## 1. Introduction

A survey of biological meteorology was undertaken by the members of the Japanese Antarctic Research Expedition (JARE-27~29) during the period from 1986 to 1989. The survey was carried out at the Yukidori Valley, Langhovde, Antarctica as part of the research project "Studies on the mechanism of the Antarctic terrestrial ecosystems" (Kanda et al., 1990). The members operated three systems for the biological meteorology, i.e., 1) meteorological observation near the biological hut, 2) microclimate observation along the stream at the Yukidori Valley and 3) unmanned microclimate observation near the hut. The microclimate data along the stream at the Yukidori Valley was published in the series of JARE Data Report (Ohtani et al., 1990).

The present volume is the second report of the three microclimate studies and deals with the microclimate data measured at the unmanned observation station near the hut for a year from

January 1988 to January 1989. The environmental factors, such as wind direction, wind speed, radiation, air temperature, relative humidity, and temperatures at the moss and the rock levels were determined.

## 2. Studied Sites

The unmanned observation station (MCS-4) was set up near the hut for biological research at the middle part of Langhovde ( $69^{\circ} 15' S$ ,  $39^{\circ} 46' E$ ) (Fig. 1). The station is about 7 m above sea level. A low hill develops at the east side of the site, and a wide flat area expands to the west side of the site and continues to coasts (Fig. 2). Poor moss colonies composing of Ceratodon purpureus and Bryum pseudotriquetrum occur around a gneiss rock. (Figs. 3, 4).

## 3. Instruments and Methods

The microclimate data were automatically recorded with data loggers (Kona System Co; KADEC-U and -UP) for each environmental factor at intervals of 30 min. Electric power was supplied by a lithium dry battery (Mitsubishi Electric Co., ER6(AA) 3.6V) and a sealed type battery (Bridgestone, SBS 110, 6V 100Ah) for data loggers and sensors for a relative humidity and an air temperature. For an anemometer with a wind vane, the electric power was supplied by the other sealed type battery (Bridgestone, SBS 40, 12V 35Ah). Data logger and battery were set in a watertight box (Fig. 2). These batteries were charged at intervals from one month to three months. The data recorded with loggers were transferred to floppy disk using a handheld computer (NEC,

PC9801LT) when battery was changed. During the observation periods, the microclimate data of some items were not obtained for some days or several months because of the troubles of sensors.

After the field measurement, data loggers and sensors were brought back to Japan. Calibration checks were made on these instruments.

The followings (a-f) summarize the items of measurements, specifications of the sensors, and the calibration procedures in Japan after the field measurement.

a. Wind speed and wind direction

A meteorological anemometer with a wind vane (Ota Keiki, Dyna Vane 111-T) was installed on the top of a box at 1.5 m above the ground. True north was determined by a magnetic compass and by the sun direction at noon.

b. Radiation

Solar radiation was measured with a quantum sensor (Li-cor Co., Li-190SB) which was mounted horizontally on the top of the box. The quantum response on the sensor is near ideal between 400 and 700 nm (Photosynthetically photon flux density, PPF<sub>D</sub>). The sensor produces a current proportional to the quantum flux. A 1000  $\mu\text{mol m}^{-2}\text{s}^{-1}$  of the quantum sensor is equivalent to 5.0 mV. Compared with a standard sensor of Li-cor Co., the output was 0.05 mV lower.

c. Air temperature

Air temperature was measured at about 1.2 m above the ground with a platinum resistance thermometer (Visala Co., HMP31UT)

which was cut off from direct solar radiation in a screen. Compared with a standard thermometer of Visala Co., the output showed the correct value.

d. Relative humidity

Relative humidity was measured at about 1.2 m above the ground with a "Humicap" sensor (Vaisala Co., HMP31UT) in a screen. Calibration checks of the sensor were made by a humidity calibration kit (Vaisala Co., HMK11) before each measurement in January, April, November 1988 and January 1989. Compared with a standard sensor, the output changed in the range of  $\pm 2\%$ .

e. Temperatures at the moss and rock levels

The moss temperature was measured for two moss colonies around the station with a thermistor sensor (Takara Kogyo, THE6)(Figs. 3, 4). The sensor was inserted into 1 cm below the surface of moss colony. At black colored colony (M.T.1, Flag A in Fig. 4), the temperature was measured throughout the year. At brown colored colony (M.T.2, Flag B in Fig.4), the temperature was measured from middle January to late March.

For the temperature at the rock level, the sensor was inserted into a cleavage at about 5 mm below the surface of gneiss rock (M.T.2, Fig. 3). The temperature was measured from middle August to early January. Compared with a standard thermometer, the output of each sensor changed in the range of  $\pm 0.1^{\circ}\text{C}$ .

f. Correction of measurement errors

For the all measured elements, measurement errors of each sensor are not added to the data indicated in the following

tables. The daily means are indicated for the day when more than 45 data were obtained at 30-min intervals (Tables 1, 2).

#### 4. Notations in Each Table

MCS	Microclimate station
TIME	Local time at Syowa Station
W.D.	Wind direction
W.S.	Wind speed (---: Calm < 0.2 m/s)
PPFD	Photosynthetic photon flux density ( $\mu\text{mol m}^{-2}\text{s}^{-1}$ )
A.T.	Air temperature
R.H.	Relative humidity
M.T.	Temperature at the moss level
R.T.	Temperature at the rock level
.	Data were not correctly obtained by troubles

#### Acknowledgments

We wish to express our deep gratitudes to Dr. O. Watanabe, the leader of JARE-29 and his members for their encouragement and willing cooperation in field work.
