Received 14 April 2006; revised 31 May 2006; accepted 2 June 2006

**Abstract**—Despite the inherent instability of C2-substituted *cis*-cyclobutane  $\beta$ -aminoacids, incorporation of such residues into peptides is shown to be possible through use of a 1-amino-2-(hydroxymethyl)cyclobutane derivative as a stable  $\beta$ -aminoacid surrogate. This synthetic strategy was validated by the synthesis of a rhodopeptin analogue.

The incorporation of conformationally restricted  $\beta$ -aminoacids into linear or cyclic peptides can dramatically influence their secondary and tertiary structures, and therefore their biological activities.<sup>1</sup> Alicyclic  $\beta$ -aminoacids are particularly attractive building-blocks for imposing constraints upon peptides.<sup>2</sup> In contrast with intensive work on cyclohexane, cyclopentane and cyclopropane  $\beta$ -aminoacids,<sup>2,3</sup> structural studies on peptides containing cyclobutane  $\beta$ -aminoacids are in their infancy.<sup>4</sup> Ortúñoz's work on the incorporation of the parent compound *cis*-2-aminocyclobutane-1-carboxylic acid into small oligomers produced encouraging preliminary results and indicated a strong tendency to impose well-defined secondary structure.<sup>4</sup> This parent molecule can be prepared in racemic<sup>5,4d</sup> or enantiomerically pure<sup>6,4d</sup> form, but the synthesis of ring-substituted cyclobutane  $\beta$ -aminoacids remains rare.<sup>7</sup>

We recently described the synthesis of a series of C1- or C2-substituted *cis*-2-aminocyclobutane-1-carboxylic acids **4** based on the photochemical [2+2] cycloaddition of substituted uracils **1** with ethylene, to give **2**, followed by two-step heterocycle transformation via a ureidoacid intermediate **3** (Scheme 1).<sup>8</sup> This work revealed the inherent instability of *cis*-cyclobutane  $\beta$ -aminoacids substituted at C2 with electron-donating substituents, even weak ones such as alkyl or aryl. Rapid ring opening

occurs by a retro-Mannich reaction leading to the corresponding acyclic  $\delta$ -ketoacids **5**.<sup>9</sup> In this letter, we provide a solution to this component instability problem in the preparation of peptides containing *cis*-cyclobutane  $\beta$ -aminoacids, and illustrate its application to the synthesis of a constrained analogue of a rhodopeptin.

Since C2-substituted *cis*-cyclobutane  $\beta$ -aminoacids cannot be used as such in peptide synthesis, it was considered appropriate to use a stable surrogate. A primary alcohol as a masked carboxylic acid function seems to be the most convenient. 1-Amino-2-(hydroxymethyl)-cyclobutane derivatives have been described with no

indication of instability.<sup>10</sup> First, we verified using a model compound that rapid access to the corresponding aminoalcohol from a cyclobutane dihydouracil derivative was feasible. Compound 6 was obtained by a [2+2] photocyclization reaction between 6-methyluracil and ethylene, as previously described.<sup>8</sup> Reduction using an excess of sodium borohydride in water at room temperature,<sup>11</sup> followed by acidification with an acidic ion exchange resin, gave ureidoalcohol 7 in 72% yield (Scheme 2). Unexpectedly, the diazotization reaction under standard conditions (1 equiv  $\text{NaNO}_2$  in 3.5 M  $\text{HCl}$  solution)<sup>8</sup> gave aminoalcohol 9 in poor yield (15%) together with cyclic carbamate 8. The best compromise to obtain the cyclobutane aminoalcohol was to generate selectively the cyclic intermediate 8 via a diazotization reaction carried out in tetrahydrofuran as co-solvent (76% isolated yield). The cyclic carbamate was hydrolyzed in basic conditions to provide aminoalcohol 9 in good yield (67%).<sup>12</sup> In contrast to its  $\beta$ -aminoacid homologue, 9 is perfectly stable.

Rhodopeptins are cyclic lipopeptides recently isolated from the bacterial species *Rhodococcus* sp. MER-N1033.<sup>13</sup> They are composed of three regular  $\alpha$ -amino acids and one  $\beta$ -amino acid with a long lipophilic side chain borne on the  $\beta$ -carbon (Fig. 1). These cyclic peptides show antifungal activities against *Candida albicans* and *Cryptococcus neoformans*. Because of the unique structure and biological activity, several analogues and peptidomimetics were synthesized for structure–activity relationship (SAR) studies.<sup>14</sup> Ohta et al. have shown that a lipophilic side chain ranging from 9 to 11 carbons, a bulky lipophilic group (Val) and a basic site (Lys or Orn) are crucial for antifungal activity. The spatial arrangement of these three side chains depends on the conformation of the cyclopeptide. The replacement of the natural  $\beta$ -aminoacid by a cyclobutane  $\beta$ -aminoacid bearing a straight carbon chain is expected to confer conformational rigidity upon the macrocycle, and possibly facilitate the macrocyclization step of its synthesis. We decided to test the hypothesis of using an aminoalcohol derivative as a stable synthetic equivalent of a C2-substituted *cis*-cyclobutane  $\beta$ -aminoacid by conducting the multi-step synthesis of the rhodopeptin analogue 10 (Fig. 1).

Rhodopeptin C1:  $\text{R} = (\text{CH}_2)_6\text{CH}(\text{CH}_3)\text{CH}_2\text{CH}_3$ ;  $n = 3$   
Rhodopeptin B5:  $\text{R} = (\text{CH}_2)_8\text{CH}(\text{CH}_3)_2$ ;  $n = 4$

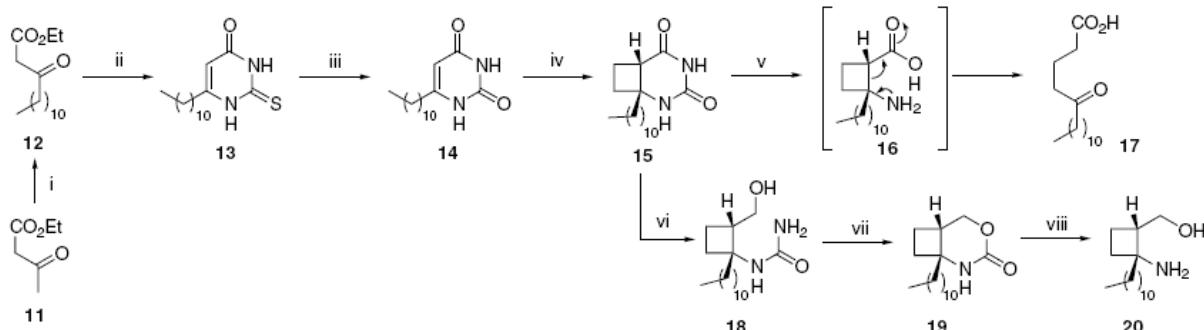

10  $\text{R} = \text{C}_{11}\text{H}_{23}$

**Figure 1.** Structures of rhodopeptins and the cyclobutane analogue 10.

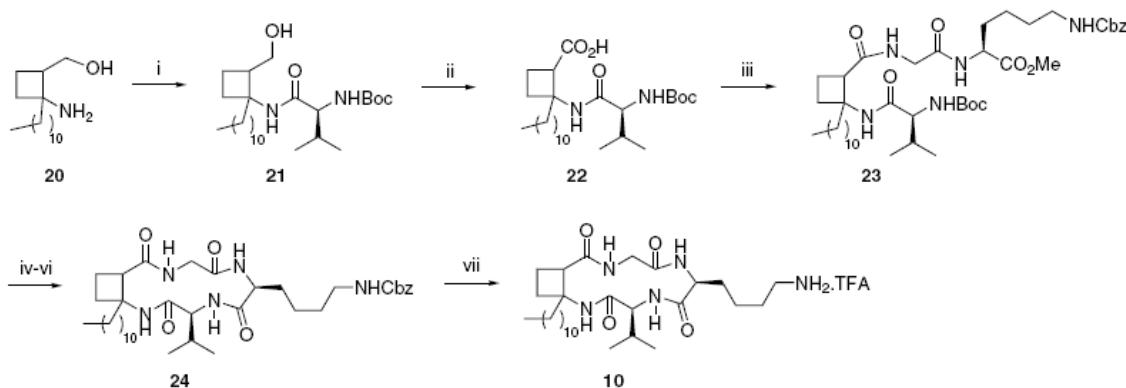

The appropriate  $\beta$ -aminoalcohol bearing a linear carbon chain ( $\text{C}_{11}\text{H}_{23}$ ) 20 was prepared from 6-undecyluracil 14 (Scheme 3). This latter compound was synthesized in three steps from ethyl acetoacetate 11, inspired by the literature procedures.<sup>15</sup> The [2+2] photocycloaddition protocol provided the *cis*-cyclobutane adduct 15 from 6-undecyluracil 14 and ethylene in a satisfying 86% yield.<sup>16</sup> Fears for the stability of 16 were confirmed: a retro-Mannich reaction occurs as previously mentioned. The treatment of heterocycle 15 with 0.5 M aqueous sodium hydroxide solution at reflux gave  $\delta$ -ketoacid 17 directly and in quantitative yield.<sup>17</sup> As an aside, it is interesting to note that this whole sequence constitutes a double homologation of  $\beta$ -ketoester 12 to give  $\delta$ -ketoacid 17.

The inherent instability of aminoacid 16 was clearly demonstrated, so its surrogate, aminoalcohol 20, was prepared in three steps. Bicyclic intermediate 15 was reduced using an excess of  $\text{NaBH}_4$  in a THF/water mixture (due to the poor solubility of compound 15 in water alone) to give ureidoalcohol 18 in excellent yield (98%). The diazotization reaction of urea 18 was carried out in aqueous  $\text{HCl}/\text{THF}$  solution to provide cyclic carbamate 19 with a yield of 77%. Finally, aminoalcohol 20 was obtained by treatment of compound 19 with base (93% yield).<sup>18</sup>

Racemic compound 20 was coupled with Boc-L-valine using EDC/HOBt to provide compound 21 in 61% yield, without recourse to primary alcohol protection (Scheme 4). This compound was obtained as a mixture of diastereoisomers, which unfortunately could not be separated by chromatography. With the lone pair on the nitrogen effectively deactivated due to its participation in the peptide bond, subsequent oxidation of the primary alcohol of 21 should give a relatively stable dipeptide derivative of 16. We selected  $\text{NaIO}_4/\text{cat. RuCl}_3$  as the oxidation system, since it had already been shown to facilitate the formation of peptides containing 2,3-methanoaspartic acid.<sup>19</sup> In the event, dipeptide acid 22 was obtained smoothly; no retro-Mannich type ring-opening reactivity of this product was observed. Coupling of 22 with a Gly-Lys derivative using EDC/HOBt provided tetrapeptide 23 (31% yield in 2 steps from compound 21), again as a diastereoisomeric mixture. Methyl ester

hydrolysis and Boc-group removal gave an intermediate tetrapeptide, which was macrocyclized using DPPA to the cyclic tetrapeptide **24** with a yield of 69% for three steps.<sup>20</sup> This is the first macrocyclization between the Val and Lys residues of a rhodopeptin analogue, and the hairpin-like turn imposed by the *cis*-cyclobutane  $\beta$ -aminoacid component<sup>4c</sup> probably facilitates the reaction. Quantitative removal of the Cbz group by hydrogenolysis in the presence of palladium on carbon in trifluoroacetic acid/dichloromethane media furnished the target rhodopeptin analogue **10** as its TFA salt.<sup>21</sup>

In conclusion, this initial study shows that an inherently unstable C2-substituted *cis*-cyclobutane  $\beta$ -aminoacid can be incorporated into a stable peptide, through use of its stable aminoalcohol surrogate. On this premise, we are currently developing access to enantiomerically pure rhodopeptin analogues for conformational studies and determination of biological activity.

Column Acclaim™ 120 C18 3  $\mu\text{m}$  (2.1  $\times$  100 mm); mobile phase  $\text{CH}_3\text{CN}-\text{H}_2\text{O}$  70/30 +  $\text{HCO}_2\text{H}$  1%; temperature 30 °C; flow rate 0.25 mL/min; UV detection at 210 nm.  $t_R$ : 11.04 and 11.65 min.
  21. Compound 10: White solid, mp 117–119 °C.  $^{13}\text{C}$  NMR (100 MHz,  $\text{CD}_3\text{OD}$ )  $\delta$  14.4 ( $\text{CH}_3$ ), 17.4 ( $\text{CH}_3$  Val), 18.0 ( $\text{CH}_2$ ), 19.1 ( $\text{CH}_3$  Val), 19.5 ( $\text{CH}_2$ ), 20.0, 20.3, 23.7, 24.0, 24.1, 24.6, 24.7, 27.9, 30.5, 30.7, 30.9, 31.2, 31.6 ( $\text{CH}$  Val), 31.9, 32.2, 33.1, 39.0, 40.4 ( $\text{CH}_2$  Lys), 40.6, 44.2 ( $\text{CH}_2$  Gly), 45.3 ( $\text{CH}_2$  Gly), 50.0 (CH), 50.3 (CH), 57.7 (CH Lys), 57.9 (CH Lys), 59.1 (CH Val), 60.3 (C), 61.4 (CH Val), 62.5 (C), 171.6, 172.3, 172.6, 173.7, 174.4, 174.6, 175.5, 176.0. HRMS (ES $^+$ ):  $m/z$  calcd for  $\text{C}_{29}\text{H}_{54}\text{N}_5\text{O}_4 [\text{MH}]^+$ : 536.4176; found: 536.4180. Analytical HPLC: Column Acclaim™ 120 C18 3  $\mu\text{m}$  (2.1  $\times$  100 mm); mobile phase  $\text{CH}_3\text{CN}-\text{H}_2\text{O}$  45/55 +  $\text{HCO}_2\text{H}$  0.5%; temperature 30 °C; flow rate 0.25 mL/min; UV detection at 210 nm. Single peak observed,  $t_R$ : 12.81 min.
