COMMUNICATION OF THE COMMISSION TO THE COUNCIL  
COMMUNITY POLICY FOR DATA-PROCESSING

First Elements for a Medium-Term programme  
Second Group of Priority Proposals

Following the Resolution of the Council on Data-Processing, of July 1974, the Commission has proposed a first series of five priority actions in the field of applications in March 1975. This communication provides a first outline of a broader strategic approach, which could be adopted in a pluriannual programme to start in January 1977, and which offers an immediate framework for a second series of priority actions which the Commission considers urgent and which should start in 1976. These actions are attached to this Communication.

A number of factors argue for this more systematic overall approach:

1) The Commission's initial proposals, though useful, were modest and will therefore have little impact on the central objectives of the Resolution of July 1974 : to encourage the European based industry and create an environment which significantly helps users to apply data-processing more cheaply and more effectively.

2) The cost of the Community's developing data-processing policy in future years remains uncertain; so there is no clear view for Member States, or the European Parliament, of what the programme will cost. Nor is it possible for Member States, by comparing one objective with another,

to identify priorities. It is also extremely difficult for the Commission to make effective and fruitful use of its limited manpower if there is no clear picture of the scale of activity that will be acceptable and indeed supported by Member States. Objectives need to be set, together with a global budget, on a rolling basis, over a period of years.

3) The European Parliament, in its opinion on the first five priority actions, has strongly emphasised the need for a wider overall strategy.

4) The difficulties within the Unidata group, and the doubts they have raised about the viability of the European-based industry, require a restatement of Community strategy.

#### The Computer Scene

Such a strategy must reflect the realities of the data-processing scene.

The pressures of scale and the competitive difficulties which have, over the years, eliminated such major enterprises as RCA, General Electric and now Xerox, from the data-processing business, continue to apply. Yet the Community's interest is that there should be a variety of competitive suppliers.

As the Table below shows, sales of systems, including medium to large data-processors are still responsible for over 50 per cent of sales of data-processing equipment. It must remain a central objective of Community policy to promote and encourage the formation of at least one major European-based grouping capable of sustaining a viable economic existence and of achieving balanced partnership with partners in the United States and Japan.

Estimated Sector Development of the Community Data Processing Market from  
1974 to 1979

\*\* ) Sales by the independent software industry

Source : Study by SOBEMAP : Study of the Requirements for Financing the  
European Data Processing Industry.

The challenge of IBM however, remains daunting and is taking a new form as it makes rapid progress towards providing customers with a total information system, including telecommunications facilities, and an immense variety of possible online applications systems. Apart from its management skills it is doing this by means of : its Systems Network Architecture; its PBX3750 telecommunications switching system for private users; the development of its minicomputer business (system 32) and the provision of a very wide range of terminals to suit different applications; and components with a greater power than any other manufacturer in the world can offer.

Community policy must also take account of the rapid transformation of the data-processing scene, in what can be called the era of distributed computing. This has the following characteristics :

a) The explosive development of component technology is making it possible to place on the market an ever-growing range of intelligent devices remote from the central processor and close to the user and his needs. The man in the street has encountered one example of the application of this component technology in the pocket calculator.

b) A continuing more rapid growth in the market for minicomputers, terminals, peripherals and communications equipment than in the market for central processors (See Table I above)

c) An increasingly close relationship between telecommunications and computing. On the one hand, an ever-growing range of computers and terminal devices are being linked through networks; on the other, telecommunications switching exchanges are becoming computers.

This new era opens up two contradictory trends relevant to Community policy :

On the one hand, the immense variety of types of equipment and software now required in systems, could open up opportunities for an ever-growing diversification and decentralisation of data-processing, provided public authorities can create a framework of standards, procurement and aid which prevent monopolisation and assist this process of diversification. Both in the interests of European users and of a healthy and competitive industry, it must be the aim of Community policy to promote such an open market and industry : an industry in which clearly defined and implemented standards permit the assembly of distributed systems from a variety of suppliers and in which the European part of the industry is able to develop its strength in a variety of sectors of the market.

A second and much less attractive possibility is however also opened up. The development by a single dominant company of a comprehensive software and systems network architecture, within which it offers a complete range of equipment to meet a large part of these needs, could lock customers in for many years to come, severely limiting their freedom of choice, if no public framework of standards, and no public policies to provide alternative suppliers with a favourable environment are developed.

In the Commission's view, the basic industrial premises of the Resolution of July 1974 remain unchallenged :

That it is not acceptable to users or the public interest for a single company to dominate and control not only the classic world of central processors but the new world of distributed computing.

That some part, at least, of this key industry must be under European control.

The European market for data-processing equipment (with some 5 billion uc. today) is still only half the size of that in the United States. But it is growing faster. Even given a slower rate of economic growth than in the past ten years, it could still double in value by 1980.

Given this growth, it is perfectly possible for a variety of European companies to thrive and become economically viable within the next ten years, provided they can operate in a favourable European environment and are promoted in the necessary ways. The strategic aim of Community policy must be to maintain a pluralistic data-processing society, in which, in the era of distributed computing, users have wide freedom of choice in the purchase of software or equipment, and a variety of competitive producers thrive.

The Document which follows elaborates some features of the overall policy needed for this sector. It is followed by a limited number of specific proposals which, in the view of the Commission, need to be decided in 1975, to make possible implementation in 1976.

In the light of these comments, and of discussions within Community institutions, the Commission proposes to present to the Council, by April 1976, an overall programme for the development of the data-processing industry in the Community and for the promotion of data-processing applications. This programme, to be based on the report on the data-processing industry which the Commission is at present elaborating, would cover the years 1977 to 1980 and would correspond to the medium-term programme envisaged in the Resolution of the Council of July 1974. The programme will provide both an overall framework for the policies of Member States and a limited number of priority actions requiring Community funding or activity.

A. THE ENVIRONMENT OF DATA-PROCESSING AND THE USER

A series of related policies is designed to maintain an open and competitive environment, in which the user is free to buy competitive equipment from a variety of suppliers, conversion costs are reduced, and standardisation in key areas opens up the market to a variety of suppliers and facilities.

1) Standards Policy

The development, maintenance and widespread acceptance of common data-processing standards helps users, by enabling them to combine equipment and software from different suppliers and permitting them to move on to new equipments without high conversion costs. It provides a framework favourable to the existence of a wide range of competitive industrial suppliers, who can offer equipment or software that can be attached to other equipment, without high adaptation costs. It is important that standards are recommended and applied by impartial public bodies, able to represent a wide spectrum of industrial and user interests, and are not imposed by an individual dominant concern, whose standards inevitably change without regard to such wider interests (of users and industry).

For these reasons, the Commission established, in February 1975, a Working Group on Standards (NGS), composed of national experts. Its tasks are to make recommendations, on desirable Community standards in the data-processing field, to assist the Commission in formulating policies for their implementation, and to recommend Community positions in world standardisation organisations. The aim of the Commission and the Group is to seek to define a Community strategy which will make maximum use of existing standards and standardisation organisations. On occasion, however, it will be necessary to promote the development of new standards.

The Working Group on Standards has already established two areas of priority activity and set up appropriate working parties :

a) COBOL is the most widely used high level language in Data-Processing. A working party is being created to try to define recommended standard European subsets of COBOL and formulate Community views in relation to international discussions on standards.

b) Network standards. These are critical to the entire development of distributed Data-Processing.

Partly in response to Community initiatives, the CEPT<sup>\*</sup> decided, at its conference in April 1975, to set up a series of working parties to work on harmonisation of future telecommunications services and standards. One of these is concerned with data-communications. The network standards working party set up by WGS will seek to elaborate and put to the CEPT preferred Community solutions with regard to those telecommunications standards which affect data-processing. It will then work to define recommendations on a wider range of data-communication standards.

c) In a third field, that of real time data-processing systems, which should be responsible for about one third of the data-processing market by 1980, the Commission is proposing that the Community should support the development of a new standard language (See Annex I).

This is an area in which there exist a substantial number of separate national languages which will become obsolete within the next five years. A European initiative now, making use of work already undertaken outside the Commission, could create a new European-based international

---

\* Conférence Européenne des Postes et Telecommunications

standard language, to be in use from 1980 onwards, bringing significant advantages to both Community users and industry.

The implementation of recommended standards requires a sustained effort by public authorities, both through public procurement policies and through the provision to private and public users of guidelines, up-to-date documentation, and advice.

During the next six months, the Commission will explore further, with national authorities, what method might most appropriately be adopted to ensure the application of recommended Community standards in public procurement policy.

With regard to implementation and support to users, it would seem sensible to make use of a network of institutions in the Member States as a permanent infrastructure. Certain such institutions already have a similar role with regard to national or international standards. In other cases, the function will need to be developed.

Overall proposals for such a structure will be made in the medium-term programme to be put forward in 1976.

## 2) Portability

Closely related to standardisation activities are proposals concerning the promotion of portable software (Annex 2 ).

In its Communication of March 1975, the Commission stressed the economic importance of reducing the high cost to users of data-processing equipment of converting software programmes, when they change from one kind of equipment to another. This aim will be served if good portable software is available, at relatively low cost, which can be used on different types of machine, and if conversion facilities and tools are readily available at low cost.

The existence and widespread use of portable software also promotes and facilitates competition between different industrial suppliers, enabling non-dominant producers of hardware to penetrate markets more easily. One of the major advantages which scale confers on the dominant manufacturer is its ability to develop and market a very wide range of applications. European-based manufacturers, taken separately, are not in a position to market so wide a range. If applications software were written in portable form, it would be easier to combine equipment from one manufacturer with applications developed by other software and hardware companies.

The existence of standard interfaces and languages is clearly an indirect help to the provision of portable software and the reduction of conversion costs. In addition, however, the Commission proposes that Community funding be made available to support and encourage the development of a limited number of types of portable software.

3) Collaboration between national centres for research and support to users

The need to develop an infrastructure in the form of a network of institutions for the support of Community standards has already been described. Such an infrastructure for Community policy is also needed in other fields, such as general technical support for users, and basic research. In certain Member States, the three tasks are in fact carried out by the same institution. The Commission has held discussions with a number of such institutions who are keen to establish a permanent pattern of collaboration. The proposal (Annex 3) for three collaborative studies by such institutions is the result.

The first study is in the field of the protection of citizen rights. This study is designed to support the hearings organised by the European Parliament and the preparation by the Commission of work on harmonisation in this field.

Studies are also proposed in the fields of programming techniques and the evaluation of characteristics of Data Base Management systems. This study, which would be carried out in the closest collaboration with users, would be designed to evaluate a number of existing DBMS systems and identify desirable characteristics including questions of portability, standards etc. The study would thus provide a research backup to the work done in the framework of 1) and 2) above.

Collaboration in these and other studies, initially proposed by three major Institutions (NCC, IRIA and EMD) will be enlarged as soon as possible to include Institutions in other Member States.

#### 4) Procurement Policy

The Resolution of the Council of July 1974 referred to the need to develop collaboration in the field of public procurement politics. A working group of national experts has been set up.

The Commission, intends to develop this work within the next six months. In addition to monitoring the progress of public procurement from European-based companies, important areas for collaboration include unbundling in procurement (hardware and software), evaluation techniques, and contractual procedures.

#### 5) Applications

The Commission has already proposed five applications projects. Studies and discussions have shown that a very wide range of further studies and developments could usefully be supported by the Community. The limitation of resources available suggests that Community support must be highly selective. To achieve this :

i) There is a need to fix an overall budget, so that priorities can be established within it.

ii) In addition to the basic requirement of interest to Community users the following criteria for selection are important in the Commission's view : Applications where study and development will generate a product of widespread interest to users and wide marketability by industry; applications whose implementation at Community level will have a significant impact on standards and wider developments, particularly in the field of networks; applications where there will be a manifest saving in public expenditure through common study or development.

Work in the field of applications has high importance, not merely because it is here that the skills of data-processing can be effectively applied to users' needs, but because it is mainly by developing new and useful applications that the European-based industry can expand its market share.

This is both the testing ground for the competition with IBM and other non-European manufacturers, and an area in which a special European contribution may be made to data-processing because solutions developed in the United States and elsewhere may not correspond to Europe's needs.

The Commission envisages proposing a new general financial mechanism which would be available as from 1977 to support joint applications studies and developments of Community interest. These resources would be available, not merely to finance studies and developments proposed by the Commission, but a part of the cost of proposals from users or industrial companies based in at least three member states of the Community.

In the meantime, and before this general scheme is introduced into operation, two new applications projects of an urgent character are proposed, to start in 1976 (Annex 4). One concerns the development of a new portable data retrieval software to succeed existing products. This is a major requirement of many public users (including such Community projects as Euronet, and legal information systems) as well as a tool of interest throughout data-processing. It is thus of major interest to both users and European industry.

The second concerns an experimental development in the field of highspeed data transmission under which CERN and the European Informatics Network (COST 11) will make use of the European Space Agency's Experimental Telecommunications-Satellite. This is a project which the Commission considers important in the wider context of network policy. It will be a pioneering activity bringing valuable lessons for both industry and users.

B. - SUPPORT FOR INDUSTRY

General Objectives

Any support provided by the Community to European-based industry must be judged in the light of three objectives :

- (i) To place the European-based industry on an equal competitive footing with its competitors, by matching the various financial advantages which they enjoy;
- (ii) To encourage and help the industry to pool resources in areas where economies of scale are necessary and thus to increase its productivity and bring nearer full economic viability;
- (iii) To promote strength and development in the key areas on which the entire future of the industry depends.

Hitherto, the bulk of aid provided by national Governments to the Data-Processing industry (see Table II) has been devoted to support the main manufacturers of central processors. This is an area in which the Commission continues to believe that industrial associations within Europe are essential, to achieve economies of scale. This is why it considers that national Governments should only accord further aids in this fields to promote promising associations between European producers.

There are, however, other major areas, described below, in which a Community supporting action is urgent, either because, as in the case of (1) below, (Support for Sales Finance), the general conditions of competition are loaded against the European-based industry and need to be redressed, or, as in the case of (2) Peripherals and (3) Components, they concern key growth areas already touched on in this Communication.

1. Equivalent Competitive Conditions for Supporting Sales

The most urgent need for a Community activity is in the field of leasing. Its established market position and gigantic internal rental income give IBM a permanent advantage in relation to other competitors who must constantly raise new external finance to fund growth. This disadvantage is aggravated by inflation and recession, which together reduce the amounts of credits which companies can raise in relation to their equity base. The problem is particularly acute for small and medium-sized companies, for leasing, initially concentrated largely on central processors, is increasingly necessary for minicomputers, peripherals and terminals of high value.

In an industry dependent on direct sales a growing, innovating company, starting from a small or nil market share can, after an initial short period, say of two years, finance further growth out of sales from income. Indeed the faster sales grow, the faster revenues and profits grow. In an industry such as data-processing, where leasing or rental prevails, the opposite is the case. The faster a company increases its sales, the more money it must raise from outside, and the worse its balance sheet.

In a market growing by some 13 percent per year, it would seem a reasonable objective for the European-based industry to aim to try to increase its market share to 41 % of the European market by 1979 and some 50 per cent by 1985. Such a growth would require some 5.000 MUC of finance in the next five years. \*

On the basis of these projections, and given present financing arrangements, it may be estimated that industry may obtain some 50 % of these funds from the private banking system. For the remainder, further financial mechanisms would appear necessary.

In the framework of the medium-term programme for data-processing, the Commission will propose a Community financial mechanism with the aim of providing the European-based part of the industry with conditions for financing sales to some extent comparable to those available to IBM.

---

\*) source : SOBEMAP : Study of the requirements for financing the European data processing industry.

## 2. Peripherals and terminals

Near-in Peripherals (discs, tapes and tapedrives, input-output devices, communications equipment and so on) form an increasingly important part of systems not only in relation to large central processors, but to smaller minicomputers and distributed systems. They formed 25% of sales in 1974, and are expected to grow to 28% by 1979 with the growth trend continuing thereafter.

Industrial experience, moreover, confirms the analysis of a study for the Commission that in this sector, as in central processors, costs tend to fall by around 15 per cent as production doubles. The search for economies of scale in production and development has already pushed many companies in the United States to seek to establish joint ventures or to buy out rather than manufacture themselves. European manufacturers, who have not even attained the scale in production of certain of these individual US companies, badly need to develop comparable policies of buying out, or developing and producing jointly, if they are to attain an economic scale of production and development. \*)

At present the most evident method of achieving such economies is to purchase from producers in the United States. One consequence of this policy is to squeeze out of existence the medium-sized European manufacturers who exist in this field. An effort within Europe to achieve rationalisation agreements and joint development of certain products would both strengthen the European industry and place it in a better position to negotiate wider transatlantic rationalisation agreements.

The Commission intends to invite manufacturers both of distributed processors and CPU's to meet with each other in a framework provided by the Commission to discuss, systematically, rationalisation agreements, involving purchase of each others' peripherals or joint production or joint purchase from third suppliers. This process could develop in 1975 and 1976.

It is also proposed to provide, as from the start of 1977, a financial incentive to such arrangements in the form of development contracts for key new products (eg. tape-library and high-speed discs) jointly developed by companies based in at least three Community countries under the new financial scheme to be proposed in April 1975 and based on the requirements and needs which the industry, as user, has identified..

\*) Y.S. HU : Towards a European policy on the EDP industry.

Further study may show that it is possible to extend the same kind of financial incentive to terminals or to modular building-blocks for terminals. Here, if network and interface standards can be established at European level, there should be important opportunities for European manufacturers to develop and sell terminals, possibly with modular characteristics, to a wide market.

### 3. Components

Price, performance, and ability to make use of advanced components are critical features in competitiveness for manufacturers of all kinds of data-processing equipment.

Their importance grows at an accelerating pace as large scale integration (LSI) makes it possible for entire systems to be grouped on a single silicon chip and permits the distribution of intelligence to an ever-widening range of devices.

Advanced electronic components are the technological key also to the transformation and growth of the telecommunications industry, where development in the next ten years will be inseparable from that of distributed computing. This, in short, is a key industry whose strength and structure are of vital interest to the Community.

Hitherto European DP manufacturers have relied heavily on American suppliers of mass-produced advanced components who have led world technology and achieved economies of scale thanks, in part to the immense size of the US Federal Government market, and the scale and stimulus provided by research and development under defence and space programmes.

Japan is also mounting a major national programme of advanced component development to serve the needs of telecommunications and data-processing industries.

Though the US component industry is not dominated by a single manufacturer and does not therefore pose the same problems of competition, as data-processing, certain problems, for the European DP industry, are growing in importance :

- a) small to medium-sized manufacturers of distributed computing equipment lack bargaining power in the purchase of even standard components and depend increasingly on their relationship with the component manufacturer for design of their product;
- b) reliance on non-IBM American suppliers of LSI chips is no longer a certain method of obtaining the most advanced components, because IBM is becoming the most advanced of these manufacturer components in the world. European DP manufacturers, for whom there is already a time lag of, say, a year in ability to include the latest component developed by other manufacturers in their systems, may be some three years behind IBM in advanced components ;
- c) a critical feature in leadtime for the development of computer systems has become the speed with which a company can translate a system concept into a usable component, tested, complete with firmware and so on. Design techniques in the utilisation of advanced components, whether developed in house or provided as a kit of tools by component manufacturers are thus essential to the computer industry.

In short, as the designer of advanced components takes over an ever-more important part of data-processing systems, it becomes increasingly important for them to be designed, developed and produced in Europe in a close service relationship to the data-processing industry.

The Commission therefore proposes the following measures :

a) To discuss with the industry and implement the most appropriate means of facilitating cooperative procurement of standard components by interested firms throughout the industry.

b) To provide, as from the start of 1977, a financial incentive in the form of development contracts for the joint development by European transnational consortia of advanced components, specified in common by customers in at least three different Community countries with a certain prospective minimum turnover for this component. Two significant objectives here would be the creation of a "second source" for supplies and the promotion of an advanced capability within the European component industry.

c) To conduct a study during 1976 on the best means of building up European LSI development facilities with special regard to the needs of the DP and telecommunications industries. Such facilities ought to bring together the capabilities of leading European component manufacturers to provide a design and development service in the application of LSI components to new DP systems.

Certain member states have already appreciated the strategic importance of the electronic component industry in any industrial policy. In particular the Federal Republic of Germany has communicated to the Commission the major programme of support which it is developing during the years 1974 to 1978, and invited other member states to cooperate. The full benefits of such essential efforts will, in the Commission's view, only be realised if the Community can develop an overall strategy for this sector involving both

coordination of national policies and common actions of the kind outlined above.

During the next six months, the Commission intends to hold discussions with industry and to invite experts from national Governments to confront and compare existing national policies with a view to elaborating an overall Community policy on electronic components annexed to the medium-term programme for dataprocessing which it will put forward in April 1976.

## C - GENERAL QUESTIONS

### 1) Management of Common Programmes

The Consultative Committee, whose establishment has been proposed in connection with the five applications projects currently before the Council, will advise and assist the Commission in the execution of the programmes outlined in this Communication. Specialised technical committees will be set up to guide each programme activity. Their members will be selected by the Commission on the advice of the Consultative Committee.

### 2) Coordination of National Policies

Proposals for Community policy are already discussed by the Commission with a group of Senior Officials.

To ensure that the medium-term programme reflects the intentions of the Resolution and embodies both common actions and coordination of national policies, a more systematic effort will be made within this group, during the coming six months, to confront and compare national policies particularly in the fields of distributed computing and components.

### 3) Preparation of the medium-term programme

In view of the preparation of the medium-term programme, certain studies in the Commission are necessary. With this in mind, a budget of 500.000 UA has been foreseen for 1976 (see Annex 5 of the document).

In April 1976, the Commission will present budget proposals for the years 1977 to 1980 defining the allocation of funds between the different classes of user (applications, components, peripherals, portable software and so on) and specifying the most appropriate financial mechanisms in such a way that the different activities can start in January 1977.

4. FINANCING OF PROJECTS

Breakdown of Expenditure

Annex N°	Project	Total Cost	1976	1977	1978	1979	1980
1	Project L T P L	6,703,100	2,433,500	2,213,600	1,394,500	661,500	
2	Portability of Software	9,443,000	823,000	5,455,000	3,165,000		
3	Support for use of data processing	5,029,000	1,064,000	1,555,000	1,555,000	855,000	
4	Applications :

	c) Studies	500,000	500,000				
	Total :	23.066.100	5.454.000	9,686,100	6,299,500	1,596,500	30.000

PROPOSAL FOR A COUNCIL DECISION

---

ADOPTING A DEVELOPMENT PROJECT FOR A COMMON LANGUAGE FOR REAL TIME  
PROGRAMMING (LTPL-PROJECT)

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community,  
and in particular Article 235 thereof,

Having regard to the proposal from the Commission,

Having regard to the Opinion of the European Parliament,

Whereas the Council agreed, in its Resolution of 15 July 1974 on a  
Community policy on data-processing, with a view to giving a Community orienta-  
tion to policy for the encouragement and promotion of data-processing, to  
adopt collaborative actions on Standards on the basis of proposals from the  
Commission,

Whereas the development of a common language for real-time applica-  
tions would enable users to get access to a vider range of  
products and reduce their costs through mutual exchange of programmes and that  
to this end it is necessary to provide for the development of such a  
language through collaboration at the Community level,

Whereas the project referred to above is seen to be necessary in order  
to attain certain Community objectives within the framework of the  
Common Market,

Whereas the Treaty establishing the European Economic Community has not  
provided the necessary powers of action to this end,

HAS ADOPTED THE DECISION

ARTICLE 1

A project for the development of a common programming language for real-time applications is hereby adopted to run from 1 January 1976 to December 1979. The project is defined under "Content of the Project" in the Annex to this decision (see paragraph 3).

ARTICLE 2

The necessary appropriations for carrying out this project shall be entered in the budget of the European Communities.

ARTICLE 3

The Commission shall be responsible for carrying out the project. It shall be assisted by the Consultative Committee for Data-Processing Projects.

The Commission shall present a report to the Council each year.

Done at Brussels  
FOR THE COUNCIL

THE PRESIDENT

DEVELOPMENT PROJECT FOR A COMMON LANGUAGE FOR  
REAL TIME PROGRAMMING (LTPL PROJECT)

1. Introduction

- 1.1. The Council Resolution of 15 July 1974 welcomed the Commission's intention to submit, after appropriate consultations, priority proposals concerning: "Collaboration on standards, applications and public procurement policy."
- 1.2. This Note will explain the Commission's first proposal in the field of standards: for a Community project for the development of a standard future language for real-time data processing applications.
- 1.3. The proposal in the Commission's view, will fulfil two important aims of the Council Resolution:
- (a) to enable users
    - to cut their costs substantially by exchanging important and costly software products between one other;
    - to attain greater independence from individual manufacturers and their products, and the possibility to buy equipment from a variety of suppliers without changing expensive software.
  - (b) - to strengthen the European-based computer industry:
    - by helping to eliminate technical obstacles to marketing;
    - by giving the European manufacturers competitive advantages in a major section of the world market.
- 1.4. Before drafting the proposal, consultations were held with the following groups:
- the Working Group on Standards
  - a group of experts, active in this field, representing users, the European Computer industry and universities, who have helped to define the technical specifications for the project;

Thus the proposal outlined in this Note is the outcome of discussions with interested (or affected) parties in the Member States, held with a view to defining, specifying and assessing the project.

## 2. Outline and justification of the project

- 2.1. The aim of the proposed project is to develop a standard programming language for computers with real-time applications, i.e., applications such as industrial process control, laboratory automation, avionics, seat reservation, the organisation of processes in electric power stations and grids, or the organisation of data flow in telecommunication networks with the aid of processors, etc..

This language, called LTFL (long-term procedural language), is intended to be available in the late seventies as an alternative to the existing languages, which are not interchangeable.

### Real-time Languages: The situation to day

- 2.2. With software products becoming more and more numerous and expensive, it has been the practice for some time to use what are known as "high-level" languages in the formulation of these products. This means that a widely used program need only be written once in one of these languages, provided, of course, that the computer on which the program is to be run permits the use of the language in question by means of a compiler. The cost of developing a compiler is in the order of 1 - 2 million u.a. Given the high cost of writing a new programme, such an investment in a compiler will quickly pay off, provided that there are not too many high-level languages competing with one another.

There is however no internationally accepted standard for real-time languages, today, but rather a considerable number of individual languages which are not interchangeable:

- in Europe : PEARL, CORAL 66, PROCOL, RTL 2, etc.
- in the USA : PL - 1 and others.

These languages have been developed primarily at national level, and some have been given considerable backing by public purchasing policy in their country of origin. Thus a privileged position is enjoyed by PEARL in Germany, PROCOL in France and CORAL 66 in England, and this position is partly maintained by the attitude of industry. In the long term, however, this partial standardisation at national level, and the consequent strengthening of the national markets, does not serve the best interests of either the manufacturer or the user.

Benefits to users

- 2.3. Among computer users, there are some industries in which operating costs are appreciably affected by the very substantial outlay for software packages. This is true, for instance, of load distribution programs for power supply undertakings, programs for safety systems in nuclear power stations and process control programs for blast furnaces and rolling mills. Consequently, many users have joined forces to bring about a standard programming language which will enable them to cut their costs by using major programs in common. At national level, this procedure is already commonplace. A foreign manufacturer, for instance, who is interested in supplying the German power supply undertakings, can do so only on the basis of PEARL.

The lack of a standard language therefore is a hindrance to the exchange of experience and programs at European level, and the further reduction in costs that would result.

As a rule, foreign suppliers of real-time data-processing systems lose any competitive advantage because of the high cost of conversion to what for them is a "foreign" language. For the user, this means greater dependence on a limited number of home suppliers. It hinders the creation of a European market.

The user, too, is deterred from converting to a "foreign" language by the fact that the program library he has acquired to date, which may represent a considerable financial investment, would lose its value.

Benefits to manufacturers

- 2.4. Manufacturing industry was at one time largely in favour of preferred national programming languages, which served a protective function by sealing off the national market. However, many companies have now grown to a size which compels them to see at least the whole of Europe as their market. Yet they find that the existence of different languages, and the resulting conversion costs incurred by the manufacturer, act as a technical barrier to trade. It is therefore in the interest of the industry that this barrier should be removed by the introduction of a standard language.

The existence of a standard real-time language would also improve the position of the whole European industry on the world market. Experience has shown the importance of a harmonised product basis for successful worldwide marketing.

## 2.5. General economic benefits

With the European software industry having in 1980 a global annual turnover of about 1 Billion u.s. it is generally assumed that the portion of real-time application software at that time will be 30 %.

On the other hand, present developments permit the conclusion that high level languages where they have replaced the individual assembler-type languages lead to overall savings of about 20 %. Half that amount, i.e. 10 % could probably be expected when a common standard language is applied instead of the high level languages now in use. So the annual savings due to a generally accepted LTPL-standard will be about 30 MUA/year.

### A European real-time language may become a world standard

2.6. Europe would seem an ideal place in which to develop a standard real-time language, which would stand an excellent chance of being adopted on a worldwide scale.

No American product satisfies the requirements. In its present form at any rate, the real-time version of PL 1 (the language supplied by IBM) is technically unsatisfactory. The IBM language System 7-RT is geared to IBM products to such an extent that it appears unsuitable for general use, and the same is true of the languages developed by the other big American computer manufacturers.

By contrast the real-time languages evolved in Europe were designed from the outset not to be specific to a manufacturer, this being one favourable consequence of the fragmentation of the European market.

From the European standpoint, there are further important considerations: The introduction of a standard always gives those concerned in its development an important marketing advantage compared with those who adopt a standard developed elsewhere. The ISO is currently exploring the views

of its members with regard to the possible establishment of a world standard in this field. It is possible that a language developed in Europe will be officially recognised as an ISO standard; even if this is not a certainty, a successful European standard language would spread beyond the bounds of Europe strengthening Europe's position in the world market.

Why a Community project

- 2.7. In view of the competitive relationship between the European countries there is no likelihood that a standard European language could be developed solely on the basis of one of the existing languages; moreover new and better features will be required of any successor language. A new standard European language (LTPL) must combine the best features of the European candidate languages. The language must also have elements in common with each of the existing languages to permit automatic translation from the candidate languages into LTPL. As a machine independent language it will by definition not affect the structure of existing operating systems. But once a new language standard is put into use it affects the development of future operating systems.

The timing

- 2.8. The success of the project proposed will depend on proper timing. In the next three or four years many of the languages currently in use have to be replaced by technically more advanced versions. This increases the scope for general acceptance of a common solution provided it is available at that time. The timescales of the project (see 3.2), therefore, calls for a speedy start even if technical progress next year changes detailed aspects. Care has been taken in the concept of the project to ensure that changes in technical conditions can be taken account of up to a very late phase of execution. Moreover, there are strong indications that efforts to develop a standard in the United States will be multiplied soon if no European solution is in sight.

The LTPL-E Group (\*)

---

The LTPL-E (Long Term Procedural Language - Europe) originated in the "Purdue Workshop on Industrial Computers" (an international gathering) at Purdue, USA. Three technical committees were formed: LTPL-America, LTPL-Japan and LTPL-Europe. Later on, when "Purdue-Europe" was formed, the LTPL-E Group took its place there as one of seven technical Committees. The Commission maintains close contact with the Purdue-Europe committees, and makes use of their advisory services in the field of data-processing.

2.9. For about two years a group of European international experts from research, industry and user circles - the "LTPL-E Group", as it is called - has been working towards this goal. The LTPL-E Group maintains close contact with all the other groups and organisations interested in, or affected by, this work, in particular with the European and American national standards authorities and the International Standards Organisation (ISO). Its international status is best illustrated by the fact that ISO recognises the LTPL-E Group as a technical advisory group".

Given the composition of this Group and the investigations it has already conducted on questions of language comparison and language standardisation, there is reason to believe that the path it has been following will lead to the goal outlined by the Commission in this proposal, provided the necessary financial resources are available.

The position of the group in an informal world-wide organisation and its good relations with the International Standards Organisation, fit in with the Commission's view that the results envisaged for this project should be regarded as a European contribution to worldwide efforts. The work already done by the LTPL-E group provides an opportunity for the Community. In order to exploit it and to serve the wider need and to develop a standard language, it is proposed that the LTPL-E development work described in 3.1. should be financed from Community resources in accordance with the schedule under Annex 5.

### 3. Content of the project

#### Project phases and working modules

##### 3.1.1. The definition phase

Comparison of all relevant candidate languages; theoretical work leading to a common language proposal.

##### 3.1.2. The implementation phase

- test implementation of the common language (feasibility, utility, acceptability)
- construction of a portable compiler
- adaptation to the structures of different machines.

purpose a compiler has to be constructed. In order to see how the language works on different machine structures, more than one test implementation needs to be made. So it is proposed to develop two different compilers. In order to extend the range of application of the language as far as possible from the very beginning, it is intended to design these compilers in a portable form.

3.1.3. The evaluation phase

- in depth application tests (viability and practicality of the language ).

The different tasks which will have to be carried out are :

a. in the definition phase:

- Language comparison (already done by the LIPL-E-Group
- Proposal for syntactic method for language description
- Formal description of the language
- Raw proposal for the language kernel
- Language adaptation study
- Final proposal for the language kernel
- Description of the language kernel in provisional syntax

- Development of
 

{	algorithmic semantics
	tasking semantics
	Input/Output semantics
	configuration description semantics

b. in the implementation phase

- Development of two compilers for different machines, comprising
 

{	language kernel
	tasking semantics
	Input/Output semantics
	algorithmic semantics
	configuration semantics
- test implementation of the

c. in the evaluation phase

- different application tests

Planning

- 3.2. Most of the work tasks depend on the results of other tasks, but not in the sense that all the definition phase has to be completed before implementation can begin; even testing can partly be undertaken at a relatively early stage.

This results form the decision scheme that is being incorporated in the planning; with programmes of such complexity straightforward strategies excluding feedback loops will be unrealistic. In innovative development work of this kind it must be possible to redefine certain modules in the light of work on others.

The time scales assigned for the three phases are:

Definition phase	Jan. 1976 - Dec. 1978
Implementation phase	Jan. 1976 - Dec. 1978
Evaluation phase	Jan. 1977 - Dec. 1979

PROPOSAL FOR A COUNCIL DECISION ADOPTING A GROUP OF PROJECTS  
IN DATA-PROCESSING CONCERNING SOFTWARE PORTABILITY

---

THE COUNCIL OF THE EUROPEAN COMMUNITIES

Having regard to the Treaty establishing the European Economic Community,  
and in particular Article 235 thereof;

Having regard to the proposal from the Commission;

Having regard to the Opinion of the European Parliament;

Whereas the Council agreed in its Resolution of 15 July 1974 on a Community policy for data-processing, with a view to giving a Community orientation to policies for encouraging and promoting data-processing, to adopt, on a proposal of the Commission, industrial development projects in areas of common interest involving transnational cooperation.

Whereas the portability of software will benefit users by substantially reducing conversion costs when changing over from one type of equipment to another; and that to this end it is required to promote a group of projects with the object of the industrial development of languages, systems and portable products, in the field of software.

Whereas the projects referred to above are seen to be necessary in order to attain certain Community objectives within the framework of the common market;

Whereas the Treaty establishing the European Economic Community makes no provision for the powers required for these purposes;

HAS ADOPTED THIS DECISION :

ARTICLE 1

Five common projects are adopted for the period from 1 January 1976  
namely :

- (a) Design and development of portable compilers; (4.3.a to 4.5.a)
- (b) Design and development of a software writing language (4.5.b to 4.8.b)
- (c) Design and development of subsystems for the management of  
data banks and transaction processing (4.4.c, to 4.6.c)
- (d) Design and development of conversion tools; (4.4.a to 4.5.d)
- (e) A preliminary study on the basic nucleus of an operating  
system for minicomputers; (4.3.c)

The indications in brackets refer to the paragraphs of the Annex to the  
present decision defining the different projects.

ARTICLE 2

The appropriations required for the implementation of these projects  
shall be shown in the budget of the European Communities.

ARTICLE 3

The Commission shall be responsible for the implementation of the  
projects. It shall be assisted in this task by the Consultative Committee  
on Data Processing Projects.

The Commission shall present an annual report to the Council.

Done at Brussels

FOR THE COUNCIL

THE PRESIDENT

A GROUP OF PROJECTS IN DATA PROCESSING  
CONCERNING SOFTWARE PORTABILITY.

1. INTRODUCTION

- 1.1. The fact that the computer market is shared by different manufacturers gives rise to numerous difficulties for the user who wishes to transfer his applications to a new, more powerful machine, or to use several incompatible items of equipment simultaneously.
- 1.2. The latter case will arise where the user has a large pool of miscellaneous equipment, **because**, for obvious reasons, he does not wish to be tied to a single manufacturer.
- 1.3. Accordingly, when applications are transferred to a new machine, or when they are processed simultaneously by different equipment, the degree of difficulty encountered by the user will depend on what, for the sake of convenience, will be called their "portability".
- 1.4. It should be noted that similar problems arise in regard to intercommunication between different machines, and these will have to be dealt with at the same time.
- 1.5. At present on the computer market, there is little or no portability of applications, and this is a constant source of annoyance to the user; changing manufacturers becomes a major problem which many prefer to avoid by opting once and for all for the leading world manufacturer who can guarantee a measure of homogeneity in the equipment.
- 1.6. The cost of converting programs and the disturbance caused in the operation of the system are considerable.
- 1.7. A preliminary estimate of the costs that are likely to be incurred in the Community for program conversion over the next five years would be somewhere in the region of 1,000 million u.a.

- 1.8 This is an unhealthy situation both for the user and for the European computer industry, whose lack of homogeneity is a major handicap in face of the monolithic organization of its main competitor.
- 1.9. Taking a wider view, it is worth pointing out that any scheme likely to give greater portability to software products would help at the same time in removing technical barriers to trade within the Community.
- 1.10. The purpose of this proposal, then, is to set up a programme of projects aimed at giving a greater measure of portability to computer software.

## 2. BASIS FOR THE PROPOSALS

- 2.1. These proposals come within the general framework of the Council Resolution on a Community policy for data processing of July 1974 (Doc. R/1793/74 (ECO 211)).
- 2.2. They are based primarily on two studies carried out for the Commission during the years 1974-75 on the portability of applications software<sup>1)</sup> and on the views of computer users concerning the problems associated with portability.<sup>2)</sup>
- 2.3. Many consultations have also been held with hardware and software manufacturers.
- 2.4. Finally, the subject has been discussed on various occasions by a Committee of Senior Officials of the Member States, which assists the Commission in matters concerning the Community policy on data processing.

## 3. OUTLINE OF THE PROPOSALS

- 3.1. The proposals which have evolved from the studies and consultations mentioned above are as follows :

---

1) CAP SOGETI : The portability of application software.  
2) CAP SOGETI : Inquiry on the portability of software.

- (a) Design and development of portable compilers;
- (b) Design and development of a software writing language;
- (c) Design and development of subsystems for data base management and transaction processing;
- (d) Design and development of conversion tools;
- (e) Preliminary study on the basic nucleus of an operating system for minicomputers;

3.2. All the projects listed above will be conducted bearing in mind not only the interests of users but also those of interested industrial parties (manufacturers of large and medium-size machines, minicomputers and possibly microcomputers, as well as software)

3.3. The resources required are summarized in the following table and presented in a detailed form in Annex 5 :

Project	Budget in u.a.			Total per project
	1976	1977	1978	
3.1.a.	223,000	1,600,000	960,000	2,783,000
3.1.b.	75,000	550,000	500,000	1,125,000
3.1.c.	250,000	1,200,000	300,000	1,750,000
3.1.d.	60,000	1,050,000	1,050,000	2,160,000
3.1.e.	30,000	600,000	-	630,000
General expenses Total	185,000	455,000	355,000	995,000
Totals	823,000	5,455,000	3,165,000	9,443,000

3.4. The amount of the 1976 budget can be regarded as final; the budgets for 1977 and 1978 are approximate and give some idea of the overall cost of the operation. They will have to be reviewed in the light of the studies carried out in 1976 and the negotiations which will be held with the interested circles in 1975 and 1976.

- 3.5. The funds which will be allocated to industrial consortia for the manufacture of portable products resulting from the scheme will be reimbursed to the Community, if the products prove commercially successful, under a scheme to be defined within the general framework of the management of the projects and of the medium-term programme.
- 3.6. The implementation of the projects will be entrusted to the Commission, assisted by the Consultative Committee on Data Processing Projects.

#### 4. CONTENT OF THE PROJECTS

##### 4.1.a. Design and development of portable compilers

The survey carried out among computer users in 1975 has revealed that one project which they regarded as extremely important was the development of portable compilers. This can be easily explained by the fact that most of the troubles that occur during program conversion are due to incompatibility between the languages supplied by the various manufacturers.

4.2.a. A preliminary study followed by the development of portable compilers would therefore satisfy a requirement that has been clearly indicated by a large number of users.

4.3.a. A study aimed at defining portable compilers would be carried out in 1976 on the following lines :

- examination of the existing languages that might be eligible (COBOL, FORTRAM, FL 1, etc.) and selection of one or more languages;
- study of the architecture to be adopted in developing the compiler(s), i.e. analysis of existing compilers, choice of structure, nature of object programs (Assembler, binary, etc..) This study could be accompanied by test runs on the computer.
- preparation of detailed specifications for the development of the portable compilers.

4.4.a. With specifications resulting from the preparatory study, a start will be made in 1977 on the development of portable compilers. The work will be carried out during 1977 and 1978.

4.5.a. For this operation, the following guidelines have been retained :

- two portable compilers will be developed (or chosen from existing compilers) for use with two languages and one type of computer;
- the portability of these compilers - either singly or in combination - will then be extended to cover six different types of computers.

4.1.b. Design and development of a software writing language

This language, together with the compilers required for use on various equipment, is a prerequisite for the implementation of all the portable products forming the subject of these projects.

4.2.b. Its development must therefore be regarded as a matter of the greatest urgency.

4.3.b. The main problem is not to define a new language for handling elementary binary items, but to develop an effective portable compiler.

4.4.b. Rather than attempting to develop something completely new, therefore, it is preferable to take existing languages as the starting point. By so doing, one can avoid :

- long-drawn-out discussions on the specifications for a language;
- new developments based on techniques that might not have been time-tested and would result in products that are unacceptable from the point of view of performance.

It is proposed, therefore, that the project should be carried out in three phases :

4.5.b. The first phase would be that of selecting an existing language (or two) according to very strict criteria. The following would be the minimum requirements :

- compilers of this language must exist on different types of machines;
- the compilers must be effective in generating object programs of the "system" type;
- the costs of development of new versions of compilers for other machines must be low;
  
- portable products must exist in this language that have given proof of their efficiency and portability.

4.6.b. This selection procedure, which ought to be carried out very rapidly in 1976, will result in the definition of a language known as ESL<sub>0</sub>, from which the future ESL language (European System Language) will be derived.

4.7.b. The second phase of the project, scheduled for 1977, will be concerned with the adaptation of ESL<sub>0</sub> to various European computers; those of the machines in question, which at present have no compiler for the ESL<sub>0</sub> language, will be provided with one. With these compilers it will be possible to push forward with the development of portable products without waiting until the final version of ESL is available. For each language selected, six adaptations of ESL<sub>0</sub> would be made.

The extension of ESL<sub>0</sub> to obtain the final ESL language will also be included in the second phase and will be completed in 1977.

4.8 .b. Finally, in the third phase, which will cover the year 1978, adaptations will be made to ESL on the same basis as for ESL<sub>0</sub>.

4.1.c. Design and development of subsystems for data base management and transaction processing

This type of product is somewhere in between an application program and an operating system. In the years ahead, subsystems of this kind will come to be more and more widely used.

4.2.c. Rather than embark on new developments which might prove long, costly and of doubtful efficiency, it is proposed to select from the existing systems those which experience has shown to be the best, and re-write them in ESL (see 4.6.b.) so that they can be used on a variety of European hardware systems.

4.3.c. The advantages of this approach are obvious :

- all the European computers would be able to benefit from the best products in every category of software at reasonable cost;
- any new software product that is developed and marketed would be available for use with a number of different computers. This would enable the European manufacturers to share the cost of developing new products;
- each manufacturer would have at his disposal a number of different products in each category, which would enable him to cater for a wider market. A data base management subsystem, for instance, may not cover all possible applications, and the fact that two complementary systems are available could be a powerful selling point.

4.4.c. The projects would be completed in two phases for each of the products considered.

4.5.c. The first phase, which will be completed in 1976, will comprise a survey of existing systems for data base management and transaction processing, and a selection will be made. The existing products will be compared from the point of view of the market they cater for, their capacity, and the user facilities they offer. Tests will be carried out.

4.6.c. The second phase, scheduled for 1977 and 1978, will consist primarily of converting the selected products first to ESL, and afterwards to ESL. These conversions would be in respect of two subsystems for data base management and two for transaction processing.

4.1.d. Design and development of conversion tools.

In the medium and long term, the development of portable products of the kind envisaged in these proposals would reduce incompatibilities between equipment and favour portability of new applications. More immediately, however, there is a large body of existing computer applications which require conversion whenever the user changes his equipment.

4.2.d. This means that this project for the development of conversion tools is designed to meet a need that is felt by any present user wishing to change over to a different computer, and it therefore has a high degree of urgency.

4.3.d. If conversion is to be carried out in the way that is most advantageous to the user both technically and financially, there are a certain number of tools that must be available such as COBOL and FORTRAN translators, translators for assembler languages, translators for control languages, file converters, etc..

4.4.d. The projects will be executed in two consecutive phases. The first phase, to be completed as early as possible in 1976, will be an investigation of the requirements followed by the preparation of specifications for the conversion tools and facilities that are found to be necessary.

4.5.d. The second phase, covering the years 1977 and 1978, will be concerned with the development of the tools that are considered necessary, and also with the adaptation of these, which will take place mainly in 1978 .

4.1.e. A preliminary study on the basic nucleus of an operating system for minicomputers

This proposal must be viewed in the light of the current trend in data processing towards systems of the distributed type. It is conceivable that the functions that have to be performed in a network may be undertaken by different computers at the various nodal centres, and may in some cases be handled by minicomputers.

4.2.e. In view of this trend, the creation of a basic nucleus for an operating system for minicomputers (common supervisor) would be likely to have considerable interest for minicomputer manufacturers, as this basic nucleus could be linked up with a number of sophisticated subsystems.

4.3.e. A study on the development of a minimum nucleus for an operating system for minicomputers (common supervisor) is proposed for 1976 with the aim of analysing the situation and evaluating specifications.

PROPOSAL FOR A COUNCIL DECISION ADOPTING  
A GROUP OF STUDIES IN SUPPORT OF THE USE OF  
DATA PROCESSING

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community, and in particular Article 235 thereof;

Having regard to the proposal from the Commission;

Having regard to the Opinion of the European Parliament;

Whereas the Council Resolutions of 15 July 1974 on a Community policy on data processing intends to give a Community orientation to policies for encouraging and promoting data processing;

Whereas the development of applications software raises a number of problems of a general nature concerning programming techniques, and relations between manufacturers and users

Whereas the development of data processing applications calls for an examination of the problems regarding data security and confidentiality from the technical, legal and social aspects, in particular in order to provide protection for citizens in respect of the use of data processing facilities;

Whereas the efficient use of computers is of considerable economic importance; and that to increase this efficiency programming techniques must be improved;

Whereas data base software and systems should be systematically examined and instruments developed to help users to select, implement and operate these systems and to facilitate standardization at a later stage;

Whereas the above projects appear necessary in order to achieve certain Community objectives in the operation of the common market;

Whereas the Treaty establishing the European Economic Community makes no provision for the powers required for these purposes,

HAS ADOPTED THIS DECISION:

Article 1

Three joint data processing projects are hereby adopted to run from 1 January 1976.

- (a) Study of data security and confidentiality (2.4 to 2.7)
- (b) Study on programming techniques (3.5)
- (c) Study on the evaluation and implementation of data base systems (4.7).

The indications in brackets refer to the paragraphs of the Annex to the present decision defining the different studies.

Article 2

The appropriations necessary for the implementation of the studies shall be entered in the budget of the European Communities.

Article 3

The Commission shall be responsible for implementation of the studies and shall be assisted by the consultative Committee on Data-Processing Projects.

The Commission shall present an annual report to the Council.

Done at Brussels

FOR THE COUNCIL

THE PRESIDENT

Studies in support of the use of data processing

1. Introduction

- 1.1 The development of applications software gives rise to a number of problems which mainly affect the users of data processing systems. Some attempts to overcome these problems have been made by hardware or software producers or users, depending on their capabilities or the advantages to themselves, but not in any coherent fashion.
- 1.2 The resultant confusion in the situation, which shows no sign of being resolved, is harmful to the development of the sector as a whole and to the proper use of data processing.
- 1.3 Consequently some effort, especially of a methodological nature, at Community level would be helpful in order to define in the medium or long term more suitable approaches to the use or design of data processing systems.
- 1.4 This effort, which would be of definite advantage to users, would also be helpful to the industries concerned as it would enable them to manufacture products better suited to actual needs, using more appropriate instruments.
- 1.5 The projects contemplated should be carried out as far as possible by competent centres independent of the user or producer sectors concerned.

- 1.6 It is therefore proposed that the execution of these studies be entrusted to national computer research centres working in close cooperation so as to ensure that the state of the art in all the Community countries is clearly established as a starting point and that the results obtained are adequately disseminated.
- 1.7 In addition, one of the main effects of the launching of these projects will be to promote cooperation between public institutes in Member States that are responsible for research and user support, thus helping to provide an infrastructure for the Community data-processing policy. The projects that follow, were defined in collaboration between certain of these Institutes and the Commission, which desires the extension of such collaboration to other Institutes in the Community.
- 1.8 These results will be disseminated to the user and producer sectors.
- 1.9 The Commission has selected the subjects for which a general approach at Community level would appear to offer the most obvious advantages.
- 1.10 The subjects selected are as follows :
- (a) Data security and confidentiality
  - (b) Programming techniques
  - (c) Evaluation and implementation of data base systems.

1.11 These subjects and the methods to be used are described briefly in the following sections 2, 3 and 4.

1.12 These studies are accompanied by a systematic action for the dissemination of information.

2. Data security and confidentiality (study a)

2.1 In its document on a Community data processing policy, the Commission drew attention to the importance of this question and the advantages of reconciling the Member States' views on it in advance rather than trying to harmonize national laws later. At the request of the Commission, the European Parliament has initiated a study of the subject and in most Member States legislation is under way. The Commission also intends to invite the authorities in Member States to provide it with information on the progress of work in this field so that it can prepare any proposals it considers useful.

2.2. There is no doubt that the methods used to ensure that data remains confidential and secure will affect the design, use and economics of future data processing systems and consequently they are of vital importance to the producers and users of such systems.

It is equally important not only for citizens privacy but also for free competition, that the proposed solutions emanate from impartial organisations.

2.3. The study proposed below, which will cover the technical, legal, social and political aspects of data security and confidentiality, is in the Commission's view a vital technical supplement to the work to be undertaken in this field by the European Parliament, government authorities and the Commission and by the computer industry. The study will provide basic data in the Community.

for a political debate to establish guidelines for legislation and practices regarding security and the protection of citizens' rights.

#### 2.4 Content of project (a)

The study will be carried out in two stages.

The first preparatory phase covering three closely linked subjects (A, B and C below) will make it possible to define specifications for the second phase comprising the main study which should provide the following results :

- a comparative analysis of legislation, recommendations and standards notably in countries of the Community, with a view to their harmonious development (A);
- improvement of security control in installations (B);
- improvement in the assessment of the impact of measures to ensure security and confidentiality on the public in general and on the functioning and structure of organizations (C).

#### 2.5 Subject A consists essentially of :

- a study of the various national legislations and concepts regarding security and confidentiality;
- an examination of current practices regarding international data circulation, especially in multinational companies.

2.6 Subject B will consist essentially of:

- a study of methods, means and techniques (from the point of view of efficiency, facility, cost, acceptability etc.) based on an inventory of faults that could cause the break-down of security;
- a study of practices in different organizations;
- research into methods helping organizations to design optimum systems as regards security and confidentiality;
- suggestions on training, publications, information on existing techniques, violations, etc.

2.7 Subject C will consist essentially of:

- an analysis of existing data circulation systems and security measures in various national environments;
- an analysis of the attitude and behaviour of users and the general public in relation to existing data circulation systems and existing measures to preserve confidentiality and security;
- an analysis of possible developments resulting from the increasing use of data processing and the new techniques and rules regarding confidentiality and security.

### 3. Programming techniques ( Study b)

- 3.1 In recent years great efforts have been made to improve the efficiency of programs and programmers. Nevertheless it is still difficult to be certain that, for example, the specifications describe the problem correctly or programs have been fully tested and are reliable and portable. Major efforts to date have concentrated on creating specific tools such as high-level languages.
- 3.2 More recently, attention has been focussed on program writing techniques rather than the tools used. In particular efforts have been made to obtain an understanding of the processes of designing and constructing programs.
- 3.3 The general situation is however confused although there have been suggestions from various quarters on programming techniques to be used. There are also communication problems between researchers and users and between different users. In addition, it appears that techniques have been commercially exploited before being impartially checked for validity.
- 3.4 It is therefore essential to carry out a study of:
- the precise nature of programming problems;
  - the relative value and validity of current proposals on the subject;
  - the requirements for research, development and dissemination.

3.5. Content of the study (b)

The initial study on programming techniques has the following main aims :

- to identify fields of special importance to users;
- to develop proposals for the fields in which the greatest needs are felt;
- to define specifications for a possible future study.

4. Evaluation and implementation of data base systems (Study c)

4.1 The use of data base systems is increasing. Some experience has been obtained, but it has never been properly documented and disseminated.

4.2 There is a need for a systematic study and for the production of tools for the selection, establishment and operation of data base systems.

4.3 Users would benefit most from the proposed project. It would provide them with assistance, obviate duplication of effort by proper dissemination of information and enable them to use the systems more professionally and more effectively.

4.4 The study may also be of benefit to producers by supplying them with information on users' real needs and with instruments for the evaluation of data base systems.

4.5 Finally, the study could provide a useful stimulus for the identification of fields in which standardization or portability projects would be desirable.

4.6 A study for the evaluation and implementation of data base systems is described below, with the main aim of providing those concerned with information on the selection, establishment and operation of these systems.

#### 4.7 Content of the study (c)

The main features of the study are the following :

- to examine existing data base systems;
- to produce detailed descriptions and analyses of data base systems;
- to test and evaluate nine data base systems in association with a certain number of users.
- on the basis of this experience and analysis to develop guidelines for the selection and implementation of data base systems;
- to provide information regarding standardization.

4.8 The results of the project will be written up in reports and possibly courses will be held or advisory services provided. One important outcome will be the creation of centres of expertise on data bases in the Community at the disposal of users and industry.

5. Dissemination of information

- 5.1 The dissemination of research information is of vital importance to research centres in general and computer research centres in particular.
- 5.2 One of the Community Member States has published a year book on public research in automation and computer science. This gives for each research subject the location, duration, nature and content of the projects, the composition of the team, the reasons for and results of the work, publications and contacts.
- 5.3 A working party in which several Member States participate has taken on the task of producing a trilingual glossary of automation and computer science (German-English-French). This glossary relates each subject to a major research heading by means of an unambiguous tree structure.
- 5.4 There can be no doubt that if they are expanded to a European level the year book and glossary would considerably facilitate exchanges, contacts, coordination, etc. between research centres and interested circles in the Member States and would usefully contribute towards developing Community cooperation in research on automation and computer science.
- 5.5 It is therefore proposed that a concerted action project in the framework of CREST be carried out to extend the yearbook and glossary to a Community level.
- 5.6 No financing at Community level is required for this project.

PROPOSAL FOR A COUNCIL DECISION ADOPTING A NUMBER OF PROJECTS  
FOR APPLICATIONS AND STUDIES IN THE FIELD OF DATA PROCESSING

THE COUNCIL OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Economic Community,  
and in particular Article 235 thereof,

Having regard to the proposal from the Commission,

Having regard to the Opinion of the European Parliament,

Whereas the Council agreed, in its Resolution of 15 July 1974 on a Community policy for data-processing, with a view to giving a Community orientation to policies for encouraging and promoting data-processing, to adopt, on a proposal of the Commission, common projects of European interest in the field of applications of data-processing.

Whereas, to this end, a priority should be granted to projects likely to help to meet the needs of users and increase the capacity of the European-based data-processing industry to satisfy these needs on the European and world markets;

Whereas, the evolution of computer-based information storage and retrieval has necessitated the provision of improved software to fulfil the growing needs of users in different professions.

Whereas the evolution of ground networks and satellite links for data communications requires the development of advanced techniques and procedures to provide the reliability required for transmitting large quantities of data at high speeds.

Whereas the development of further projects of Community interest and of a medium term programme in data processing requires systematic exploratory study.

Whereas the projects and studies referred to above are seen to be necessary in order to attain certain Community objectives within the framework of the Common Market,

Whereas the Treaty establishing the European Economic Community has not provided the necessary powers of actions to this end,

HAS ADOPTED THE DECISION

Article 1 :

Two joint data-processing projects and a set of exploratory studies are hereby adopted to run from 1 January 1976 with the following objectives :

- 1) the specification of a computer-based information and storage retrieval system (3.3. Annex A)
- 2) Experimental application in high speed data communication techniques (3.1.1. and 3.2.1. Annex B)
- 3) A set of exploratory studies required to complete the definition of actions in the framework of a medium-term programme.

The indications in brackets refer to the paragraphs of the Annex to the present decision defining the projects.

Article 2

The necessary appropriations for carrying out these projects and studies shall be entered in the budget of the European Communities.

Article 3

The Commission shall be responsible for carrying out the projects and studies. It shall be assisted by the Consultative Committee on Data-Processing Projects.

The Commission shall present a report to the Council each year.

Done at Brussels

FOR THE COUNCIL,

THE PRESIDENT

**PROJECT FOR THE SPECIFICATION AND DEVELOPMENT OF A COMPUTER-  
BASED INFORMATION STORAGE AND RETRIEVAL SYSTEM**

---

**Project Summary**

The project covers the specification, design and development of a generalised computer software package of advanced design for the storage and retrieval of information. It covers two phases :

- in the first phase the characteristics desired by users in all fields (legal, scientific documentation, economic documentation, environmental information, etc.) will be identified and analysed; the package to meet these needs will be specified and the means of implementation defined.
- in the second phase, the generalised package for use on a number of manufacturers computers will be developed, and for some specific fields of use special additional modules will be designed and developed to enable the package to be used in these applications.

The duration of the project is expected to be 3 1/2 years.

The decision of the Council concerns only the cost of the specification phase. The financing of the development phase will be covered under the general financial mechanism, which will be proposed by the Commission in the framework of the medium term programme and which envisages financial participation from industry.

In view of urgent industrial need a rapid Council decision for funding the specification phase is required so that work may start in early 1976.

**1. Statement of the Problem**

1.1. Modern society generates a vast quantity of information which traditional techniques cannot handle. The quantity of information generated in all fields of technology, business, law, medicine and other fields is expected to increase at an accelerating rate in future years. Users are also demanding better quality information, as a basis for business decisions or research plans, as a guide to precedents in law or medicine or simply as source of press and learned references to a particular topic.

Even with a good index and reference library the task of retrieval of information is daunting, yet the value of stored information depends, in many cases critically, on the ease and speed with which it can be sifted, selected and retrieved. The problem of information retrieval is thus fundamental to modern industrial Society.

1.2. Recognizing this market need, computer manufacturers have attempted to fulfil it by offering information and text retrieval packages on their large computers.

1.3. None of these packages has however wholly satisfied the requirements of users in the professions concerned. One manufacturer who has the advantage of an established world market has met greater success than others in fulfilling user needs and in market penetration. Even in this case, however, the package is available only on large machines, though an evolution of the software is to be expected within the next two years in order to consolidate the position held.

Users claim that problems are still posed by the high cost and complexity of data entry and updating, by inadequate ease and speed of access to information, by shortcomings and differences in searching and enquiry facilities. And they dislike the precondition that they must invest in a large computer. Users require a transparent computer-based information storage and retrieval system to which the non-expert can easily have access. In order to overcome some of these problems large users in Member States have attempted to produce their own software, thus multiplying the costs of development of such systems in the Community.

1.4. Those European-based manufacturers who have invested in producing specialised information and text retrieval packages have found the venture a limited commercial success due to a lack of market penetration.

Each of the European manufacturers has faced, on the one hand, the solid block of IBM's established market and on the other a wide and disparate variety of relatively small public and private users.

In this, as in other applications fields, both users and the European industry could benefit from a systematic effort at European level to coordinate and then translate into specifications users needs followed by the development of a family of portable products, available on a variety of computers, and embodying those qualities which present products lack.

2. Proposed solution :

- 2.1. It is proposed that at the European level, the design and development of an advanced software package of modular construction which would be implemented on different European computers, both large and small, be undertaken. This software should be substantially computer independent and thus make it easier for users to move from one kind of equipment to another.
- 2.2. The computer software so designed should be capable of analysing indexing and storing large amounts of information and should also confer on all foreseeable users, whatever their discipline, a powerful searching capability. While the basic system would be common, specific modules should be provided to meet the particular working environment of special classes of users.
- 2.3. The proposed solution envisages a close and ongoing user and industry participation from the outset through the design and development stages of the software package. Systems already in being following other Community projects (Legal Information Systems and Import/Export, etc.) must be examined and taken into consideration to ensure continuity of exploitation of the data.

In view of the high risk of the product and the need to bring together both users and industry at Community level it is proposed to fund the specification phase through the Community budget.

In the development phase, a financial contribution to development costs is expected from industry. The maintenance of the package should be entrusted to an industrial organization which would provide equal access to the different manufacturers and users alike in return for an appropriate rental.

### 3. Content of the Project

3.1. The project covers the design, specification and development of an advanced European software package which will have maximum portability between different manufacturers' computers. This package will not only be better than existing software products for this application sector but should have an effective product cycle of around ten years.

3.2. It is proposed to carry out the project in two phases : a specification phase and a development phase. In view of the critical time constraints imposed by the evolution of competitive products it is essential that development be undertaken immediately after the specification phase. It is assumed that in view of the strategic importance of this project, a council decision will be taken soon so that work can commence on June 1, 1976.

#### 3.3. Specification Phase

The specification phase will have the following main objectives :

- to gather adequate knowledge of the characteristics of existing systems
- to gather information about the needs of users and potential users and, if they are users, to obtain their reactions to the system they are using
- to determine target machine configurations for different manufacturers
- to determine bridging requirements for users of existing systems

- to draw up the package specification on the basis of the users views and design the method of constructing the package
- to select up to four specific information fields and specify and design the special modules needed
- to study the possible impact of the evolution of competing technologies over the life of the package.

The specification phase comprises a series of technical studies, user and market surveys requiring highly experienced personnel in various disciplines. This work would be coordinated by the Project Leader in close consultation with and guidance from the Technical Committee. Systems already in operation following other Community projects (Legal documentation and Import/Export for example) would be examined and taken into consideration.

#### 3.4. The Development Phase

This phase will have two main objectives :

- to develop the specified package and test it with pilot users before final release
- to produce documentation about all aspects of the end product including manuals for both users and suppliers and to hand over the product maintenance and distribution responsibility to the organisation chosen.

#### 4. Project Method

4.1. It is proposed that a project leader be appointed on a full-time basis by 1st June 1976. With assistance from the Consultative Committee, and major users he would establish a Technical Committee which would work with him on a continuous basis during the evolution and completion of the project.

In addition to his normal responsibilities (described in doc. COM 1191/III 74 E) the Project Leader will :

- take account in the specification phase of related information coming from other Community Projects
- assist in the selection of an industrial organisation for the maintenance and distribution of the products
- assist in handing over the package to this organisation.

4.4. At the beginning of the specification phase a Technical Committee composed of experts from industry and major users would be established. In addition to the normal functions (described in Doc 1191/III/74 E) the Committee will have the following tasks :

it will act as workshop where the contractors staff can hear about the latest experiences in information retrieval developments and requirements;

it can nominate suitable users within the group and outside to try out the package before it is finally released ;

it will be used to broadcast the existence of the work that is being done to avoid unnecessary duplication of effort elsewhere.

5. Time Scale :

- 5.1. There is currently a need for the proposed package and it should be produced at the earliest opportunity. It is understood that world's largest manufacturer's package is currently being upgraded and for some users this could be a deciding factor in their future planning and choice of hardware. The schedule summarised below assumes the appointment of a Project Leader by 1st June 1976 and all other quoted dates are relative to this point.
- 5.2. It is proposed that suitable Contractors be appointed by 1 September 1976 and that the design specification phase would commence as soon as practical after this date.
- 5.3. Except for the selection and specification of the applications modules, which is not expected before April 1978, all of the specification phase would be expected to be complete by June 1977.
- 5.4. In the development phase it is planned that documentation work would commence in April 1977 but the development phase proper would not commence until July 1977. At this point, a four month crash programme would begin to produce a very rough working model of the package so that potential users will have a chance to experience the broad aspects of the package in operation.

5.5. The members of the Technical Committee will use the rough of the package for scrutiny and comment. Detailed specifications of some of the modules would be modified to take account of their comments, as late as May 1978. It is expected that the development and distribution responsibility will be handed over to the organisation chosen by the Commission on the advice of the Consultative Committee.

It is not expected that the project can be accelerated to complete it in under  $3\frac{1}{2}$  years. Provided that the Council adopts the project in time, the time-table is :

Specification Phase

General Package	September 1976 - June 1977
Applications modules	September 1977 - March 1978

Development Phase

Documentation work	April 1977 - July 1979
Programming	June 1977 - December 1979

EXPERIMENTAL APPLICATION IN HIGH SPEED DATA COMMUNICATIONProject Summary

The project covers an experimental development for a computer application comprising a series of experiments conducted by users in computer-to-computer communication using the European Informatics Network (EIN) and the orbital test satellite planned by the European Space Agency (ESA). The application provides for experiments in advanced data communications techniques in high speed transmission using communication facilities planned by the different participants in the project : EIN, ESA, European Organisation for Nuclear Research (CERN) and its collaborating laboratories.

The duration of the project is expected to be five years . A Council decision on a Community contribution to the Cost is required before the end of 1975 so that the project may commence in January 1976 to fit in with the development programs of ESA and EIN.

1. Statement of the Requirement1.1 Introduction

The impact of new data communications techniques is already having an effect on almost all aspects of human affairs. The conduct of experiments in the use of the EIN communications sub-network and the ESA test satellite (OTS) in the demanding area of data processing for high energy physics research will be of great mutual benefit to the organisations involved, and should provide valuable information as a basis to judge the likely impact elsewhere of new developments in data communications and its applications.

1.2. Background - EIN

EIN is expected to become operational in 1976. It is designed to provide experience in computer network technology which could pave the way for other international computer networks. However, no provision has yet been made to augment the research work of the initial centres by pilot user-applications involving real traffic which could help in initial debugging and test out reliability of service, system capacity and the like. As the EIN project is an experiment in computer networking it is important to attract users who can benefit from the experimental environment.

1.2.1 Requirement - EIN

Pilot users with operational requirements for data Communication are needed to check out the system performance from the point of view of such users.

The experience gained from EIN should help in evolving guide-lines and standards that can be applied when designing new computer networks.

This could include :

- a)- performance e.g., reliability, load factor, etc.
- b)- user-interface hardware and software techniques
- c)- distributed processing techniques

1.3 Background - OTS

The Orbital Test Satellite (OTS) is an experimental communications satellite being built by the European Space Agency (ESA) and scheduled for launching in mid-1977. The satellite contains two narrow band channels which are available for use in high speed data transmission experiments. The purpose of OTS is to act as a forerunner to the planned European Communications Satellite and to try out the new ideas and techniques which the latter will use.

### 1.3.1 Requirement - OTS

The development of the satellite along with its powerful communications capability is already being funded by ESA. Users and potential users with computer to computer applications requiring high speed data transmission facilities are needed to explore the capability provided by OTS. Practical experiments should be conducted in bulk data transfer with particular reference to error-checking and error procedures. Such experiments would be valuable as a source of early operational data based on real usage of a satellite link and in the planning and design of standard equipment by industry. Simple, low cost, earth stations handling data rates not in routine use today, will require the development of appropriate antennae, radio frequency amplifiers and receivers, data transmission equipment and formats.

### 1.4. Background - CERN

Hundreds of scientists from Member Countries come to CERN to carry out high energy experiments. Experimental data on bubble chamber film and on tens of thousands of magnetic tapes is collected every year at CERN and the great majority is eventually analysed on computers in the experimenters' home laboratories. At present the means of transport of the data (by aircraft or by road) is inadequate. This constraint makes it impossible to use computers in the scientist's home laboratories to control the running of their experiments at CERN, by analysing significant sized samples of data and returning the results in time to correct errors or malfunctions. These sample calculations have, therefore, to be done at CERN. The physicists have to develop and maintain two sets of programs, possibly for different makes of computers, with all the extra work and possibilities of error which this entails.

#### 1.4.1 Requirement - CERN

A developed and economical system of data communication between the various laboratories allowing remote use of computers would increase the efficiency of CERN's operation and make for a better balance

CERN is thus very interested in current developments towards international data networks and is ready to participate in their development in any way consistent with the mission and resources of the organisation. Several other high energy physics laboratories have indicated similar interest and desire to join in experiments on international data transmission.

2. Proposal

2.1 CERN and its collaborating laboratories are particularly well placed to help in tests involving realistic heavy traffic, since the high energy physicists form a community accustomed to exploiting large quantities of data, while working with equipment and services which do not have public service reliability and availability. They will not therefore be deterred from using an experimental network such as EIN. It is therefore proposed as a first stage that the EIN network be extended to include a node at CERN which would enable the scientific community to make such experiments using the network.

2.2 As a second stage, CERN and interested associated laboratories will be provided with the necessary equipment to establish a satellite link. This would require the provision of a transmit/receive earth station at CERN and appropriate earth stations at the various laboratories. Experiments using the OTS satellite are proposed as a continuation of the series of planned traffic experiments at much lower speed using the EIN. Several associated laboratories of CERN have shown interest in these experiments, notably RHEL in the UK, and DESY in Germany who are advanced in their arrangements. Other possibilities are Centres in Amsterdam, Bologna and Paris.

---

RHEL : Rutherford High Energy Laboratory

DESY : Deutsche Elektronen Synchrotron

### 3. Content of the Project

There are two stages in the project which are described below.

#### 3.1. Stage 1

##### 3.1.1. Content

- Installation of data transmission equipment to extend EIN to CERN and to permit experiments in computer to computer communication between CERN and Rutherford Laboratory.
- The key elements of stage 1 of the project include work :
  - to establish and test at saturation capacity with real data a computer-to-computer link between CERN and Rutherford Lab. using EIN, EPSS and the necessary interconnecting computers.
  - to assess how the results of these experiments influence the organisation and implementation of high energy physics research and other applications.

##### 3.1.2. Time Scales

EIN is due to start initial operation in mi-1976. Allowing several months for testing by its designers, the testing phase of CERN experiments using the network could start around end-1976. Before then, the CERN node should be installed, checked out, and the first experiments prepared at CERN and Rutherford Laboratory. This implies that the node computer should be purchased and installed at CERN early in 1976.

The traffic experiments will have, on this time scale, a testing phase during the early months of 1977, after which the network should be made available on a suitable planned schedule for use by the physics groups concerned. The duration of a particular group's use of EIN should be planned for around two years (till 1979), this being the typical time scale for a high energy experiment. When other laboratories participate the duration of the experiments may be prolonged.

3.2 Stage 2

3.2.1 Content

It is proposed to install transmitting/receiving equipment at CERN and a receiver at RHEL, thus providing a one-way transmission link via the satellite. The satellite earth station at CERN will be interfaced to the equipment already installed for connection to EIN (in Stage 1).

The key elements of stage 2 include :

- The development and testing of the equipment necessary to establish a computer to computer link via the OTS system at high data transmission rates.
- The experimental use of the OTS satellite for bulk transfer of data with particular emphasis given to developing error checking techniques and error control procedures.
- The feasibility of using a terrestrial data network to control bulk data transfer through a satellite channel.

3.2.2. Time Scales

The satellite is due to be launched in mid-1977 and tests by CERN and its partners could commence, on a partial basis, during the following 6 months. The main data experiments can only begin in 1978.

In order to match this schedule the following succession of events is foreseen :

- |  |             |
|--|-------------|
| - order of equipment                     | mid-1976    |
| - delivery of equipment                  | Spring 1977 |
| - testing and commissioning of equipment | mid-1977    |
| - duration of experiments (3 years)      | 1977-1980   |

PROJECT MANAGEMENT AND BUDGET REQUIREMENTS

The following pages set out, under the heading of actions or groups of actions, the methods of project management envisaged by the Commission, as well as an estimate of financial expenditure; the latter is summarised in each case by one or more brief financial summaries. It is noted that the project expenditure is of non-obligatory character.

1. Development project for a common language for real time programming (LTPL-Project)

- 1.1. The Commission will be responsible for implementation of the project and will be assisted by the Consultative Committee on Data-Processing Projects.
- 1.2. A technical Committee will be set up. This will be a small working party of international experts selected from among the users and the industry, which will meet regularly and provide a close liaison with the project leader on technical and development questions. Its actual function is to translate user requirements into technical specification, and provide a channel of communication between the users and the project. Composition and experiences make it highly recommendable to use LTPL-E group in this function.
- 1.3. The project leader will be a person with high-level training appropriate to the nature and scope of the project. The project leader will be assigned to the implementation of the project on a full-time basis.
- 1.4. Contractors will be responsible for the execution of technical work. These will be consortia of European companies especially software houses.

Financial implications

- 1.5. The total cost of the project will be 6.703.100 Units of accounts, distributed over four years.

The estimated costs are shown in the tables on the following two pages. The financial summary form corresponding to this action is shown on page 74.

The expenditure has been estimated on the basis of price forecasts at the middle of 1975. The Commission may decide to adjust the amounts, depending on the actual date of the Council decision, in the light of the economic situation.

(e)

ESTIMATED COSTS OF LTPL PROJECT

I. General expenses (in Units of Account)

	1976	1977	1978	1979	TOTAL
Project leader à 60.000 per year	60.000	60.000	60.000	60.000	240.000
Assistant à 30.000 per year	30.000	30.000	30.000	30.000	120.000
Travel costs Project leader + assistant 2 per year USA : 1.500 10 per year Europe : 250	5.500	5.500	5.500	5.500	22.000
Management and Administration - 1 Secretary - Overhead costs for office and other administration expenses - Printing and publication of Documents	80.000	80.000	80.000	80.000	320.000
Committee travel costs 4 per year, 20 attendants at 200	16.000	16.000	16.000	16.000	64.000
<b>Total per year</b>	191.500	191.500	191.500	191.500	766.000

II. Expenses for working contracts and technical computing time (LTPL-Project)

A. Definition phase

		1976	1977	1978	1979	Total
Technical manpower ca. 35 men year at 40.000	--	1.032.000	302.100	83.000	-	1.417.100
Computing time		10.000	10.000	10.000	-	30.000

B. Implementation phase

Technical manpower 60 men year at 40.000		900.000	1.000.000	500.000	-	2.400.000
Computing time		300.000	300.000	200.000	-	800.000

C. Evaluation phase

Technical manpower 22 men year at 40.000		-	280.000	280.000	320.000	880.000
Computing time		-	130.000	130.000	150.000	410.000

<b>Total costs</b>						
a. general costs		191.500	191.500	191.500	191.500	766.000
b. contracts + computing time		2.242.000	2.022.100	1.203.000	470.000	5.937.100

<b>Total Project costs</b>	<b>6.703.100 U.A.</b>
----------------------------	-----------------------

FINANCIAL SUMMARY FORM

1. Budgetary post concerned: Article 321
  
2. Title of project: Development of a common language for real time programming-LTPL Project
  
3. Legal basis: Article 235 of the Treaty  
Decision of the Council dated .....
  
4. Objective of the Action: Development of a common language for real time programming in view of standardisation
  
5. Total cost of Action and annual payments foreseen,
  - 5.0. Total cost: 6,702,750 U.A.
  
  - 5.1. Time-table for payments:

	<u>1976</u>	<u>1977</u>	<u>1978</u>
U.A.	2.433.150	2.213.600	1.394.500
  
  - |      |             |
|------|-------------|
|      | <u>1979</u> |
| U.A. | 661.500     |
  
6. Financing: Provisions to be made in future budgets.

2. Software Portability (Annex 2)

- 2.1. The Commission will be responsible for the implementation of the projects and will be assisted by the Consultative Committee on Data Projects.
- 2.2. Day-to-day project management will be entrusted to a project leader selected for his knowledge of the subject.
- 2.3. The projects will be developed in close collaboration with the interested parties, i.e; hardware and software manufacturers, users and computer research centres. The membership of the technical committees will be determined by the nature of the product and the special knowledge required.
- 2.4. With regard to product policy, the Commission will collaborate closely with the Consultative Committee and the interested parties in working out a suitable policy to cover :
- the recovery of public investments in the event of a product proving commercially successful;
  - industrial ownership;
  - distribution and maintenance of the products;
  - recommendations for the use of products (possibly standardization) within the framework of a Community policy on public contracts.
- 2.5. The estimated costs are shown in the tables on the following three pages.  
The financial summary form corresponding to this action is shown on page 78.

Cost EstimatePORTABILITY

Project	Nature of work	Period (months)	Cost per man-year in u.a.	Work (man-months)	Computer costs	Total
<u>Compilers</u>						
4.4.a. (year 1976)	(See 4.3.a of text)	6	60,000	1 x 6	-	30,000
	- Study of existing languages	6	60,000	3 x 6	23,000	113,000
	- Study of Architecture;					
	- Preparation of specifications	4		4 x 4		80,000
	2 languages					<u>223,000</u>
Total						
4.6.a. (years 1977 and 1978)	(See 4.6.a of text)	24	40,000	16 x 24	320,000	1,600,000
	- design of 2 portable compilers (1977);					960,000
	- extension for 6 types of machines (1978);					
	Est. cost per version 10% of cost of compiler					<u>2,560,000</u>
Total						
<u>Language</u>						
4.7.b. (year 1976)	(See 4.5.6. of text)	6	60,000	2 x 6	15,000	75,000
	- analysis of existing languages and selection (ESL <sub>0</sub> )					
4.10.b. (year 1977)	- adaptation of ESL <sub>0</sub> ;	12	40,000	7 x 12	70,000	350,000
	- modification of ESL <sub>0</sub> to obtain ESL	12	40,000	4 x 12	40,000	200,000
Total						
4.11.b. (year 1978)	- Modification of ESL	12	40,000	10 x 12	100,000	500,000

<u>Subsystems</u>							
4.6.c. (year 1976)	Selection of products :						
	- Data bank	6	60,000	4 x 6	30,000		150,000
	- Transactions	6	60,000	3 x 6	20,000		100,000
						Total	250,000
4.8.c. (years 1977 et 1978)	Conversion to ESL <sub>o</sub>						
	- Data bank	12	40,000	14 x 12			1,200,000 (1977)
	- Transactions	12	40,000	10 x 12	240,000		
	- Conversion to ESL (est. cost 25 % of ESL <sub>o</sub> )						300,000 (1978)
						Total	1,500,000
<u>Conversion tools</u>	(See 4.4.d. of text)						
4.5.d. (year 1976)	- Specification of tools	6	60,000	2 x 6	-		60,000
4.6.d. (years 1977-78)	(See 4.7.d. of text) - Design of tools and modification	24	40,000	20 x 24	500,000		2,100 000
<u>O.S. for mini-computers</u>	(See 4.3.e of text)						
4.4.e (year 1975)	- Study and specifications	6	60,000	1 x 6	-		30,000
(year 1977)	(See 4.5.e of text) - Design						600,000

General expenses

The overall annual costs are as follows :

	1976	1977	1978
Project Leader	60,000	60,000	60,000
Assistant project Leaders	-	120,000	120,000
Secretariat Services	50,000	200,000	100,000
Travel expenses for technical Committees	50,000	50,000	50,000
Travel expenses for Advisory Committee	25,000	25,000	25,000
Total	185,000 u.c.	455,000 u.c.	355,000 u.c.

Summary

Projects	1976	Budget in u.a. 1977	1978	Total per project in u.a.
a	223,000	1,600,000	960,000	2,783,000
b	75,000	550,000	500,000	1,125,000
c	250,000	1,200,000	300,000	1,750,000
d	60,000	1,050,000	1,050,000	2,160,000
e	30,000	600,000	-	630,000
General expenses	185,000	455,000	355,000	995,000
Total	823,000	5,455,000	3,165,000	9,443,000

SUMMARY OF FINANCIAL RECORD SHEET

:

1. Relevant budget heading : Article 321
2. Title of project : **Projects in Data Processing concerning Software portability**
3. Legal basis : - Article 235 of the Treaty  
- Council Decision of .....
4. Aim of project : **Design and development of portable compilers, a software writing language, subsystems for data base management and transaction processing, conversion tools, a basic operating system for minicomputers.**
5. Total cost of project and annual appropriations required
  - 5.0. Total cost : 9,503,000 u.a.
  - 5.1. Time scale :

	<u>1976</u>	<u>1977</u>	<u>1978</u>
u.a.	823,000	5.455,000	3,165,000
6. Finance : **provisions to be made in future budgets.**

3. Studies in support of the use of data-processing (Annex 3).

- 3.1. The Commission will be responsible for the implementation of the project and will be assisted by the Consultive Committee Data Processing Projects
- 3.2. A project manager will be given the day to day management of the various actions. It is proposed that this role is combined with project leader of the "portability" project since several aspects of these two projects are complementary. The project manager will be assisted by a deputy for the individual projects.
- 3.3. The Commission will take care that a close liaison is established between the Institutes directly charged with carrying out the work and all interested organisations whether research, user or industrial. These Institutes will be selected by virtue of their experience in the areas being considered and their willingness to cooperate with each other in the framework of the Community.
- 3.4. The estimated costs are shown in the tables on the two following pages.  
The financial summary form corresponding to these studies is shown on page 82.

Cost estimateStudies in support of the use of data processing

Project																					
<u>Data security and confidentiality</u> (see 2.8 of text)  First phase   Second phase	A - 29 000 u.a. B - 26 000 u.a. C - <u>32 000 u.a.</u> 87 000 u.a. from 1976 budget  A - 600 000 u.a. SUMMARY FINANCIAL RECORD SHEET

1. Relevant budget heading: Article 321
2. Title of project: Studies in support of the use of data processing
3. Legal basis: Article 235 of the Treaty  
Council Decision of .....
4. Aim of the project: To carry out a study on data security  
and confidentiality  
Study on programming techniques  
To evaluate and implement data base systems
5. Cost of the project and annual appropriations provided:  
5.0 Total cost: 5 029 000 u.a.  
5.1 Timetable:           1976                   1977                   1978                   1979  
                  1 064 000 u.a. 1 555 000 u.a. 1 555 000 u.a. 855 000 u.a.
6. Financing: provisions to be made in future budgets.

4. Applications and studies in the field of data-processing  
(Annex 4)

4.1. Project for the specification and development of a computer-based information storage and retrieval system (Annex A to Annex 4)

FINANCIAL RECORD SHEET

Cost estimate

1. Cost of specification phase: ..... 471.000 u.a.

	<u>1976</u>	<u>1977</u>	<u>1978</u>
<u>Technical costs:</u>			
- Contracts to industry personnel and computer time:	10,000	170,000	
- Users technical Group	5,000	10,000	20,000
- Project management			
Project leader:	30,000	25,000	55,000
Travel costs:	3,500	2,500	5,000
 <u>Total Technical costs</u>			
 - Administration costs	 25,000	 25,000	 25,000
 <u>Total costs/year</u>	 <u>133,500</u> =====	 <u>232,500</u> =====	 <u>105,000</u> =====

2. The cost of the development phase is estimated at 1,6 M.U.A.

FINANCIAL SUMMARY FORM

1. Budgetary post concerned : Article 321
  
2. Title of Project : Project for the specification and development of a  
Computer-based Information Storage and Retrieval  
System (Annex A to Annex 4)
  
3. Legal Basis : Article 235 of the Treaty  
Decision of the Council dated 15th July 1974
  
4. Objectives of the Action : The specification of a Computer-based Information  
Storage and retrieval system usable for many  
applications and over a wide range of computers.
  
5. Total cost of Action and annual payments forseen
  - 5.0 Total Cost 471,000
  - 5.1. Time-table for payments :

	<u>1976</u>	<u>1977</u>
U.A.	133,500	232,500
	<u>1978</u>	
U.A.	105,000	
  
6. Financing : Provisions to be made in future budgets.

4.2. Experimental application in high speed data transmission (Annex B to Annex 4).

4.2.1. Cost of Stage 1 - Extension of EIN

		total cost u.a.
a) <u>Design and Installation Phase</u>		
(i) <u>Capital Costs :</u>		
- Supply and installation of network Switching Centre .....	u.a. 170,000	
- Modems .....	65,000	
- Remote Gateway computer (common to stage 2) and other equipment at CERN	<u>95,000</u>	
TOTAL	<u>330,000</u>	330,000
(ii) <u>Other costs during design, Installation and Commissioning (1976)</u>		
- Staff - 6 man years by EIN, CERN and RHEL at 40,000 u.a.	240,000	
- Travel and administration	30,000	
- maintenance of switching centre ( $\frac{1}{2}$ year)	<u>10,000</u>	
TOTAL COSTS 1976	<u>280,000</u>	280,000
b) <u>Transmission experiments phase :</u>		
- Operation and maintenance of Switching Centre	20,000	
- Data links to other centres	30,000	
- Staff for conduct and evaluation of experiments ( 4,5 from EIN, CERN, RHEL)	180,000	
- Travel and administration	<u>30,000</u>	
TOTAL COSTS PER YEAR	<u>260,000</u>	
c) Cost for 3 years 1977, 1978 and 1979		<u>780,000</u>
TOTAL COST OF PROJECT STAGE 1		<u>1,390,000</u>

\* Financing required

from the Community : 490,000 u.a.

This includes the cost of equipment, maintenance and the cost of data links.

4.2.2. Cost of Stage 2 : Extension to use (OTS) Satellite

a) <u>Design and Installation Phase</u>		Total cost
(i) <u>Capital Costs :</u>	u.a.	u.a.
- Supply and Installation of 3 simple earth stations at		
CERN .....	110,000	
RHEL .....	50,000	
DESY .....	110,000	
- Equipment modifications	<u>50,000</u>	
* TOTAL	<u>320,000</u>	320,000
(ii) Other Costs during design, installation and commissioning		
- Staff - 8 man years by ESA, CERN, RHEL, DESY at 40.000 u.a.	320,000	
- Travel and administration	30,000	
- equipment maintenance (2/3 year)	<u>20,000</u>	
	<u>370,000</u>	<u>370,000</u>
		690,000
b) <u>Transmission experiments phase (for three years)</u>	<u>Cost per year</u>	
* - operation and maintenance of earth stations	30,000	
- Staff for conduct and evaluation of experiments : 7 staff per year	280,000	
- Travel and administration	<u>30,000</u>	
- Cost per year	<u>340,000</u>	
Cost for 3 years (1978, 1979, 1980)		<u>1,020,000</u>
TOTAL COST		<u>1,710,000</u>

\* Financing required from the Community 430,000.

This includes the cost of equipment and maintenance:

4.2.3. Community Funding Required and schedule of Payment :

		<u>Payment Schedule by Year</u>				
	<u>Total Funding</u>	1976	1977	1978	1979	1980
Stage 1	490,000	340,000	50,000	50,000	50,000	
Stage 2	<u>430,000</u>	<u>160,000</u>	<u>180,000</u>	<u>30,000</u>	<u>30,000</u>	<u>30,000</u>
TOTAL	<u>920,000</u>	<u>500,000</u>	<u>230,000</u>	<u>80,000</u>	<u>80,000</u>	<u>30,000</u>

A contribution of 920,000 u.a. from the Community represents 34 % of the total cost of the project.

4.3. The financial summary forms is on page 88.

FINANCIAL SUMMARY FORM

1. Budgetary post concerned : Article 321
2. Title of project : Experimental application in high speed  
data transmission.
3. Legal basis : Article 235 of the Treaty  
Resolution of the Council dated 15th July, 1974
4. Objective of the Action : The project comprises experiments in computer  
to computer Communications using computer  
networks and satellite link for develop-  
ment of advanced techniques in high speed  
transmission
5. Total cost of Action and annual payments foreseen
  - 5.0 Total cost : 920 ,000 a.u.
  - 5.1 Time table for payments :
 

<u>1976</u>	<u>1977</u>	<u>1978</u>	<u>1979</u>	<u>1980</u>
500,000	230,000	80,000	80,000	30,000
6. Financing : Provisions to be made in future budgets.

FINANCIAL SUMMARY FORM

---

1. Budgetary post concerned : Article 321
2. Title of project : A set of exploratory studies.
3. Legal basis : - Article 235 of the Treaty  
- Resolution of the Council dated 15th July 1974.
4. Objective of the Action : A set of technical studies and surveys  
required to complete the development of  
actions in a medium term programme.
5. Total cost of Action and annual payments foreseen
  - 5.0 Total cost : 500,000 a.u.
  - 5.1. Time-table for payments : 

<u>1976</u>
500,000 u.a.
6. Financing : Provisions to be made in future budgets.
