1. Introduction

Svalbard, an archipelago consisting of several islands (Fig. 1), is an important and unique place for Arctic research. The Japanese Observatory, which is called "Rabben", was established in April 1991 at Ny-Ålesund, Svalbard. It is located about 1.5 km north-west from the center of Ny-Ålesund. The latitude, longitude and altitude of the observatory are 78°55'N, 11°56'E and about 40 m, respectively. We maintain an automatic system for meteorological data acquisition, because no permanent staff stay at the observatory throughout the year. Ground based measurements of meteorological elements have been made continuously since August 16, 1992 at the observatory (Aoki *et al.*, 1996a, b). This report presents the data from January 1996 to December 1998. Durations of data gaps during the period are listed in Table 1.

2. Instrumentation

The automatic system for meteorological data acquisition is composed of several sensors and a data recording system. Atmospheric pressure, temperature, humidity, global solar radiation, wind speed and wind direction are continuously measured. The specifications of the sensors are shown in Table 2. A barometer³ was installed in a room at Rabben. Air temperature and humidity are measured by a platinum resistance

thermometer and a polymer capacitive sensor, respectively. The sensors are installed in a radiation shield on a meteorological tower 1.5 m above the ground (Fig. 2). The IRDAM anemometer is mounted atop the meteorological tower 8 m above the ground. The principal wind sensor is similar to a hot-wire anemometer. Since the direct signal from the sensor is influenced by changes of atmospheric pressure and temperature, the sensor has its own computer, barometer and thermometer to correct the factors. A cup anemometer made by Makino Applied Inst. Inc. was also mounted at a height of 7.5 m on the meteorological tower as a backup. When the IRDAM data were not available, the wind speed data from the cup anemometer are shown with asterisks (*). Global solar radiation is measured by a pyranometer mounted on the roof of Rabben. Analog outputs from the sensors are converted to digital data through a data logger. The digital data are averaged every 5 min and recorded on a floppy disk by the data acquisition system. On November 1996, a new file server connected to the internet was installed in Rabben. By automatic data transfer from the data acquisition system to the file server, it became possible to monitor the data from Japan. In order to prevent confusion due to change of local time, *i.e.* summer time and normal time, we use universal time (UT). Hourly mean data, except for wind direction data, are shown in Table 3. Wind direction in Table 3 indicates the most frequent direction throughout the hour. Daily mean data are shown in Table 4. The daily mean data are calculated by averaging the hourly mean data.

Acknowledgments

The authors express their sincere thanks to the members of the Norwegian Polar Research Institute in Ny Ålesund for maintaining our data acquisition system. The authors also thank Ms. Miki Yoshioka, Arctic Environment Research Center of the National Institute of Polar Research, for her support in data processing and preparing this manuscript. This work has been partially supported by the Ministry of Education, Science and Culture through Grants-in-Aid Nos. 09041095, 11208201 and 11691138.

Notation in Table 4.

TTTTMMDD:	Date (Year, Month and Date)
Pst:	Pressure at the observatory height (daily mean)
T:	Air temperature (daily mean)
U:	Relative humidity (daily mean)
GR:	Global radiation (daily mean)
WV:	Wind speed (daily mean)
n:	Using hourly mean data for calculation

Table 4. Daily summaries of meteorological data.
