Pumpkin Germplasm & Disease Resistance Evaluations

Brad R. Bergefurd, Horticulture Specialist and Extension Educator, South Centers Dr. Sally Miller, Professor Department Plant Pathology, Wooster Claudio Vrisman, Department Plant Pathology, Wooster Thomas Harker, Horticulture Research Assistant, South Centers Wayne Lewis, Farm Manager, South Centers Ryan Slaughter, Horticulture Research Assistant, South Centers

OBJECTIVES:

To screen new pumpkin variety releases (2017-2018) for their production performance under Ohio growing conditions and to evaluate yield potential and fruit quality characteristics for the southern Ohio area.

MATERIALS and METHODS:

This trial evaluated twenty replicated pumpkin cultivars for their production suitability, performance and quality attributes under southern Ohio growing conditions. Cultivar selections were new releases along with industry standard varieties. Input was received from seed companies, growers, and industry personnel regarding variety selection and standard comparison. Seeds were direct seeded to the field on June 7th. A randomized complete block design with three blocks and five plants per variety per plot was used in the study. Rows were spaced 8 ft apart with seeds planted 3 ft apart in the row and row length was 12 ft. This study was conducted at the Ohio State University (OSU) South Centers/Piketon Research & Extension Center at Piketon, Ohio (lat. 39.07° N, long. 83.01° W), elevation 578 feet. The experimental soil is designated as a DoA—Doles silt loam, with 0–3% slopes. It is a deep, nearly level and somewhat poorly drained soil. Typically, the soil surface is a brown, friable silt loam about 20 cm deep and beneath this the subsoil is about 18.5 m. 578 pounds of 19-19-19 fertilizer per acre were applied prior to planting. Fungicides were applied following recommendations from the Midwest Vegetable Production Guide for Commercial Growers (ID-56). Sandea pre-emerge herbicide was applied to the trial. Weeds were also controlled with cultivation and hand hoeing.

Two separate trials were planted using the same cultivars; one was sprayed for downy mildew alone and the other for both powdery and downy mildew. There were six fungicide applications made over the 2018 growing season. See Figure 1.

Figure 1. Fungicides applied to pumpkin trials.

Spray Date	Chemical Applied	Application Rate	Sprayed for Downy Mildew Only	Sprayed for Powdery and Downy Mildew
7/16/2018	Presidio	4 floz./acre	Х	X

RESULTS:

Overall plant and fruit quality was good in the no powdery mildew fungicide portion of this year's trial. Even with no powdery mildew spray applications applied to the trial during the growing season there was very little powdery mildew present. Overall fruit yield was good for this trial. Marketable pounds per acre ranged from a high of 39,490 (Honky Tonk) to a low of 9,727 (Zeus) pounds per acre. Average fruit weight ranged from a high of 22.68 pounds (Hulk) to a low of 2.74 pounds (Miniwarts).

Overall plant and fruit quality was good in the powdery mildew plus downy mildew portion of this year's trial. Overall fruit yield was good for this trial. Marketable pounds per acre ranged from a high of 63,915 (Bayhorse Gold) to a low of 6,762 (SPU13118) pounds per acre. Average fruit weight ranged from a high of 21.75 pounds (Hulk) to a low of 2.40 pounds (Miniwarts).

Fruit quality rating was taken at the time of harvest. We rated the fruit and stems on a scale of 0-5. The following scale illustrates the amount of Powdery Mildew and Plectosporium lesions on the stems and fruit at harvest. See Tables 3 and 4.

- 0 being no disease present.
- 1 being 1% 19% disease present.
- 2 being 20% 39% disease present.
- 3 being 40% 59% disease present.
- 4 being 60% 79% disease present.
- 5 being 80% 100% disease present.
