**Frequency Distribution  
of Soil Tests in Indiana  
by County and by Soil Group  
for 1962**

Soil samples are numbered as received in the Purdue Soil Testing Laboratory.

Samples are tested for potassium, using a flame photometer.

The pH (acidity) of soil is measured with glass electrode pH meter.

FREQUENCY DISTRIBUTION OF SOIL TESTS IN INDIANA  
BY COUNTY AND BY SOIL GROUP FOR 1962

Eldon L. Hood and Russell K. Stivers

INTRODUCTION

This bulletin is a report of the summary of the soil test information on samples received by the soil testing laboratory during 1962.

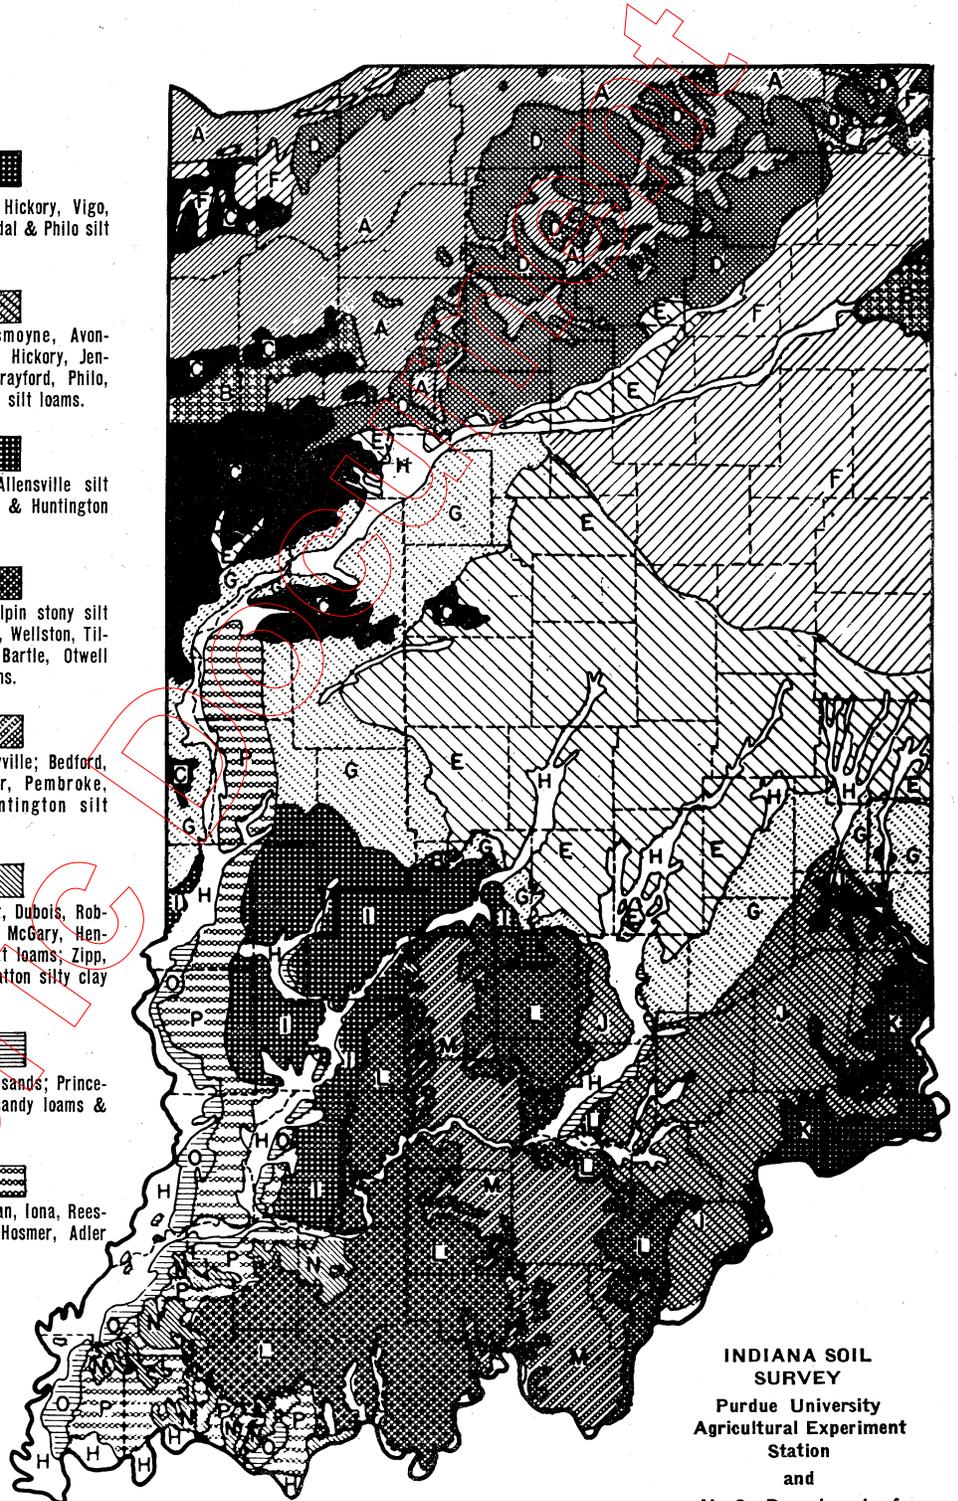

Soil samples sent to the Purdue University Soil Testing Laboratory are analyzed chemically for pH, lime requirement, available phosphate and available potash. The nitrogen recommendations are based on general soil type, soil color, recent cropping history and the crop to be grown. Fertilizer recommendations for phosphate and potash are made largely from laboratory tests. The location of the sample, the general characteristics of the soil, previous fertilization and liming practices, recent cropping history, and the crop to be fertilized were taken from the field and cropping information sheet.

During 1962, 39,425 soil samples were analyzed. The data from these samples were summarized on a state-wide basis, by county, as well as by soil group.

The soil group classifications used here need clarification since the samples were placed in the various soil groups according to the information given on the soil test information sheet. Thirty-seven soil groups were used. Each soil sample was placed into one of 16 separate soil regions in the state according to the geographic location of the sample (Map 1). The samples within each soil region were subdivided into soil groups on the basis of soil color, soil texture, drainage, and land form. The soil group number, the combinations of properties used to obtain them and the soil types within each group are shown in Table 1.

**Principal Soil Types of the Regions**

Figure 1. Soil regions of Indiana.

TABLE 1 - THE PROPERTIES OF THE SOIL GROUPS USED.

Soil Group Number	Properties of Soil Groups	Soil Types Included in Soil Group
1	All Bottom Lands	Eel, Genesee, Huntington, Lindsay, Sharkey, and Shoals
2	Mucks in region A	Carlisle, Edwards, Houghton, and Linwood
3	Level, poorly-drained soils of region A	Gilford, Granby, Maumee, Morocco, Newton, Runnymede, and Willvale
4	Level, well-drained soils of region A	Door, Fox, Kalamazoo, Nekoosa Oshtemo, Plainfield, Tracy, Tyner, and Warsaw
5	Region B soils in Allen County	Blount, Hoytville, Lenawee Merrill, Nappanee, and Toledo
6	Western region B soils	Ade, Darroch, Foresman, Jasper, Maumee, and Rennselaer loams and sandy loams; Onarga and Ridgeville sandy loam; Procter and Brenton; Strole silt loam
7	Sloping soils of region C	Corwin, Dana, Flanagan, Mellott, Octagon, Parr, and Sidell
8	Level soils of region C	Chalmers, Elliott, Odell, Otterbein, Raub, Romney, and Toronto
9	Mucks in region D	Carlisle, Houghton, and Linwood
10	Sandy soils in region D	Allendale, Coloma, Fox, Hillsdale, Oshtemo, Metea, Miami sandy loams and loamy sands
11	Loam and heavier soils in region D	Bremen, Brookston, Crosby, Galena, Kokomo, Miami, and Otis
12	Level light-colored soils of region E	Bethel and Crosby silt loams
13	Sloping light-colored soils of region E	Celina, Fox, Hennepin, and Miami silt loams
14	Dark-colored soils of region E	Brookston and Kokomo silty clay loams
15	Level light-colored soils of region F	Blount and Nappanee

TABLE 1 - THE PROPERTIES OF THE SOIL GROUPS USED (CONT'D)

<u>Soil Group Number</u>	<u>Properties of Soil Groups</u>	<u>Soil Types Included in Soil Group</u>
16	Sloping light-colored soils of region F	Morley and St. Clair
17	Dark-colored soils of region F	Pewamo
18	Level light-colored soils of region G	Delmar, Fincastle, Reesville silt loams
19	Sloping light-colored soils of region G	Birkbeck, Fox, Hennepin, Manlove, and Russell silt loams
20	Dark-colored soils of region G	Brookston, Cope, Kokomo, and Ragsdale
21	Sandy-textured terrace soils of region H	Elkinsville, Fox, Martinsville, and Warsaw
22	Loam and heavier-textured terrace soils of region H	Abington, Bartle, Elkinsville, Elston, Fox, Homer, Lyles, Montgomery, Ockley, Sleeth, McGary, Westland, and Wheeling
23	Level Soils of region I	Ava, Cory, Iva, and Vigo
24	Sloping soils of region I	Cincinnati, Hickory, and Parke
25	Level soils of region J	Avonberg, Cana, Clermont, Rossmoyne, and Whitcomb
26	Sloping soils of region J	Cincinnati, Hickory, Grayford, Colyer, and Jennings
27	Level soils of region K	Lawrence
28	Sloping soils of region K	Fairmount, Switzerland, and Allensville
29	Level soils of region L	Bartle, Johnsburg, Pekin, Peoga, Haubstadt, Dubois, and Tilsit
30	Sloping soils of region L	Elkinsville, Gilpin, Muskingum, Montevallo, Wellston, and Zanesville
31	Level soils of region M	Bedford, Guthrie, and Lawrence
32	Sloping soils of region M	Bewleyville, Crider, Corydon, Frederick, and Pembroke
33	Level soils of region N	Dubois, Haubstadt, Henshaw, McGary, Montgomery, Patton, Robinson, and Zipp

TABLE 1 - THE PROPERTIES OF THE SOIL GROUPS USED (CONT'D)

<u>Soil Group Number</u>	<u>Properties of Soil Groups</u>	<u>Soil Types Included in Soil Group</u>
34	Sloping Soils of region N	Markland, Parke, Negley, and Otwell
35	Soils of region O	Ayrshire, Bloomfield, and Princeton
36	Level soils of region P	Iva, Muren, Ragsdale, Reesville, and Stoy
37	Sloping soils of region P	Alford, Hosmer, and Iona

Historic Document

The soil test values for phosphate and potash were divided into five categories. The categories and their meaning are shown in Table 2.

TABLE 2 - SOIL TEST VALUE CATEGORIES FOR PHOSPHATE AND POTASH

Category	Soil Test Value Range for		Meaning in terms of fertilization
	Phosphate ( $P_2O_5$ )	Potash ( $K_2O$ )	
Very Low	0-40	0-100	Needs heavy rates
Low	41-100	101-180	Needs moderately heavy rates
Medium	101-180	181-250	Needs maintenance plus
High	181-300	251-375	Needs maintenance only
Very High	301 +	376 +	Less than maintenance until test drops

The frequency distributions of pH, phosphate tests, potash tests, and nitrogen recommendations were calculated by county, by soil group, and for the state.

The pH distribution by county is shown in Table 3 (pages 9-11). In addition, the average limestone application for each county is given in the right hand column. This was calculated by multiplying the percentage of samples in each pH category by its lime requirement and then summing these to get the average.

The percent distribution for phosphate and potash is given by county in Table 4 (pages 12-34) in a 5 by 5 arrangement giving the frequency distribution of all combinations of the phosphate and potash tests. At the bottom of each table the totals for potash in each category are given. The totals for phosphate are given in the right hand column. The overall phosphate and potash distribution for the state is shown in Table 5, page 35. The nitrogen recommendations for corn, wheat, and oats by county are given in Table 6, pages 36-37. These recommendations are based on the sample information and soil type. The average recommendation serves to show the relative need for nitrogen in one area of the state as compared with another. The actual amount to use can be more accurately determined from a knowledge of recent cropping and soil type.

The pH distribution by soil region is shown in Table 7, page 38, and by soil group in Table 8, pages 39-40. The phosphate and potash test frequency distribution are given by soil group in Table 9, pages 41-50.

The average nitrogen recommendations for corn, wheat, and oats for each soil group are shown in Table 10, page 51. These recommendations are based on the samples taken for each crop respectively.

The phosphate and potash recommendations for corn are given by county in Table 11, pages 52-53, and by soil group in Table 12, page 54. These recommendations are the weighted average calculated from all samples received. They indicate the relative need for phosphate and potash by county and by soil group.

The frequency distributions shown in this publication can serve as a guide for fertilizer use in the various parts of the state. They are a guide for fertilizer recommendations where there is no soil test information; however, in order to fertilize efficiently on any particular farm, soil testing is necessary to determine the actual status of that particular soil.

\* Information consisted of soil type, soil color, and texture as determined in laboratory, and recent crop history as shown on farmer information blanks. This information, rather than the average should be used to determine nitrogen recommendations. (Recommendations in 1962 were made for an average of 100 bushels of corn, 40 bushels of wheat, and 60 bushels of oats per acre.)

\* Information consisted of soil type, soil color, and texture as determined in laboratory and recent crop history as shown on farmer information blanks. This information, rather than the average should be used to determine nitrogen recommendations. (Recommendations in 1962 were made for an average of 100 bushels of corn, 40 bushels of wheat, and 60 bushels of oats per acre.)

TABLE 7 - PERCENTAGE DISTRIBUTION OF pH (ACIDITY) SOIL TESTS BY REGION WITH ESTIMATED AVERAGE LIME REQUIREMENT. 1962

\* This is a weighted average, obtained by multiplying each percentage figure by the estimated tonage of lime needed to raise the pH to 6.5.

1/ Includes only the portion of region B in Allen County.

2/ Includes portions of region B which lie in Newton, Jasper, Pulaski, Morgan, and Hendricks Counties.
