

RIOMETER RECORDS OF 30 MHz COSMIC NOISE

AT SYOWA STATION, ANTARCTICA IN 1988

Hideo MAENO and Atsushi OHISUKA

(Communications Research Laboratory, Koganei-shi, Tokyo 184)

1. Introduction

Observations of cosmic radio noise with a standard riometer (relative ionospheric opacity meter) at 30 MHz have been carried out at Syowa Station, Antarctica, since February 1966 by members of the Communications Research Laboratory. A report has been prepared which includes hourly values and chart records of cosmic noise absorption observed during the period from January 1 to December 31, 1988. Copies of the data are available to users on request.

The request should be addressed to:

Communications Research Laboratory
Ministry of Posts and Telecommunications
2-1, Nukui-Kitamachi 4-chome, Koganei-shi
Tokyo 184, Japan.

2. Location

Syowa Station			
Geographic		Geomagnetic	
Latitude	Longitude	Latitude	Longitude
69°00'S	39°35' E	-70.0°	80.2°

3. Observer

Atsushi OHISUKA (Communications Research Laboratory)

4. Instrumentation

The receiver of the riometer which has a center frequency of 30 MHz and a band width of 3.5 kHz is connected to a vertically directed five-element Yagi antenna whose elements are oriented in the east-west direction. The antenna is designed to match a 50 ohm coaxial transmission line (8D-2V) of 80 m in length.

The noise power output is recorded on a strip chart recorder with a 1mm/min chart speed. Noise power levels of 0,1,2,3 and 4 dB from a reference noise diode are also recorded once a day at 8h in 45° EMT (Eastern Meridian Time: UT + 3 hours).

The receiver was replaced by a new one with a band width of 7.5 kHz at 20h EMT on January 17, 1987.

5. Remarks

The cosmic noise power level shows a remarkable sidereal diurnal variation caused by the passage of the cosmic radio source across the zenith. On account of the revolution of the earth, the time (local time) when the same cosmic radio source passes the zenith becomes earlier by about 4 min from day to the next and returns to its initial state after a year. If the ionosphere is in a quiet condition, the diurnal variation of the cosmic noise power is easily extracted from the chart recordings.

The hourly values of ionospheric absorption given in the CNA (Cosmic Noise Absorption) tables are the deviations (in dB) of cosmic noise intensity from the reference sidereal diurnal variation. The reference sidereal diurnal variation is determined from the diurnal variations on several selected quiet days in each month.

On the strip chart, cosmic noise intensity (indicated by C) and also geomagnetic H-component at Syowa Station (indicated by H) are recorded. The H-component increases upward in the figure and the calibration signal, the vertical bar, at each hour denotes a depression by 200 nT. Note that the cosmic noise intensity increases upward in the figure until 20h EMT on January 17,1987 but downward after that time.
