

**Oceanographic Data of the 35th Japanese Antarctic Research Expedition
from November 1993 to March 1994**

Hirofumi OKANO and Akihiko OGAWA

Hydrographic Department, Maritime Safety Agency,
3-1, Tsukiji 5-chome, Chuo-ku, Tokyo 104-0045

The results of oceanographic observations on the icebreaker "Shirase" and tidal observations at Syowa Station, Antarctica, are presented in this report. The oceanographic observations were carried out in the summer mission of the 35th Japanese Antarctic Research Expedition (JARE-35) from November 1993 to March 1994. The tidal observation was continued through the winter mission of JARE-34 from February 1992 to January 1993.

1. Oceanographic Observations

The track of the icebreaker "Shirase" and the station sites of oceanographic observations in JARE-35 are shown in Fig. 1. Surface water sampling and chemical analysis were done during the cruise from Tokyo to Sydney. XBT (expendable bathythermograph), XCP (expendable current profiler) and serial observations were carried out in the Southern Ocean. Two surface drifting buoys were deployed in the Antarctic Circumpolar Current.

(1) Surface water sampling

Surface water sampling for surface water temperature measurement and chemical analysis were carried out at 115 stations en route. The sampling was done twice or three times a day using a plastic bucket (5 or 10 L). Even if the icebreaker "Shirase" stayed in ice covered area, the sampling was made. The results are given in Table 1.

(2) XBT observation

XBT observations were carried out at 121 stations in the Southern Ocean en route from Fremantle to Sydney. The results are given in Table 2, Figs. 2 and 3.

(3) Serial observation

Serial observations were carried out at 15 stations in total. Serial observations with Rosette sampler (2.5 L Niskin bottle) and CTD (Conductivity, Temperature and Depth profiling system: Falmouth Scientific FSI TRITON ICTD) were carried out at 13 stations, and serial observations with 2 L Nansen bottles and CTD (Neil Brown Mark IIIB) were carried out at 2 stations. The results including interpolated and calculated values of temperature, salinity, sigma-t and dynamic depth anomaly at each standard depth together with meteorological data are given in Table 3.

(4) Chemical analysis of sampled water

Chemical analysis of sea water collected with Nansen bottles, Niskin bottles and bucket was done by the following methods. Chemical analysis for the following items (b) - (h) was carried out by the methods described by Strickland and Parsons (1972). Items (a) and (e) were analyzed by the methods in Japan Oceanographic Data Center (1984) and Motomizu and Korechika (1988), respectively. Items (f, g) were analyzed by the methods in Bergamin *et al.* (1978), Andersson (1979) and Gine *et al.* (1980). Items (i) and (j) were analyzed by the methods in Mizu no Bunseki (Japan Society for Analytical Chemistry, Hokkaido Branch, 1981). Items (k) - (p) were analyzed by the methods in Hydrographic Department (1994).

(a) Practical salinity	: Conductive salinometer (Auto-Sal Model 8400A)
(b) pH	: Glass electrode method (Horiba digital pH meter F-16)
(c) Dissolved oxygen	: Winkler method (Metrohom Model E41520S Titrator)
(d) Phosphate-P	: Molybdenum blue method (Shimadzu UV-210A Spectrophotometer)
(e) Silicate-Si	: Molybdenum yellow method (Sanuki FI-3000 Flow Injection Analysis system)
(f) Nitrite-N	: Naphtylethylenediamine method (Sanuki FI-3000 Flow Injection Analysis system)
(g) Nitrate-N	: Cadmium (Cd) - copper (Cu) reduction column, naphtylethylenediamine method (Sanuki FI-3000 Flow Injection Analysis system)
(h) Ammonium-N	: Indophenol blue method (Shimadzu UV-210A Spectrophotometer)
(i) Calcium (Ca)	: EDTA titration method (Metrohom Model E41520S Titrator)
(j) Magnesium (Mg)	: EDTA titration method (Metrohom Model E41520S Titrator)
(k) Petroleum oil	: n-Hexane extraction-spectrophotofluorometry
(l) PCBs	: n-Hexane extraction-gas chromatography
(m) Cadmium (Cd)	: Solvent extraction-atomic absorption spectrophotometry
(n) Copper (Cu)	: Solvent extraction-atomic absorption spectrophotometry
(o) Zinc (Zn)	: Solvent extraction-atomic absorption spectrophotometry
(p) Mercury (Hg)	: Cold vapor atomic absorption spectrophotometry

The results of items (a) to (j) are given in Tables 1 and 3, and the results of items (k) to (p) are given in Table 4.

(5) Current observation with two surface drifting buoys

Two surface drifting buoys were deployed in the summer mission of JARE-35. The first surface drifting buoy (ID No. 17254) was deployed at 54°36.0' S, 109°48.9' E on December 8, 1993 and the second (ID No. 17255) was deployed at 59°31.8' S, 148°44.0' E on March 14, 1994. The first buoy remained in operation until December

31, 1995 and the second until January 1, 1996. The drifting buoy trajectories are shown in Fig. 4. The location and times of drifting buoys deployed in the operation period are shown in Table 6.

(6) Vertical current observations with XCP

XCP (Sippican Inc. U.S.A.) observations were carried out at three stations. However, normal data were obtained at only one station among three stations. The result is given in Fig. 5.

(7) Ocean current observations

Ocean current observations were carried out for 14 days (January 15 to January 28, 1994) at Kita-no-seto (East Ongul Island) by electromagnetic current meter (ALEC ELECTRONICS Co. ACM8M). The observation depth was 15 m below the sea surface. The results are given in Fig. 6. Figure 6 includes the sea level data obtained at Syowa Station (see the next section).

2. Tidal Observations

Tidal observations at Syowa Station have been carried out since 1966. A tide gauge (Meisei-Denki Co., QWP-8-303D) had been set by JARE-32 members on January 1990. The tide gauge sensor was placed on the sea bed about 15 m below the sea surface in Nisi-no-ura Cove (East Ongul Island). The data logger was installed in the Earth Science Laboratory at Syowa Station.

The methodology of tidal observations is described by Odamaki *et al.* (1991). In this system, the relative water pressure compensated for atmospheric pressure is measured with a quartz oscillator. The sensor range is 0-50 m and its accuracy is 0.01% to full scale, *i.e.* 0.005 m. The data sampled 5 times per second are averaged over one minute and recorded on solid IC memory every 10 min. The gauge was maintained by Mr. K. Okano, a member of the winter party of JARE-34, through the year. Hourly sea level was recorded. Daily and monthly mean sea levels were calculated with the hourly data. The results from February 1993 to January 1994 are given in Table 5.

Acknowledgments

The authors express their sincere thanks to Prof. T. Watanabe, the leader of JARE-35, Dr. K. Yokoyama, the leader of JARE-35 winter party and the members of JARE-35 for their helpful support and valuable advice, and Prof. N. Sato, the leader of JARE-34 and the winter members of JARE-34 for their cooperation. The authors also express their sincere thanks to Mr. K. Okano, the member of JARE-34 winter party, for his kind efforts to maintain and to take care of the tide gauges from February 1993 to January 1994.

The authors also express their thanks to Captain T. Hisamatsu, the officers and crews of the icebreaker "Shirase".
