PREFACE

In 1976 a research group at the University of Queensland was commissioned to produce input-output tables for the state and regions of Queensland. The ensuing report, which is now known as the GRIT report (Generation of Regional Input-Output Tables), documented input-output tables for year 1973-74.

GRIT is a variable-interference non-survey based system, producing "hybrid" input-output tables. It is based on a combination of non-survey and survey methods but allows interference in the mechanical application of these methods at the discretion of the analyst.

Considerable interest in the GRIT methodology was evident upon its appearance, and enthusiasm for developing GRIT type tables for other areas of Australia emerged. Major modifications have been made to the original GRIT procedure and the new system has been entitled GRIT II. Using the GRIT II methodology input-output tables, at a regional and state/territory level, have since been developed for South Australia, Northern Territory and Victoria.

This report contains input-output tables for the regions and state of Queensland for the year 1978/79. It is an update of the original GRIT report in both a temporal and methodological sense.

The GRIT II system is a further attempt to promote regional input-output analysis from the status of simply a research technique to that of an operational planning technique.

GRIT II provides a methodology for developing regional input-output tables at relatively low cost, but free of substantial error.

ACKNOWLEDGEMENTS

The completion of this project was possible only with a very considerable amount of assistance in terms of the provision of data advice and material support.

In particular, representatives of the following organisations provided valuable assistance and sound advice.

Department of Commercial and Industrial Development

Australian Bureau of Statistics

Department of Primary Industry

Department of Mines

State Electricity Commission

Department of Forestry

Co-Ordinator General's Department.

In addition, a cross-section of firms and industry groups, too numerous to mention individually, provided many helpful comments and substantial supplementary data.

Particular acknowledgement is due to the Department of Commercial and Industrial Development for financial support of the project, to Mr. G. Baker (Deputy Director, Technical) of that department for his assistance and advice, and to Mr. D. Long of that department for his assistance on many matters of detail and evaluation of data.

Thanks are due also to Ms Geok Latham, Miss Caroline Verhoeven, Mrs. Christine Ives, Miss Margaret Cowan and Mrs. Noreen Wolgast for their willing assistance in the production of this report.

J.B. MORISON

G.R. WEST

R.C. JENSEN

CHAPTER 1

INTRODUCTION

The input-output tables and multipliers for Queensland are presented in this report. They have been produced at both the State and regional level using what is now termed the GRIT methodology. Detailed documentation of this methodology is presented in the original GRIT¹ and GRIT II^{2,3} reports. The tables and multipliers are presented without comment, apart from a basic definition and interpretation of input-output tables and multipliers in general.

1.1 Background of the GRIT System

In 1976, following discussions between representatives of the Queensland Co-ordinator General's Department and a research group at the University of Queensland, it was agreed that the research group would produce input-output tables and multipliers for the State and regions of Queensland. The project funded both by that Department and the Queensland Department of Commercial and Industrial Development, resulted in December 1977 in the report now known as the GRIT report.¹

-
1. Jensen, R.C., Mandeville, T.D. and Karunaratne, N.D. (1977), Generation of Regional Input-Output Tables for Queensland. Report to the Co-ordinator General's Department and the Department of Commercial and Industrial Development; Department of Economics, University of Queensland. Published (1979) as Regional Economic Planning: Generation of Regional Input-Output Analysis, Croom Helm, London.
 2. West, G.R., Wilkinson, J.T. and Jensen, R.C. (1979), Generation of Regional Input-Output Tables for the State and Regions of South Australia. Report to the Treasury Department, the Department of Urban and Regional Affairs and the Department of Trade and Industry; Department of Economics, University of Queensland.
 3. West, G.R., Wilkinson, J.T. and Jensen, R.C. (1980), Generation of Regional Input-Output Tables for the Northern Territory. Report to the Northern Territory Department of the Chief Minister; Department of Economics, University of Queensland.

The research group faced the major problem that the methods in current use to assemble regional input-output tables were, for obvious reasons, unsuitable for the project. The most widely used method, the survey method, ideally involved sample surveys of firms in each industry in each region, of consumers, governments and so on. Such a task was prohibitively expensive, not only in terms of funds, but in terms of time. Tables of this nature frequently involve several man-years; the tables are usually outdated by the time they are published. The alternatives to the survey approach were a number of 'non-survey' approaches which attempted to produce regional tables from national tables by applying 'single-sheet' conversion techniques of various types. The non-survey tables which resulted from these procedures were of dubious repute, and generally accepted as of insufficient accuracy.

It was clear that a new procedure for producing regional input-output tables was necessary. This procedure should produce tables of an acceptable degree of accuracy in a relatively short period of time and at relatively low cost. Following a period of theoretical research, a procedure termed the Generation of Regional Input-Output Tables (GRIT) was evolved. This procedure employed a number of mechanical means to produce first estimates of regional input-output tables from national input-output tables, and allowed facilities for operator interference to introduce survey based or other superior estimates into the tables, according to the preferences of the analyst.

Since the emergence of the GRIT report, further developments associated with the GRIT procedure have occurred. One development has been the use of the procedure for developing and using GRIT input-output tables for impact studies. Another has been the interest shown in evaluation and improvement of the GRIT procedure. During early 1979, the Governments of the Northern Territory and South Australia also commissioned the research group to produce input-output tables at a regional and Territory-

State level. These tables are contained in two reports, termed the GRIT II reports (West et al. 1979; 1980) and allowed the research group to implement a number of these improvements into the GRIT procedure.

The latter development is of some importance, and relates to the nature of the original GRIT methodology. This methodology consists of a number of procedural steps, each of which was considered to contribute to the ultimate accuracy and realism of the final input-output tables. Some of these steps have been the subject of criticism in the literature, and were deserving of closer attention in order to improve the accuracy of the calculation procedures. Perhaps more important, however, were some of the conclusions reached relating to the accuracy of the GRIT tables. The GRIT report took a pragmatic approach to the question of accuracy, suggesting that a holistic concept of accuracy was appropriate and that such accuracy could be attained by concentrating more effort on the larger coefficients which exert a greater influence on the size of the multipliers, and less on the smaller coefficients which are, apparently, operationally irrelevant (see Jensen and West 1980). Thus the GRIT report implied a round concept of accuracy optimisation. The GRIT II reports are much more explicit with respect to this concept, and attempt accuracy optimisation as an explicit additional part of the technique, in addition to several other minor modifications. This required the latter version of GRIT to be distinguished from the original and the title GRIT II was applied to the revised procedure.

1.2 Outline of the Report

The prime object is to present the input-output tables and multipliers for the regions and State of Queensland for the year 1978/79. These results are provided in Chapter 3 and in the various Appendices. A brief introduction to input-output analysis is given in Chapter 2, while a discussion of the selection of regional boundaries, together

with a map defining the regions, is provided in Chapter 3. Some significant revisions and changes that have been made to the original GRIP procedure, as a result of empirical and applied experimentation, are described briefly in Chapter 4.

CHAPTER 2

INPUT-OUTPUT TABLES AND MULTIPLIERS¹

Input-output tables and analysis have been part of the literature of economic analysis for some time. A number of useful texts² provide detailed introductions to the technique, and further insights into the power and flexibility of input-output. This chapter provides only a brief introduction to the input-output technique, by reference to a highly aggregated 3-sector table of the Queensland economy.

This chapter is included primarily to demonstrate the multiplier structure and terminology used in the empirical sections of this report. The authors have been dissatisfied for some time with the conventional input-output multipliers and the inconsistencies in interpretation of these multipliers. They have developed a revised structure and terminology for input-output multipliers; this structure is considered to be simpler to interpret and to avoid inconsistencies in interpretation. The multiplier structure described in this chapter has been applied in all studies by the authors since 1978, and by most input-output analysts in Australia.

2.1 The Input-Output Transactions Table

An input-output table represents an economy in terms of aggregated industrial or commodity groups, or sectors. The table traces out the value of transactions, in dollar terms, between these sectors for a given year. Through normal trading transactions, sectors sell goods and services to other sectors and to final users or final demand, and buy their inputs from other sectors and sources of primary inputs. The transactions table summarises the intersectoral

-
1. This chapter is a revised version of chapters in the original CRIT Report (Jensen, Mandeville and Karunaratne, 1979) and the CRIT II reports (West, Wilkinson and Jensen, 1979, 1980).
 2. See, for example Mierzyk (1965), Chenery & Clark (1962) and Richardson (1972).

flows for a given period and is conventionally presented in matrix form. A highly-aggregated 3-sector transactions table for the Queensland economy is shown as Table 2.1. Each row indicates the sales flows from one sector to another and to final demand. From Table 2.1, Sector 1 sells \$129.1m of its output (of \$1819.9m) to firms in the same sector, \$703.5m to firms in Sector 2, \$30.6m to firms in Sector 3, \$102.4m to household consumers as final users and \$864.3m to other final demand sources. The columns show the purchasing patterns of the sectors. For example, Sector 2 purchases \$242.5m from firms in Sector 1, \$778.6m from firms in the same sector, \$359.2m from firms in Sector 3, \$946.9m from primary inputs in the form of household labour (via wages, salaries etc.) and \$1107.6m in the form of other primary inputs.

TABLE 2.1: HIGHLY AGGREGATED TRANSACTIONS TABLE, QUEENSLAND,
1973-4 (\$m)

Sector	Intermediate Sectors			Household Consumption	Other Final Demand	Total Output
	1	2	3			
	(Quadrant I)			(Quadrant II)		
1	129.1	703.5	30.6	102.4	864.3	1819.9
2	242.5	778.6	359.2	762.2	1897.3	4039.8
3	224.0	503.2	536.7	1434.2	1325.5	4023.6
	(Quadrant III)			(Quadrant IV)		
Households	191.6	946.9	1860.4	-	-	2798.9
Other Primary Inputs	1052.7	1107.6	1446.7	500.1	429.2	4516.3
Total	1819.9	4039.8	4023.6	2798.9	4516.3	17198.5

It is usual to define four quadrants (Quadrants I to IV) in an input-output table. Quadrant I is termed the 'intermediate' or the 'processing' quadrant. It shows the flows of transactions between the industrial sectors defined for the study, and, as later described, provides the analytical core of the input-output technique.

Quadrant II indicates sales by each sector to final demand. This quadrant in most input-output tables traditionally includes columns relating to personal consumption, capital formation, some government expenditure and exports. Quadrant III lists the primary inputs into each industry, i.e. those inputs which are not purchases from local industrial sectors. It represents mainly value-added in production. Normally included in this quadrant are rows for depreciation, indirect taxes, wages and salaries (the household row in Table 2.1), gross operating surplus, imports and other value-added items. Quadrant IV, showing primary inputs absorbed by final demand, is normally of less importance in most input-output tables and is often ignored in analytical terms. This quadrant includes however, in tables with direct allocation of imports, the basic value of imported goods consumed by householders; this is often a relatively significant entry in input-output models of small or rural economies.

The number of sectors shown in a particular table is determined mainly by the availability of data and the objectives of the study. All endogenous sectors of the economy are included within the intermediate quadrant of the table and exogenous sectors are included in other quadrants. Endogenous sectors are those which are assumed to be influenced by the internal structure of the economy, while exogenous sectors are those assumed to be governed by external influences. Thus exports, capital expenditure and government spending are usually treated as exogenous since these are often influenced primarily by factors external to the regional economy. Personal consumption expenditure is treated as exogenous in one application of input-output tables, the standard or 'open' table, but as endogenous in the 'closed' or induced-consumption table.

The transactions table provides a concise, descriptive snapshot of a particular economy at a point in time. It is also a disaggregated and consistent accounting system for an economy. The final demand components are considered to indicate the equivalent of what GNP or GRP (Gross Regional Product) measures on the expenditure side, and primary inputs are the same as the receipts side. However, since GNP or GRP accounting seeks to avoid the double-counting involved in all the transactions leading up to final demand, it contains only part of the information represented in an input-output table. In the regional policy and planning context, the transactions table gives both a general understanding of the economy of a particular region, and important information on particular aspects of the region's economy.

Before discussing the output, income and employment multipliers in some detail, it is necessary to distinguish between the treatment of the household sector in 'open' and 'closed' input-output models. In open input-output models, household personal consumption is located in the final demand portion of the table, and its accompanying row comprising wages, salaries and other household income is included with primary inputs. Alternatively, the input-output table may be closed with respect to households by inserting the household row and column into the endogenous matrix. The implications of these alternatives will become clear in the discussion on multipliers in Section 2.2.

2.2 The Mathematical Structure of Input-Output

Once the transaction table has been compiled, simple mathematical procedures can be applied to derive output, income and employment multipliers for each sector in the economy. These procedures are illustrated briefly with accompanying comment.

The transactions table may be represented by a series of equations thus:

$$\begin{aligned}
 X_1 &= X_{11} + X_{12} + \dots + X_{1n} + Y_1 \\
 X_2 &= X_{21} + X_{22} + \dots + X_{2n} + Y_2 \\
 &\vdots \\
 &\vdots \\
 X_n &= X_{n1} + X_{n2} + \dots + X_{nn} + Y_n
 \end{aligned}$$

where

$$\begin{aligned}
 X_i &= \text{Total output of intermediate sector } i \text{ (row totals)} \\
 X_{ij} &= \text{Output of sector } i \text{ purchased by sector } j \text{ (elements} \\
 &\quad \text{of processing sector)} \\
 Y_i &= \text{Total final demand for the output of sector } i.
 \end{aligned}$$

It is possible, by dividing the elements of the columns of the transactions table by the respective column totals to derive coefficients which represent more clearly the purchasing pattern of each sector. These coefficients, variously termed 'direct' or 'input-output' coefficients or less appropriately 'technical coefficients', are normally notated as the a_{ij} , and represent the direct or first round requirement from the output of each sector following an increase in output of any sector.

In equation terms the model becomes:

$$\begin{aligned}
 X_1 &= a_{11}X_1 + a_{12}X_2 + \dots + a_{1n}X_n + Y_1 \\
 X_2 &= a_{21}X_1 + a_{22}X_2 + \dots + a_{2n}X_n + Y_2 \\
 &\vdots \\
 &\vdots \\
 X_n &= a_{n1}X_1 + a_{n2}X_2 + \dots + a_{nn}X_n + Y_n
 \end{aligned}$$

where $a_{ij} = X_{ij}/X_j$, when a_{ij} is the input-output coefficient. This may be represented in matrix terms:

$$X = AX + Y \quad \dots (1)$$

where $A = [a_{ij}]$, the matrix of input-output coefficients. The A matrix of direct coefficients for the Queensland example is given in Table 2.2.

TABLE 2.2: DIRECT COEFFICIENTS MATRIX, QUEENSLAND, 1973-4

Sector	1	2	3
1	.071	.174	.005
2	.133	.193	.089
3	.123	.125	.133
<hr/>			
Total			
Intermediate	.327	.492	.227
Households	.105	.234	.413
Other Primary			
Inputs	.568	.274	.360
<hr/>			
Total	1.000	1.000	1.000

Equation (1) can be extended to:

$$X(I-A) = Y \quad \text{where } I-A \text{ is termed the Leontief matrix}$$

or $X = (I-A)^{-1}Y$ where $(I-A)^{-1}$ is termed the 'general solution' (or simply the inverse of the open model).

Let this general solution be represented by:

$$Z = (I-A)^{-1} = [z_{ij}]$$

This open inverse is given for the Queensland example by Table 2.3.

TABLE 2.3: $Z = (I-A)^{-1}$, QUEENSLAND, 1973-4

Sector	1	2	3
1	1.116	.246	.032
2	.205	1.304	.136
3	.188	.222	1.178
<hr/>			
Total	1.509	1.772	1.346

The input-output table can be 'closed' with respect to certain elements of the table. Closure involves the transfer of an item from the exogenous portions of the table (Quadrants II, III and IV) to the endogenous section of the table (Quadrant I); closure implies that the analyst considers that the transferred item is related more to the level of local economic activity than to external influences. Closure of input-output tables with respect to households is common; this is illustrated for the Queensland table in Table 2.4.

TABLE 2.4: DIRECT COEFFICIENTS MATRIX, CLOSED WITH RESPECT TO HOUSEHOLDS, QUEENSLAND

Sector	1	2	3	Households
1	.071	.174	.098	.036
2	.133	.193	.089	.273
3	.123	.125	.133	.512
Households	.105	.234	.413	.

We refer to the 'closed' or 'augmented' matrix as A^* ; the inverse of the Leontief matrix formed from A^* is given by $Z^* = (I - A^*)^{-1}$, and is provided for this example in Table 2.5.

TABLE 2.5: $Z^* = (I - A^*)^{-1}$, QUEENSLAND, 1973-4

Sector	1	2	3	Households
1	1.165	.352	.138	.204
2	.378	1.604	.505	.710
3	.456	.689	1.752	1.102
(Total)	(1.999)	(2.625)	(2.395)	
Households	.399	.695	.856	1.643

2.3 Input-Output Multipliers

A multiplier is essentially a measurement of response to an economic stimulus. In the case of input-output multipliers the stimulus is normally assumed to be an increase of one dollar in sales to final demand by a sector. Under the linearity assumption of input-output, the stimulus can be defined as a decrease in sales of one dollar to final demand, or simply as the average dollar of sales to final demand. We are interested in the major categories of impact in terms of output, income and employment increases. These major categories of impact are listed below. They are:

- (i) The Initial Impact. This refers to the assumed dollar increase in sales; it is the stimulus, or the cause of the impacts. It is the unity base for the output multiplier and provides the identity matrix of the Leontief matrix. Associated directly with this dollar increase in output is an own-sector increase in household (HH) income in

wages, salaries etc. used in the production of that dollar of output. This is the household coefficient h_j (\$0.105 for Sector 1). Associated also will be an own-sector increase in employment, represented by the size of the sector employment coefficient. This employment coefficient e_j represents an employment/output ratio and is usually calculated as "employment per dollar of output".³

- (ii) The First-Round Effect. This refers to the effect of the first-round of purchases by the i^{th} sector providing the additional dollar of output. Clearly in the case of the output multiplier this is shown in the elements of the direct coefficients matrix (Table 2.2). For example, the direct effect of an increase of one dollar in the output of Sector 1 is 7.1 cents on Sector 1, 13.3 cents on Sector 2, and 12.5 cents on Sector 3 (these are termed the disaggregated direct effect) or a total of 32.7 cents on all intermediate sectors of the economy. The disaggregated effects are given by the individual a_{ij} , and the total first-round effects by the $\sum_j a_{ij}$.

First-round income effects are calculated by multiplying the first-round output effects by the appropriate III income coefficients, as shown in Table 2.6. The total first-round income effect is given by $\sum_i a_{ij} h_j$, in this case 8.9 cents, and the disaggregated income effects, or the extent to which III income increases in each sector due to the first-round output effects, is given by the individual $a_{ij} h_j$, i.e. in this case 0.7 cents in Sector 1, 3.1 cents in Sector

3. This, and some other studies by the authors have used "employment per thousand dollars of output" to reduce the use of very small numbers in multiplier analysis.

TABLE 2.6- FIRST-ROUND INCOME EFFECTS, SECTOR 1, QUEENSLAND, 1973-4

Sector	a_{11}	h_1	$a_{11}h_1$
1	.071	.195	.007
2	.135	.234	.031
3	.123	.413	.051
First-Round Income Effect			= .089

2 and 5.1 cents in Sector 3. First-round employment effects are calculated in the same manner, using the employment coefficient e_1 in the place of the household coefficient h_1 .

- (iii) Industrial Support Effects. This term is applied here to "second and subsequent round" effects, as successive waves of output increases occur in the economy to provide industrial support as a response to the original dollar increase in sales to final demand. The term excludes any increases caused by increased household consumption. Output effects are calculated from the open Z inverse (Table 2.3), as a measure of industrial response to the first-round effects. The industrial support output requirements must be calculated as the elements of the columns of the Z inverse, less the initial dollar stimulus and the first-round effects, as shown in Table 2.7. This table shows that the industrial support effects of an increase of one dollar in the sales of Sector 1 to final demand are 4.5 cents on Sector 1, 7.2 cents on Sector 2 and 6.5 cents on Sector 3, or a total of $\sum_i z_{ij} - 1 - \sum_j a_{jj}$ over all sectors of 18.2 cents. The industrial support income effects for each sector will be defined consistently with the output effects as column (5) of Table 2.7 multiplied

TABLE 2.7: CALCULATION OF INDUSTRIAL SUPPORT OUTPUT AND INCOME EFFECTS, SECTOR I, QUEBEC/LAND, 1975-4

Sector	Z	Initial	First-	HH	Industrial Support Effects	
	column	Stimulus	Round	Coefficient	Output (a)	Income (b)

1	1.116	1.000	.071	.105	.045	.005
2	.205	-	.133	.234	.072	.017
3	.188	-	.123	.413	.065	.027
	1.509	1.000	.327		.182	.049

(a) Column (1) less columns (2) & (3)

(b) Column (5) by column (4)

by the HH income coefficients i.e. individually in disaggregated income effects as $z_{ij}h_i - h_j - a_{ij}h_i$, or as total industrial support income effects as $\sum_i z_{ij}h_i - h_j - \sum_i a_{ij}h_i$. The industrial support employment effects for each sector can be similarly calculated.

The first-round and industrial support effects are together termed the production-induced effect.

- (iv) Consumption-induced Effects. The consumption-induced effect is defined in a manner similar to that used in conventional input-output multipliers, namely as that induced by increased HH income associated with the original dollar stimulus in output. The consumption-induced output effects are calculated in disaggregated form as the difference between the corresponding elements of the open and closed inverse i.e. $z_{ij}^* - z_{ij}$, and in total as $\sum_i z_{ij}^* - \sum_i z_{ij}$. The consumption-induced income effects are simply these output effects multiplied by the household coefficients, i.e. $z_{ij}^*h_i - z_{ij}h_i$ for each disaggregated effect and $\sum_i z_{ij}^*h_i - \sum_i z_{ij}h_i$ for the total consumption-induced income effect. Again, the consumption-induced employment effects are simply the consumption-induced output effects

multiplied by the appropriate employment coefficients.

The four effects are summarized in Table 2.8. It should be noted that employment multipliers are calculated by substituting the employment coefficient e_i for the household coefficient h_i in Table 2.8.

Table 2.8 draws attention to an important fifth classification of impacts, namely flow-on effects. These are defined as the impacts which occur in all sectors of the economy due, in this case, to the initial impact of a dollar increase in sales by Sector 1. Flow-on impacts are therefore calculated as total impacts, less the initial impact; this allows for the necessary separation of "cause and effect" factors in the multipliers. The cause of the impact is given by the initial impact (the original dollar increase in sales by Sector 1), and the effect is represented by the first round, industrial support and consumption-induced effects, which together constitutes the flow-on effects. It should be noted that the flow-ons occur in all sectors, including the impacting sector (i.e. Sector 1 in this case). They do not simply measure flow-ons to all other sectors, although this is frequently the case in practice since the flow-on effects to the impacting sector are often very small.⁴

4. The flow-on effects to impacting sectors are often zero in the case of new industries with weak linkages to the local economy.

TABLE 2.8: OUTPUT AND INCOME EFFECTS OF AN INCREASE IN SALES TO FINAL DEMAND

	Output Multipliers		Income Multipliers	
	General Case	Example	General Case	Example
(i) Initial Impact	i	i	h_j	.105
(ii) First-Round Effect	$\sum_i a_{ij}$.327	$\sum_i a_{ij} h_i$.089
(iii) Industrial Support Effect	$\sum_i z_{ij}^{-1} - \sum_i a_{ij}$.182	$\sum_i z_{ij} h_i - h_j - \sum_i a_{ij} h_i$.049
(iv) Consumption Induced Effect	$\sum_i z_{ij}^+ - \sum_i z_{ij}$.490	$\sum_i z_{ij}^+ h_i - \sum_i z_{ij} h_i$.155
(v) Flow-on Effect	$\sum_i z_{ij}^* - 1$.999	$\sum_i z_{ij}^* h_i - h_j$.293
Total Effect	$\sum_i z_{ij}^*$	1.999	$\sum_i z_{ij}^* h_i$.398

Output multipliers for the Queensland example are shown in Tables 2.9 and 2.10, and revised income multipliers of consistent definition in Tables 2.11 and 2.12. These multipliers indicate, for example, that a dollar increase in sales of sector 1 to final demand results in:

- (i) an initial income increase to the workers/staff/owners in Sector 1 of \$0.105.
- (ii) a first-round output effect on all sectors of \$0.327 (\$0.071 in Sector 1, \$0.133 in Sector 2, and \$0.123 in Sector 3), accompanied by a first-round income increase of \$0.089, being \$0.007, \$0.031, and \$0.051 in each sector.
- (iii) industrial support output effects of \$0.182 (being \$0.045, \$0.072 and \$0.065 in the three sectors), which in turn are accompanied by industrial support income increases of \$0.049, being \$0.005, \$0.017 and \$0.027 in each sector respectively.
- (iv) consumption-induced output effects of \$0.490 (\$0.049, \$0.173 and \$0.268 respectively in the sectors) and accompanying consumption-induced income increases of \$0.156, being in each sector \$0.005, \$0.040, and \$0.110 respectively.

Sector	Initial ^(a)	First Round ^(b)	Industrial Support ^(c)	Induced ^(d)	Total ^(e)	Flow-on ^(f)
1	.105	.007	.005	.005	.122	.017
2	-	.031	.017	.040	.089	.089
3	-	.051	.027	.110	.188	.188
	.105	.089	.049	.155	.399	.294

(a) from Table 2.2

(b) from Table 2.6

(c) from Table 2.7

(d) from section (iv) of text

(e) from Table 2.5

(f) total multiplier less initial impact

These cause total output effects of \$1.999, which occurs in Sector 1 to the extent of \$1.165, Sector 2 as \$0.378, and Sector 3 as \$0.456. Actual flow-on output effects on each sector, or the resulting impact of the initial dollar increase on all sectors of the economy are \$0.165 on Sector 1, \$0.378 on Sector 2, and \$0.456 on Sector 3, making a total of \$0.999 in total flow-on output effects.

Total income effects occurring as a result of the initial dollar stimulus in Sector 1 will be \$0.399, which will occur in Sector 1 as \$0.122, Sector 2 as \$0.089, and Sector 3 as \$0.188. These occur as total flow-on income effects of \$0.294, as \$0.017 in Sector 1, \$0.089 in Sector 2, and \$0.188 in Sector 3.

An alternative and useful method of presentation of impacts is in terms of the percentage distribution of impacts among sectors. For example, Table 2.13 shows that the output impact of each dollar increase (or decrease)

TABLE 2.13: SECTORAL DISTRIBUTION OF IMPACTS - SECTOR 1

Sector	Output Impacts		Income Impacts	
	Actual	Percentage	Actual	Percentage
1	.165	16.5	.017	5.8
2	.378	37.8	.089	30.3
3	.456	45.6	.188	63.9
	.999	100.0	.294	100.0

in the sales of Sector 1 to final demand will be distributed mainly to Sector 3 (45.6 per cent) and to Sector 2 (37.8) per cent. The income impact will go predominantly to Sector 3 (63.9 per cent). In empirical impact exercises, these disaggregated impacts can be expressed in estimates of actual levels of output, income and employment effects.

2.4 Type I and Type II Multipliers

The output multipliers are calculated on a 'per unit of initial effect' basis - i.e. output responses to a dollar change in output. Income multipliers as described above refer to changes in income per dollar initial change in output. Income multipliers are conventionally converted to ratios expressing a 'per unit' measurement, and described as Type I and II multipliers.⁵ These are given as:

$$\text{Type IA Income Multiplier} = \frac{\text{Initial} + \text{First Round Effects (IP)}}{\text{Initial Effects (I)}}$$

$$\text{Type IB Income Multiplier} = \frac{\text{Initial} + \text{Production-induced Effects (IP)}}{\text{Initial Effects (I)}}$$

$$\text{Type IIA Income Multiplier} = \frac{\text{Initial} + \text{Production-induced} + \text{Consumption-induced Effects (IPC)}}{\text{Initial Effects (I)}}$$

$$\text{Type IIB Income Multiplier} = \frac{\text{Flow-on Effects (F)}}{\text{Initial Effects (I)}}$$

The Type I and II income multipliers for the Queensland example are given in Table 2.14. The Type IA multiplier illustrates, for example that for each dollar of initial income effect (as a result of increased output) in sector 1, associated first-round effects will be \$0.85; when

5. The term multiplier in this case, although a convention, is an inappropriate expression since no causality exists between the elements of the ratio.

Industrial support effects are included (Type IB), associated income effects will be \$1.31, and when consumption-induced effects are included (Type IIA), associated income will be \$2.80. These are more commonly expressed in the Type IIB multipliers which refer only to flow-on effects.

TABLE 2.14: TYPE I AND II INCOME MULTIPLIERS, QUEENSLAND, 1973-4

CHAPTER 5THE STATE AND REGIONS OF QUEENSLAND3.1 Considerations in the Definition of Region

Consideration of what constitutes a region and of how the nation/state may be subdivided into a system of regions is a prerequisite for any economic analysis at the regional level. The choice and definition of a region is constrained by the number of regions to be considered, and this number depends on the form and nature of the analysis. The approximate number of regions to be considered has to be predetermined before regional delimitation can be attempted.

One approach to the definition of a region is based on the notion that separate spatial units which exhibit particular common characteristics may be linked together to form a homogeneous region. Such characteristics might include similar production structures or consumption patterns, the prevalence of a dominant natural resource or even non-economic variables such as similar topography or climate. However, some areas which can be linked on the basis of some particular characteristics will at the same time exhibit other characteristics which enable them to be linked to a different (or neighbouring) region. This makes the task of deciding appropriate boundaries more difficult.

Differences in economic phenomena will generally be evident in any one region. For example, most regions will contain both urban and rural areas. Moreover, large areas are likely to exhibit an uneven distribution of population with greater numbers clustered in urban centres and fewer people scattered over rural parts. The economic significance of such features is that it becomes difficult to consider

such regions as uniformly homogeneous since "large areas, centres always introduce heterogeneity".¹

There is a functional interdependence between the internal components of a region, and also between the region itself and its neighbouring regions. Internally, functional linkages may be derived from service connections within the region, while externally, transportation networks, trade links, production links, communication networks, migration flows, and flows of raw materials and manufactured products, etc. link a particular region with a wider spatial framework. Thus, emphasis on one type of region rather than another may depend on the structure of the regional system considered as a whole.

If there are a number of areas with clearly defined economic structures, then the division of the national/state economy into a number of regions is made easier. However, where clearly marked geographic areas of economic specialization are not evident the choice of regional boundaries becomes more difficult and arbitrary. Therefore the choice of an ideal region is constrained by the purpose for which delimitation of a set of regions is required and by the overall structure and degree of integration of the system as a whole.

3.2 The Regional Boundaries

Since many input-output studies are commissioned by regional or national government agencies, existing administrative units often form the basis of regional boundaries. Ideally, however, the "regions" of an input-output analysis should exhibit reasonably stable inter-regional trade coefficients and conform to a production or supply area which preserves local economic structures.

1. E. Ullman, p. 16 quoted in Gajda, R.T. (1964), "Methods of Economic Rationalization", *Geographica Polonica* 4 (183), reproduced in Richardson, H.W., Regional Economics (1972), Weidenfeld and Nicolson, London.

Queensland contains a wide range of regions in terms of economic complexity. The more isolated regions of the State exhibit a simple economic structure with one or two primary industries providing the export base, very restricted local manufacturing (e.g. bakeries, light engineering), and the importation of most consumer goods. However, the Brisbane region exhibits all the complexities of a modern city region. In order to encompass the different levels of economic complexity of the individual regions, the study team together with representatives of the various Queensland Government departments decided to divide the regions into three types of regions - metropolitan, provincial and rural.

The administrative units which formed the basis for delimitation of the regional boundaries were Statistical Divisions.¹ This facilitated the collection of required data since government authorities collect information on such divisions for their own purposes. Each of the eleven regions defined (1 metropolitan, 3 provincial and 2 rural) correspond to a Statistical Division of the same name.

Metropolitan regions generally exhibit diversified economic structures with significant manufacturing and tertiary sectors and relatively few primary industries. The Brisbane region consisting of the Brisbane Statistical Division represented the major metropolitan region in the State, and was considered to exhibit a sufficiently diverse economy to warrant attention in its own right.²

A number of regions were defined under the general heading of provincial regions. These generally contained a significant urban area (e.g. Townsville in the Northern region and Toowoomba in the

1. Statistical Divisions as defined by the Australian Bureau of Statistics.
2. In the original CRIT report the Metropolitan region was comprised of the Moreton and Brisbane Statistical Divisions and called the Moreton region. In this report these two Statistical Divisions are classified as two separate regions - Moreton and Brisbane.

having been region with a range of manufacturing activity, and where the primary activities were relatively diverse.

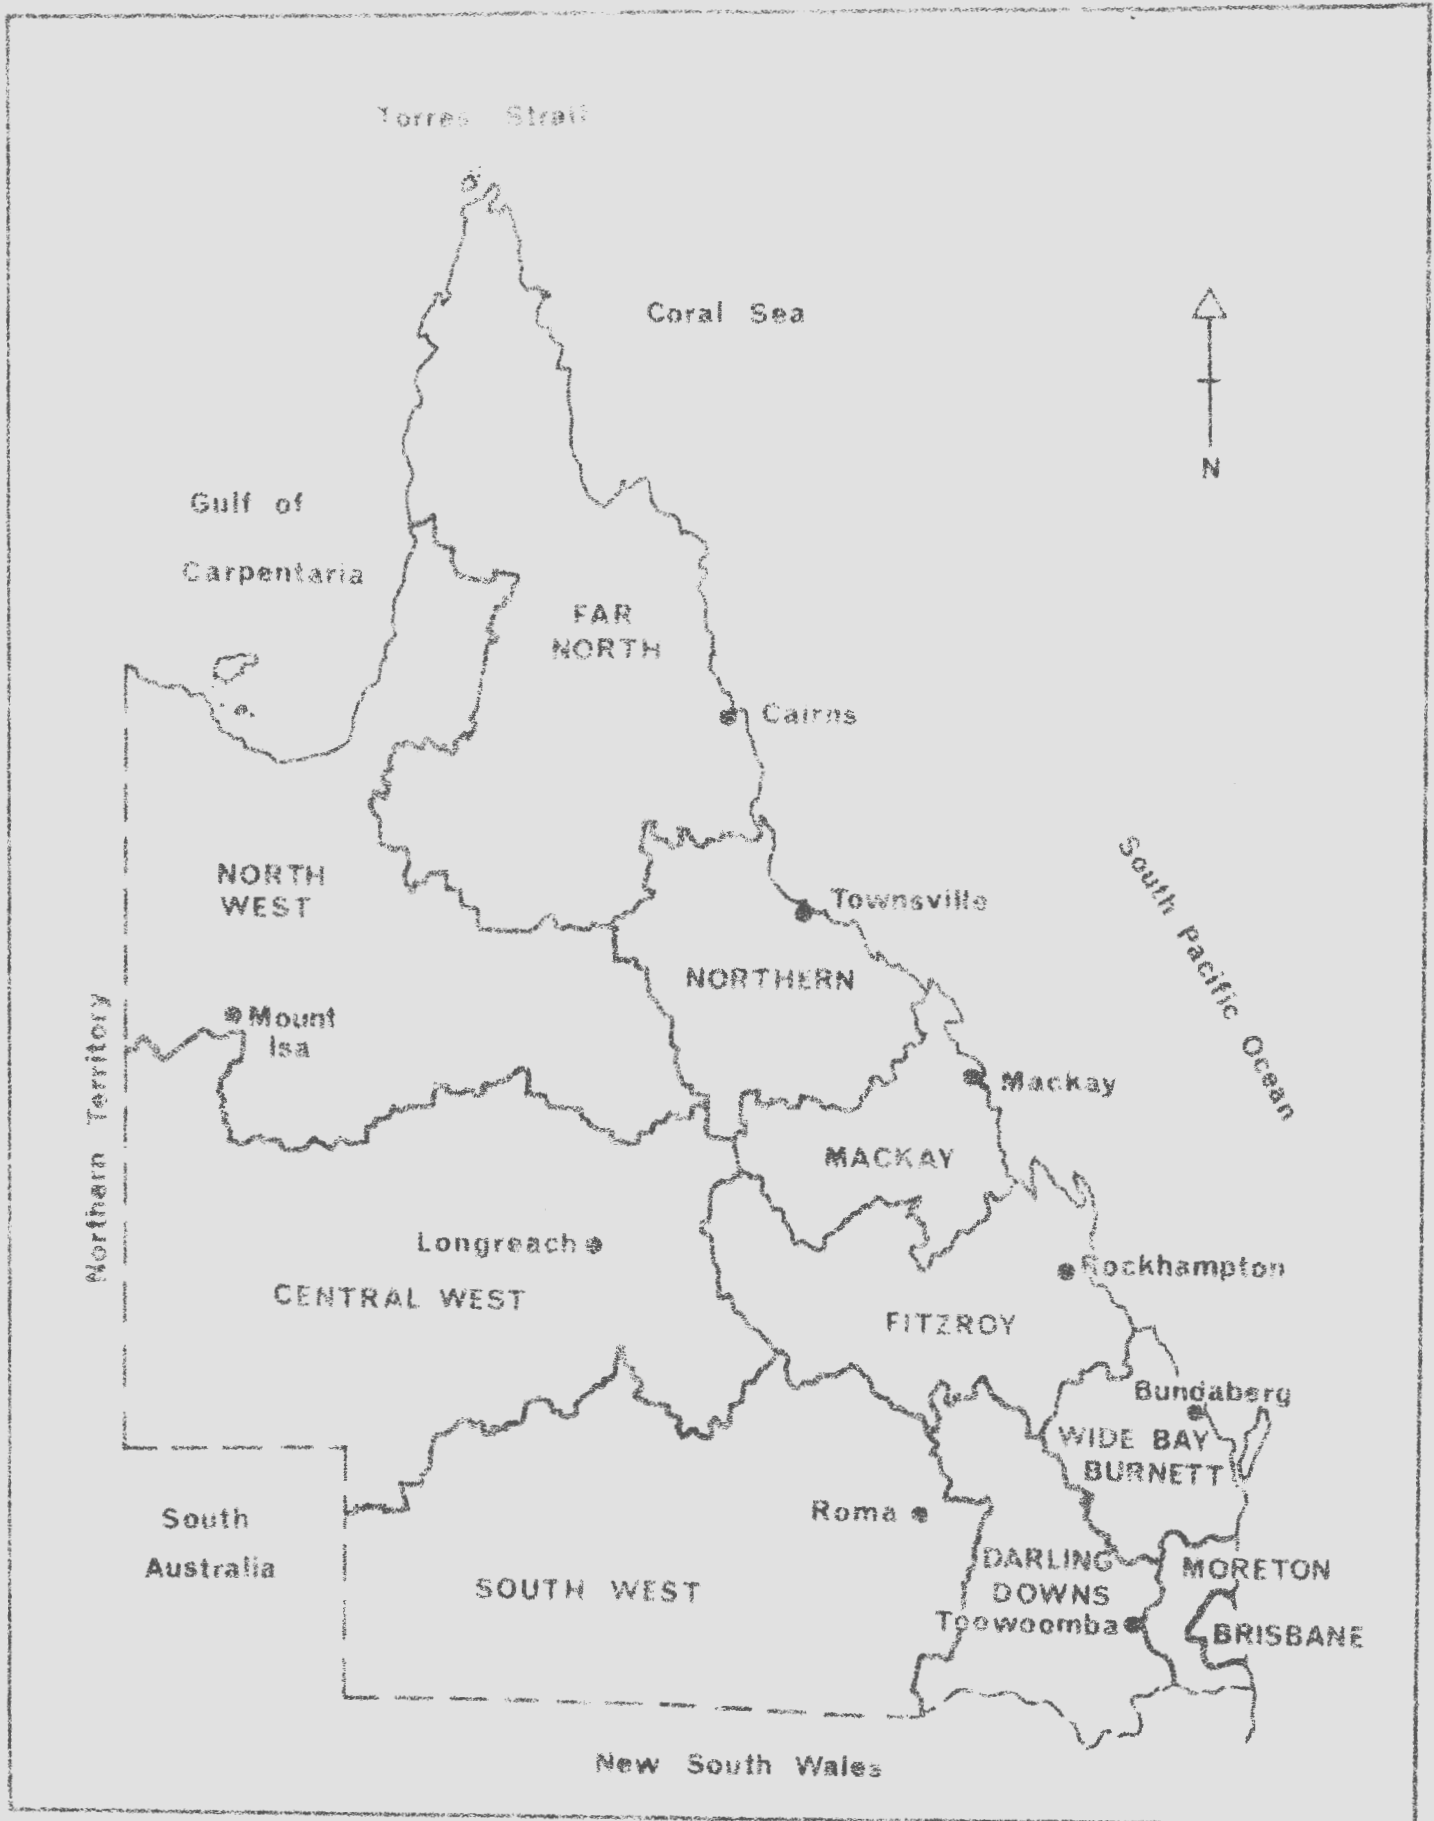

Two regions were defined as being rural regions. Rural regions represent economies which exhibit a simpler structure. For example, those which contain a few primary industries and whose manufacturing sector consists of a small number of basic industries.

Finally, a region encompassing the state as a whole facilitated the preservation of statistical consistency as well as allowing interstate comparisons to be made.

The regions of the State of Queensland are listed below according to the type of region to which they are classified.

The regional boundaries are shown on Map 1.

MAP 1
THE REGIONS OF QUEENSLAND

CHAPTER 4GRIT II¹

This chapter sets out the major differences between the original GRIT system and the GRIT II system used in this study. Three major modifications were introduced: (i) the location quotient technique used to obtain the basic regional table was modified; (ii) a technique was incorporated to isolate the critical cells of the prototype table (this allows a more cost-effective approach to table accuracy); and (iii) changes in the aggregation system were introduced to allow better compatibility between tables. There were, of course, numerous other minor modifications of an operational nature incorporated to make the procedure more efficient. For example, the GRIT computer program has been largely modified and is now split into two parts. Part A derives the initial transactions tables, and Part B is a standalone package which allows the operator to update, impact, aggregate, RAS, etc. the derived tables. The resultant package allows the operator extreme flexibility in the manipulation and use of the tables.

4.1 Modifications to the Simple Location Quotient

The location quotient (LQ) is a measure which compares the relative importance of an industry in a region to its relative importance in the nation.

$$\text{i.e. } LQ_i = (X_i^r / X^r) / (X_i^n / X^n)$$

where X represents output or employment and the superscripts r and n denote region and nation respectively. The LQ is used to estimate regional imports, on the assumption that the regional trade coefficients differ from the national technical coefficients only by the magnitude of the regional import coefficient. Thus

1. This chapter draws on West, G.R. (1980), Generation of Regional Input-Output Tables (GRIT): An Introspection, Economic Analysis and Policy, 10, 1 and 2, 71-80.

$$a_{ij}^r = r_{ij} + m_{ij}$$

where a_{ij} is the national technical coefficient, r_{ij} is the regional trade coefficient, and m_{ij} ($0 \leq m_{ij} \leq a_{ij}$) is a regional import coefficient. Operationally, the regional coefficients for row i are estimated by multiplying the national coefficient by LQ_i and apportioning the difference to imports,

$$\text{i.e. } r_{ij} = a_{ij} LQ_i \quad \text{where } LQ_i \leq 1.$$

This means that the region produces less than its share of national output in industry i , and imports are therefore required. If $LQ_i > 1$, the region is deemed to produce more than its fair share of output of industry i , and the balance is exported.

There are a number of deficiencies in the simple LQ. They tend to overestimate intraregional interdependence and ignore cross-hauling. Also they assume uniformity in production and demand/consumption patterns throughout the nation. Thus large regional industries that conform to the national 'average' would be fairly well represented, but the more unique a regional industry is in terms of different production function and demand/supply characteristics, the less appropriate is the simple LQ. Identification of these industries and the addition of superior transactions data into the table is a characteristic of the GRIT methodology. The system is enhanced, however, if some of these abnormalities can be taken account of at the LQ stage of the procedure.

The LQ applied in GRIT used employment data, as this is the only reliable data available at the regional 109-sector level for some of the smaller regions. Thus

$$LQ_i^E = \frac{E_i^r/E^r}{E_i^n/E^n}$$

When this was applied to the Northern Territory region, its deficiencies were obvious. A number of modifications were therefore applied experimentally and the following system appeared to produce more representative results.

The first modification was to adjust the national employment figures. If national production levels of industry i include a significant export component, then E_i^n is an inappropriate base for estimation of the IQ for industry i in a region, since E_i^n is normally assumed to represent national employment in industry i for domestic consumption. Therefore the E_i^n 's were adjusted to represent national employment in the production of industry i for domestic use. Similar adjustments were carried out for industries which comprised substantial import components.

The second modification attempts to take account of labour productivity differences between corresponding regional and national industries and between the region and the nation, where data were available. The only measure of productivity which we could hope to obtain fairly comprehensive data on was labour output ratios. The productivity ratio of the region relative to the nation is thus

$$\theta = (E^r/X^r)/(E^n/X^n)$$

where X refers to output, and the productivity ratio for the corresponding industries is

$$\theta_i = (E_i^r/X_i^r)/(E_i^n/X_i^n).$$

The simple employment IQ was thus modified to become

$$IQ_i^x = IQ_i^E \cdot \frac{\theta}{\theta_i}.$$

If the labour output ratio was not available for a particular industry, the output based IQ automatically reverted back to the employment IQ.

Thirdly, in an attempt to take account of demand and consumption pattern differences throughout the nation, estimates of personal consumption were derived where possible and consumption ratios were obtained for the region relative to the nation and also between corresponding regional and national sectors. Thus

$$C = C^r/C^n$$

and $C_i = C_i^r/C_i^n$

where C_i refers to the per capita consumption levels of significant commodities or groups of commodities. Where possible, price differentials were taken into account in deriving C_i . The modified LQ thus becomes

$$\begin{aligned} LQ_i^{CX} &= LQ_i^X \cdot \frac{C}{C_i} \\ &= LQ_i^E \cdot \frac{\theta}{\theta_i} \cdot \frac{C}{C_i} \end{aligned}$$

Therefore if the local per capita consumption for commodity i is higher than the corresponding national per capita consumption, the LQ_i will be lower resulting in relatively higher imports and/or lower exports of commodity i . Again, if the relevant data were not available, LQ^{CX} automatically reverted back to LQ^X or LQ^E .

It appears that the above modified LQ gives a more accurate measure of regional trade coefficients in regions which are relatively more distant from the national 'average'. In the South Australian region where relatively comprehensive data was available for comparison purposes, the modified LQ performed much better than the simple LQ. For example, those industries which are relatively strong in terms of the national economy (e.g. white goods, wine production) exhibited larger row transactions, while weaker industries had larger import components. The intermediate matrix total was reduced overall, and so were the majority of the multiplier values. This is intuitively what we would expect as the South Australian economy is biased toward the primary end of the national spectrum. On the whole the multipliers were regarded as more 'reasonable' when compared with other economic models.

4.2 Accuracy Optimization²

The completion of regional input-output tables within any reasonable budget/time constraint makes it virtually impossible for close scrutiny to be given, and superior data obtained for all the coefficients in the prototype table. In addition it would be very difficult to justify such a procedure in terms of cost-benefit considerations. Analysts would agree that some sections of the table are more 'critical' than others. Thus first priority of these limited resources should go to ensuring that the 'critical' areas are relatively accurate; less attention can be given to the 'non-critical' areas.

The problem has been determining which coefficients are 'critical'. Up to now there have been only vague rules of thumb in this regard, the majority of which have been derived from shocking and simulation techniques. Some of these rules of thumb were implicit in CRIT, but lacked mathematical backing. Recent developments have shown that there is a simple mathematical relationship between errors in coefficients and errors in input-output multipliers. This relationship is explicitly included in this study.

4.3 The Concept of Accuracy³

Accuracy in input-output can be considered in two ways:

(i) Cell accuracy, which refers to the exactness with which the input-output table represents the 'true' table for the economy. This is the accounting interpretation of the input-output

-
2. For a technical discussion on this aspect of the procedure, see West (1981).
 3. For a full discussion on the concept of accuracy in regional input-output see Jensen (1979).

table epitomised by those concerned with the preparation of the national tables, where the exercise is seen simply and appropriately as an extension of the national accounts. This interpretation requires cell-by-cell accuracy in the statistical sense, on the assumption that if each cell of the table is an accurate record of the 'true' transaction, the table as a whole will reflect the 'true' table with a high degree of accuracy. This interpretation can be called *partitive accuracy*.

(ii) *Model accuracy*, which refers to the exactness with which the input-output model reflects the realism of the operation of the regional economy. This emphasises the 'snapshot' interpretation of the economy. This interpretation relies, not on accuracy in each cell of the table, but with the accuracy with which the table represents the main features of the economy in a descriptive sense and preserves the importance of these features in an analytical sense. While *partitive accuracy* represents the accounting accuracy of the table, *holistic accuracy* represents the operational accuracy of the table.

Once we move from the world of the more reliable 'hard' data and technical input-output teams at the national level to the world of inadequate and often unreliable data and limited research resources at the regional level, the distinction between these two interpretations becomes more important. Input-output literature casts doubt on our ability to achieve *partitive accuracy* with existing data sources and research resources. Although *partitive accuracy* is possible in some portions of the table, it is not appropriate (in fact not feasible) as a general approach to regional input-output tables.

4.4 Modifications to the Aggregation Scheme

The original IJL system employed a two-tier weighting aggregation scheme to obtain the non-uniform and uniform transactions tables. The non-uniform tables are derived using an employment weighted aggregation scheme, by necessity, as reliable output data are not available at the 109 sector regional level. The uniform tables were then derived from the non-uniform tables by an output weighted aggregation scheme.

This two-tier system thus creates problems. If the non-uniform tables are not of the same dimension, then the tables are not directly comparable, as weights have been applied to different numbers of sectors. This is particularly true at the uniform table level, as different weighting systems have been applied over different sectors. Thus, even though all the uniform tables are of the same dimension and contain the same sectors, an individual transaction in one table cannot be compared with the corresponding transaction in another table. Although each individual table is representative of that region, comparisons across regions, or with the state, are not possible, and this is further complicated by regional imports and exports.

To overcome the aggregation problem, several alternative schemes were hypothesised and empirically tested. The problem arises that there is no simple benchmark for comparison between differently derived tables for a given region. It was finally decided, in the interests of consistency and ease of manipulation, to aggregate all the tables to the highest possible common level using employment weights; any additional aggregation would be done with output weighting. The study team felt that the output weighting system is marginally superior, but were concerned with the possibility that users of the tables could become disconcerted by the inevitable

across table inconsistencies, despite the fact that across table comparisons of any input-output tables requires extreme caution.

The present GRIT II system may still produce some minor inconsistencies, but to a lesser extent. Wholly mechanically produced tables should not be inconsistent, but the GRIT system depends on operator manipulation at various stages of the procedure, with the insertion of superior data, etc. Very often superior estimates are available for a particular industry at a regional level but not at the state level, or vice versa, or the two estimates are inconsistent but cannot be verified. It is virtually impossible to verify transactions across tables in any case, as each regional transaction between industries contains an element of imports and/or exports. It is maintained, however, that every effort is taken to ensure obvious inconsistencies are minimized.

Any remaining inconsistencies have been further minimized by the parallel construction of the Queensland interregional table. Detailed analysis of interregional trade flows ensures that the regional tables are consistent with the state table.

CHAPTER 5THE QUEENSLAND TABLES

A brief definition of input-output analysis, a description of the Queensland boundaries and a summary of major changes made to the original GRIT procedure have been provided in the previous chapters. Some technical aspects peculiar to this study are presented in Section 5.1 below while a summary and the location of the results included in this report are given in Section 5.2.

5.1 Technical Notes

The GRIT methodology requires that the national table be in the form of industry by industry, in basic values, and with direct allocation of imports. The latest year for which the national input-output table is available is 1974-75 and consultation with the Australian Bureau of Statistics Input-Output Section revealed that a national table of the above description was available for that year. Hence, this national table was used in the compilation of the regional input-output tables presented in this report.

A major characteristic of the GRIT procedure in the utilisation of superior data where this is considered appropriate. Subject to the format of the available data, superior information can be inserted into the system in four stages.

- (i) disaggregated superior data - where data are available at the disaggregated 109-sector regional level;
- (ii) disaggregated/aggregated data - where data are available in a form disaggregated by column and aggregated by rows;
- (iii) aggregated superior data - where data are available at the non-uniform aggregation level; and
- (iv) transactions superior data - where data are available in transactions form at the various levels of aggregation.

The research group utilised all four stages of superior data insertion. Superior data were obtained from various sources. Extensive consultations occurred between the research group and the various ABS departments, both at the state and national levels. Several other state Government departments were consulted including the Department of Primary Industry, Mines Department, Co-ordinator General's Department, State Electricity Commission and Department of Forestry. All available standard and non-standard publications were pursued and detailed information was obtained in the areas of agriculture, manufacturing, mining and electricity.

At the transactions stage, various superior data sources were utilized. Household consumption expenditure for the State was obtained from the ABS household expenditure survey 1975-76, and reduced to sub-state regional level by the use of location quotients. Export data were obtained with the help of interstate trade statistics supplied by the ABS. In this study, other final demand and other value added were obtained as residuals.

Other superior transactions data were inserted in the light of additional information obtained after the preliminary tables were circulated.

5.2 Summary of Tables Produced

The GRIT aggregations scheme, shown in Appendix I, combines the national sectors listed in the right hand column to obtain the sectors defined for the metropolitan region. This defines the 36 sectors used in the Brisbane region and Queensland State table. For the non-metropolitan regions the aggregation proceeds until 19 sectors for the provincial regions have been formed. The aggregation continues until 11 sectors have been formed for the rural regions.

This method is designed to cater for the detail required for the different types of economies, and also to produce comparability of definition of these sectors between regions. The latter is achieved by the fact that sectors in the smaller tables are aggregates of identifiable sectors in the larger tables.

The GRIT system allows the aggregation procedure to be continued to produce uniform tables as required by the analyst. The uniform tables are aggregations of non-uniform tables. The types of tables produced in this report are summarised in Table 5.1.

TABLE 5.1 Summary of Types of GRIT II Tables produced for Queensland

<u>Input-Output Table of:</u>	<u>Non-uniform tables</u>	<u>Uniform Tables</u>
State of Queensland	36-sector	11-sector
Brisbane region	36-sector	11-sector
Moreton region	19-sector	11-sector
Wide Bay-Burnett region	19-sector	11-sector
Darling Downs region	19-sector	11-sector
South-West region		11-sector
Fitzroy region	19-sector	11-sector
Central-West region		11-sector
Mackay region	19-sector	11-sector
Northern region	19-sector	11-sector
Far North region	19-sector	11-sector
North-West region	19-sector	11-sector

Two sets of transactions tables with accompanying tables of coefficients (inverse matrices of the closed model) and multipliers were produced. A series of 11-sector tables, termed uniform tables, was produced for the regional and state economies. Secondly, a series of non-uniform tables was produced, including 36-sector tables for the Brisbane region and the State of Queensland, and 19-sector tables for the provincial regions. Note that non-uniform tables were not produced for the two rural regions - the South West and Central West

regions. The presentation of the tables of transactions, coefficients and multipliers required the preparation of approximately one hundred tables. The location of these tables throughout this report is itemised in Table 5.2 to assist the reader with ready reference to the results of the study.

Sector definitions used in this report are identical to those applied in the original GRIT report (Jensen, Mandeville and Karunaratne, 1979). It should be noted, however, that because of the differences between the GRIT I and GRIT II methodologies (outlined in Chapter 4), detailed comparisons between the tables of the two reports is not advisable (for example, GRIT I tables were a hybrid gross/net combination because of data problems, but the GRIT II tables are fully gross tables).

In this chapter the 11-sector uniform tables and associated multipliers are presented without comment. Non-uniform transactions tables, multipliers and coefficient tables have been presented in appendices. The non-uniform tables should, of course, be considered simply as providing more detail relating to those sectors which are shown in a more disaggregated form.

In both the uniform and non-uniform transactions and coefficient tables, sectors are represented by numbers in the interests of space. These numbers represent sectors as defined in Appendix I. It will be noted that the same sector number is retained throughout uniform and non-uniform tables, the numbering is modified to denote disaggregation for non-uniform tables.

For example, Sector 4 in the uniform tables refers to the manufacturing sector; in the 19-sector tables of provincial regions, Section 4 is disaggregated into Sectors 4A-4F. In the 36-sector tables, these are further disaggregated into Sectors 4A1-4A5, 4B1-4B4, and so on.

For convenience in the reading of this chapter the sector titles for the eleven-sector tables are reproduced below:

<u>Sector No.</u>	<u>Title</u>
1	Animal industries
2	Other primary industries
3	Mining
4	Manufacturing
5	Electricity, gas and water
6	Building and construction
7	Trade
8	Transport and communication
9	Finance
10	Public administration and defence
11	Community services, and personal services.

In addition Appendix I has been summarised and reproduced as a loose sheet to enhance the reading of the appendix tables.

TABLE 5.2 Location of GRIT II Input-Output Results for Queensland

Form of Results	Uniform Tables (11-Sector Tables for State and Regions)	Non-Uniform Tables (36-Sector Tables for State and Metropolitan Region, 19-Sector Tables for Provincial Regions)

APPENDIX I

Sector Classification

APPENDIX I

Sector Classification

<u>Rural Regions</u>	<u>Provincial Regions</u>	<u>Metropolitan Region & State</u>	<u>National Sectors Included</u>
1. Animal industries	1. Animal industries	1. Animal industries	01.01 Sheep 01.03 Meat cattle 01.04 Milk cattle and pigs
2. Other primary industries	2A. Other agriculture	2A. Other agriculture	01.02 Cereal grains 01.05 Poultry 01.06 Other farming 02.00 Services to agriculture
	2B. Forestry, fishing	2B. Forestry, fishing	03.00 Forestry and logging 04.00 Fishing, trapping and hunting
3. Mining	3A. Coal and crude petroleum mining	3A. Coal and crude petroleum mining	12.00 Coal and crude petroleum mining
	3B. Other mining	3B. Other mining	11.01 Iron 11.02 Other metallic minerals 14.00 Non-metallic n.e.c. 16.00 Services to mining
4. Manufacturing	4A. Food manufacturing	4A1. Meat and milk products	21.01 Meat products 21.02 Milk products
		4A2. Fruit and vegetable products, oils and fats	21.03 Fruit and vegetable products 21.04 Margarine, oils and fats
		4A3. Flour, cereals, bread	21.05 Flour mill and cereal food products 21.06 Bread, cakes and biscuits
		4A4. Confectionery and other food n.e.c.	21.07 Confectionery and cocoa products 21.08 Food products n.e.c. (including fish and sugar)

Rural RegionsProvincial RegionsMetropolitan Region & StateNational Sectors Included

		4A5. Beverages and tobacco	21.09	Soft drinks, cordials and syrups
			21.10	Beer and malt
			21.11	Alcoholic beverages n.e.c.
			22.01	Tobacco products
4B. Wood and paper manufacturing		4B1. Sawmills, plywoods	25.01	Sawmill products
			25.02	Plywood, veneers and manufactured boards
		4B2. Joinery, furniture	25.03	Joinery and wood products n.e.c.
			25.04	Furniture, mattresses, brooms and brushes
		4B3. Paper products	26.01	Pulp, paper and paper-board
			26.02	Fibreboard and paper containers
			26.03	Paper products n.e.c.
		4B4. Newspapers, printing	26.04	Newspapers and books
			26.05	Commercial and job printing and printing trade services
4C. Machinery, appliances, equipment		4C1. Household appliances, machinery and equipment	33.01	Photographic, scientific equipment etc.
			33.02	Television sets, radios, communication and electronic equipment n.e.c.
			33.03	Household appliances n.e.c.
			33.04	Electrical machinery and equipment n.e.c.
			33.05	Agricultural machinery and equipment
			33.06	Construction, earthmoving and materials handling machinery and equipment
			33.07	Other machinery and equipment.

Rural RegionsProvincial RegionsMetropolitan Region & StateNational Sectors Included

		4C2. Motor vehicles, ships, locomotives and aircraft	32.01 Motor vehicles and parts and transport equipment n.e.c.
			32.02 Ship and boat building and repair
			32.03 Locomotives, rolling stock and repair
			32.04 Aircraft building and repair
4D. Metals, metal products	4D1. Basic iron and steel	29.01 Basic iron and steel	
	4D2. Non-ferrous metal basic products	29.02 Non-ferrous metal basic products	
	4D3. Fabricated and other metal products	31.01 Fabricated structural metal products	
		31.02 Metal containers, sheet metal products	
		31.03 Cutlery and hand tools, metal coating and finishing and metal products n.e.c.	
4E. Non-metallic mineral products	4E. Non-metallic mineral products	28.01 Glass and glass products	
		28.02 Clay products	
		28.03 Cement	
		28.04 Ready-mix concrete	
		28.05 Concrete products	
		28.06 Gypsum, plaster and other non-metallic mineral products	
4F. Other manufacturing	4F1. Chemicals, petroleum products	27.01 Chemical fertilisers	
		27.02 Industrial chemicals n.e.c. (plastic materials, synthetic resins, industrial gases, synthetic rubber, other basic chemicals)	
		27.03 Paints, varnishes and lacquers	

Rural RegionsProvincial RegionsMetropolitan Region & StateNational Sectors Included

		27.04	Pharmaceutical and veterinary products, agricultural chemicals	
		27.05	Soap and other detergents	
		27.06	Cosmetic and toilet preparations	
		27.07	Chemical products n.e.c. (incl. ammunition, explosives and fireworks)	
		27.08	Petroleum and coal products	
	4F2. Textiles	23.01	Prepared fibres (cotton ginning, wool scouring, top-making)	
		23.02	Man-made fibres, yarns and fabrics	
		23.03	Cotton, silk and flax yarns, fabrics and household textiles	58.
		23.04	Wool and worsted yarns and fabrics	
		23.05	Textile finishing	
		23.06	Textile floor covering, felt and felt products	
		23.07	Textile products n.e.c. (incl. canvas, rope, etc.)	
	4F3. Knitting mills, clothing, footwear	24.01	Knitting mills	
		24.02	Clothing	
		24.03	Footwear	
	4F4. Leather, rubber and plastic products	34.01	Leather tanning, leather and leather substitute products n.e.c.	
		34.02	Rubber products	
		34.03	Plastic and related products	

Rural RegionsProvincial RegionsMetropolitan Region & StateNational Sectors Included

		4F5. Other manufacturing	34.04	Signs, advertising displays, writing and marking equipment
			34.05	Ophthalmic articles, jewellery, silverware and other manufacturing
5. Electricity, gas and water	5. Electricity, gas and water	5A1. Electricity	36.01	Electricity generation and distribution
		5A2. Gas	36.02	Gas production and distribution
		5A3. Water, sewerage	27.01	Water, sewerage and drainage
6. Building and construction	6. Building and construction	6. Building and construction	41.01	Residential buildings
			41.02	Other building and construction
7. Trade	7. Trade	7. Trade	46.01	Wholesale trade
			48.01	Retail trade
			48.02	Motor vehicle repairs
			48.03	Other repairs
8. Transport and communication	8. Transport and communication	8A1. Transport	51.01	Road transport
			52.01	Railway transport, other transport and storage
			53.01	Water transport
			54.01	Air transport
		8A2. Communication	55.01	Communication
9. Finance	9. Finance	9A1. Finance	61.01	Banking
			61.02	Finance and life insurance
			61.03	Other insurance
			61.04	Investment, real estate and leasing

Rural RegionsProvincial RegionsMetropolitan Region & StateNational Sectors Included10. Public administration
and defence10. Public administration
and defence10. Public administration
and defence11. Community services,
entertainment

11A. Community services

11A. Community services

11B. Entertainment etc.

11B. Entertainment etc.

61.05 Technical and other
business services
61.06 Ownership of dwellings71.01 Public administration
72.01 Defence81.01 Health
82.01 Education, libraries,
etc.
83.01 Welfare services,
religious and
community organisations91.01 Entertainment and
recreational services
92.01 Restaurants, hotels and
clubs
93.01 Personal services
