mathbf{F}_{M_{2}^{\prime}}$ also appears in (3.2.14).
We have shown that the product and the coproduct of $\mathbf{P} \mathbf{M}_{k}$ are still well-defined on $\mathbf{P} \mathbf{M}_{k} \equiv$. Hence, $\mathbf{P M}_{k} \equiv$ is a Hopf subalgebra of $\mathbf{P M}$.

We say that an equivalence relation $\equiv$ on $C_{k}^{*}$ is a good congruence if it satisfies (1), (2) and (3) of Theorem 3.6. Let $\equiv$ be a good congruence. Note that since $\equiv$ is compatible with the decompression process, any matrix contained in a $\equiv$-equivalence class $[M]_{\equiv}$ is obtained by switching columns of $M$. Then, any $\equiv$-equivalence class $[M]_{\equiv}$ of $k$-packed matrices only contains matrices whose size and number of nonzero entries are the same as in $M$. Hence, Theorem 3.6 also implies that the family (3.2.9) forms a basis of Hopf subalgebras of both $\mathbf{P M N} \mathbf{N}_{k}$ and $\mathbf{P M L}{ }_{k}$. We respectively denote these by $\mathbf{P M} \mathbf{N}_{k} \equiv$ and $\mathbf{P} \mathbf{M L}_{k} \equiv$.
3.2.5. Computer experiments. Let us recall here the definitions of some well-known good congruences.

The Baxter congruence (see [Gir12]), denoted by $\equiv_{\mathrm{Bx}}$, is the reflexive and transitive closure of the Baxter adjacency relation $\longleftrightarrow \mathrm{Bx}$ defined for $u, v \in A^{*}$ and $\mathrm{a}, \mathrm{b}, \mathrm{c}, \mathrm{d} \in A$ by

$$
\begin{array}{lll}
\mathrm{c} u \mathrm{ad} v \mathrm{~b} \longleftrightarrow{ }_{\mathrm{Bx}} \mathrm{c} u \text { da } v \mathrm{~b} & \text { where } & \mathrm{a} \leqslant \mathrm{~b}<\mathrm{c} \leqslant \mathrm{~d} \\
\mathrm{~b} u \text { da } v \mathrm{c} \longleftrightarrow \mathrm{Bx}  \tag{3.2.16b}\\
\mathrm{~b} u \text { ad } v \mathrm{c} & \text { where } & \mathrm{a}<\mathrm{b} \leqslant \mathrm{c}<\mathrm{d} .
\end{array}
$$

The Bell congruence (see [Rey07]), denoted by $\equiv_{\mathrm{Bl}}$, is the reflexive and transitive closure of the Bell adjacency relation $\longleftrightarrow \mathrm{Bl}$ defined for $u \in A^{*}$ and $\mathrm{a}, \mathrm{b}, \mathrm{c} \in A$ by

$$
\begin{equation*}
\mathrm{ac} u \mathrm{~b} \longleftrightarrow \mathrm{Bl}_{\mathrm{Bl}} \mathrm{ca} u \mathrm{~b} \quad \text { where } \quad \mathrm{a} \leqslant \mathrm{~b}<\mathrm{c} \text { and for all } \mathrm{d} \in u, \mathrm{~d} \geqslant \mathrm{c} \tag{3.2.17}
\end{equation*}
$$

The hypoplactic congruence (see [KT97, KT99]), denoted by $\equiv_{\mathrm{H}}$, is the reflexive and transitive closure of the hypoplactic adjacency relation $\longleftrightarrow{ }_{\mathrm{H}}$ defined for $u \in A^{*}$ and $\mathrm{a}, \mathrm{b}, \mathrm{c} \in A$ by

$$
\begin{array}{ll}
\mathrm{ac} u \mathrm{~b} \longleftrightarrow_{\mathrm{H}} \mathrm{ca} u \mathrm{~b} & \text { where } \quad \mathrm{a} \leqslant \mathrm{~b}<\mathrm{c} \\
\mathrm{~b} u \mathrm{ca} \longleftrightarrow_{\mathrm{H}} \mathrm{~b} u \mathrm{ac} & \text { where } \quad \mathrm{a}<\mathrm{b} \leqslant \mathrm{c} \tag{3.2.18b}
\end{array}
$$

The total congruence equivalence relation, denoted by $\equiv_{\mathrm{T}}$, is the reflexive and transitive closure of the total adjacency relation $\longleftrightarrow{ }_{\mathrm{T}}$ defined by $u \equiv_{\mathrm{T}} v$ for any $u, v \in A^{*}$ such that $\operatorname{ev}(u)=\operatorname{ev}(v)$.

By Theorem 3.6, all these congruences lead to bigraded Hopf subalgebras of $\mathbf{P M}_{k}$. Table 2 shows first few dimensions of the Hopf subalgebras of $\mathbf{P M} \mathbf{N}_{1}$ and $\mathbf{P M L} \mathbf{1}_{1}$ obtained from these congruences, computed by computer exploration.

## 4. Alternating sign matrices

Recall that an alternating sign matrix [MRR83], or an $A S M$ for short, of size $n$ is a square matrix of order $n$ with entries in the alphabet $\{0,+,-\}$ such that every row and column starts and ends by + and in every row and column, the + and the - alternate. For instance,

$$
\delta:=\left[\begin{array}{ccccc}
0 & + & 0 & 0 & 0  \tag{4.0.19}\\
0 & 0 & + & 0 & 0 \\
+ & - & 0 & 0 & + \\
0 & + & - & + & 0 \\

Table 2. First few dimensions of the Hopf subalgebras $\mathbf{P M} \mathbf{N}_{1} \equiv$ and $\mathbf{P M L}_{1} \equiv$, where $\equiv$ is successively the Baxter, Bell, sylvester, plactic, hypoplactic, and total congruence.
4.1. Hopf algebra structure. Let $\delta$ be an ASM. We denote by $M^{\delta}$ the matrix satisfying

$$
M_{i j}^{\delta}:= \begin{cases}1 & \text { if } \delta_{i j} \in\{+,-\}  \tag{4.1.1}\\ 0 & \text { otherwise }\end{cases}
$$

For instance, with the ASM $\delta$ defined above, we obtain

$$
M^{\delta}=\left[\begin{array}{lllll}
0 & 1 & 0 & 0 & 0  \tag{4.1.2}\\
0 & 0 & 1 & 0 & 0 \\
1 & 1 & 0 & 0 & 1 \\
0 & 1 & 1 & 1 & 0 \\
0 & 0 & 1 & 0 & 0
\end{array}\right] .
$$

It is immediate that $M^{\delta}$ is a 1 -packed matrix of the same size than $\delta$. Besides, observe that since the + and the - alternate in an ASM, by starting from a 1-packed matrix $M$, there is at most one ASM $\delta$ such that $M^{\delta}=M$.

Let ASM be the vector space spanned by the set of all ASMs. For any ASM $\delta$, let us denote by $\mathbf{F}_{\delta}$ the element $\mathbf{F}_{M^{\delta}}$. Due to the above observation, the family $\mathbf{F}_{\delta}$, where $\delta$ are ASMs, spans ASM. Moreover, since the $\operatorname{map} \mathbf{F}_{\delta} \mapsto \mathbf{F}_{M^{\delta}}$ is an injective morphism from $\mathbf{A S M}$ to $\mathbf{P} \mathbf{M}_{1}$, this family forms a basis.

The product and the coproduct of $\mathbf{P} \mathbf{M}_{1}$ induce the product and the coproduct of $\mathbf{A S M}$. For example, we have

$$
\mathbf{F}_{\left[\begin{array}{c}
0
\end{array}+0\right.}^{+}-\mathbf{D}^{+}+\mathbf{F}_{[+]}=\mathbf{F}\left[\begin{array}{cccc}
0 & + & 0 & 0  \tag{4.1.3}\\
+ & - & + & 0 \\
0 & + & 0 & 0 \\
0 & 0 & 0 & +
\end{array}\right]+\mathbf{F}\left[\begin{array}{cccc}
0 & + & 0 & 0 \\
+ & - & 0 & + \\
0 & + & 0 & 0 \\
0 & 0 & + & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{cccc}
0 & 0 & + & 0 \\
+ & 0 & - & + \\
0 & 0 & + & 0 \\
0 & + & 0 & 0
\end{array}\right]+\mathbf{F}\left[\begin{array}{cccc}
0 & 0 & + & 0 \\
0 & + & - \\
0 & 0 & + \\
+ & 0 & 0 & 0
\end{array}\right],
$$

and

Theorem 4.1. The vector space ASM, endowed with the product and coproduct of $\mathbf{P M}_{1}$, forms a free, cofree, and self-dual bigraded Hopf algebra which admits a bidendriform bialgebra structure.

Proof. Let $\delta_{1}$ and $\delta_{2}$ be two ASMs of respective sizes $n_{1}$ and $n_{2}$ and let $M \in M^{\delta_{1}} \bar{Ш} M^{\delta_{2}}$. Let us denote by $M_{1}$ (resp. $M_{2}$ ) the matrix consisting in the first $n_{1}$ (resp. last $n_{2}$ ) rows of $M$. By construction, $M_{1}$ contains columns coming from $\delta_{1}$ and some null columns. The relative order of columns of $M^{\delta_{1}}$ is the same as in $M_{1}$, i.e., the $i$ th column of $M^{\delta_{1}}$ is the $i$ th nonzero column of $M_{1}$. Hence, the rows of $M_{1}$ start and end with + and then + and - alternate. Similarly, the same property is satisfied in $M_{2}$. Furthermore, the nonzero column of $M_{1}$ are followed by null columns of $M_{2}$ and the nonzero column of $M_{2}$ are preceded by null columns of $M_{1}$. Hence, the columns of $M$ start and end with + and + and - alternate. Thus $M$ is an ASM so that ASM is stable for the product of $\mathbf{P} \mathbf{M}_{1}$.

Let $\delta$ be an ASM and $L \bullet R$ be a column decomposition of $M^{\delta}$. By Lemma 1.1, a column decomposition never splits a matrix by separating two nonzero entries on a same row. Then, the nonzero rows of $L$ and $R$ start and end with + and + and - alternate. Thus, $\operatorname{cp}(L)$ and $\operatorname{cp}(R)$ are ASMs and ASM is stable for the coproduct of $\mathbf{P} \mathbf{M}_{1}$.

This shows that ASM is a Hopf subalgebra of $\mathbf{P} \mathbf{M}_{1}$ and also that ASM inherits from the bidendriform bialgebra structure of $\mathbf{P} \mathbf{M}_{1}$ (see Theorem 2.9). Finally, since ASM admits a bidendriform bialgebra structure, by [Foi07], it is free, cofree, and self-dual.

From now, we shall see ASM as a simply graded Hopf algebra so that the degree of any $\mathbf{F}_{\delta}$, where $\delta$ is an ASM, is the size of $\delta$. The dimensions of ASM form Sequence A005130 of [Slo] and the first few terms are

$$
\begin{equation*}
1,1,2,7,42,429,7436,218348,10850216,911835460,129534272700 \tag{4.1.5}
\end{equation*}
$$

By using same arguments as those used in Section 2.1, one can build multiplicative bases of ASM by setting, for any ASM $\delta$,

$$
\begin{equation*}
\mathbf{E}_{\delta}:=\sum_{M^{\delta} \leqslant M^{\delta^{\delta^{\prime}}}} \mathbf{F}_{\delta^{\prime}} \quad \text { and } \quad \mathbf{H}_{\delta}:=\sum_{M^{\delta^{\prime}} \leqslant M M^{\delta}} \mathbf{F}_{\delta^{\prime}} . \tag{4.1.6}
\end{equation*}
$$

This gives another way to prove the freeness of ASM by using same arguments as those of Theorem 2.4. Hence, ASM is freely generated by the elements $\mathbf{E}_{\delta}\left(\right.$ resp. $\left.\mathbf{H}_{\delta}\right)$ where the $\delta$ are ASMs such that the $M^{\delta}$ are connected (resp. anti-connected) 1-packed matrices. The first few numbers of algebraic generators of ASM are

$$
\begin{equation*}
0,1,1,4,29,343,6536,202890,10403135,889855638,127697994191 \tag{4.1.7}
\end{equation*}
$$

and the first few dimensions of totally primitive elements are

$$
\begin{equation*}
0,1,0,2,20,277,5776,188900,9980698,868571406,125895356788 \tag{4.1.8}
\end{equation*}
$$

Moreover, since the transpose of an ASM is also an ASM, by Proposition 2.5, the map $\phi$ : $\mathbf{A S M} \rightarrow \mathbf{A S M}^{\star}$ linearly defined for any ASM $\delta$ by

$$
\begin{equation*}
\phi\left(\mathbf{F}_{\delta}\right):=\mathbf{F}_{\delta^{T}}^{\star} \tag{4.1.9}
\end{equation*}
$$

is an isomorphism.
4.2. Alternating sign matrices statistics. We recall here the definitions of some statistics on ASMs. Their description passes through six-vertex configurations and osculating paths, combinatorial objects in bijection with ASMs.

The statistics discussed in this article have been already exploited in the literature. For instance, in [EKLP92], the authors focused on these statistics to understand the relationship between domino tilings of Aztec diamonds and ASMs.
4.2.1. Six-vertex configurations. A six-vertex configuration (see for example [Bre99, Bax08] for further information and references) of size $n$ is a $n \times n$ square grid with oriented edges so that each vertex has two incoming and two outcoming edges. There are six possible configurations for each vertex. We consider here the six-vertex model with domain wall boundary conditions [Kor82] i.e., all horizontal (resp. vertical) edges on the boundary of this model are oriented inwardly (resp. outwardly) (see Figure 8(c)).

The bijection [Kup96] between ASMs of size $n$ and six-vertex configurations of the same size consists in replacing each vertex configuration by $0,+$, or - according to the rules described in Figure 7. Reciprocally, to recover a six-vertex model from an ASM $\delta$, we first replace each nonzero

Figure 7. Correspondence between vertices of six-vertex configurations and entries of ASMs.
entry of $\delta$ by the corresponding vertex configuration (see the last two configurations of Figure 7). Then, for each zero entry of $\delta$, we look at the sum $\ell$ (resp. $a$ ) of the entries to the left (resp. above) of it and in the same row (resp. column). By the alternating property of the ASMs, $\ell$ and $a$ belong to $\{0,1\}$. Now, set in $\delta$ the configuration $\ll($ resp. $>)$ if $\ell=1$ (resp. $\ell=0$ ) together with the configuration $\bigvee_{V}\left(\right.$ resp. $\left.\widehat{\wedge}^{\hat{}}\right)$ if $a=1$ (resp. $a=0$ ). Figures $8(\mathrm{a})$ and $8(\mathrm{c})$ form an example.
4.2.2. Statistics on six-vertex configurations and $A S M$. Let us denote by ne $(\delta)$ (resp. $\operatorname{sw}(\delta)$, $\operatorname{se}(\delta)$, $\mathrm{nw}(\delta)$, oi $(\delta)$, io $(\delta)$ ) the number of vertices ne (resp. sw, se, nw, oi, io) in the six-vertex configuration in bijection with the ASM $\delta$. Let $\mathfrak{Z}:=\{\mathrm{se}, \mathrm{nw}, \mathrm{sw}, \mathrm{ne}\}$ be the set of the statistics counting the four configurations of 0 and $\mathfrak{N}:=\{$ io, oi $\}$ be the set of the statistics counting the two nonzero configurations.
4.2.3. Sets of osculating paths. These statistics share some symmetries that are naturally interpreted on sets of osculating paths (see [BMH95, Beh08]). Let $\Pi$ be a $n \times n$ square of lattice points with rows (resp. columns) labelled from 1 to $n$ from top to bottom (resp. from left to right). A lattice path on $\Pi$ is a sequence $\left(v_{0}, v_{1}, \ldots, v_{r}\right)$ of vertices of $\Pi$ such that $v_{i}-v_{i-1} \in\{(1,0),(0,-1)\}$ for all $i \in[r]$. A set of osculating paths on $\Pi$ is a set of lattice paths on $\Pi$ in which different paths do not cross each other but can share some vertices.

We can associate a set of osculating paths with any six-vertex configuration according to the rules described in Figure 9. Domain boundary conditions ensure that each path starts at $(i, 1)$ and ends at $(1, j)$ for some $i$ and $j$. Figures $8(\mathrm{c})$ and $8(\mathrm{~d})$ form an example.

$$
\left[\begin{array}{cccccc}
0 & 0 & + & 0 & 0 & 0 \\
+ & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & + & 0 \\
0 & + & 0 & 0 & - & + \\
0 & 0 & 0 & + & 0 & 0 \\
0 & 0 & 0 & 0 & + & 0
\end{array}\right]
$$

$$
\text { (a) An ASM } \delta
$$

(c) The six-vertex configuration in bijection with $\delta$.

(b) The corner sum matrix in bijection with $\delta$.

(d) The set of osculating paths in bijection with $\delta$.

Figure 8. Four objects in correspondence: ASMs, six-vertex configurations, corner sum matrices, and sets of osculating paths.

Figure 9. Correspondence between vertices of six-vertex configurations and osculating paths.

The direct interpretation of ASMs in terms of sets of osculating paths is directly based upon the corner sum matrix introduced in [RR86]: given an $n \times n$ matrix $M$, the corner sum matrix $\bar{M}$ of $M$ is defined by

$$
\begin{equation*}
\bar{M}_{i, j}:=\sum_{\substack{i \leqslant k \leqslant n \\ j \leqslant \ell \leqslant n}} M_{k, \ell} . \tag{4.2.1}
\end{equation*}
$$

Figures 8(a) and 8(b) form an example. We associate with any ASM $\delta$ of size $n$ the set of osculating paths described as follows. By regarding $\bar{\delta}$ as a $(n+1) \times(n+1)$ square of lattice points, we draw on it the south and the east boundaries of the areas consisting in a same value greater than zero. This produces a set of $n$ osculating paths. Figures $8(b)$ and $8(d)$ form an example. Since the steps of the paths in the first row (resp. column) are, by construction, always vertical (resp. horizontal), this set of osculating paths can be seen without loss of information on the $n \times n$ square of lattice points.

The different $2 \times 2$ submatrices configurations in a corner sum matrix of an ASM are exactly

They obviously describe the correspondence given in Figure 9.

HOPF ALGEBRA ON PACKED SQUARE MATRICES
4.2.4. Symmetries between ASMs statistics.

Proposition 4.2. Let $\delta$ be an ASM of size $n$. Then,

$$
\begin{equation*}
\operatorname{se}(\delta)=\operatorname{nw}(\delta), \quad \operatorname{ne}(\delta)=\operatorname{sw}(\delta), \quad \mathrm{oi}(\delta)=\mathrm{io}(\delta)+n \tag{4.2.3}
\end{equation*}
$$

Proof. Consider the set of osculating paths $P$ associated with $\delta$ and the correspondence between the vertices of six-vertex configurations and osculating paths (see Figure 9). The first identity of (4.2.3) is equivalent to say that there are in $P$ as many horizontal steps as vertical steps. Since in $P$, any osculating path connects the $i$ th vertex of the first column with the $i$ th vertex of the first row of the grid, for any $i \in[n]$, this property holds. Whence the first identity.

Consider now the ASM $\delta^{\prime}$ where, for any $i \in[n]$, the $i$ th row of $\delta^{\prime}$ is the $(n-i+1)$ st row of $\delta$. Then, in the six-vertex configuration in bijection with $\delta^{\prime}$, all ne (resp. sw) configurations come from se (resp. nw) configurations of the six-vertex configuration in bijection with $\delta$. Then, the second identity follows from the first one.

The last identity follows immediately from the fact that any row and column of $\delta$ starts and ends by + , and the + and the - alternate.
4.3. Algebraic interpretation of some statistics. We provide algebraic interpretations of the statistics on ASMs recalled in the previous section by using the Hopf algebra ASM. To be more precise, we study the algebraic quotients of ASM by equivalence relations defined via ASMs statistics.
4.3.1. Maps from ASM to $q$-rational functions. Let us recall the following notations in the algebra $\mathbb{K}(q)$ of $q$-rational functions:

$$
\begin{gather*}
{[n]_{q}:=1+q+\cdots+q^{n-1}, \quad n \geqslant 1,}  \tag{4.3.1}\\
{[0]_{q}!:=1, \quad[n]_{q}!:=[1]_{q}[2]_{q} \ldots[n]_{q}, \quad n \geqslant 1,}  \tag{4.3.2}\\
{\left[\begin{array}{c}
n_{1}+n_{2} \\
n_{1}, n_{2}
\end{array}\right]_{q}:=\frac{\left[n_{1}+n_{2}\right]_{q}!}{\left[n_{1}\right]_{q}!\left[n_{2}\right]_{q}!}, \quad n_{1}, n_{2} \geqslant 0 .} \tag{4.3.3}
\end{gather*}
$$

Lemma 4.3. Let $\delta, \delta_{1}$, and $\delta_{2}$ be three ASMs such that $M^{\delta} \in M^{\delta_{1}} \bar{\Psi} M^{\delta_{2}}$. Then, for any $s \in \mathfrak{N}$,

$$
\begin{equation*}
s(\delta)=s\left(\delta_{1}\right)+s\left(\delta_{2}\right) \tag{4.3.4}
\end{equation*}
$$

Proof. The two statistics oi and io of $\mathfrak{N}$, respectively count the number of entries + and - in ASMs. This result follows from the fact that the shifted shuffle of packed matrices does not add nor remove nonzero entries and the fact that any nonzero entry encoding a + (resp. -) in the operands $M^{\delta_{1}}$ and $M^{\delta_{2}}$ gives rise to a + (resp. -) in $M^{\delta}$.

Here is the product (4.1.3) in ASM, seen on six-vertex configurations, where boldfaced vertices are of kind io.

Proposition 4.4. The map $\phi_{s}: \mathbf{A S M} \rightarrow \mathbb{K}(q)$ linearly defined, for any $s \in \mathfrak{N}$ and any ASM $\delta$ of size $n$ by

$$
\begin{equation*}
\phi_{s}\left(\mathbf{F}_{\delta}\right):=\frac{q^{s(\delta)}}{n!} \tag{4.3.6}
\end{equation*}
$$

is an algebra morphism.
Proof. This result follows immediately from Lemma 4.3 and the fact that the product of two matrices of sizes $n_{1}$ and $n_{2}$ in ASM over the fundamental basis contains $\binom{n_{1}+n_{2}}{n_{1}}$ terms.

Lemma 4.5. Let $\delta, \delta_{1}$, and $\delta_{2}$ be three ASMs such that $M^{\delta} \in M^{\delta_{1}} \bar{\Psi} M^{\delta_{2}}$. Let $m$ be the size of $\delta_{2}$ (resp. $\delta_{1}$ ) and $\left\{k_{1}<k_{2}<\cdots<k_{m}\right\}$ be the set of the indices of the columns of $M^{\delta}$ coming from $M^{\delta_{2}}$ (resp. $M^{\delta_{1}}$ ). Then, for any $s \in\{\mathrm{nw}, \mathrm{se}\}$ (resp. $s \in\{\mathrm{sw}, \mathrm{ne}\}$ ),

$$
\begin{equation*}
s(\delta)=s\left(\delta_{1}\right)+s\left(\delta_{2}\right)+\sum_{1 \leqslant j \leqslant m}\left(k_{j}-j\right) . \tag{4.3.7}
\end{equation*}
$$

Proof. Let us prove the statement for the nw statistic. Let us denote by $n_{1}$ the size of $\delta_{1}$ and by $M_{1}\left(\right.$ resp. $\left.M_{2}\right)$ the first $n_{1}$ (resp. the last $m$ ) rows of $\delta$.

Notice that the zero columns of $M_{2}$ have no nw configuration and that the nw configurations lying in the nonzero columns of $M_{1}$ (resp. $M_{2}$ ) are those of $\delta_{1}$ (resp. $\delta_{2}$ ). It remains to count, for all $j \in[m]$, the number of nw configurations in the $k_{j}$ th column of $M_{1}$. Observe that the sums of the entries above any zero of the $k_{j}$ th column are 0 . Besides, there are exactly $k_{j}-j$ zeros in the $k_{j}$ th column such that the sums of the entries to their left are 1 . These zeros are, by definition, nw configurations, whence (4.3.7).

This is also valid for the statistic sw since the symmetry consisting in swapping the $i$ th and $(n-i+1)$ st row of ASMs of size $n$ exchanges the nw configurations into sw configurations. By Proposition 4.2, this also proves the statement of the se and ne statistics.

Here is the product (4.1.3) in ASM, seen on six-vertex configurations, where boldfaced vertices are of kind nw.

Proposition 4.6. The map $\phi_{s}^{\prime}: \mathbf{A S M} \rightarrow \mathbb{K}(q)$ linearly defined, for any $s \in \mathfrak{Z}$ and any ASM $\delta$ of size $n$ by

$$
\begin{equation*}
\phi_{s}^{\prime}\left(\mathbf{F}_{\delta}\right):=\frac{q^{s(\delta)}}{[n]_{q}!} \tag{4.3.9}
\end{equation*}
$$

is an algebra morphism.

Proof. Let us prove the statement of nw statistic; the three other cases are analogous. Let $\delta_{1}$ and $\delta_{2}$ be two ASMs of respective sizes $n_{1}$ and $n_{2}$. Lemma 4.5 implies

$$
\begin{aligned}
\phi_{\mathrm{nw}}^{\prime}\left(\mathbf{F}_{\delta_{1}} \cdot \mathbf{F}_{\delta_{2}}\right) & =\frac{q^{\mathrm{nw}\left(\delta_{1}\right)+\mathrm{nw}\left(\delta_{2}\right)}}{\left[n_{1}+n_{2}\right]_{q}!} \sum_{\left\{k_{1}, \ldots, k_{n_{2}}\right\} \subset\left\{1, \ldots, n_{1}+n_{2}\right\}} q^{\left(k_{1}-1\right)+\cdots+\left(k_{n_{2}}-n_{2}\right)} \\
& =\frac{q^{\mathrm{nw}\left(\delta_{1}\right)+\mathrm{nw}\left(\delta_{2}\right)}}{\left[n_{1}+n_{2}\right]_{q}!}\left[\begin{array}{c}
n_{1}+n_{2} \\
n_{1}, n_{2}
\end{array}\right]_{q} \\
& =\phi_{\mathrm{nw}}^{\prime}\left(\mathbf{F}_{\delta_{1}}\right) \cdot \phi_{\mathrm{nw}}^{\prime}\left(\mathbf{F}_{\delta_{2}}\right)
\end{aligned}
$$

By similar arguments, all previous results remain valid in the dual $\mathbf{A S M}{ }^{\star}$ of $\mathbf{A S M}$. Hence,
Proposition 4.7. The maps $\psi_{s}: \mathbf{A S M}^{\star} \rightarrow \mathbb{K}(q)$ and $\psi_{t}^{\prime}: \mathbf{A S M}^{\star} \rightarrow \mathbb{K}(q)$ linearly defined, for any $s \in \mathfrak{N}, t \in \mathfrak{Z}$, and any $A S M \delta$ of size $n$ by

$$
\begin{equation*}
\psi_{s}\left(\mathbf{F}_{\delta}^{\star}\right):=\frac{q^{s(\delta)}}{n!} \quad \text { and } \quad \psi_{t}^{\prime}\left(\mathbf{F}_{\delta}^{\star}\right):=\frac{q^{t(\delta)}}{[n]_{q}!} \tag{4.3.10}
\end{equation*}
$$

are algebra morphisms.
Here is the product (4.1.3) in $\mathbf{A S M}^{\star}$, seen on six-vertex configurations, where the vertices represented by squares are of kind io while those represented by circles are of kind nw.

4.3.2. Equivalence relations on $A S M$ s and associated subspaces of ASM. Let $S \subseteq \mathfrak{Z} \cup \mathfrak{N}$ be a set of statistics and $\sim_{S}$ be the equivalence relation on the set of ASMs defined, for any ASMs $\delta_{1}$ and $\delta_{2}$ of the same size, by

$$
\begin{equation*}
\delta_{1} \sim_{S} \delta_{2} \quad \text { if and only if } s\left(\delta_{1}\right)=s\left(\delta_{2}\right) \text { for all } s \in S \tag{4.3.12}
\end{equation*}
$$

We denote by $I_{S}$ the associated vector space spanned by

$$
\begin{equation*}
\left\{\mathbf{F}_{\delta_{1}}-\mathbf{F}_{\delta_{2}}, \delta_{1} \sim_{S} \delta_{2}\right\} \tag{4.3.13}
\end{equation*}
$$

4.3.3. The algebra $\mathbf{A S M} / I_{\mathrm{i}}$. Let us first study the statistic io $\in \mathfrak{N}$.

Proposition 4.8. The quotient $\mathbf{A S M} / I_{\mathrm{I}_{\mathrm{o}}}$ is a commutative algebra.
Proof. The subspace $I_{\text {io }}$ of $\mathbf{A S M}$ is a two-sided ideal of ASM. Indeed, let $\delta, \delta_{1}$, and $\delta_{2}$ be three ASMs such that $\delta_{1} \sim_{\text {io }} \delta_{2}$. Since the products $\mathbf{F}_{\delta} \cdot \mathbf{F}_{\delta_{i}}$ and $\mathbf{F}_{\delta_{i}} \cdot \mathbf{F}_{\delta}$ for $i \in\{1,2\}$ have the same number of terms, Lemma 4.3 implies that the products $\mathbf{F}_{\delta} \cdot\left(\mathbf{F}_{\delta_{1}}-\mathbf{F}_{\delta_{2}}\right)$ and $\left(\mathbf{F}_{\delta_{1}}-\mathbf{F}_{\delta_{2}}\right) \cdot \mathbf{F}_{\delta}$ are in $I_{\mathrm{io}}$. Hence, ASM/ $I_{\mathrm{io}}$ is an algebra.

Besides, the ideal $I_{\text {io }}$ contains the commutators. Indeed, let $\delta_{1}$ and $\delta_{2}$ be two ASMs. Since the products $\mathbf{F}_{\delta_{1}} \cdot \mathbf{F}_{\delta_{2}}$ and $\mathbf{F}_{\delta_{2}} \cdot \mathbf{F}_{\delta_{1}}$ have the same number of terms, Lemma 4.3 implies that $\mathbf{F}_{\delta_{1}} \cdot \mathbf{F}_{\delta_{2}}-\mathbf{F}_{\delta_{2}} \cdot \mathbf{F}_{\delta_{1}}$ is in $I_{\mathrm{io}}$. Thus, $\mathbf{A S M} / I_{I_{\mathrm{io}}}$ is commutative as an algebra.

Note however that $\mathbf{A S M} / I_{\text {io }}$ does not inherit the structure of a coalgebra of ASM because even if

$$
x:=\mathbf{F}\left[\begin{array}{cccc}
0+ & + & 0 & 0  \tag{4.3.14}\\
+- & + & 0 \\
0 & + & 0 & 0 \\
0 & 0 & 0 & +
\end{array}\right]-\mathbf{F}\left[\begin{array}{cccc}
0+0 & 0 \\
+- & 0 & + \\
0+ & 0 & 0 \\
0 & 0 & + & 0
\end{array}\right]
$$

is an element of $I_{\mathrm{io}}$, the element

$$
\Delta(x)=1 \otimes x+\mathbf{F}_{\left[\begin{array}{c}
0+0  \tag{4.3.15}\\
+-+ \\
0+0
\end{array}\right] \otimes \mathbf{F}_{[+]}+x \otimes 1 .}
$$

is not in $\mathbf{A S M} \otimes I_{\mathrm{io}}+I_{\mathrm{io}} \otimes \mathbf{A S M}$. Hence, $I_{\mathrm{io}}$ is not a coideal.
Proposition 4.9. The dimension $A_{n}^{\mathrm{io}}$ of the nth graded component of $\mathbf{A S M} / I_{\mathrm{i}}$ is $\left\lfloor\frac{n^{2}}{4}\right\rfloor+1$.
Proof. Let $\delta$ be an ASM of size $n$ with a maximal number of io configurations (i.e., a maximal number of - ). Then, it is easy to see that

$$
\begin{equation*}
\mathrm{io}(\delta)=\sum_{i=0}^{\left\lfloor\frac{n}{2}\right\rfloor-1} i+\sum_{i=1}^{\left\lfloor\frac{n-1}{2}\right\rfloor} i \tag{4.3.16}
\end{equation*}
$$

Indeed, the first and last row of an ASM can contain only one + and no - . Let $i \geqslant 2$ and let $A_{i-1}$ be the matrix consisting in the first $i-1$ rows of $A$. The -s in row $i$ can only be in those columns for which the corresponding column sum of the submatrix $A_{i-1}$ is 1 . Since the row sums of $A_{i-1}$ are 1 and the column sums of $A_{i-1}$ are 0 or 1 , exactly $i-1$ of the column sums of $A_{i-1}$ are 1 . We conclude that there are at most $(i-1)$-s in row $i$. The same argument applies to the column sums taken from bottom to top. Hence, the rows $i$ and $n-i+1$ are at most $(i-1)-\mathrm{s}$. If $n$ is odd, then the row $(n+1) / 2$ has only nonzero entries, alternating between + and - , and the row $(n+1) / 2$ has $\left\lfloor\frac{n}{2}\right\rfloor-\mathrm{S}$.

Now, since for any $0 \leqslant k \leqslant \operatorname{io}(\delta)$, there exists an ASM $\delta^{\prime}$ such that $\operatorname{io}\left(\delta^{\prime}\right)=k$, we obtain, by a simple computation, the statement of the proposition.

The dimensions of $\mathbf{A S M} / I_{\mathrm{io}}$ form Sequence $\mathbf{A 0 3 3 6 3 8}$ of [Slo] and the first few terms are

$$
\begin{equation*}
1,1,1,2,3,5,7,10,13,17,21 \tag{4.3.17}
\end{equation*}
$$

A basic argument on generating series implies that these dimensions cannot be the ones of a free commutative algebra and hence, $\mathbf{A S M} / I_{\mathrm{i}}$ is not free as a commutative algebra.

Using the symmetry between the statistics io and oi provided by Proposition 4.2, we immediately have $\sim_{\mathrm{oi}}=\sim_{\text {io }}$ and then, $\mathbf{A S M} / I_{\mathrm{oi}}=\mathbf{A S M} / I_{\mathrm{I}_{\mathrm{o}}}$.
4.3.4. The algebra $\mathbf{A S M} / I_{\mathrm{nw}}$. Let us now study the statistic nw $\in \mathfrak{J}$.

Proposition 4.10. The quotient $\mathbf{A S M} / I_{\mathrm{nw}}$ is a commutative algebra.
Proof. The subspace $I_{\mathrm{nw}}$ of $\mathbf{A S M}$ is a two-sided ideal of ASM. Indeed, let $\delta, \delta_{1}$ and $\delta_{2}$ be three ASMs of respective sizes $n, n_{1}$ and $n_{2}$ such that $\delta_{1} \sim_{n w} \delta_{2}$. Lemma 4.5 implies that the number of nw configurations of an ASM $\delta^{\prime}$ such that $\mathbf{F}_{\delta^{\prime}}$ appears in $\mathbf{F}_{\delta} \cdot \mathbf{F}_{\delta_{1}}$ (resp. $\mathbf{F}_{\delta} \cdot \mathbf{F}_{\delta_{2}}$ ) depends only on the number of nw configurations in $\delta$ and $\delta_{1}$ (resp. $\delta_{2}$ ) and a subset of $\left[n+n_{1}\right]$ (resp. [ $\left.n+n_{2}\right]$ ) of size $n_{1}$ (resp. $n_{2}$ ) corresponding to the positions in $\delta^{\prime}$ of the columns coming from $\delta_{1}\left(\right.$ resp. $\delta_{2}$ ).

Since $\delta_{1} \sim_{\mathrm{nw}} \delta_{2}$, the product $\mathbf{F}_{\delta} \cdot\left(\mathbf{F}_{\delta_{1}}-\mathbf{F}_{\delta_{2}}\right)$ is in $I_{\mathrm{nw}}$. Similarly $\left(\mathbf{F}_{\delta_{1}}-\mathbf{F}_{\delta_{2}}\right) \cdot \mathbf{F}_{\delta}$ also is in $I_{\mathrm{nw}}$. Hence, ASM/ $I_{\text {nw }}$ is an algebra.

The ideal $I_{\mathrm{nw}}$ contains the commutators. Indeed, let $\delta_{1}$ and $\delta_{2}$ be two ASMs of respective sizes $n_{1}$ and $n_{2}$. The symmetry of $q$-binomial coefficients implies that there are as many subsets $S_{1,2}$ of [ $n_{1}+n_{2}$ ] of size $n_{2}$ as subset $S_{2,1}$ of $\left[n_{1}+n_{2}\right.$ ] of size $n_{1}$ such that the sum of elements of $S_{1,2}$ is equal to the sum of elements of $S_{2,1}$. Lemma 4.3 implies that $\mathbf{F}_{\delta_{1}} \cdot \mathbf{F}_{\delta_{2}}-\mathbf{F}_{\delta_{2}} \cdot \mathbf{F}_{\delta_{1}}$ is in $I_{\mathrm{nw}}$. Thus, $\operatorname{ASM} / I_{\mathrm{nw}}$ is commutative as an algebra.

Note however that $\mathbf{A S M} / I_{\text {nw }}$ does not inherit the structure of a coalgebra of ASM because even if

$$
x:=\mathbf{F}\left[\begin{array}{cccc}
0 & 0 & 0 & +  \tag{4.3.18}\\
+ & 0 & 0 & 0 \\
0 & 0 & + & 0 \\
0 & + & 0 & 0
\end{array}\right]-\mathbf{F}\left[\begin{array}{cccc}
0 & 0 & + & 0 \\
0 & + & 0 & 0 \\
+ & 0 & - & + \\
0 & 0 & + & 0
\end{array}\right]
$$

is an element of $I_{\mathrm{nw}}$, the element

$$
\Delta(x)=1 \otimes x+\mathbf{F}_{[+]} \otimes \mathbf{F}_{\left[\begin{array}{ccc}
0 & 0 & +  \tag{4.3.19}\\
0 & + & 0 \\
+ & 0 & 0
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{l}
+ \\
0
\end{array}\right.}^{0}+\mathbf{F}_{\left[\begin{array}{cc}
0 & + \\
+ & +
\end{array}\right]}+\mathbf{F}_{\left[\begin{array}{ccc}
+ & 0 & 0 \\
0 & 0 & + \\
0 & + & 0
\end{array}\right] \otimes \mathbf{F}_{[+]}+x \otimes 1}
$$

is not in $\mathbf{A S M} \otimes I_{\mathrm{nw}}+I_{\mathrm{nw}} \otimes \mathbf{A S M}$. Hence, $I_{\mathrm{nw}}$ is not a coideal.
Proposition 4.11. The dimension $A_{n}^{\mathrm{nw}}$ of the $n$th graded component of $\mathbf{A S M} / I_{\mathrm{nw}}$ is $\binom{n}{2}+1$.
Proof. Let us first show that there are at least $\binom{n}{2}+1 \sim_{n_{w}}$-equivalence classes of ASMs of size $n$ by considering a process that associates with a permutation matrix $M_{1}$ of size $n$ a permutation matrix $M_{2}$ such that $\operatorname{nw}\left(M_{2}\right)=\operatorname{nw}\left(M_{1}\right)+1$. If $M_{1}$ is not the permutation matrix $I_{n}$ of the identity, there is a greatest integer $k \geqslant 0$ such that $M_{1}=I_{k} / M_{1}^{\prime}$ and $M_{1}^{\prime}$ is not empty. Consider now the matrix $M_{2}:=I_{k} / M_{2}^{\prime}$ where $M_{2}^{\prime}$ is the matrix obtained by swapping the $(i-1)$ st and the $i$ th columns of $M_{1}^{\prime}$ so that $i$ is the index of the column of $M_{1}^{\prime}$ containing its uppermost 1 . Starting with the matrix $M_{1}$ of size $n$ of the form $1 \backslash \cdots \backslash 1$, we can iteratively apply the previous process $\binom{n}{2}$ times. Since each iteration obviously increases by one the number of nw configurations, all the $\binom{n}{2}+1$ permutation matrices are in different $\sim_{n w}$-equivalence classes.

Let us then show that there are no more than $\binom{n}{2}+1 \sim_{n_{w}}$-equivalence classes of ASMs of size $n$. Each entry of an ASM $\delta$ of size $n$ gives rise to a configuration among the six possible. Then,

$$
\begin{equation*}
n^{2}=\operatorname{nw}(\delta)+\operatorname{ne}(\delta)+\operatorname{sw}(\delta)+\operatorname{nw}(\delta)+\mathrm{io}(\delta)+\mathrm{oi}(\delta) \tag{4.3.20}
\end{equation*}
$$

By using the symmetries provided by Proposition 4.2, (4.3.20) becomes

$$
\begin{equation*}
n^{2}=2 \operatorname{sw}(\delta)+2 \operatorname{nw}(\delta)+2 \operatorname{io}(\delta)+n \tag{4.3.21}
\end{equation*}
$$

and we deduce that $\mathrm{nw}(\delta) \leqslant \frac{n^{2}-n}{2}=\binom{n}{2}$.
The dimensions of ASM/ $I_{\text {nw }}$ form Sequence A152947 of [Slo] and the first few terms are

$$
\begin{equation*}
1,1,2,4,7,11,16,22,29,37,46,56 \tag{4.3.22}
\end{equation*}
$$

A basic argument on generating series implies that these dimensions cannot be the ones of a free commutative algebra and hence, $\mathbf{A S M} / I_{\mathrm{nw}}$ is not free as a commutative algebra.

Using the symmetry between the statistics nw and se provided by Proposition 4.2, we immediately have $\sim_{\mathrm{se}}=\sim_{\mathrm{nw}}$ and then, $\mathbf{A S M} / I_{\mathrm{se}}=\mathbf{A S M} / I_{\mathrm{nw}}$. Moreover, by using the same arguments as before, $\mathbf{A S M} / I_{\mathrm{sw}}$ and $\mathbf{A S M} / I_{\mathrm{ne}}$ are the same commutative algebras.

Note that the map $\theta: \mathbf{A S M} / I_{\mathrm{nw}} \rightarrow \mathbf{A S M} / I_{\mathrm{sw}}$ linearly defined for any $\mathrm{ASM} \delta$ by

$$
\begin{equation*}
\theta\left(\pi_{\mathrm{nw}}\left(\mathbf{F}_{\delta}\right)\right):=\pi_{\mathrm{sw}}\left(\mathbf{F}_{\overleftarrow{\delta}}\right) \tag{4.3.23}
\end{equation*}
$$

where $\pi_{\text {nw }}$ (resp. $\pi_{\text {sw }}$ ) is the canonical projection from ASM to ASM/ $I_{\text {nw }}$ (resp. ASM $/ I_{\text {sw }}$ ) and $\overleftarrow{\delta}$ is the ASM where, for any $i \in[n]$, the $i$ th column of $\overleftarrow{\delta}$ is the $(n-i+1)$ st column of $\delta$, is an isomorphism between ASM $/ I_{\mathrm{nw}}$ and $\mathbf{A S M} / I_{\mathrm{sw}}$.
4.3.5. The algebra $\mathbf{A S M} / I_{\mathrm{i}_{\mathrm{i}, \mathrm{nw}}}$. Let us finally study the set of statistics $\{\mathrm{io}, \mathrm{nw}\}$.

Proposition 4.12. The quotient $\mathbf{A S M} / I_{\mathrm{I}_{\mathrm{i}, \mathrm{nw}}}$ is a commutative algebra.
Proof. This follows directly from Propositions 4.8 and 4.10.
Note however that ASM $/ I_{I_{\mathrm{i}, \text {, nw }}}$ does not inherit the structure of a coalgebra of ASM because even if

$$
x:=\mathbf{F}\left[\begin{array}{cccc}
0 & + & 0 & 0  \tag{4.3.24}\\
+ & - & + & 0 \\
0 & 0 & 0 & + \\
0 & + & 0 & 0
\end{array}\right]-\mathbf{F}\left[\begin{array}{cccc}
0 & + & 0 & 0 \\
0 & 0 & + & 0 \\
+ & - & 0 & + \\
0 & + & 0 & 0
\end{array}\right]
$$

is an element of $I_{\mathrm{io}, \mathrm{nw}}$, the element

$$
\Delta(x)=1 \otimes x+\mathbf{F}_{\left[\begin{array}{l}
0+0  \tag{4.3.25}\\
+-+ \\
0+0
\end{array}\right] \otimes \mathbf{F}_{[+]}+x \otimes 1 .}
$$

is not in $\mathbf{A S M} \otimes I_{\mathrm{io}, \mathrm{nw}}+I_{\mathrm{io}, \mathrm{nw}} \otimes \mathbf{A S M}$. Hence, $I_{\mathrm{io}, \mathrm{nw}}$ is not a coideal.
By computer exploration, the first few dimensions of $\mathbf{A S M} / I_{\mathrm{I}_{\mathrm{i}, \mathrm{nw}}}$ are

$$
\begin{equation*}
1,1,2,5,13,31,66,127,225 \tag{4.3.26}
\end{equation*}
$$

and seems to be Sequence A116701 of [Slo].
A basic argument on generating series implies that these dimensions cannot be the ones of a free commutative algebra and hence, $\mathbf{A S M} / I_{\mathrm{i}, \mathrm{nw}}$ is not free as a commutative algebra.
4.3.6. Others quotients of ASM. Using the symmetries provided by Proposition 4.2, all the algebras ASM $/ I_{S}$, where $S$ contains two nonsymmetric statistics, are equal to ASM $/ I_{I_{\mathrm{io}, \mathrm{nw}}}$. Moreover, note that by using the same arguments as before, one can prove that for any $S \in \mathfrak{Z} \cup \mathfrak{N}, \mathbf{A S M} / I_{S}$ is a commutative algebra isomorphic to $\mathbf{A S M} / I_{\mathrm{i}_{\mathrm{o}}}, \mathbf{A S M} / I_{\mathrm{nw}}$, or $\mathbf{A S M} / I_{I_{\mathrm{io}, \mathrm{nw}}}$.
