Submitted on 9 Aug 2014

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Context

Smart Home characteristics

- Heterogeneity: different *elements* e.g., devices, services and technologies.
 - Variability: different characteristics e.g., the amount of offered resources for a given element.
- ⇒ Volatility: changing set of applications deployed on a changing set of elements Where to deploy new applications? In the Smart Home? On the Cloud? Or distributed on both?
- ⇒ How to deploy them? Only in one place? By distributing the applications between the Cloud and the Smart Home?

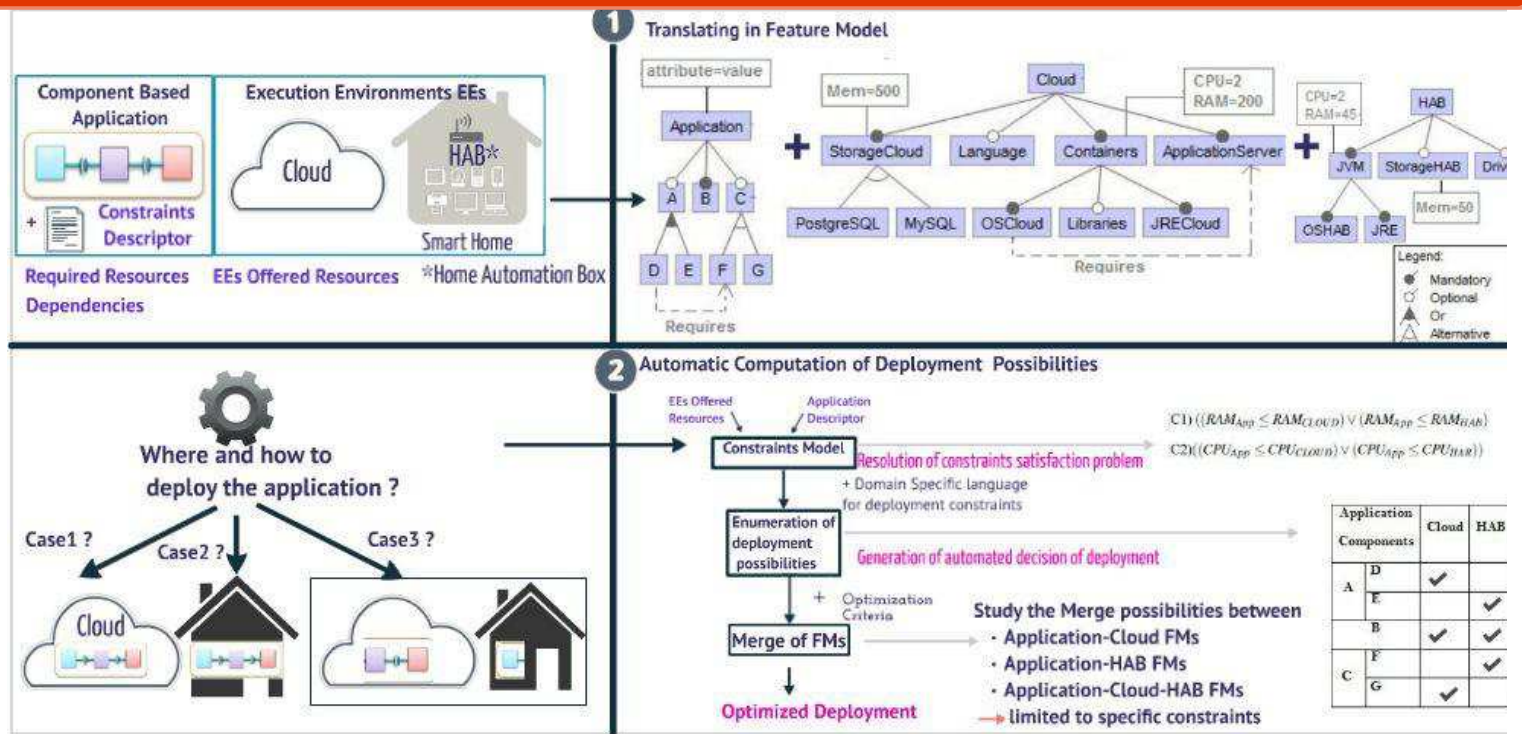

Motivations

1. Balance the computational load between the Smart Home and the Cloud.
2. Reduce the acquisition cost for users by limiting the embedded systems resources.
3. Reduce the scalability cost when application set grows.

Challenges

1. Optimization of the deployment of a new component-based application onto a distributed environment (Smart Home + Cloud) despite the heterogeneity and the variability.
2. Run Time self-adaptation of the application deployment to volatility.

Approach

Ongoing Work

- Choosing FM [1] formalism to manage variability and heterogeneity.
- Extending FM by addressing Localization Constraints e.g., Colocation, Dislocation of software components.
- Proposing a DSL to express the deployment constraints.

Future Work

1. React to the volatility by run time self-adaption of the application deployment using code offloading and migration between the Smart Home and the Cloud
2. Build a self-* architecture supporting the self-configuration, self-optimization and self-adaptation of the application deployment[2].
