## 1 Introduction

### 1.1 Scope

This document, in according to the Spectrometers and Imagers for MPO BepiColombo Integrated Observatory SYStem (SIMBIO-SYS) Technical Note, Layout and Data flow agreement detailed in [RD.1], all the Flight Operation Procedures (FOPs) SIMBIO-SYS to be used during the operational phases of the instrument. This issue represents a review of [RD.2] considering all the improvements made after the Near Earth Commissioning Phase (NECP)[RD.4] and before ICO1 phase.

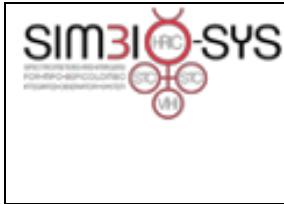

**Differently from the date in the header, present Technical Note refers to activities performed between December 2018 and June 2019 (ICO1,dNECP) partially anticipated in [RD.4].**

## 2 SIMBIO-SYS FOP definition and description

During all operative phases the SIMBIO-SYS instrument will be commanded through proper sequence of commands which are sent to the MPO Space-Craft (S/C) using FOP. These can be grouped into 4 distinct types depending on the application context:

- CRitical Procedure (CRP): to be used for safety command the instrument
- ENGineering procedure (ENG): to be used for SW update, memory check and HK management
- Flight Control Procedure (FCP): to be used for the scientific usage of the channel
- TeST procedure (TST): special procedure to be used for specific test during all the operative phases

In the following paragraphs, all the SIMBIO-SYS FOPs are described grouped as listed above.

### 3.1.4 SIMBIO-SYS Run Diagnostic Mode (SS-CRP-003)

#### 3.1.4.1 Objectives

The aim of this FOP is to starts the Main Electronic (ME) Diagnostic Mode, then each of the three channel diagnostics can be started. The default duration for each channel simulation is set here to 30s but can be easily changed modifying the release time of the "Stop Diagnostic Mode" TeleCommand (TC).

The diagnostic telemetry is dummy science actually generated by the ME. Finally, the diagnostic of ME is turned off.

Like in Science, HRIC and STC can be used in mosaic mode, while VIHI channels has only "continuous" science mode.

If **MOSAIC MODE is selected** (by setting appropriately the parameters in the TC to start the HRIC or STC diagnostic) the required number of Science simulation with the related repetition time will be created by the ME.

As soon as the required images are acquired, the ME will automatically stop the simulation and switch to HRIC/STC idle diagnostic mode.

So, if **MOSAIC MODE is selected**, the "Stop Diagnostic Mode" TC for that channel should NOT be uplinked.

#### 3.1.4.2 Summary of Constraints

The ME must be in Application SoftWare (ASW) started mode before starting the procedure, otherwise the TC to enter diagnostic mode shall be discarded.

### 3.1.5 SIMBIO-SYS HRIC Simulated Readout (SS-CRP-004)

#### 3.1.5.1 Objectives

The aim of this FOP is to simulate HRIC detector science dataflow with a fixed pattern or an increasing counter. The type of reading is selected by the sequence formal parameter. The "simulated science" is commanded using the normal science TC but specifying parameter "LS Bit 1 PE mode" = 1.

The ASW sends the Start Science TC to the Proximity Electronics (PE) with flag "test Mode"; the PE does not program the detector but simulates the detector by generating fixed/ counter pattern. The ME handles the incoming "simulated science" as "nominal science" and applies the editing/compression as specified by the user in the Start Science TC.

The "Simulated science acquisition" allows to test the science generation and traffic towards S/C limiting the items under test to ME CPCU + ME CU + PE without the detector (that is being simulated).

### 3.1.10 SIMBIO-SYS Manual Switch On (SS-CRP-009)

#### 3.1.10.1 Objectives

The aim of this FOP is to manually switch on SIMBIO-SYS on its Nominal or Redundant Interface.

The procedure includes steps to:

- time synchronize the Boot SoftWare (BSW)
- verify BSW version
- load ASW FLIGHT version
- time synchronize ASW
- verify ASW version

**THE PROCEDURE IS SUPPOSED TO RUN IN A NON NOMINAL SITUATION, THEREFORE THE FINAL ACTIVATION OF ANY MONITORING AND EVENT ACTION ENTRY IS OPTIONAL AS PER PI INPUTS.**

The sequence of power up and related TM time-stamp is the following (email from Vincent Carlier, 23 March 2016):

*At the power-on of SIMBIO-SYS, the FPGA companion chip of the RTC takes around 4 seconds to power-up with a timeout of 5 seconds. During this situation the SpaceWire (SpW) link is not activated by SIMBIO-SYS. S/C is in Auto Start mode and waits SIMBIO-SYS to start the SpW link. Thus nothing happens from SIMBIO-SYS at this stage, any telecommand can simply not be received by SIMBIO-SYS.*

*When the FPGA power-up is completed (or the timeout expires), the SpW link is activated. The two TM (5,1) "SIMB BSW report" and "SIMB Mode Change" are sent immediately. These two TMs are always unsynchronized. The OBT field is the init value (1273536000) + ~80ms.*

*From now another timeout of 5 seconds is started. SIMBIO-SYS waits the Time Update Service 9 Telecommand TC(9,129) from S/C.*

*If the TC Time Updated is received before the end of the timeout, the OBT is updated at the next Time Code and the first HK report TM(3,25) is sent to S/C synchronized before the end of the timeout.*

*If the timeout expires SIMBIO-SYS sends the first HK report TM(3,25) unsynchronized (OBT value = 1273536000 + ~5s).*

### 3.2.3 SIMBIO-SYS HRIC Read - Write Address (SS-ENG-002)

#### 3.2.3.1 Objectives

The aim of this FOP is to read or write the contents of a HRIC FPGA address. There is a limited number of addresses available for this operation, see appendix to this procedure. The values that can be written and the associated functionality are listed in [RD.7] Table 3.7.2.3-2 PE Addresses contents.

#### Notes

Differently from other uploaded parameters (i.e. VIHI Bias Detector parameters which remain in the PE RAM until the PE is switched off) when the TEC parameters have been uploaded, they are written in the CPCU RAM, so they remain available up to the next SIMBIO-SYS switch off (see [RD.2] Section 8.3.1.10 and 8.3.1.16).

#### 3.2.3.2 Summary of Constraints

The "WRITE ADDRESS" command must be followed by a "CONFIRM" command (included in this procedure).

### 3.2.11 SIMBIO-SYS check SW version and ASW Flight vs Lab version (SS-ENG-012)

#### 3.2.11.1 *Objectives*

The aim of this FOP is to check the SW version of BSW and ASW, and to verify whether ASW has been loaded from the Flight or from the Laboratory EEPROM image.

#### 3.2.11.2 *Summary of Constraints*

The BSW check must be performed before starting ASW.

The ASW check must be performed after the ASW is started at address 0x40100000.

The addresses and check values provided are valid for the ASW version 2.6.001 and BSW version 2.1.i3 , as per BC-SIM-ORS-MA-002 April 6 2016.

### 3.3.2 SIMBIO-SYS ME Switch On by OBCP (SS-FCP-001)

#### 3.3.2.1 Objectives

The aim of this FOP is to trigger execution of the SIMBIO-SYS ME Switch On OBCP named KSS04000MEON in [RD.5]. The OBCP shall normally be triggered by the Mission Planning process using the command sequence defined by this procedure.

Essentially: the current condition is checked, the SPW link enabled, the LCL on selected side is closed, the BSW is synchronized with OBT, a connection test TC is verified, ME status is checked, ASW is started if requested, ASW is synchronized with OBT, final condition is checked. For more details see [RD.5].

### 3.3.11 SIMBIO-SYS VIHI Off by OBCP(SS-FCP-010)

#### 3.3.11.1 Objectives

The aim of this FOP is to trigger execution of the SIMBIO-SYS VIHI Graceful Shutdown OBCP named KSS04007VGOF in [RD.5]. The OBCP shall normally be triggered by the Mission Planning process using the command sequence defined by this procedure.

Essentially: the current condition is checked, the TEC is switched OFF, the detector is switched OFF (twice, if needed), the channel (PE) is switched OFF. If nominal completion is achieved, an event is generated to inform the ME OFF OBCP that VIHI is now OFF. For more details see [RD.5].

#### 3.3.14.1 Objectives

The aim of this FOP is to operate the VIHI shutter, Calibration Lamp, Calibration LED. The setpoints of each operation are available as formal parameters, the default value being set as per GAF inputs.

#### 3.3.14.2 Summary of Constraints

VIHI calibration loads (Lamp, LED and shutter) may be switched on only when VIHI PE and Detector are ON. Otherwise the Lamp/LED/Shutter On TC are ignored by the PE.  
Moreover, ONLY ONE of these three loads can be active at any time.

### 3.3.15 SIMBIO-SYS Upload of Parameters (SS-FCP-014)

#### 3.3.15.1 Objectives

The aim of this FOP is to modify, up to the next UploadParam TC to the same channel, or up to SIMBIO-SYS power off, the specified parameter and value for one SIMBIO channel.

#### Notes

Differently from other uploaded parameters (i.e. STC/HRIC TEC parameters) which been uploaded, they are written in the CPCU RAM, so they remain available up to the next SIMBIO-SYS switch off, VIHI Bias Detector parameters will remain in the PE RAM until the PE is switched off (see [RD.2] Section 8.3.1.10 and 8.3.1.16).

### 3.3.16 SIMBIO-SYS Set NECP-CRUISE or STD thermal control thresholds (SS-FCP-015)

#### 3.3.16.1 Objectives

Prior to SIMBIO-SYS power ON in NECP or Cruise check-out, the instrument needs to be heated up to reach the PEs operational temperature range. This is done by increasing the settings of TCS heater line 22 (heater switching thresholds) at least two hours before planned ME switch ON.

At the end of SIMBIO activities, after the ME is switched OFF, heater settings must be restored to cruise values in order to save power (about 18 W).

The reference document for this procedure is [RD.9].

**Notes:** In case of upload of VIHI Bias Detector parameters, they will remain in the PE RAM until the PE is switched off differently by TEC cameras parameters which are written in the CPCU RAM, so they remain available up to the next SIMBIO-SYS switch off (see [RD.2] Section 8.3.1.10 and 8.3.1.16).

### 3.4.5 SIMBIO-SYS STC functional tests (SS-TST-020)

#### 3.4.5.1 Objectives

The aim of this FOP is to test the Detector/TEC cycles and the acquisition of a limited set of images in continuous mode:

- 10 GM with RT=2 s
- 10 GM with RT=12.3 s
- 10 CM with RT=0.4 s
- 10 CM with RT=2.05 ms

The acquisitions are performed after a Collect Interval update (1 s), switch on of the Detector and the TEC.

As reported in 3.4.5.7 these science parameters has been changed respect previous FOP version before ICO1 Test (Jun 2019).
