### 1. Introduction

This data book summarizes upper atmosphere physics data acquired by the "Upper Atmosphere Physics Monitoring Systems" at Syowa Station and Asuka Station in 1990. The items of observations at Syowa Station are as follows:

1) Geomagnetism : H-, D-, and Z-components of magnetic variations

Total force of the geomagnetic field

H-, D-, and Z-components of magnetic pulsations

2) ELF-VLF wave : Intensities at 0.35, 0.75, 1.2, 2, 4, 8, 30, 60 and 95 kHz

Wide-band (0-15 kHz) signal of ELF-VLF emissions

3) Ionosphere : Cosmic noise absorption at 30 MHz

4) Aurora : All sky camera

Panchromatic auroral images recorded on B/W films

: Scanning photometer

Meridian scanning record at three wavelengths

427.8 nm ( $\text{N}_2^+ \text{ 1NG}$ ), 630.0 nm (OI) and 486.1 nm (H $\beta$ )

- : Fixed directional photometer
  - Auroral intensity of 427.8 nm ( $N_2^+$  1NG) in three directions
  - 30° poleward, zenith and 30° equatorward
- : Multi-channel photometer
  - Photometer for multi-wavelengths directed to the magnetic zenith
  - Observation items and wavelengths ;
    - $N_2$  1P : 670.5 nm, 646.9 nm,  $N_2^+$  1NG : 427.8 nm
    - OI : 630.0 nm, 557.7 nm, 844.6 nm
- : All sky TV
  - Panchromatic TV images of aurora
- : Monochromatic CCD TV
  - Monochromatic TV observations of aurora
- : Fabry-Perot Doppler Imaging System
  - Thermospheric temperature and wind vector measurement

The following are observation items for Asuka Station:

- 1) Geomagnetism: H-, D-, and Z-components of magnetic variations
  - : H-, D-, and Z-components of magnetic pulsations
- 2) Ionosphere : Cosmic noise absorption at 30 MHz
  - : Differential doppler measurement of NNSS telemetry signals
- 3) Aurora : All sky camera
  - : Fixed directional photometer for 427.8 nm ( $N_2^+$  1NG)

An outline of the systems is given in Section 2. Section 3 presents specifications of the observation instruments and the data acquisition systems. The recording periods are also listed in Section 3. The format of the compiled digital data is shown in Section 4. Magnetograms in the period of January 1-December 31, 1990 for Syowa Station and Asuka Station are given in Appendix 1.

All sky camera film data, magnetograms and the summary plots of the monitoring data are available to users on request. The request should be addressed to:

World Data Center C2 for Aurora  
 National Institute of Polar Research

9-10, Kaga 1-chome, Itabashi-ku,  
Tokyo 173, Japan.

Digital and analog data described here are available to scientists who cooperate the joint study of Antarctic upper atmosphere physics. The request should be addressed to:

Upper Atmosphere Research Division  
National Institute of Polar Research  
9-10, Kaga 1-chome, Itabashi-ku,  
Tokyo 173, Japan.

## 2. Upper Atmosphere Physics Monitoring System

### 2.1. Syowa Station

A real-time digital data acquisition system of upper atmosphere physics was constructed at Syowa Station in January 1981 (Sato *et al.*, 1984), and these data have been collected and published as JARE Data Reports (Upper Atmosphere Physics) (Sato *et al.*, 1984 ; Fujii *et al.*, 1985; Sakurai *et al.*, 1985 ; Ono *et al.*, 1986; Yamagishi *et al.*, 1987; Kikuchi *et al.*, 1988; Miyaoka *et al.*, 1990; Sato *et al.*, 1991 ; Kadokura *et al.*, 1992), and this report forms the 10th volume of this series.

A block diagram of this system is shown in Fig. 1. The sensors for measuring weak natural electromagnetic waves such as ELF-VLF emissions, ULF magnetic pulsations and the cosmic radio noise absorption (CNA) were installed at a remote station on West Ongul Island located about 5 km apart from Syowa Station in order to avoid man-made electromagnetic interferences. The data of magnetic pulsations and CNA were transmitted to Syowa Station by a PCM telemeter in VHF band. Wide-band signals of ELF-VLF emissions were transmitted to Syowa Station by an FM telemeter in UHF band.

The electric power of the remote station has been supplied by a solar battery system with the maximum output power of 530 W since February 1985. An additional solar battery system with the maximum power of 365 W was installed in January 1987 to reinforce the battery system in remote station. During the months of polar night, the rechargeable batteries with the capacity of 200 Ah were charged up once a month by a 16 kVA diesel-engine dynamo.

At Syowa Station, the sensors of fluxgate and proton magnetometers were set up about 150 m apart from the data processing building. All the auroral photometric observation instruments were

placed on the roof of the date processing building. The data acquisition facilities were installed inside the data processing building. All the outputs from the observation instruments were supplied to a switching matrix terminal board before they are fed to pen recorders, analog data recorders, a computer system and two sets of the TEAC DR-200 digital data logger system since January 1987. An 8 mm video tape recorder is used for the wide-band recording of VLF emissions. One volume of the tape can record the data for 24 hours.

All the data were recorded referring the universal time supplied from a precise timing system. This system consisted of NNSS satellite timing receiver, a quartz frequency standard with a stability of  $2 \times 10^{-11}/\text{day}$ , and a time code generator. The time code generator supplies modulated IRIG-A, -B and slow code for analog data recorders and 36-bit BCD code for digital recording system. The absolute accuracy of this system is about 1 ms.

## 2.2. Asuka Station

A block diagram of the upper atmosphere physics monitoring system is shown in Fig. 2. Sensors of an induction and a fluxgate magnetometers, and 30 MHz riometer were fixed under snow at the locations approximately 150 m southeast of the observation building. A fixed direction photometer was placed on the roof of the observation building. An all sky camera was installed inside the building. A loop antenna (1 m x 1 m square) in order to receive omega signals for a time code generator was also set up about 50 m southeast apart from the observation building.

Observation signals from the induction, the fluxgate magnetometers and the riometer were put into a digital data logger system (TEAC DR-200/MT800GP), a long-term analog data recorder R-950L and an 8-channel chart recorder. Data from photometer was recorded by using another digital data logger system, and chart recorders. The time code generator (ECHO AQ-9000) which was automatically corrected within  $\pm 10$  ms using omega signals supplied analog data recorders with IRIG-B and slow code, and also the digital data logger system with BCD time code, 0.5 pps sampling pulses and 1 pps external clocks continuously.

### 3. Specifications of Instruments

#### 3.1. Syowa Station

##### 3.1.1. Geomagnetism

###### (1) Magnetogram

Magnetic variations were measured by a three-axis fluxgate magnetometer. The full-scale ranges of H-component was changed on February 8, 1990 to avoid a saturation due to a big storm. The full scale ranges were +1250 -3750 nT for H- component and  $\pm 2500$  nT for D- and Z-components, and the frequency response was DC-2 Hz. The noise level was less than 0.5 nT. The H-, D-, and Z-components of the magnetometer were recorded in digital form with sampling rate of 1 Hz. The H-component of the magnetometer was also recorded by chart recorder and a long-term analog data recorder, R-950L.

Continuous computer plots of magnetogram in the period of January 1 to December 31, 1990 are given in Appendix 1. In these plots, positive signs of the H-, D-, and Z-components indicate northward, westward and downward, respectively. One division of the vertical axis corresponds to 100 nT.

###### (2) Total force of the geomagnetic field

The total force of the geomagnetic field (F) was continuously measured by a proton magnetometer. The observation range was 0-65000 nT, and the frequency response was up to 0.2 Hz. The noise level was less than 0.2 nT.

###### (3) ULF magnetic pulsations

The H-, D-, and Z-components of ULF magnetic pulsations were detected by three sets of search coil magnetometers. The search coil sensors had permalloy cores wound by copper wire (0.4 mm $\varnothing$ , 40000 turns). The permalloy core had a dimension of 1 cm in diameter and 100 cm in length. The detectable intensity range of the magnetometer was 0.001-5 nT/s, and the frequency range 0.001-3 Hz. The search coil magnetometers were set at the remote station on West Ongul Island. The output signals from the telemetry receiver were recorded by a long-term analog data recorder R-950L, a chart recorder and digital data recorder. The sampling frequency of the digital data was 1 Hz for each component.

###### (4) Base line of the magnetic field and K-index

The ordinary magnetogram was available also on chart papers with a recording speed of 5 cm/h. The sensitivities of the H-, D-, and Z-components on the chart papers are 118 nT/cm, 100 nT/cm, and 111 nT/cm, respectively. According to the maximum deviations of the H- and D-component from these quiet-day baseline, K-indices were calculated for each 3-hour interval by using the following scale.

K-index	Deviation	K-index	Deviation
0	: 0 - 25 nT	5	: 350 - 600 nT
1	: 25 - 50	6	: 600 - 1000
2	: 50 - 100	7	: 1000 - 1660
3	: 100 - 200	8	: 1660 - 2500
4	: 200 - 350	9	: 2500 and more

Tables 1 and 2 give the baseline values and K-indices at Syowa Station in 1990. Inquiries or requests for data copies of the magnetic field measurements should be addressed to World Data Center C2 for Aurora, NIPR.

### 3.1.2. ELF-VLF waves

The receiving site of natural ELF-VLF electromagnetic waves was located at the remote station in order to avoid man-made electromagnetic interferences. The ELF-VLF receiving system at the remote station comprised a triangle-shaped three turn loop antenna (10 m in height, 20 m in the length of the bottom side), a pre-amplifier and a main amplifier. The gains of the pre- and main amplifiers were 60 and 40 dB, respectively. The ELF-VLF wave intensities at the frequency bands of 0.35, 0.75, 1.2, 2, 4, 8, 30, 60, 95 kHz were measured by using a 9-channel filter bank and detector units. The ELF-VLF emissions within the intensity range of  $10^{17}$  to  $10^{-13}$  W/m<sup>2</sup> Hz were detected by this system. These data were recorded with a sampling rate of 1 Hz. The wide-band ELF-VLF signals up to 15 kHz were recorded on 8 mm video tape recorders.

### 3.1.3. Ionosphere

Cosmic noise absorption at 30 MHz was measured with a riometer made by La Jolla Science. The bandwidth and time constant of the receiver were 150 kHz and 0.25 s, respectively. The riometer was also installed at the remote station.

Observations of the ionosphere vertical soundings, the cosmic noise absorption (20, 30 and 45 MHz), the CW field strength (8 and 10 MHz) and the aurora radar (112 MHz) were also carried out continuously by other observation systems at Syowa Station, and the observational results have been published as JARE Data Reports (Ionosphere). Inquiries and requests for data copies are to be addressed to:

World Data Center C2 for Ionosphere  
Communications Research Laboratory  
Ministry of Posts and Telecommunications  
2-1, Nukui-Kitamachi 4-chome, Koganei-shi, Tokyo 184, Japan.

### 3.1.4. Aurora

#### (1) All sky camera

Black and white all sky aurora images were observed by using a 35 mm cine-pulse camera with a fish-eye lens of f/1.4 and an exposure time of 7 s. The observations were carried out during clear nights in 1990, as given in Table 3. Inquiries or requests for the all sky data copies should be addressed to World Data Center C2 for Aurora of NIPR.

#### (2) Meridian scanning photometer

The auroral emission at the wavelengths of 427.8 nm ( $\text{N}_2^+$  1NG), 630.0 nm (OI) and 486.1 nm (H $\beta$ ) were observed by a meridian scanning photometer installed in 1987. The interference filter for H $\beta$  was tilted with 1 s period measuring a doppler effect of the auroral H $\beta$  emission. The field of view of the photometer was 3° for 427.8 nm and 630.0 nm, and 5° for H $\beta$  emissions. The scanning from the poleward horizon to the equatorward horizon required 30 s. The meridian scanning photometer data were recorded with a sampling frequency of 10 or 25 Hz. Observation periods are appeared in Tables 4 and 5 with noted as PHO.

#### (3) Fixed directional photometer

A three-direction photometer detected 427.8 nm emission at three zenith angles (zenith, 30° poleward and 30° equatorward). The field of view was 5°. The measurable auroral intensity was within the range from 7 R to 28 kR. Observation periods are appeared in Tables 4 and 5 with noted as PHO.

#### (4) Multi-channel photometer

A multi-channel photometer directed the magnetic zenith of Syowa was installed in 1990. The photometer has a narrow field of view ( $1^\circ$ ) with a high sampling rate (10 or 25 Hz). A detailed description of the multi-channel photometer has been made by Ono *et al.* (1992). Observation periods are appeared in Tables 4 and 5 with noted as PHO.

(5) All sky TV

Panchromatic TV imaging of aurora by using a fish-eye lens with a field of view of  $180^\circ$ . Observed images were recorded by using VTR in NTSC format and selected images every 10 s were recorded in Optical Video Disk (OVD) system which can store 108000 pictures in one disk. Observation periods are appeared in Tables 4 and 5 with noted as SIT.

(6) Monochromatic CCD TV

Monochromatic imaging of aurora by using intensified CCD imageries. Observation wavelengths were selected from 630.0 nm (OI), 557.7 nm (OI), 427.8 nm ( $N_2^+ 1NG$ ) and 486.1 nm (H $\beta$ ). Observed data were recorded in PCM format and also recorded in VTR and OVD. Observation periods are appeared in Tables 4 and 5 with noted as CCD.

(7) Fabry-Perot Doppler Imaging System

Temperature and wind vector measurement by using the Fabry-Perot Interferometer for auroral emissions. Observation wavelengths were selected from 630.0 nm (OI) and 557.7 nm (OI). Observation periods are appeared in Tables 4 and 5 with noted as FPDIS.

## 3.2. Asuka Station

### 3.2.1. Magnetogram

Magnetic variations were measured by a three-axis fluxgate magnetometer (SHIMAZU MB162), the same type as used at Syowa Station. The full-scale ranges were +1250 -3750 nT for H-component and  $\pm 2500$  nT for D- and Z-components, and the frequency response was DC-2 Hz. The noise level was less than 0.5 nT. The fluxgate magnetometer was set in the sensor area about 150 m southeast of the observation building. The H-, D-, and Z-components of the magnetometer were simultaneously supplied to a R-950L long-term data recorder, an 8-channel chart recorder and a DR-200 digital data logger with a sampling rate of 1 Hz.

Continuous computer plots of magnetogram in the period of January 1 to December 31, 1990 are given in Appendix 1 along with the magnetograms at Syowa Station. In these plots, positive

signs of the H-, D-, and Z-components indicate northward, westward and downward, respectively. One division of the vertical axis corresponds to 100 nT.

### 3.2.2. ULF magnetic pulsations

The H-, D-, and Z-components of ULF magnetic pulsations were detected by the search coil (induction) magnetometers of the same type as those used at Syowa Station. The search coil magnetometers were also set in the sensor area about 150 m southeast of the observation building. The output signals from the induction magnetometer were supplied to the R-950L data recorder, the 8-channel chart recorder and the DR-200 digital data logger. The sampling frequency of the digital data was 1 Hz.

### 3.2.3. Ionosphere

Cosmic noise absorption at 30 MHz was measured with a riometer made by La Jolla Science, the same type as used at Syowa Station. The bandwidth and time constant of the receiver were 150 kHz and 0.25 s, respectively. The riometer was also set in the sensor area about 150 m southeast of the observation building in December 1988. The riometer data were also supplied to the R-950L data logger. The sampling frequency of the digital data was 1 Hz.

A differential doppler frequency measurement for the NNSS telemetry signals (150 and 400 MHz) was made by using a NNSS receiver during 1990. The differential doppler frequency gives variation of the total content of electrons varying along the satellite path. The measured frequency was recorded by using a personal computer on a floppy disks every 1 s.

### 3.2.4. Aurora

#### (1) Fixed directional photometer

A photometer installed in December 1988 detecting 427.8 nm ( $\text{N}_2^+$  1NG) emission at zenith direction. The data was recorded by the 8-channel chart recorder and the DR-200 digital data logger with the sampling frequency of 1 Hz.

#### (3) All sky camera

Black and white all sky aurora images were observed by using a 35 mm cine-pulse camera with a fish-eye lens of f/2.8. A picture was taken every 30 s with an exposure time of 20 s using KODAK 4-X (ISO 400) high-sensitive film. The observations were carried out during clear nights in 1990, as given in Table 6. Inquiries or requests for the all sky data copies should be addressed to World Data Center C2 for Aurora of NIPR.

#### 4. Compiled Digital Tape Format

##### 4.1. Syowa Station

Digital recordings had been continued with almost the same system as those used in Iceland for the geomagnetic conjugate observations since 1984. The compile process of these data has been made based on the compilation process for the Iceland MT data. The specifications of the compiled digital tapes are as follows:

Track	: 9
Record density	: 6250 BPI
Record format	: FB
Block length	: 28848 bytes
Logical record length	: 48 bytes
Label	: Non-label
Filing	: Multi-file (1 file/day)

In these tapes, 24 kinds of upper atmospheric data are recorded every 1 s in the following sequence.

Word No.	Observation item	Word No.	Observation item
1	H-component of magn. field	13	VLF 8 kHz
2	D-component of magn. field	14	VLF 30 kHz
3	Z-component of magn. field	15	VLF 60 kHz
4	H-component of ULF waves	16	VLF 95 kHz
5	D-component of ULF waves	17	Total magn. force
6	Z-component of ULF waves	18	MBR angle
7	CNA (30 MHz)	19	MBR N-S sweep
8	VLF 350 Hz	20	MBR E-W sweep
9	VLF 750 Hz	21	MBR E30°
10	VLF 1.2 kHz	22	MBR S30°
11	VLF 2 kHz	23	MBR Zenith
12	VLF 4 kHz	24	MBR N30°

Each datum is recorded on a tape with 2 bytes in the binary form of signed 2's complement, and a set of these 24 data make a logical record of 48 bytes. The 10 min data make a block of 28848 bytes. One-day data (144 blocks) make one file and one-month data (28-31 files) make one volume. At the

beginning of each block, the starting time of this period is recorded with 48 bytes in the following format:

Sequence	Item	
1	Year	(2 bytes)
2	Total day	(2 bytes)
3	Hour	(2 bytes)
4	Minute	(2 bytes)
5	Station code	(4 bytes)
6	Space	(36 bytes)

The magnetic field data recorded on a compiled tape can be transformed to physical quantities by the following relations:

$$H, D, Z\text{-component of the geomagn. field (nT)} = \text{DATA} * 2500/2048$$

$$H\text{-component of ULF waves (nT/s)} = \text{DATA}/141$$

$$D\text{-component of ULF waves (nT/s)} = \text{DATA}/158$$

$$Z\text{-component of ULF waves (nT/s)} = \text{DATA}/316$$

As for CNA, VLF and MBR data, individual calibration values are required to transform MT data. Inquiries about these data should be addressed to Upper Atmosphere Research Division of NIPR. Figure 3 illustrates the structure of the compiled digital tape, in which one-day data (144 blocks) make one file and one-month data (28-31 files) make one volume. The more detailed information about the compiled TEAC DR-200 MT data were reported by Uchida *et al.* (1988).

#### 4.2. Asuka Station

The digital data recording with a TEAC DR-200/MT-800GP system started since February 19, 1987 at Asuka Station. The compilation of these data has been made in the same style as the DR-200 data from Syowa and Iceland Stations. The specification of the compiled digital tapes are as follows:

Track	: 9
Record density	: 6250 BPI
Record format	: FB
Block length	: 9616 bytes

Logical record length : 16 bytes  
Label : Non-label  
Filing : Multi-file (1 file/day)

In these tapes, 8 kinds of upper atmospheric data are recorded every 2 s in the following sequence.

Word No. Observation item

- 1 H-component of magnetic field
- 2 D-component of magnetic field
- 3 Z-component of magnetic field
- 4 H-component of ULF waves
- 5 D-component of ULF waves
- 6 Z-component of ULF waves
- 7 CNA (30 MHz)
- 8 Auroral photo emission at zenith direction (427.8 nm)

H, D, Z-components of the geomagnetic field (nT) are obtained by DATA\*2500/2048. Figure 4 illustrates the structure of the compiled digital tape for Asuka Station. The sampling frequency of the digital data was 1 Hz. Its block length is 9616 bytes because 1 block (10 min data) contains 601 logical records (1 s data and a time header, 16 bytes). Further information about these data should be addressed to Upper Atmosphere Research Division of NIPR.

For co-researchers of NIPR, it is permitted to use the HITAC M-680D computer system of the Information Science Center. The center has various kinds of software such as tape-to-tape copy, displays and spectrum analysis program.

#### Acknowledgments

It is a pleasure to acknowledge all the members of the 31th Japanese Antarctic Research Expedition for their enthusiastic support to the upper atmosphere physics observations both at Syowa Station and Asuka Station. The publication of this report was supported by the Upper Atmosphere Physics Research Division, WDC-C2 for Aurora and Information Science Center of the National Institute of Polar Research.
