

Recent and past processes at the ice-sheet base of Jutulstraumen drainage basin (Antarctica)

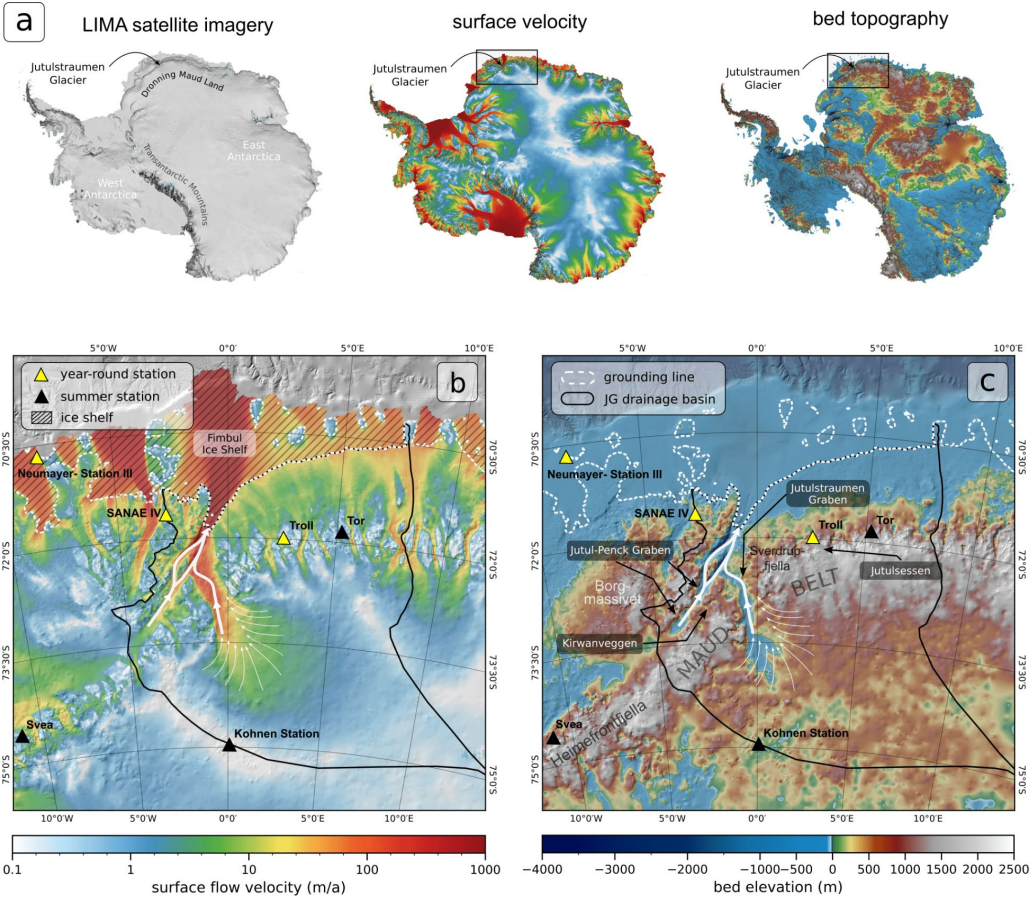

Steven Franke, Niklas Neckel, Hannes Eisermann,
Veit Helm, Daniel Steinhage, Jölund Asseng,
Heinrich Miller, Wilfried Jokat, Graeme Eagles,
Reinhard Drews, Olaf Eisen, Daniela Jansen

Study region and data

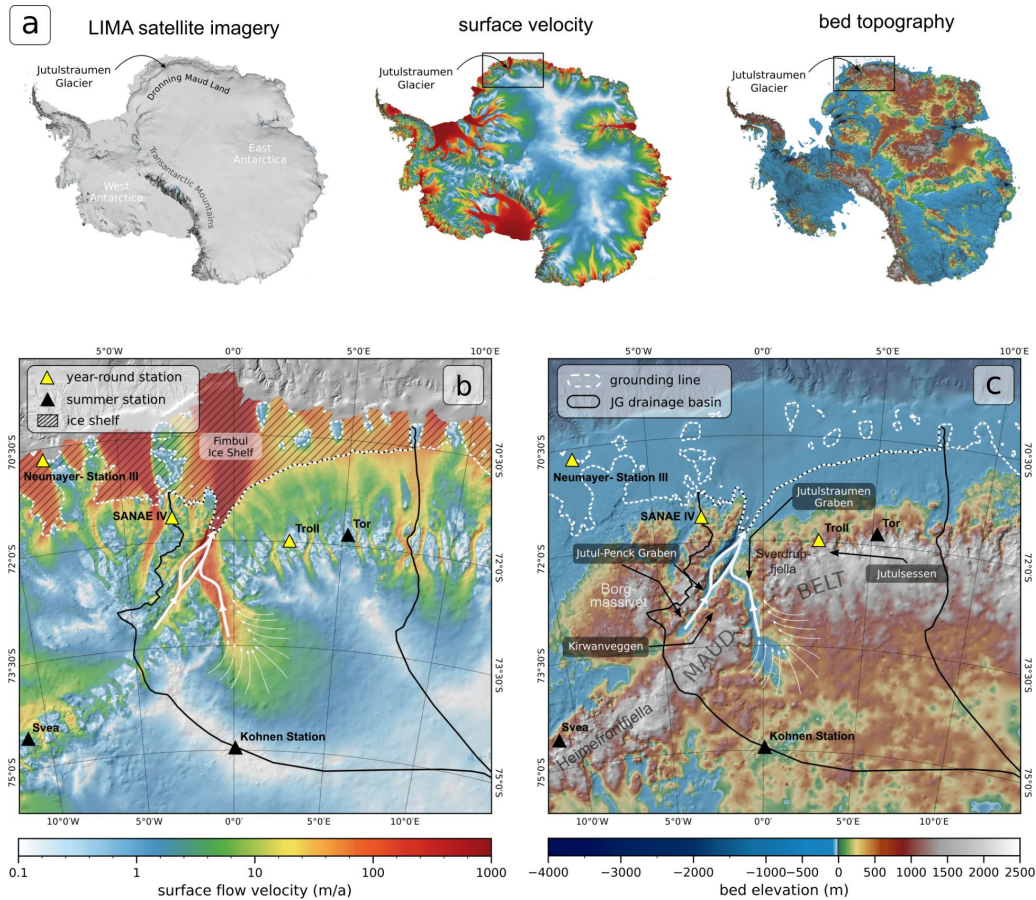

Study region and data

(1) Ice-penetrating radar data

Study region and data

(1) Ice-penetrating radar data

(2) Ice surface displacement (vertical) from DInSAR Sentinel-1 data

Preserved landscapes underneath the Antarctic Ice Sheet reveal the geomorphological history of Jutulstraumen Basin

Steven Franke¹ | Hannes Eisermann¹ | Wilfried Jokar^{1,2} |
Graeme Eagles¹ | Jölund Asseng¹ | Heinrich Miller¹ | Daniel Steinhage¹ |
Veit Helm¹ | Olaf Eisen^{1,2} | Daniela Jansen¹

Aim

- Investigate the radar-derived bed topography at very high resolution
- Decipher the ice-flow history from the geomorphology beneath the ice

Aim

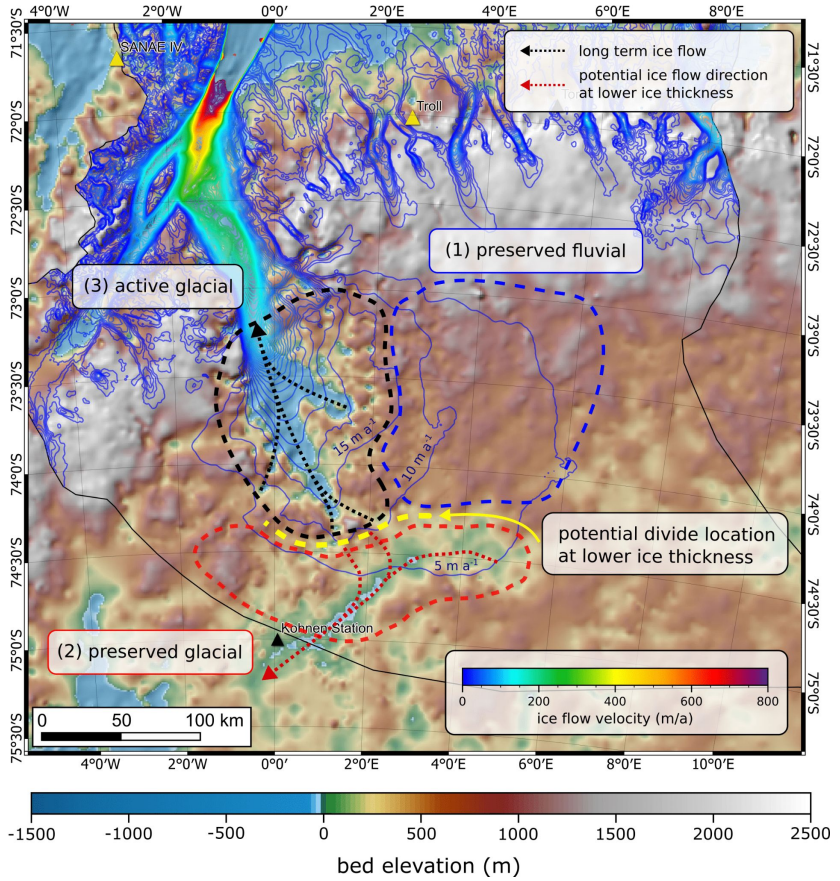

- Investigate the radar-derived bed topography at very high resolution
- Decipher the ice-flow history from the geomorphology beneath the ice

Methods

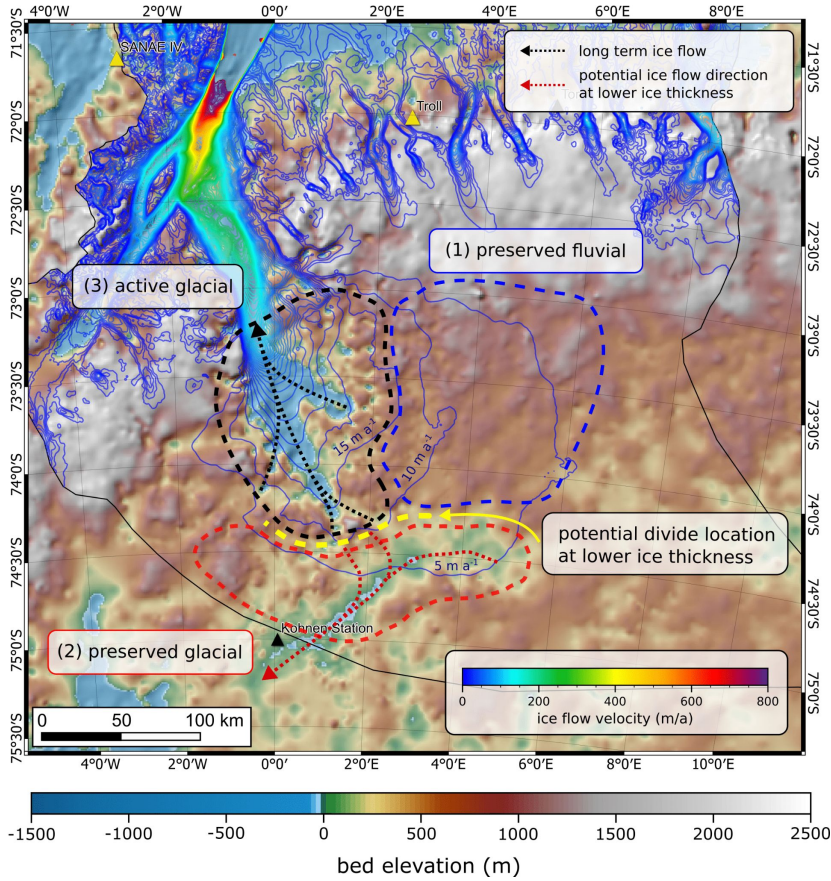

- new bed topography DEM
- hypsometry
- basal roughness
- water flow on a isostatically corrected surface
- analysis of valley geometries

Valley analysis and landscape interpretation

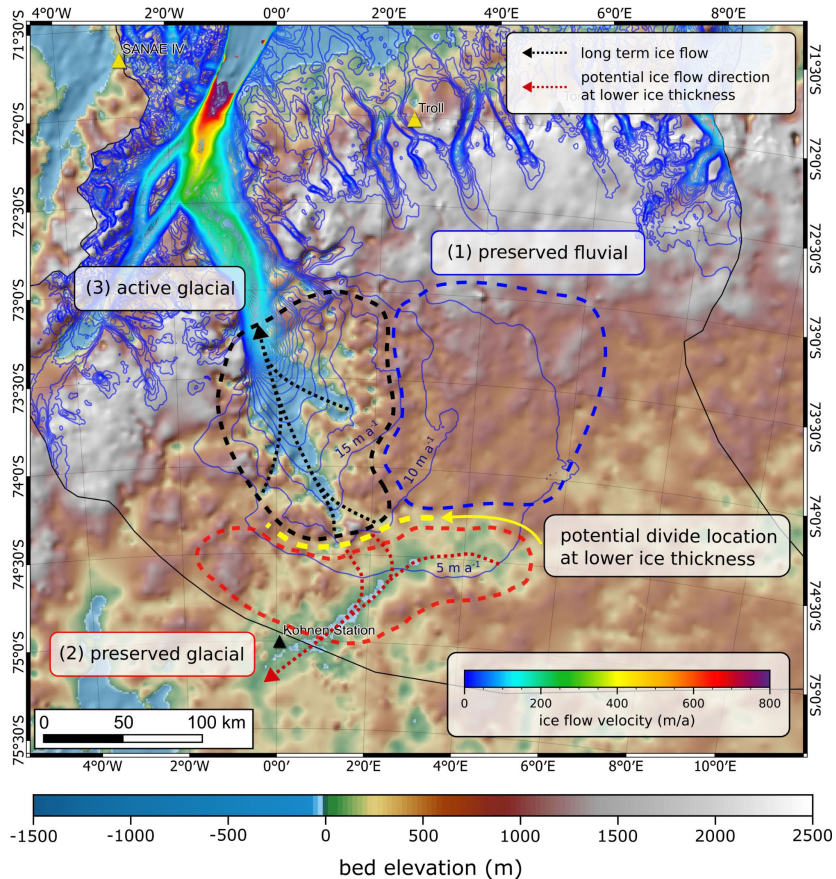

Valley analysis and landscape interpretation

- shallow, narrow and V-shaped valleys East off the fast flowing region

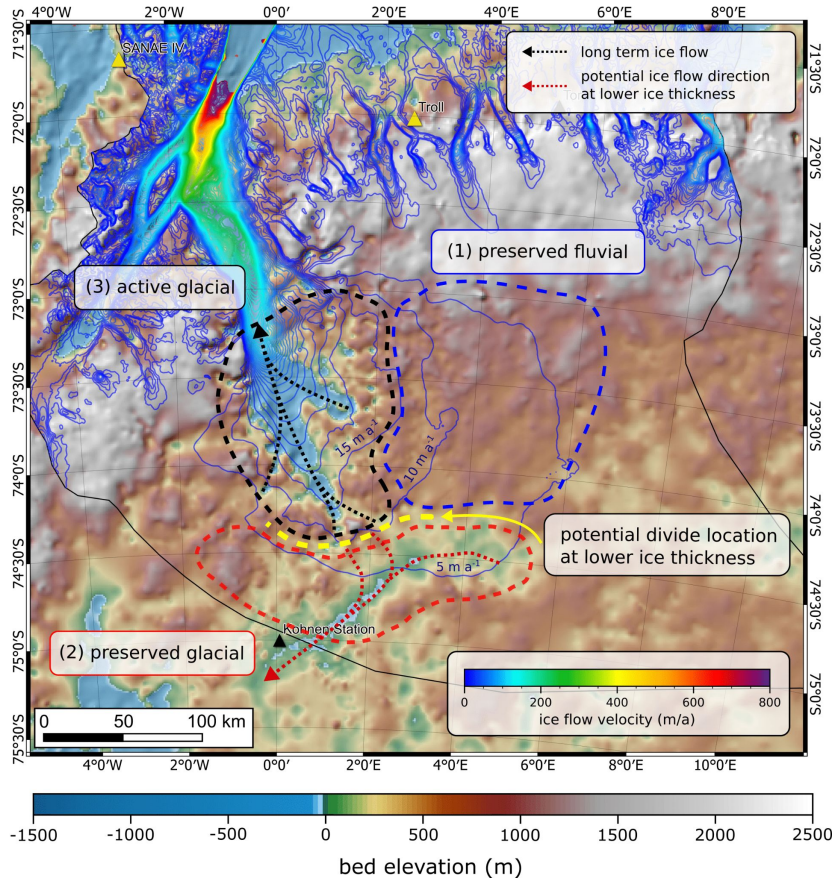

Valley analysis and landscape interpretation

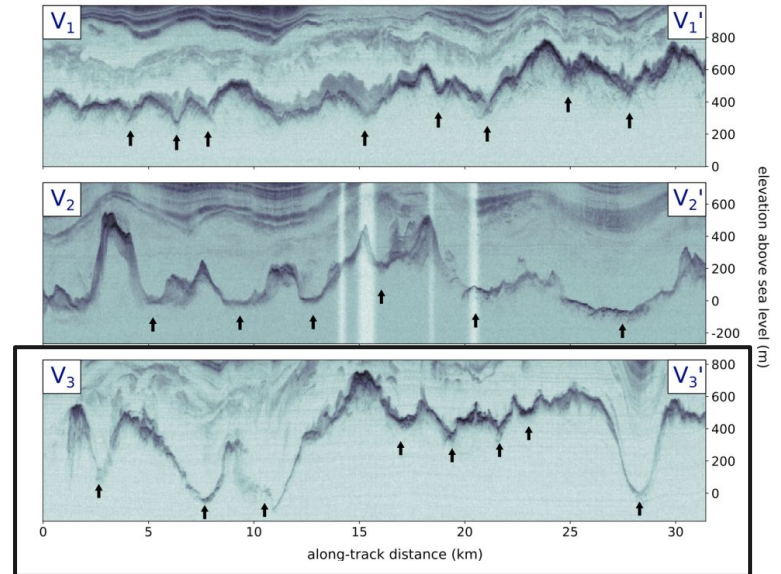

1. shallow, narrow and V-shaped valleys East off the fast flowing region
2. shallow, wide and U-shaped valleys upstream of the fast flowing region

Valley analysis and landscape interpretation

1. shallow, narrow and V-shaped valleys East off the fast flowing region
2. shallow, wide and U-shaped valleys upstream of the fast flowing region
3. deep, wide and U-shaped valleys in the fast flowing region

¹Alfred Wegener Institute, Helmholtz Centre for Polar and Marine Research, Bremerhaven, Germany, ²Department of Geosciences, Eberhard Karls University Tübingen, Tübingen, Germany

Aim

- Investigate the cause for “bull’s-eye” fringe patterns from DInSAR
- Interpret their spatial and temporal evolution in a glaciological context

Evidence of Cascading Subglacial Water Flow at Jutulstraumen Glacier (Antarctica) Derived From Sentinel-1 and ICESat-2 Measurements

Niklas Neckel¹, Steven Franke¹, Veit Helm¹, Reinhard Drews², and Daniela Jansen¹

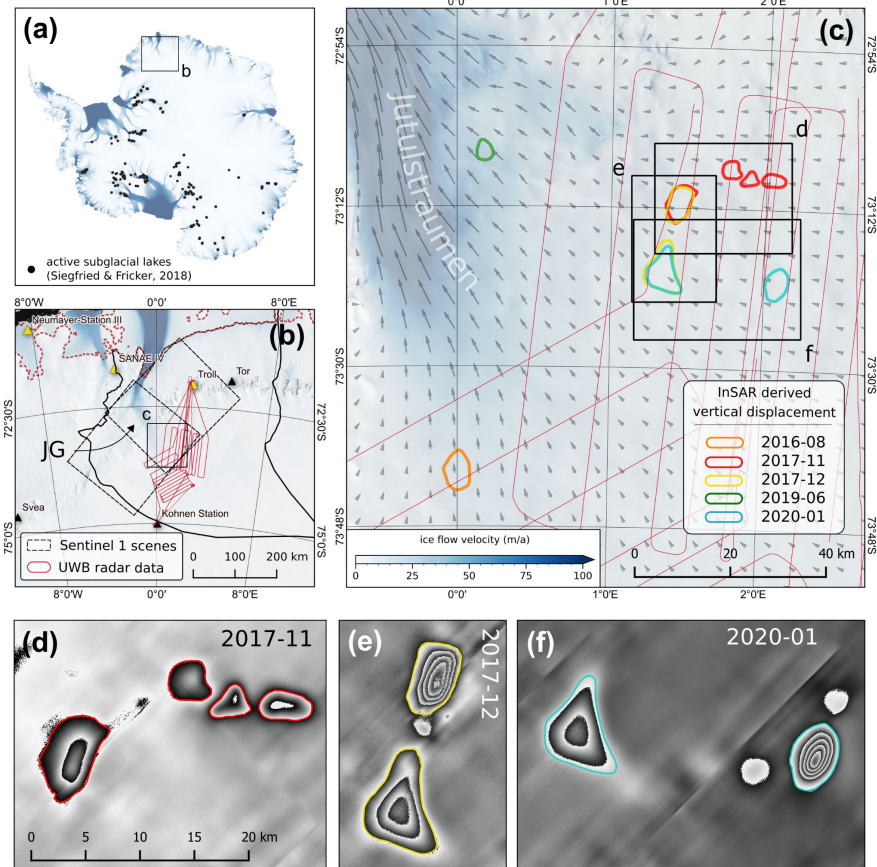

¹Alfred Wegener Institute, Helmholtz Centre for Polar and Marine Research, Bremerhaven, Germany, ²Department of Geosciences, Eberhard Karls University Tübingen, Tübingen, Germany

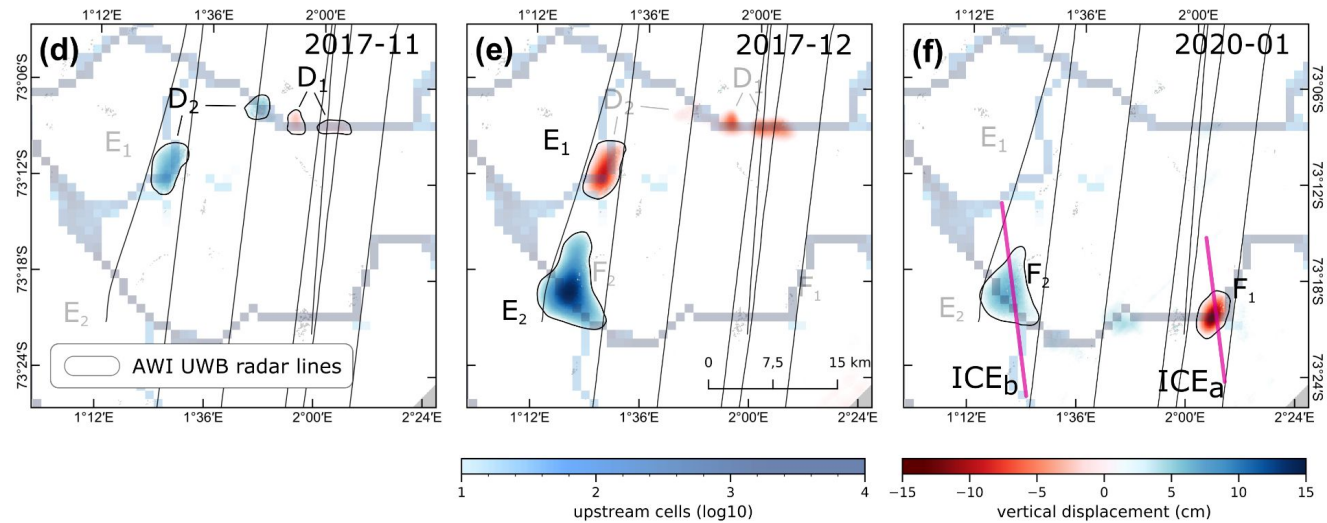

Aim

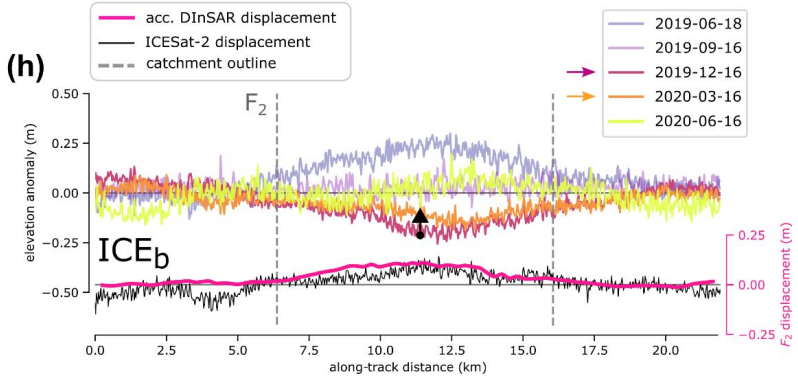

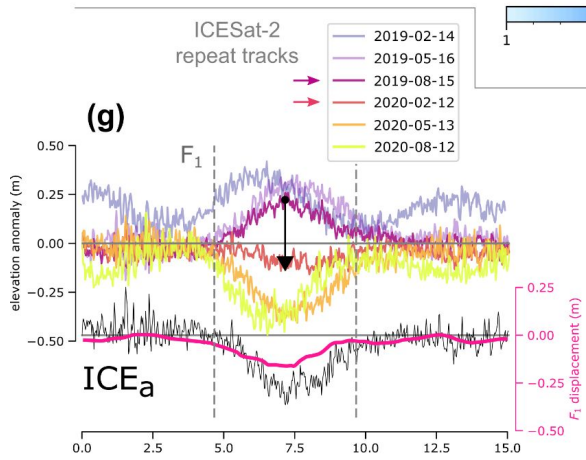

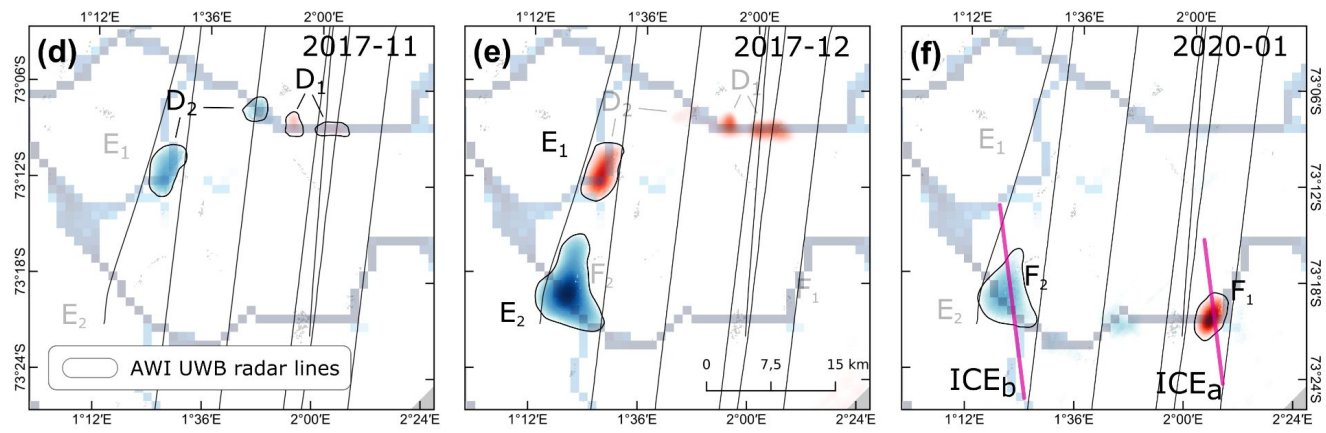

- Investigate the cause for “bull’s-eye” fringe patterns from DInSAR
- Interpret their spatial and temporal evolution in a glaciological context

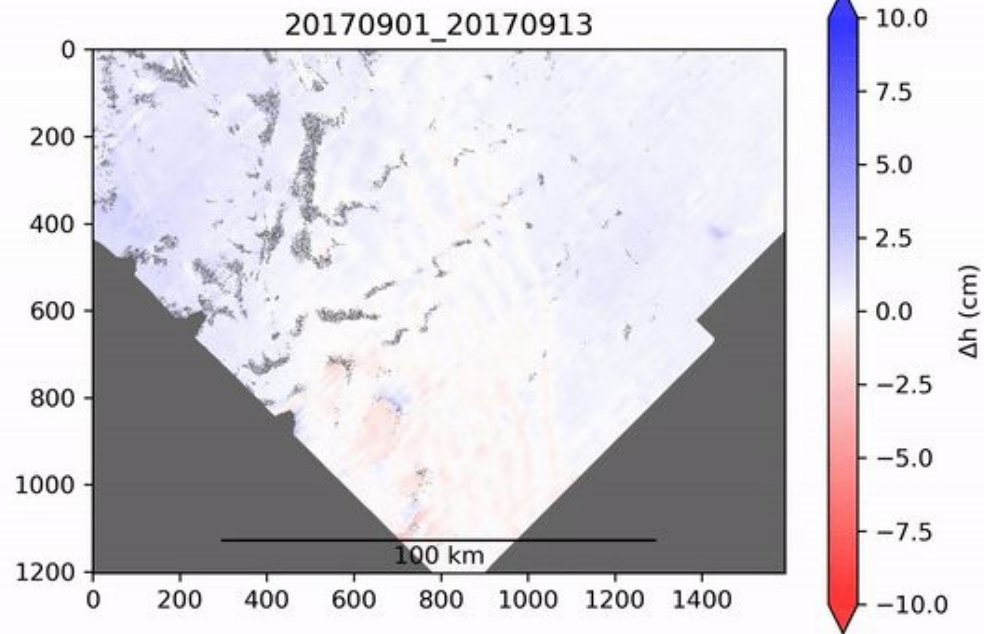

Methods

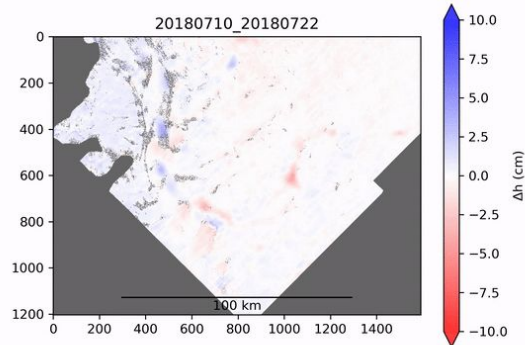

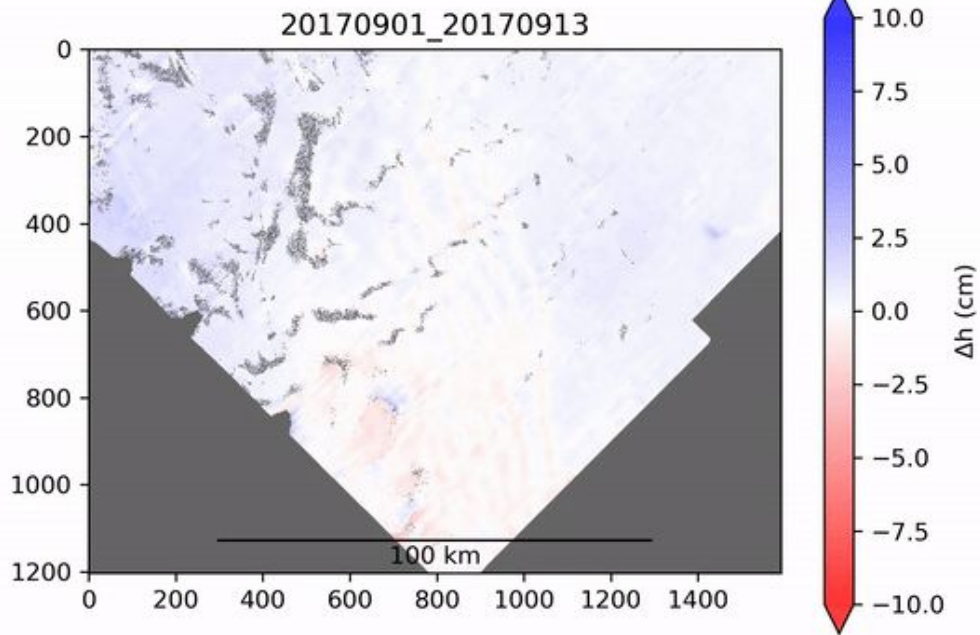

- DInSAR of Sentinel-1 data
- ICESat-2 laser altimetry
- Ice-penetrating radar data

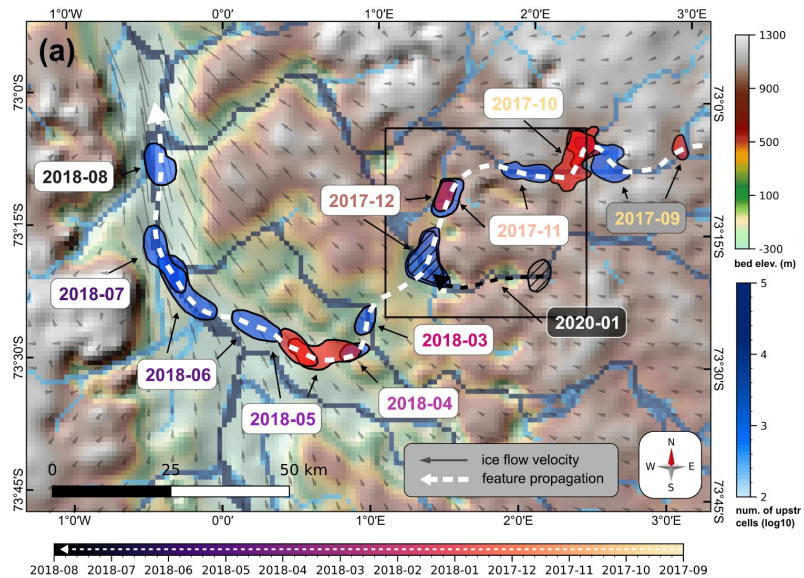

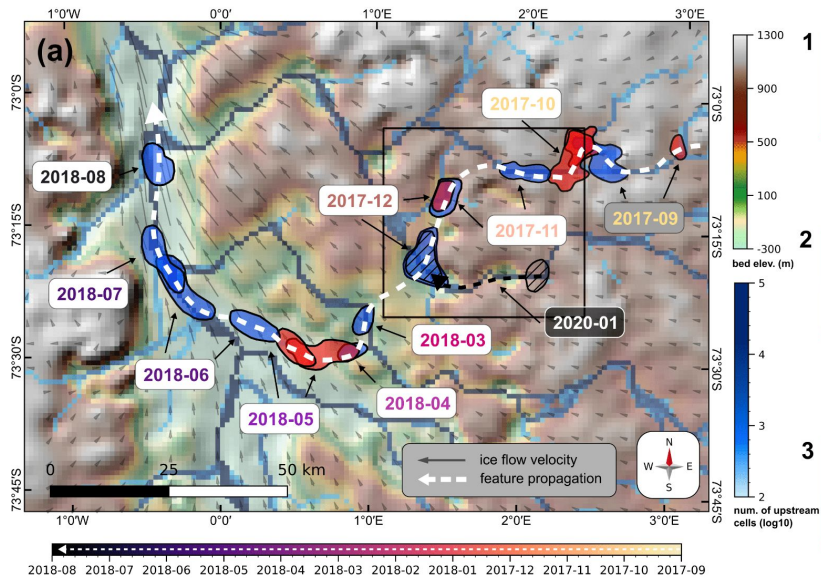

Detect active lakes
Antarctic/Greenland-wide

“Bulls-eye” detection with
Machine Learning

New active lakes inform about
the general subglacial
hydrological system

Can be used for hydrology
model validation

And to quantify the volume of
subglacial water transport
