What Are The Benefits Of Treatment Of Familial Hypercholesterolaemia (FH)?

A Cost-Effectiveness Model Based On Real-World Data Considering Cholesterol Burden

Background

FH is a genetic disorder
 Raises LDL-cholesterol
 High LDL-cholesterol raises risk of cardiovascular disease
LDL-cholesterol burden means greater risk for longer exposure

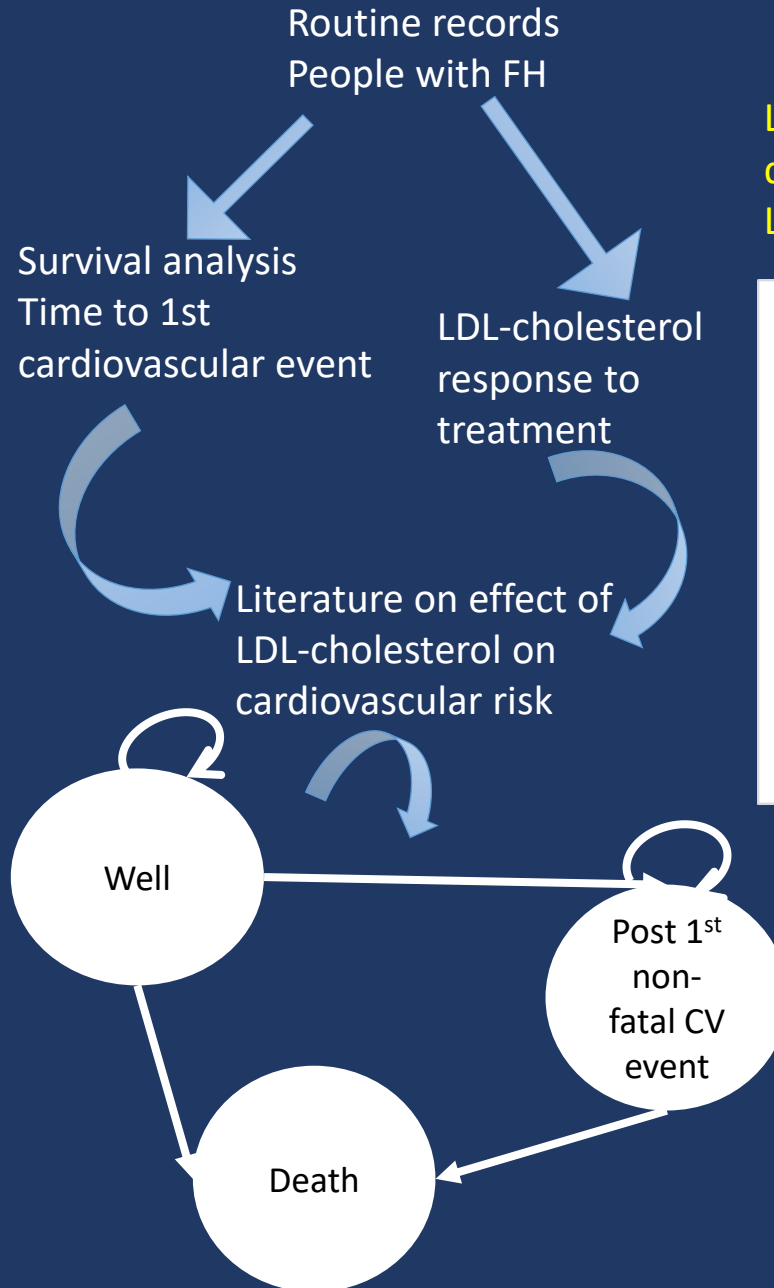

Objectives

- To use real world-data from individuals with FH in UK
- To estimate cardiovascular risk
- To develop new cost-effectiveness model
- To predict outcomes

1. Centre for Health Economics, University of York, UK
2. NIHR School for Primary Care Research, University of Nottingham, UK
3. Institute of Cardiovascular Science, University College London, UK.

Large difference in net health gain depending on whether LDL-cholesterol burden is included

Findings

- Treatment is highly beneficial
- Greater benefits in younger people, with higher LDL-cholesterol or prior cardiovascular history
- Benefits depend on how LDL-cholesterol burden is considered
