DE LISBOA  
INSTITUTO POLITÉCNICO DE LISBOA

Instituto Politécnico de Lisboa – Escola Superior de Tecnologia da Saúde de Lisboa

I Webinar de Investigação Aplicada em Farmácia

Autores: Natália Costa e Cátia Oliveira

Prof.<sup>a</sup> Liliana Aranha Caetano e Prof.<sup>a</sup> Elisabete Carolino

# Our Study

**Main project: EXPOsE – Establishing protocols to assess occupational exposure to microbiota in clinical settings;**

Financed by FCT – Fundação para a Ciência e Tecnologia (**02/SAICT/2016 – Project nº 23222**) and by the Polish National agency of Academic Exchange (PPN/BIL/2018/1/00231)

# Our Study

Correlational analysis of the relationship between variables

**“Does the air quality of healthcare facilities influences biological responses?”**

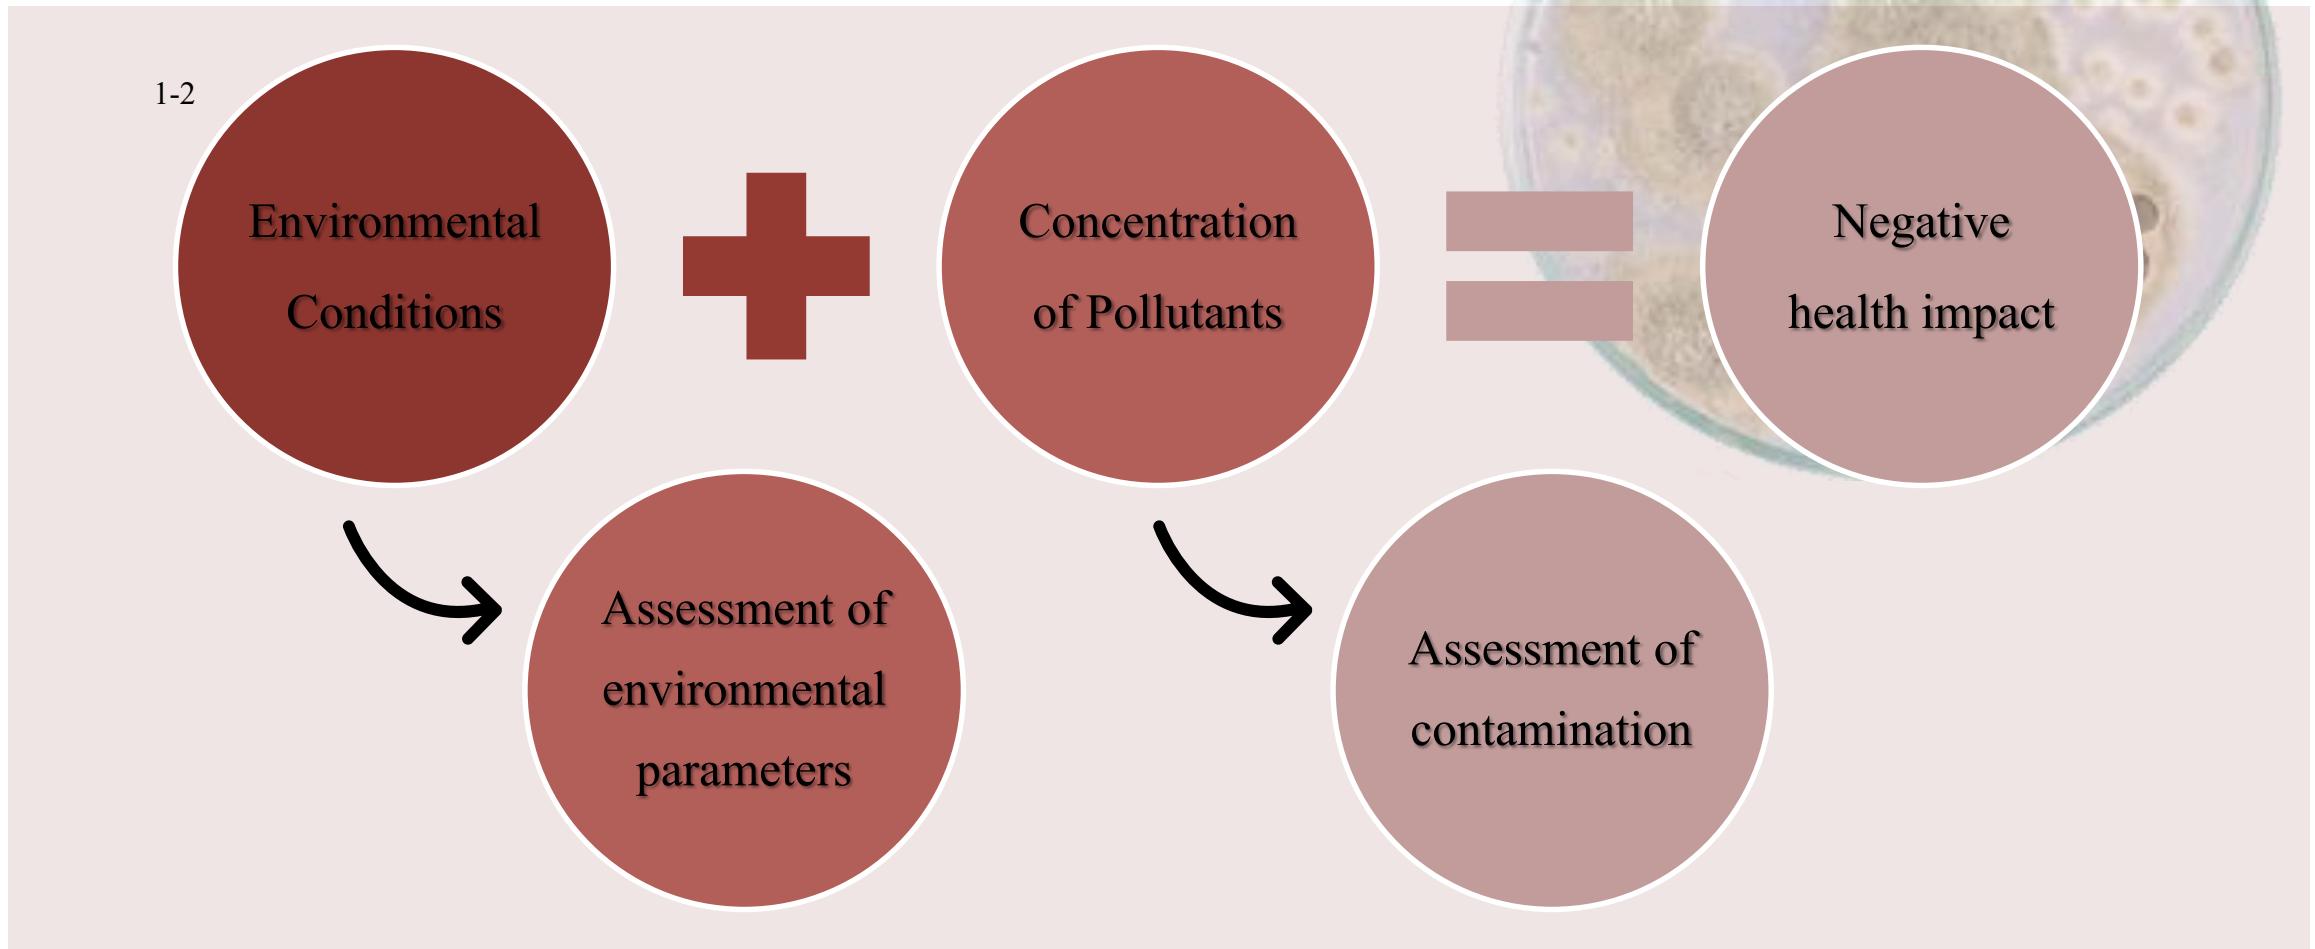

“Indoor Air Quality”, “Bioaerosols”, “Nosocomial Infections” and “Assessment Methods of Environmental Contamination”

Healthcare facilities display an important role in the transmission of airborne infections

Risk assessment to promote patients and professionals safety

# Indoor Air Quality

# Bioaerosols and Nosocomial Infections

Bioaerosols are particles with biological origins

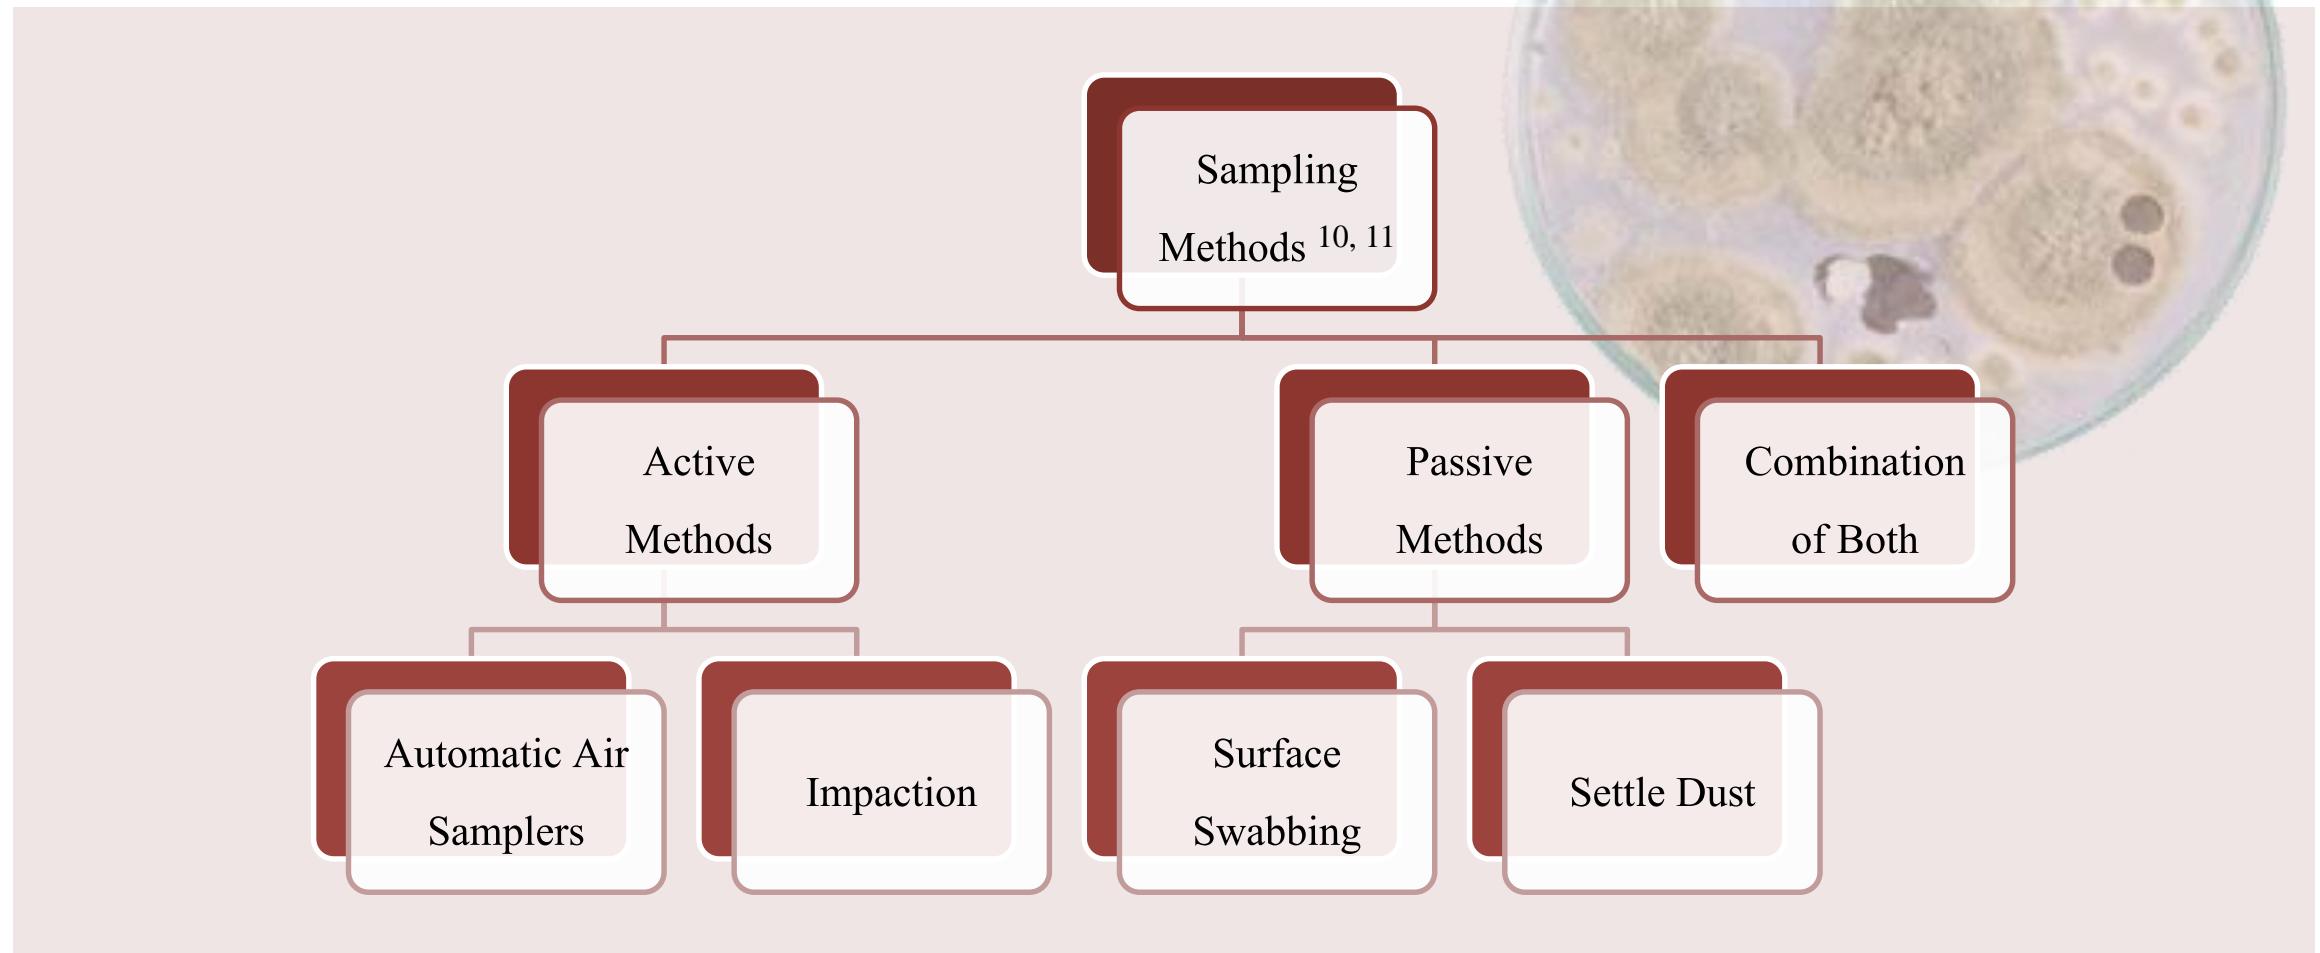

→ Infections, irritations and allergies

→ Nosocomial infections<sup>2-9</sup>

↓  
⚠ Methods for controlling airborne pathogens

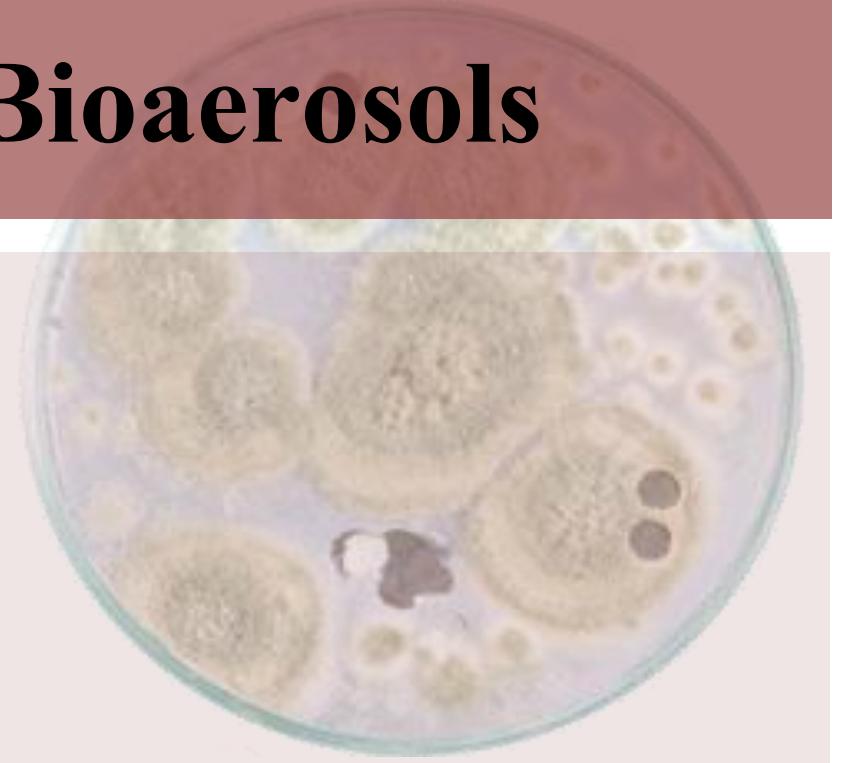

# Methods of Assessing Environmental Contamination

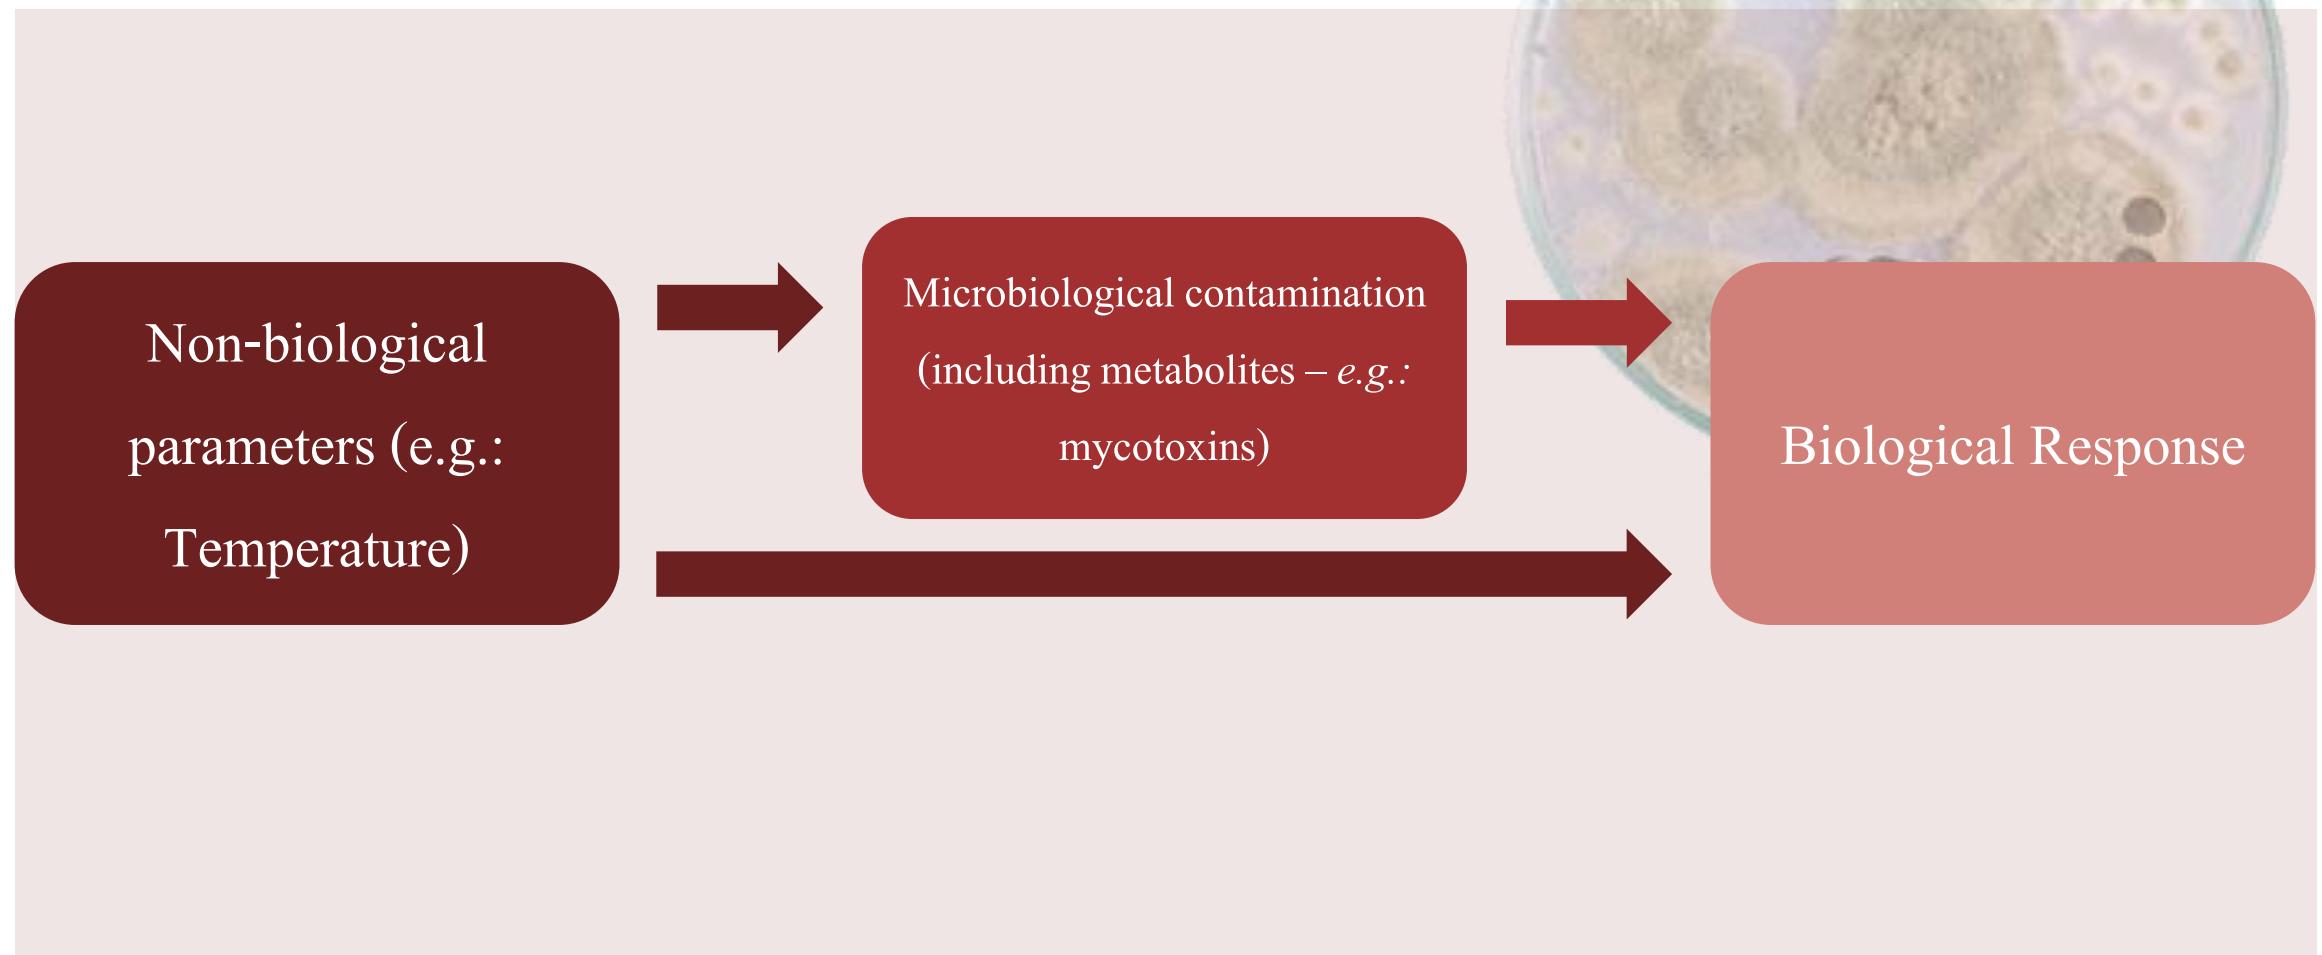

# Biological Response to Bioaerosols

Measured using:

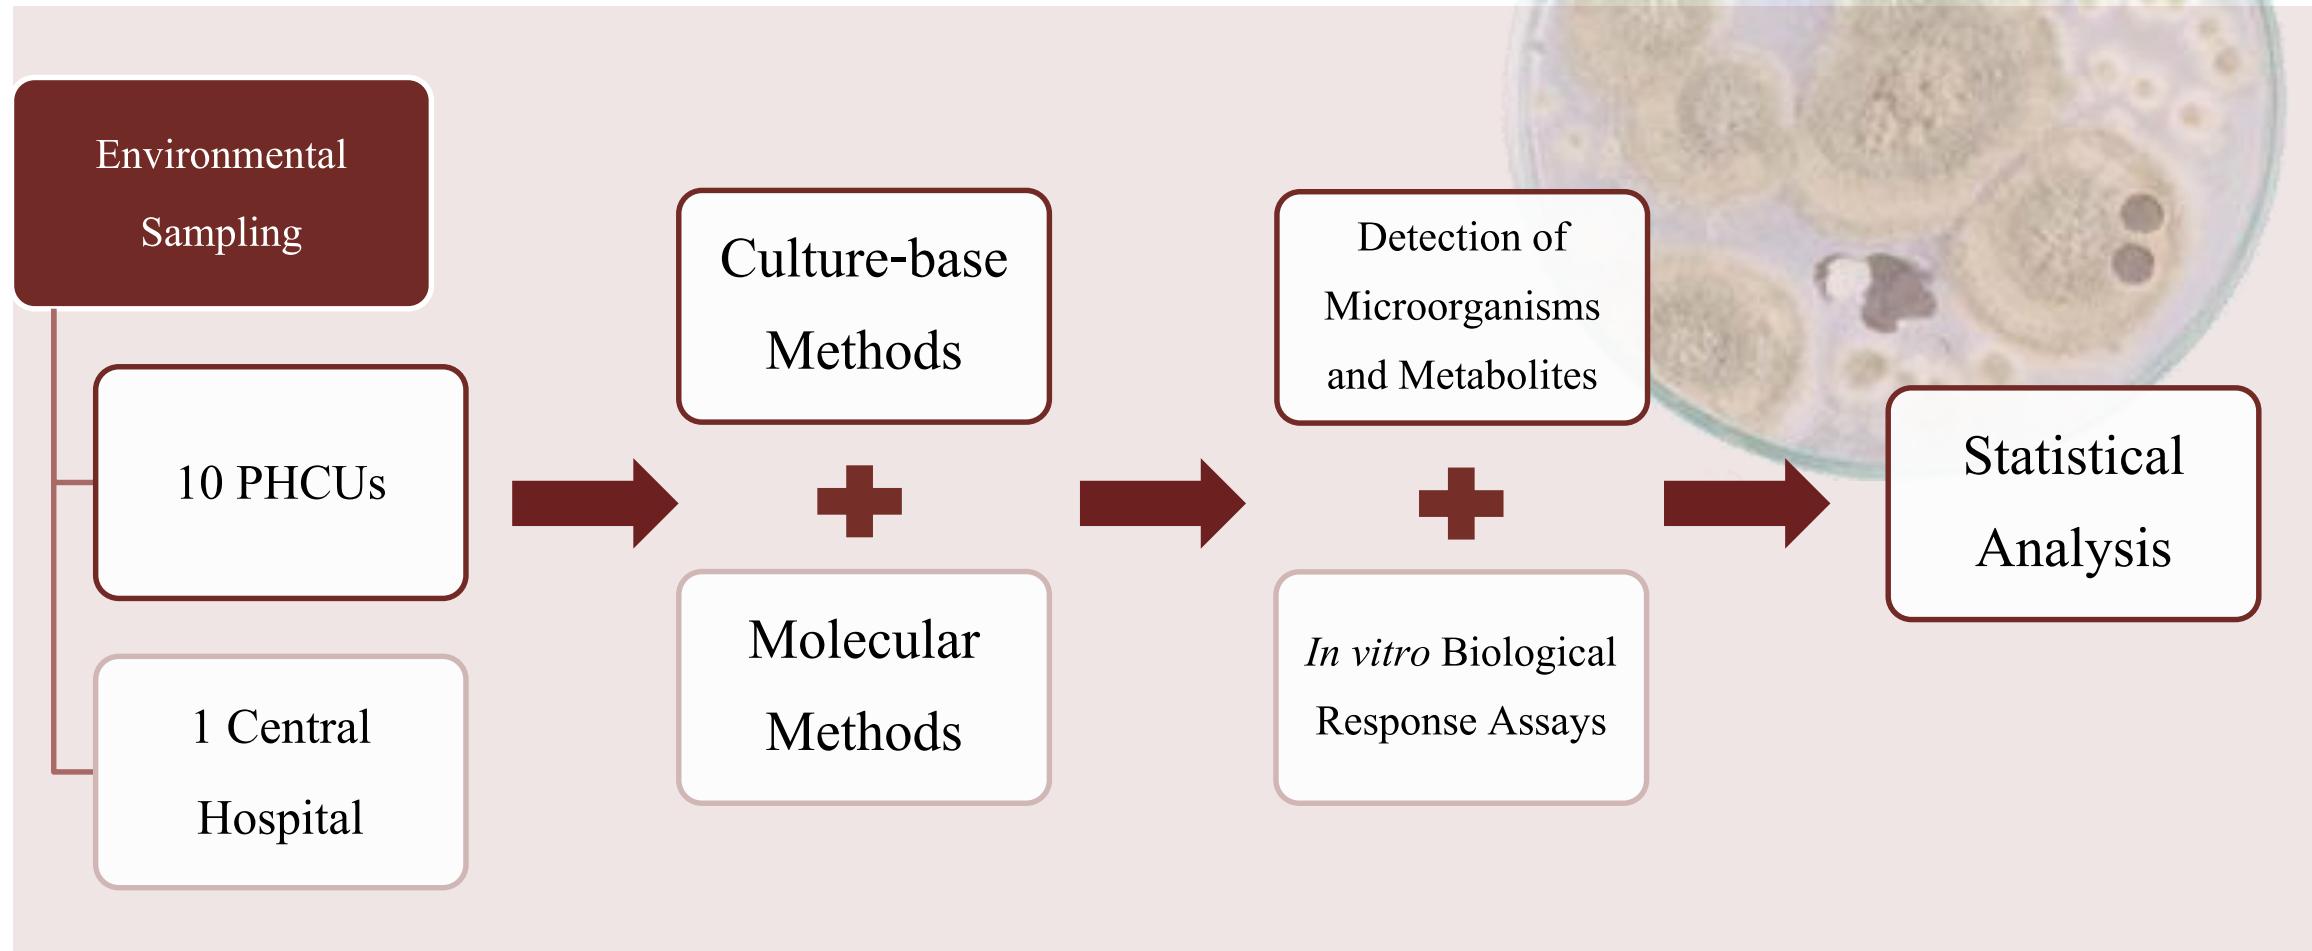

- ☒ Cytotoxic effects on THP-1 cells<sup>12, 13</sup>;
- ☒ Cytotoxic effects on Calu-3 cells<sup>14</sup>;
- ☒ Pro-inflammatory effects of cytokines IL-1 $\beta$  and TNF- $\alpha$  (from THP-1 cells)<sup>12, 13</sup>

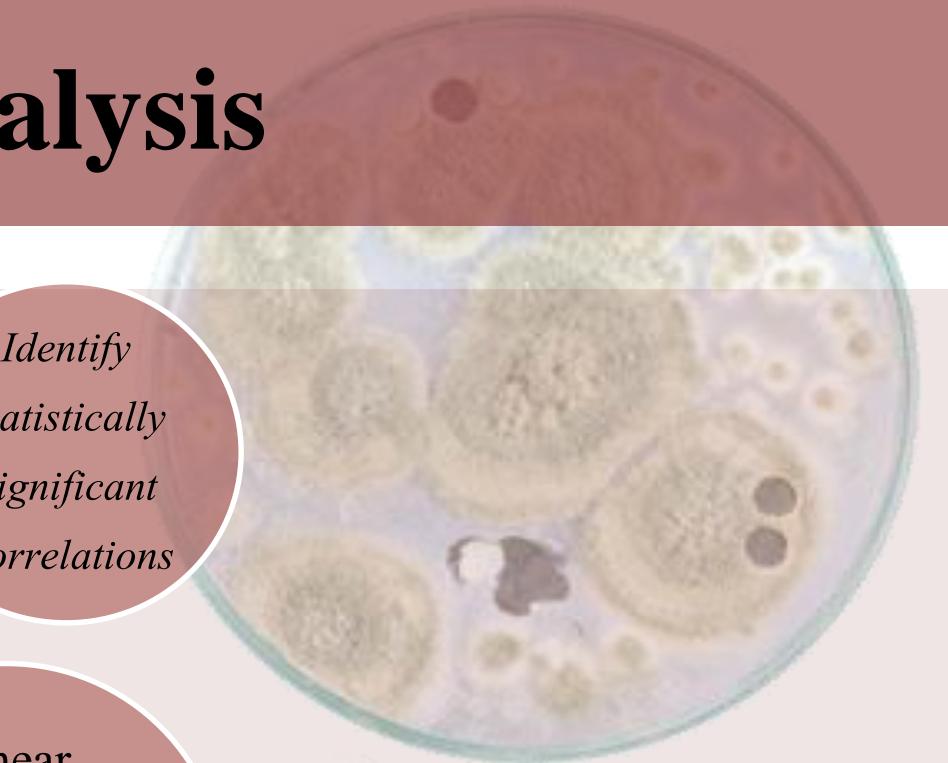

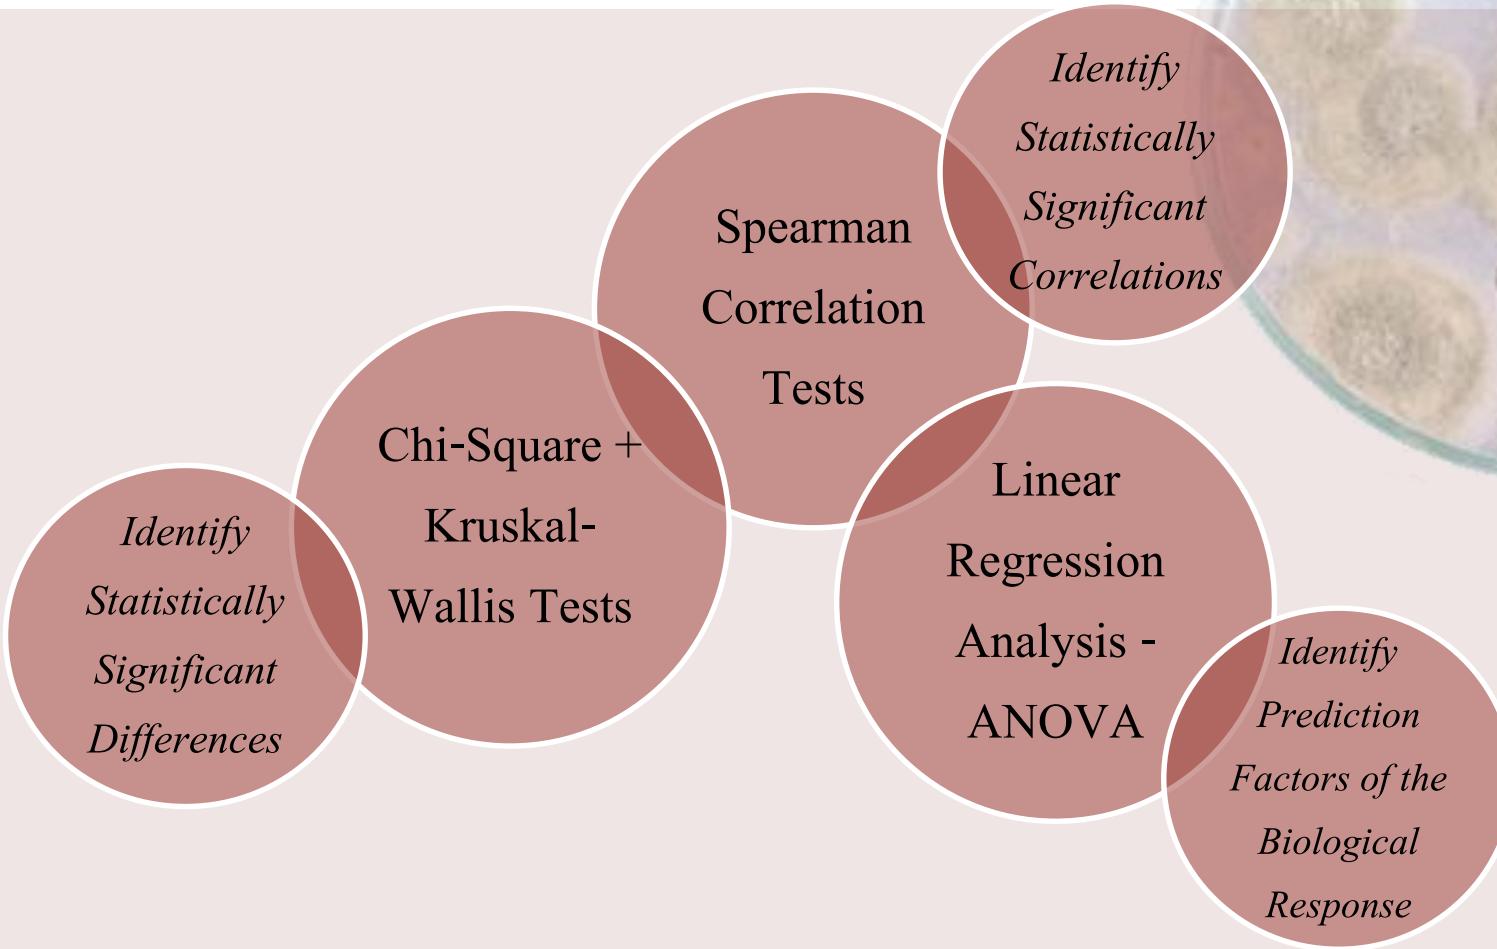

# Objectives

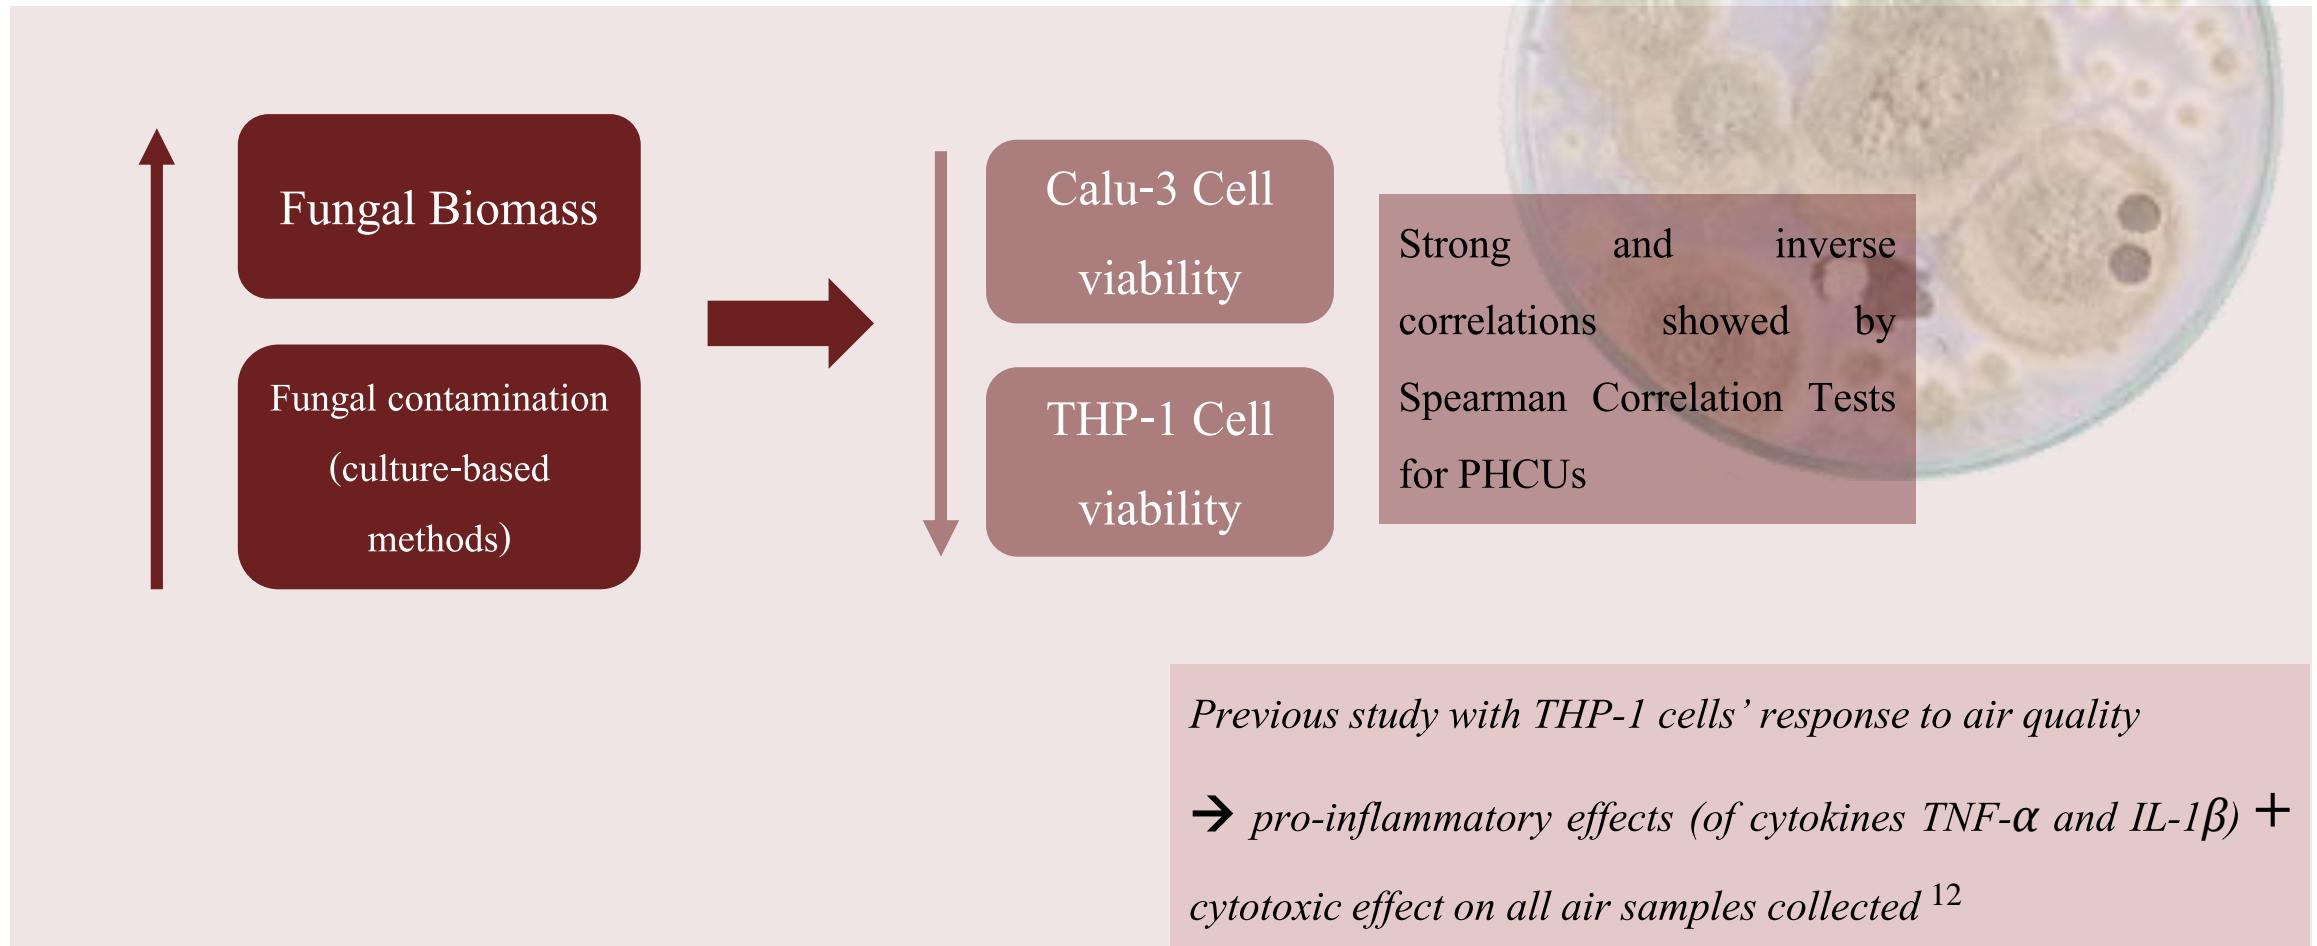

# Materials and Methods

# Statistical Analysis

# Main Results

# Main Results

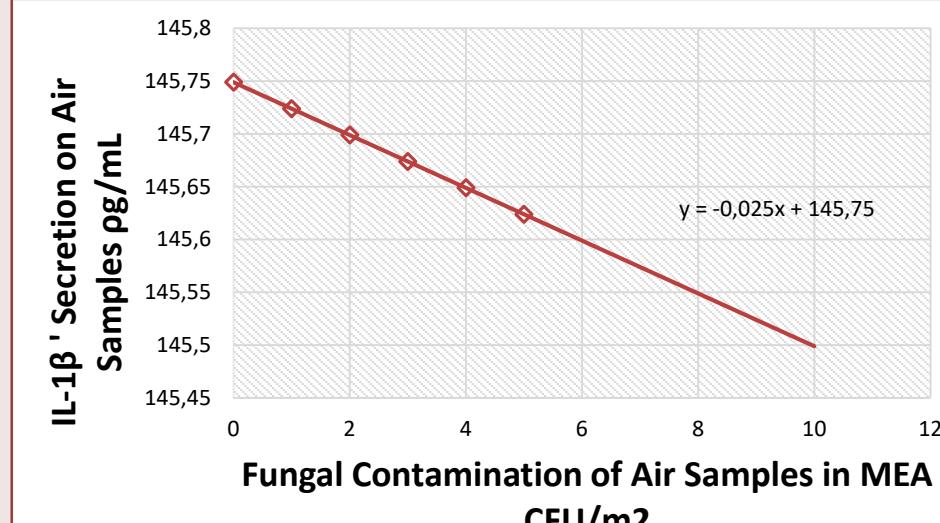

Figure 1 - Linear Regression Analysis (ANOVA Test), model 1

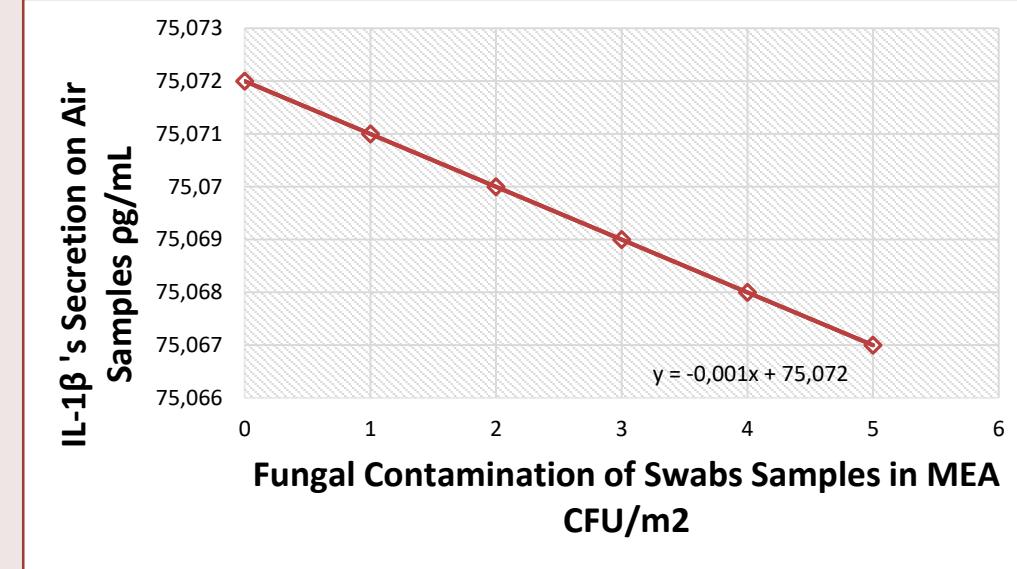

Figure 2 - Linear Regression Analysis (ANOVA Test), model 4

Fungal contamination decreases IL-1 $\beta'$  secretion

# Main Results

Variables (air contamination CFU/m <sup>2</sup> )	Influence over dependent variable (THP-1 cells' relative viability %)
VRBA (Gram (-) bacterial contamination)	-0.272
MEA (fungal contamination)	-0.18
DG18 (fungal contamination)	0.06

Figure 3 - Linear Regression Analysis (ANOVA Test), model 2

Variables (air contamination CFU/m <sup>2</sup> )	Influence over dependent variable (Calu-3 cells' relative viability %)
Total TSA (bacterial contamination)	-0.065
VRBA (Gram (-) bacterial contamination)	-4.183

Figure 4 - Linear Regression Analysis (ANOVA Test), model 3

Fungal

contamination with Gram (-) bacteria was mainly associated with decreased cell viability in THP-1 cells in air samples

Gram (-) bacteria combined with total bacterial contamination (on TSA), on air samples, decreases cell viability of Calu-3

# Main Results

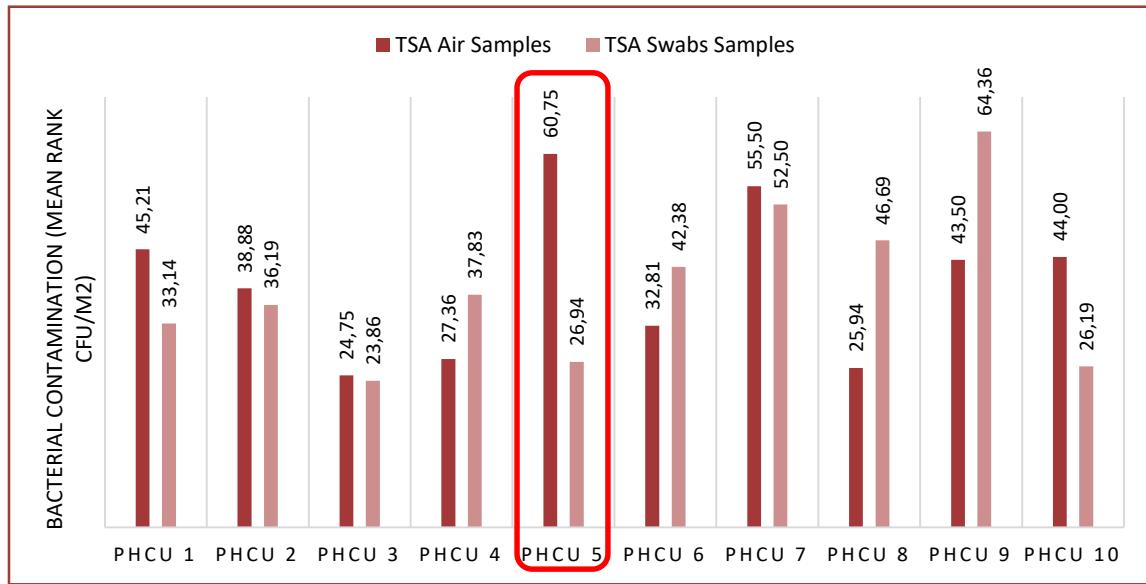

Figure 5 - Mean Ranks (results of Kruskal-Wallis test) to compare bacterial counts between PHCUs

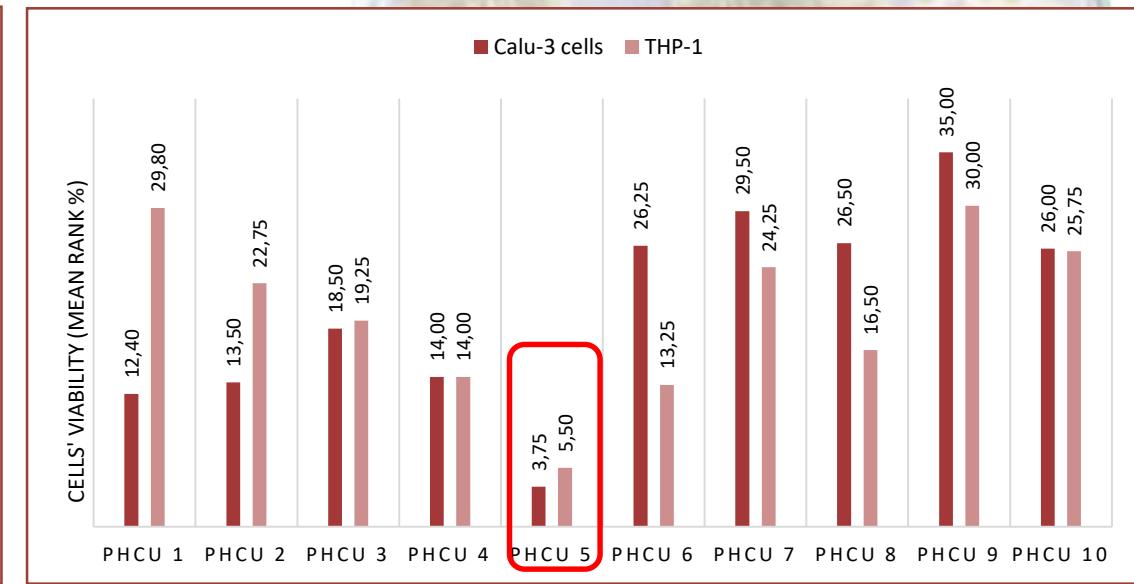

Figure 6 - Mean Ranks (results of Kruskal-Wallis test) to compare biological responses of both cell lines between PHCUs

PHCU 5, which had the highest count of bacterial contamination (on TSA) also had the lowest count of Calu-3 and THP-1 viabilities.

# Main Results

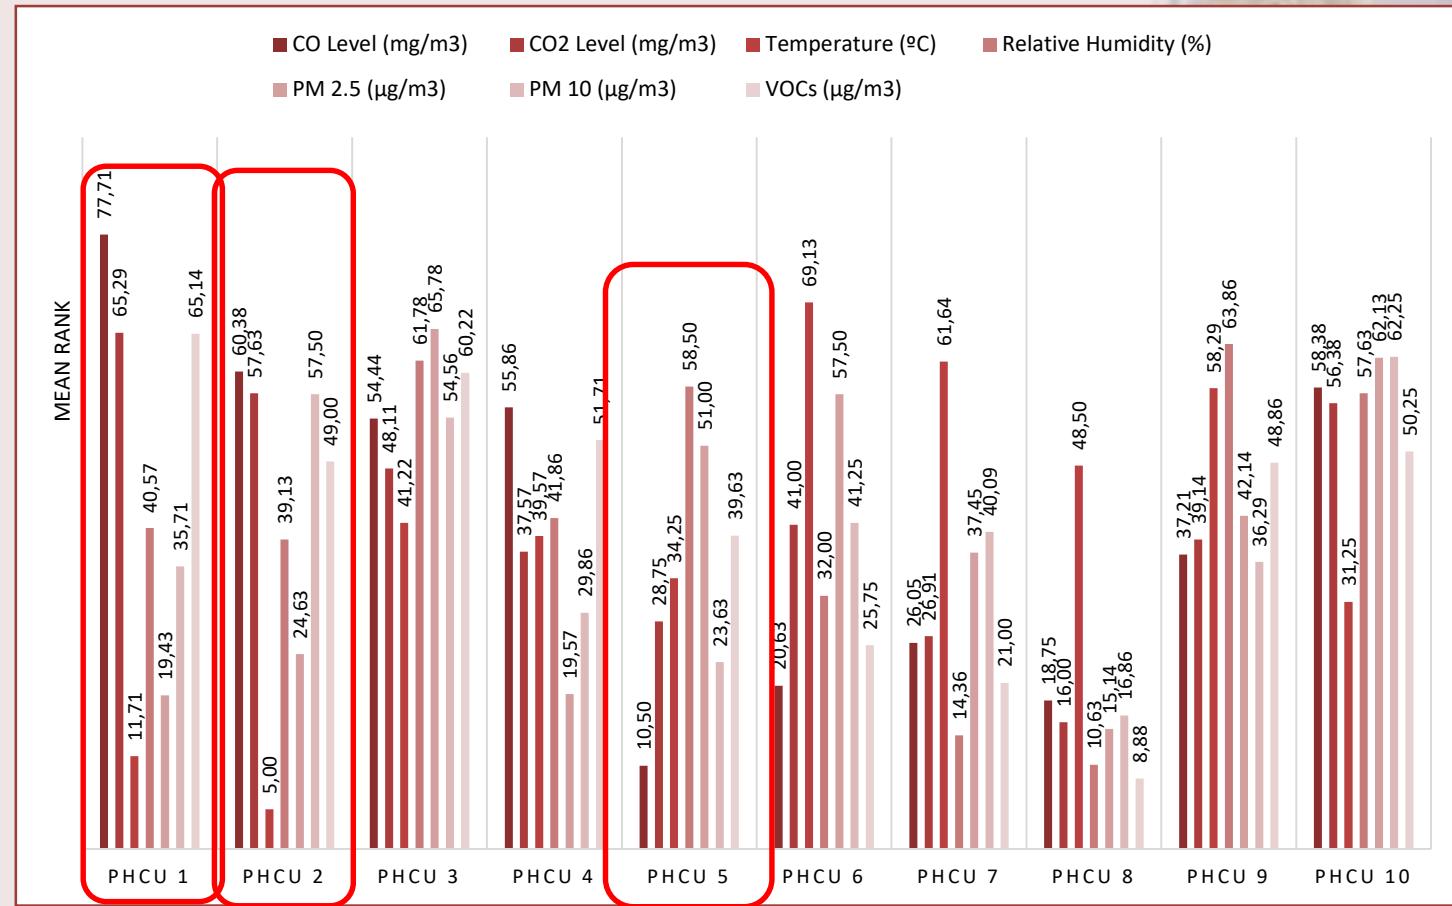

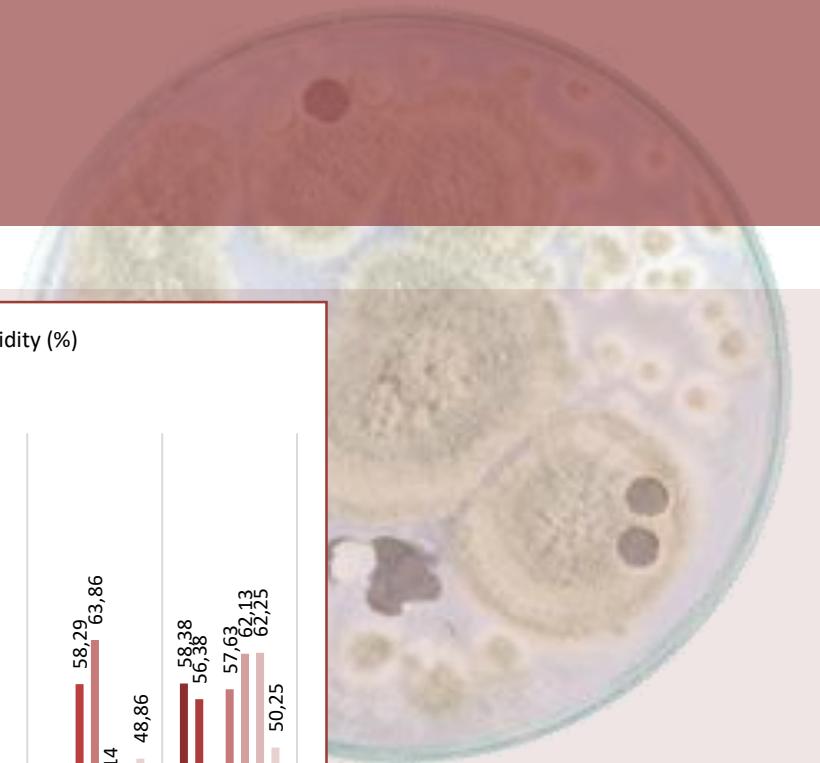

Figure 8 - Mean Ranks (results of Kruskal-Wallis test) to compare environmental parameters between PHCUs

# Main Results

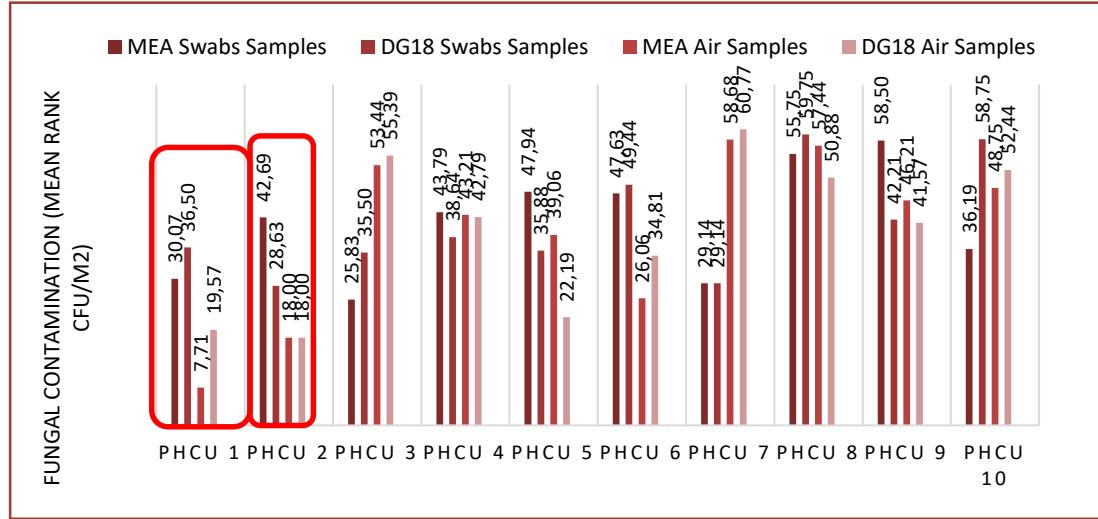

Figure 9 Mean Ranks (results of Kruskal-Wallis test) to compare fungal counts between PHCUs

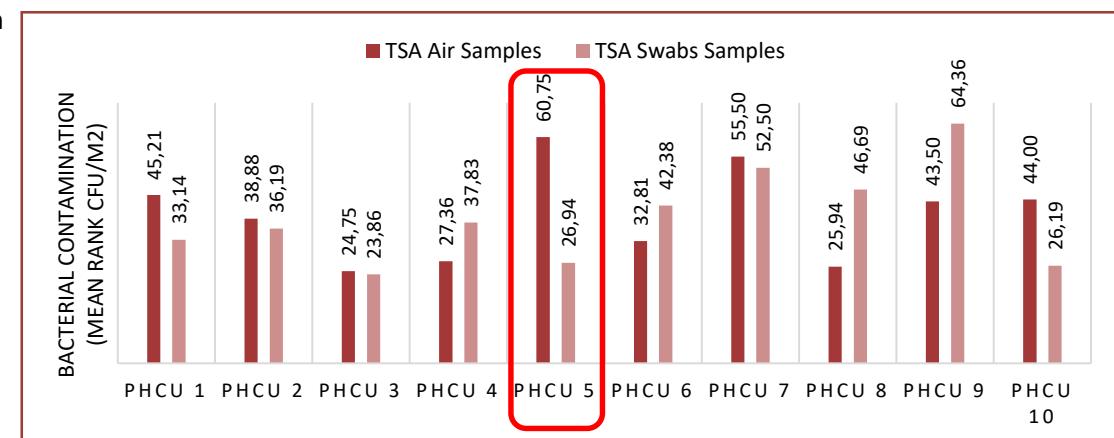

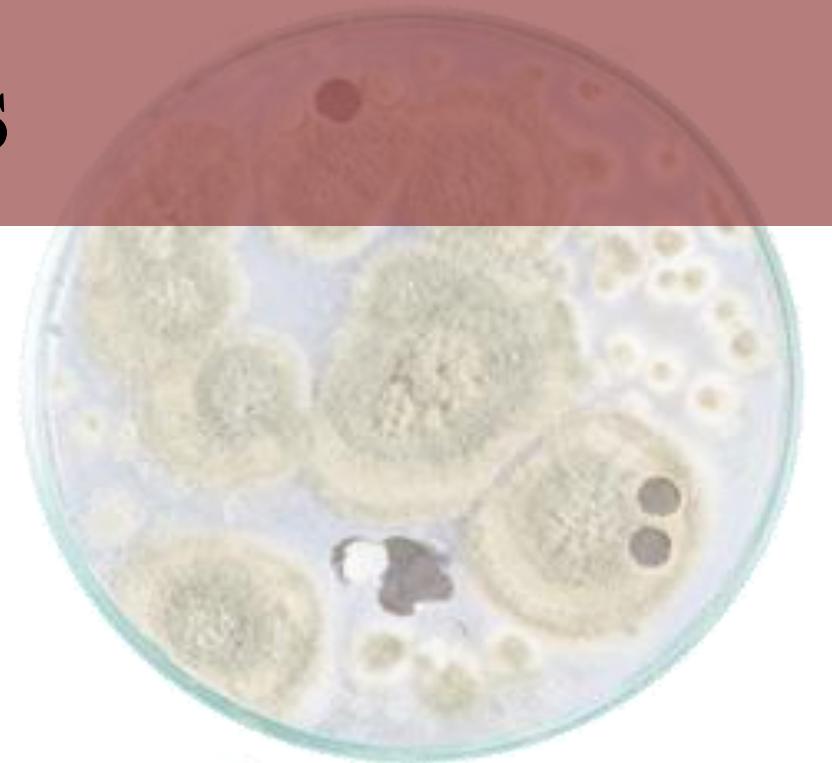

Figure 10 - Mean Ranks (results of Kruskal-Wallis test) to compare bacterial counts between PHCUs

# Main Results

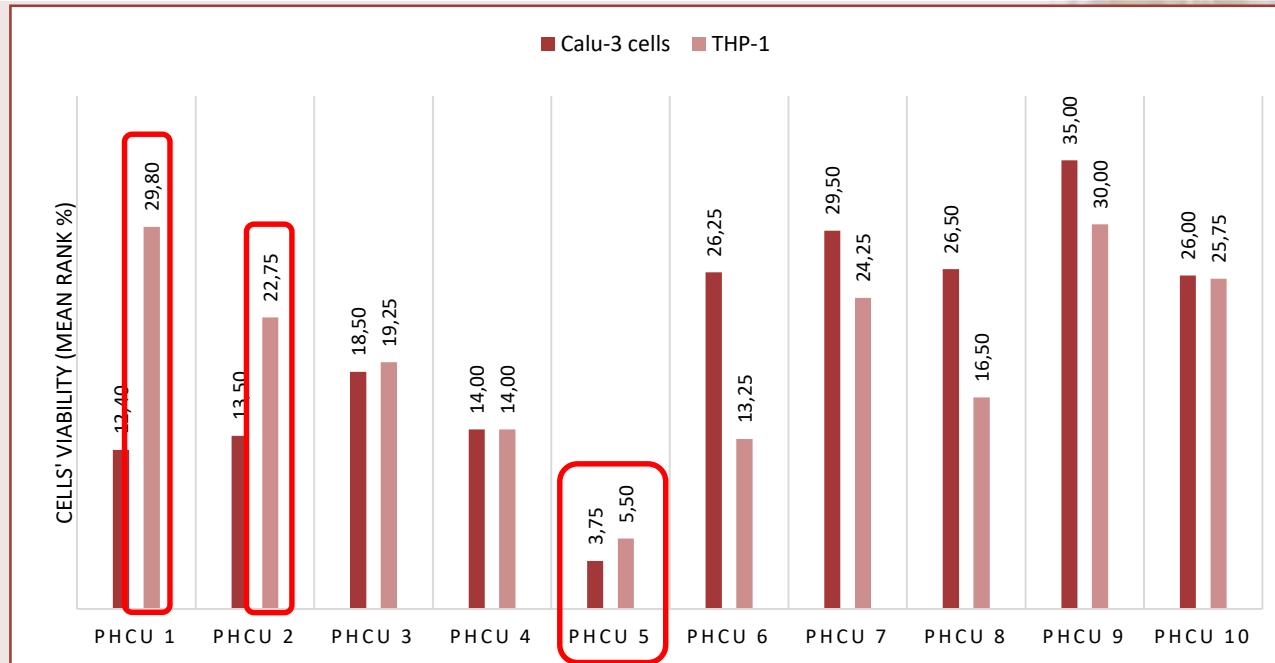

Figure 11 - Mean Ranks (results of Kruskal-Wallis test) to compare biological responses of both cell lines between PHCUs

Higher levels of carbon monoxide and dioxide may reduce viable fungal and bacterial air contaminants and allow higher viability of THP-1 and Calu-3 cells.

# Main Results

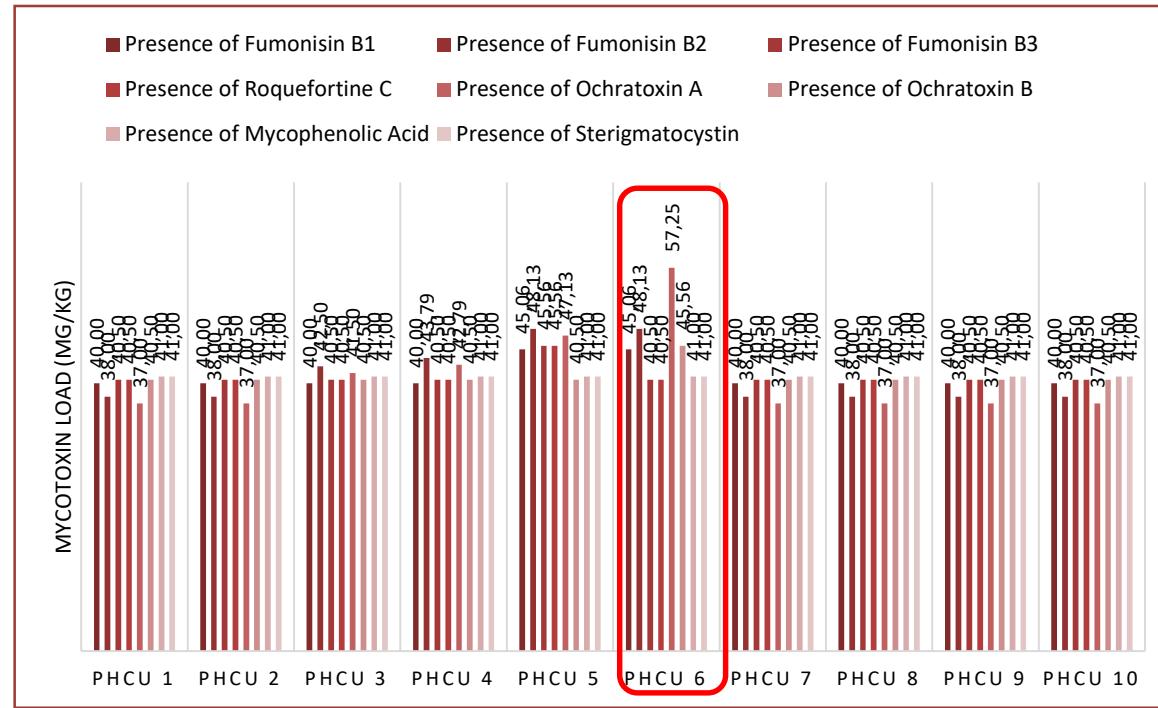

Figure 13 - Mean Ranks (results of Kruskal-Wallis test) to compare mycotoxin counts between PHCUs

Ochratoxin A has been associated with decrease in metabolic activity, cell proliferation, differentiation, phagocytic behavior and other effects over THP-1 cells and Fumonisin I with decreased cell viability also in THP-1 cells<sup>17, 18</sup>

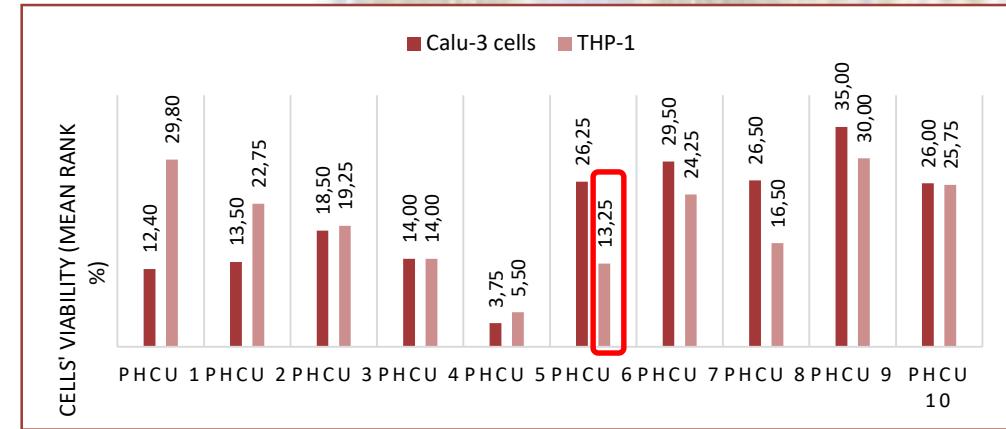

Figure 14 - Mean Ranks (results of Kruskal-Wallis test) to compare biological responses of both cell lines between PHCUs

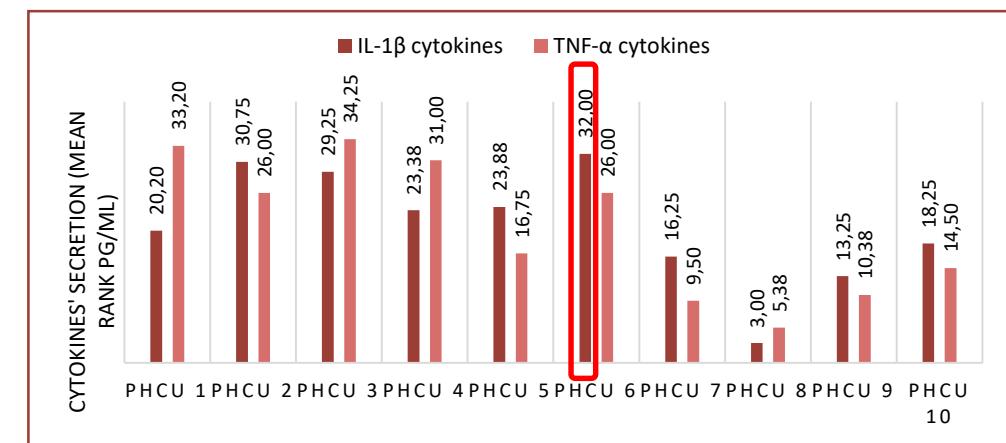

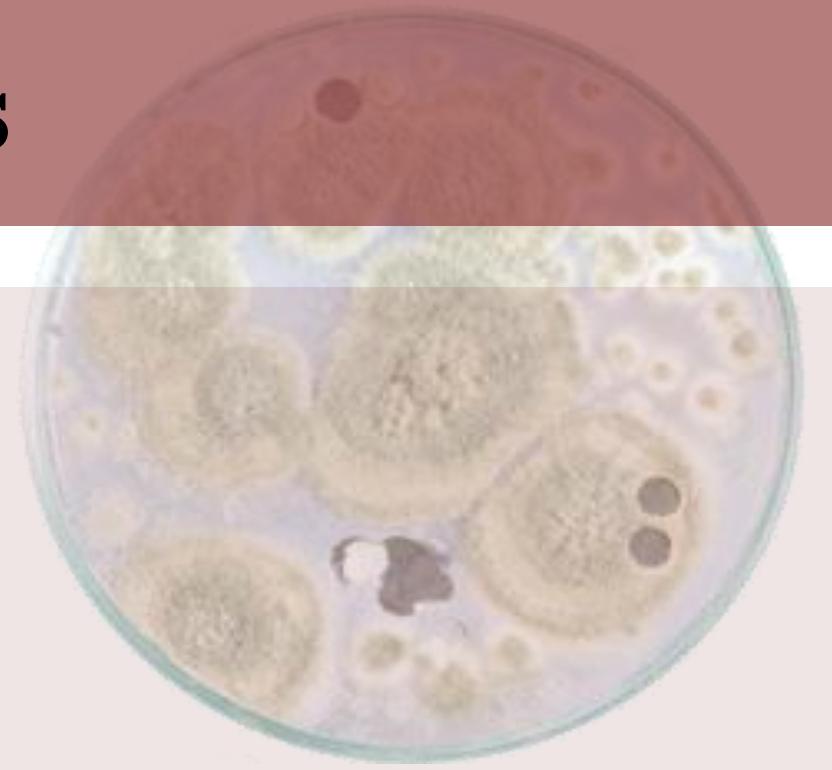

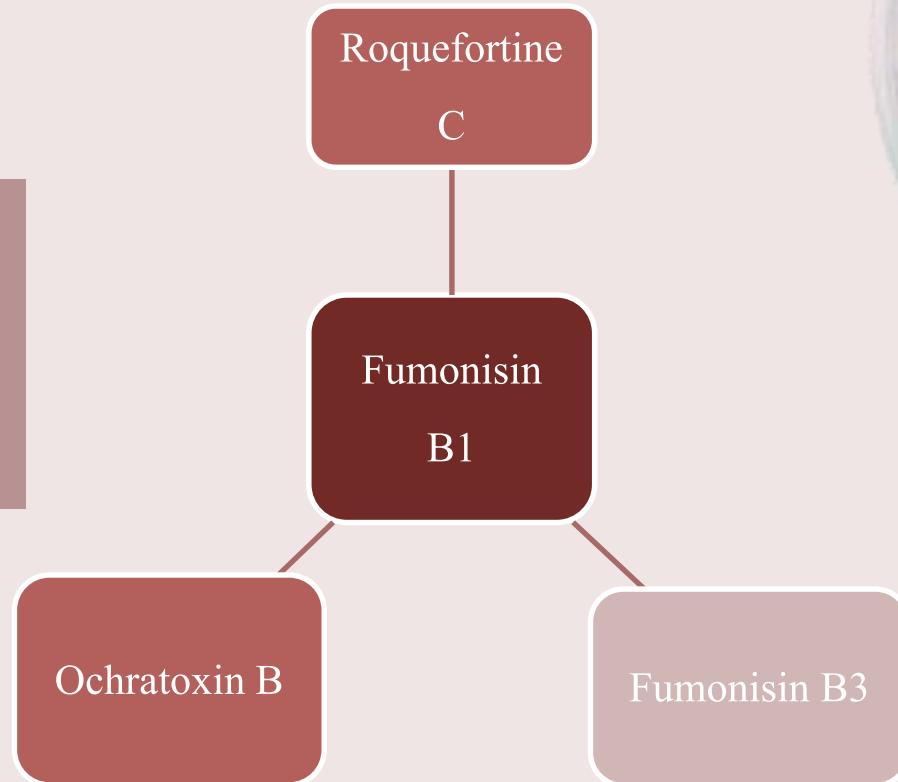

Figure 15 - Mean Ranks (results of Kruskal-Wallis test) to compare biological responses of both cytokines between PHCUs

# Main Results

Strong and direct correlations showed by Spearman Correlation Tests for PHCUs

*Trichothecene mycotoxins and aflatoxins can be efficiently inactivated with common cleaning products, such as sodium hypochlorite<sup>19, 20</sup>*

19. Wilson, SC; J Occup Environ Hyg. 2004;

20. Yang, CY; Appl Microbiol. 1972;

# Main Results

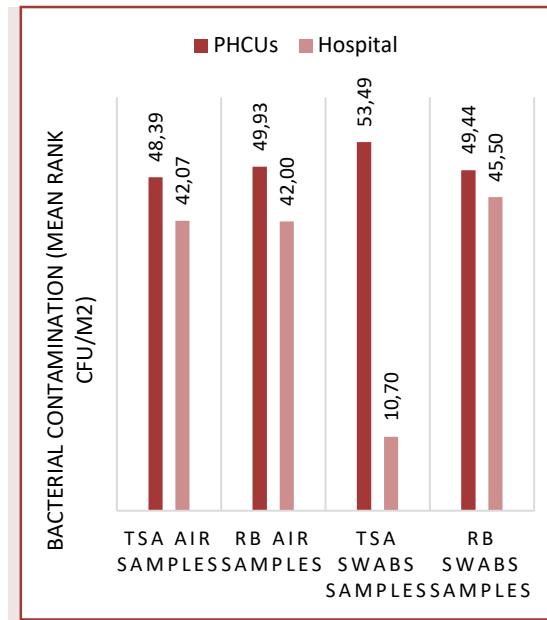

Figure 16 - Mean Ranks (results of Kruskal-Wallis test) to compare bacterial counts between all PHCUs and the Hospital

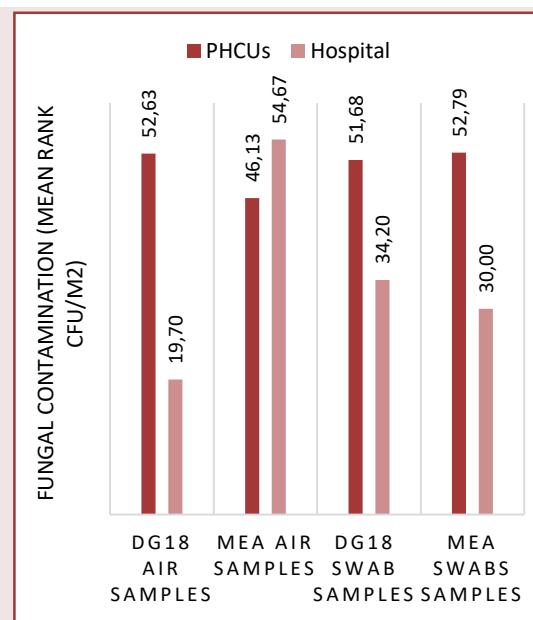

Figure 17 - Mean Ranks (results of Kruskal-Wallis test) to compare fungal counts between all PHCUs and the Hospital

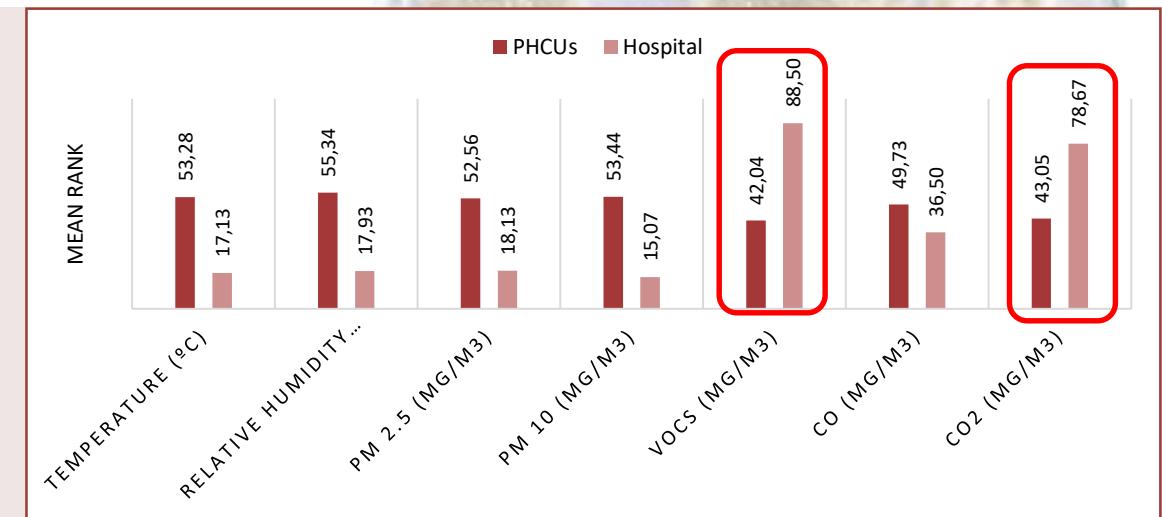

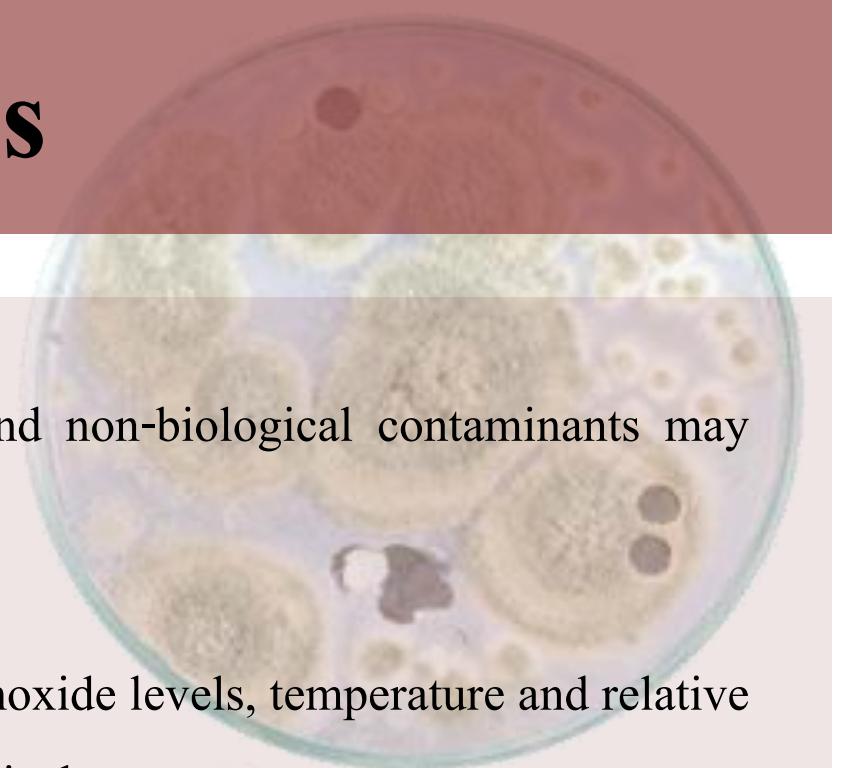

Figure 18 - Mean Ranks (results of Kruskal-Wallis test) to compare non-biological parameters between all PHCUs and the Hospital

Lower contamination of fungi and bacteria + higher carbon dioxide and VOCs

# Main Findings

- ☒ Indoor air quality parameters associated with microbiological and non-biological contaminants may influence the biological response in Calu-3 and TPH-1 cells;
- ☒ Fungal and bacterial (namely gram (-) specimens) load, carbon monoxide levels, temperature and relative humidity proved to be statistically significant influencers of the biological response;
- ☒ Correlations between the presence of different mycotoxins in air samples may suggest improper practices and/or inefficient cleaning and disinfecting methods.
