# Introduction

## Heart Failure (HF):

- Structural anomaly and/or committed cardiac function => inadequate cardiac output unable to meet the metabolic necessities of the organism.

Normal heart

Normal ventricular chambers

Congestive heart

Thickening of the ventricular chambers and smaller filling capacity and ejection of blood

<https://www.drugwatch.com>

# Aim

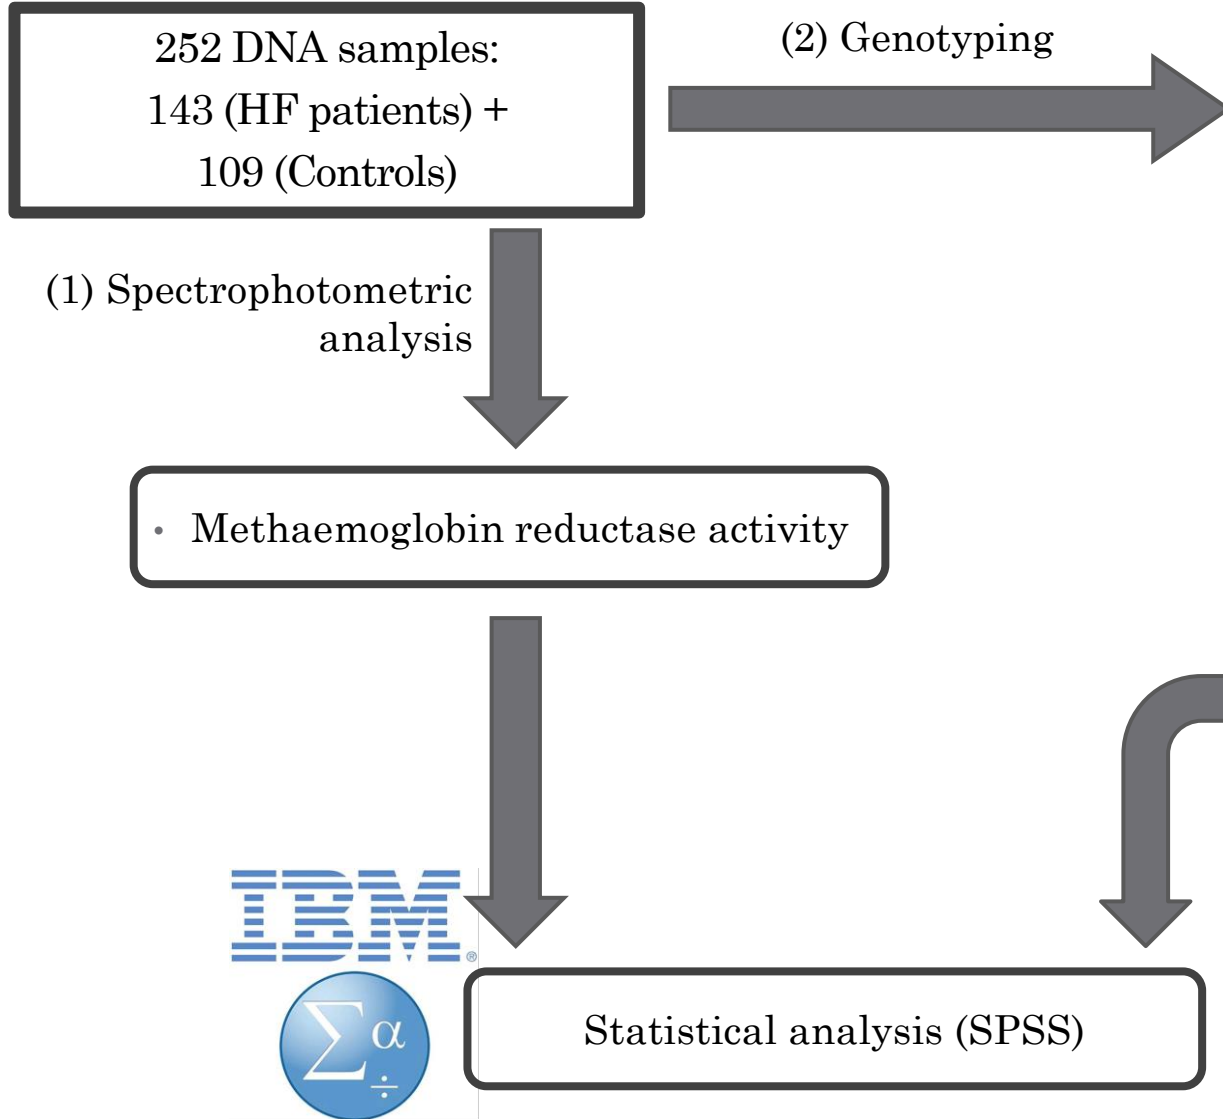

- Can *HFE* and *HPSE* polymorphisms and methaemoglobin reductase activity influence HF?

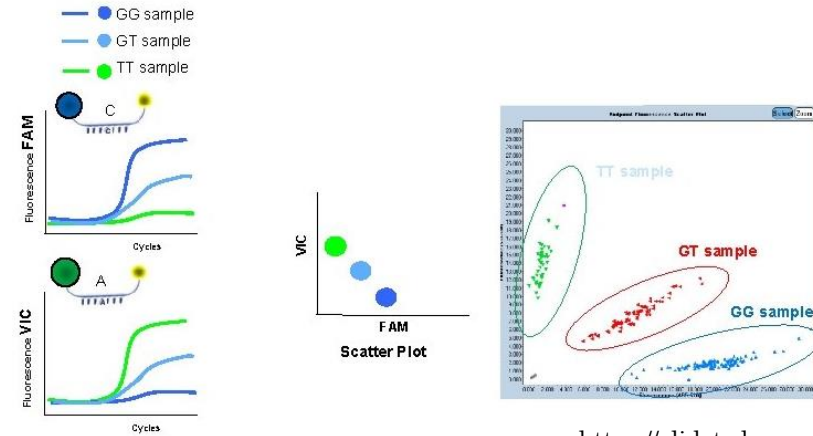

18-19

NOV 2021

# Methodology

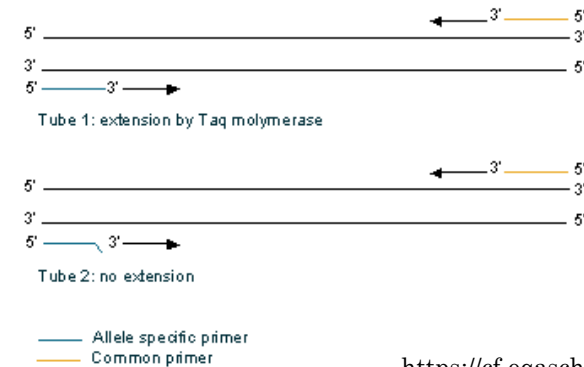

- rs4693608 polymorphism (*HPSE* gene) – Endpoint PCR

<https://slidetodoc.com>

- C282Y and H63D polymorphisms (*HFE* gene) – ARMS Multiplex

<https://cf.eqascheme.org>

# Results

Table 1 – Comparison of genotypic distribution of *HFE* and *HPSE* polymorphisms between HF and control populations.

Polymorphism (Gene)	Genotype/ Allele	Controls n (%)	HF Patients n (%)	p-value	[OR (95% CI)]
H63D ( <i>HFE</i> )	HD	18 (19.8)	22 (27.2)	0.042 <sup>1</sup>	2.889 <sup>1</sup> (1.041 - 8.018)
	HH + DD	73 (80.2)	59 (72.8)		
rs4693608 ( <i>HPSE</i> )	GG	29 (30.5)	23 (20.9)	0.045 <sup>2</sup>	0.435 <sup>2</sup> (0.193 - 0.982)
	AA + GA	66 (69.5)	87 (79.1)		
rs4693608 ( <i>HPSE</i> )	AA + GA	66 (69.5)	87 (79.1)	0.045 <sup>2</sup>	2.297 <sup>2</sup> (1.018 - 5.179)
	GG	29 (30.5)	23 (20.9)		

Risk

Protective

Risk

<sup>1</sup>Binary logistic regression, adjusted for age and sex.

<sup>2</sup>Binary logistic regression, adjusted for age.

Table 2 – Comparison of methaemoglobin reductase activity between HF and control populations.

Methaemoglobin reductase activity (µmol/g Hb/min)					
Population	n	Median	Minimum	Maximum	p-value
Controls	37	20.633	12.418	31.200	0.019 <sup>1</sup>
HF Patients	94	15.651	8.370	47.267	

<sup>1</sup>Binary logistic regression, adjusted for age.

# Conclusions
