

OCEANOGRAPHIC AND MARINE BIOLOGICAL DATA BASED ON THE  
ROUTINE OBSERVATIONS NEAR SYOWA STATION BETWEEN  
FEBRUARY 1984 AND JANUARY 1985 (JARE-25)

Introduction

A three-year programme of marine biological investigations in the fast ice area near Syowa Station was planned by the Japanese Antarctic Research Expedition (JARE) as part of the international BIOMASS (Biological Investigations of Marine Antarctic Systems and Stocks) programme. One of the main objectives of the programme was to acquire marine biological data and samples with environmental parameters throughout the year to draw out a scheme of Antarctic under-ice marine ecosystems near Syowa Station. This programme commenced in 1982 (JARE-23) and we took part in the third year survey in 1984. The third year survey was stressed on the ecology of higher producers such as fish and krill and also on the decomposition processes

---

of organic matter under the fast ice. Series of routine oceanographic observations were made at three fixed stations.

In this report, we present oceanographic and marine biological data (Tables 3-5). Description of the sea ice condition in the study area is also given.

### Study Area

Observations were carried out at three fixed stations (Stns. 1, 2 and 3) out of the five stations established by JARE-23. Localities of Stns. 1, 2 and 3 are shown in Fig. 1. As the fast ice around Stn. 3 was carried away in the middle of March, the routine observation was interrupted at Stn. 3 until May when the sea ice grew thick enough to support a snow vehicle and a sledge. Both breakage and formation processes of sea ice around study area are indicated in Figs. 2 and 3.

### Methods

Eleven series of observations were carried out from 18 February 1984 to 6 January 1985. The date and items of each observation are listed in Table 1. Water samples for physical and chemical analyses were collected from depths listed in Table 2 using Van Dorn bottles of 6 l capacity. The depth indicated in the Table 2 was measured from sea level. Method for physical, chemical and plant pigment analyses were almost the same as those employed by JARE-23 (Fukuchi et al., 1985) and JARE-24 (Watanabe et al., 1986).

For measuring salinity and temperature of sea water, we newly employed a in situ CSTD monitor (FIC Model AFC-III) as well as an ordinary salinometer (Auto Lab. Model 601 MK III)

and reversing thermometers, both of which had been used in JARE-23 and -24. The CSTD monitor was very convenient to record continuous vertical profiles of temperature and salinity. Digital data of temperature and salinity are recorded at one meter depth intervals. These data were compared with ordinary determinations by salinometer and thermometer. Temperature determined by two methods is almost identical, however, salinity is quite different by both methods in some cases. Because of these results, temperature determined by the CSTD and salinity determined by salinometer are adopted and listed in the tables unless otherwise stated in the present report.

For nutrients analyses, a Hitachi Model 320 spectrophotometer (same as JARE-24) and for pigment analyses, a Shimadzu Model RF-510 spectrofluorometer (same as JARE-23) were employed. An under-water fluorometric observation was made by an in situ fluorometer of Variosens II. A total of 56 plankton samples were collected by two kinds of NORPAC nets. Size of both is 45 cm in diameter and 180 cm in side length. The mesh openings of the nets were 25  $\mu\text{m}$  (p25 net) and 330  $\mu\text{m}$  (GG54), respectively. Sediment sample was collected by a gravity corer or Ekman-Birge sampler.

#### Acknowledgments

We wish to thank Prof. T. Hirasawa, the leader of JARE-25 and his members for their encouragement and willing cooperation in the field work. Thanks are also due to Prof. T. Hoshiai, Dr. M. Fukuchi and Mr. A. Tanimura of JARE-23 who successfully started the field work of this programme and to Mr. K. Watanabe, Dr. H. Satoh and Dr. E. Takahashi of JARE-24 who made many re-

search facilities ready to use for us from the beginning of our field observation.

Abbreviations:

STD; observation of sea water temperature and salinity by a CSTD monitor.

VD ; sampling of sea water by Van Dorn bottle.

NET; plankton sampling by NORPAC net.

VAR; under water fluorometric observation by Variosens II.

SED; sediment collection by gravity corer or Ekman-Birge sediment sampler.
