Краткое описание

There was performed a comprehensive assessment of working conditions of refinery workers on the results of the carrying out of certification of workplaces on working conditions. An analysis of the sample materials laboratory control over the content of harmful substances in the working area of industrial premises refinery. The prolonged exposure to harmful factors on the health of workers of the main production throughout the length of service was established to be a major risk factor for the development of somatic and malignant diseases, to the gain in the morbidity rate and can become a cause of the emergency of malignancies. © 2015 Izdatel'stvo Meditsina.
