

RECORDS OF RADIO AURORA AT SYOWA STATION, ANTARCTICA IN 1993 and 1994

Kyoji IWASAKI, Takashi YAMAGUCHI and Kiyoshi IGARASHI

(Communications Research Laboratory, Koganei-shi, Tokyo 184)

1. Introduction

This report presents a summary of data obtained in the period of 1993 and 1994 with the auroral radar at Syowa Station, Antarctica.

Two kinds of data are available: a) chart records of the time variation of echo intensity and b) digital MT.

Inquiries about the data should be addressed to:

Antarctic Research Section
Communications Research Laboratory (C R L)
Ministry of Posts and Telecommunications
2-1, Nukui-Kitamachi 4-chome, Koganei-shi
Tokyo 184, Japan

TEL:+81-423-27-6886, FAX:+81-423-27-7618, TELEX:2832611 DEMPA J

2. Location

Syowa Station			
Geographic		Geomagnetic	
Latitude (Deg.)	Longitude (Deg.)	Latitude (Deg.)	Longitude (Deg.)
69.00 S	39.58 E	-70.13	82.04

3. Observers

Kyoji IWASAKI and Takashi YAMAGUCHI (Communications Research Laboratory)

4. Equipment

The main parameters of the auroral radar at Syowa Station are shown in Table 1. The three antenna beams with half power width of about 4 degrees are directed toward the geomagnetic south, 32.8° west from the geomagnetic south, and 47.0° east from the geomagnetic south, respectively. In 1992 two antenna beams directed

to the geomagnetic south and 32.8° west from the geomagnetic south were used. These two antenna beams were switched alternately. Details of the data processing and the radar system are described in references.

Table 1. Specifications of the auroral radar at Syowa Station

Site	Syowa Station (69°00' S, 39°35' E)
Type	Coherent pulse radar
Frequency	50, 112 MHz
Peak power	15 kW
Pulse width	100 μ s
Puls repetition frequency	50 Hz (333 Hz for spectrum observation)
Antenna	Three sets of 14-element coaxial collinear array
Antenna gain	25 dB
Antenna beam width	4° (half power width) in horizontal plane
Receiver bandwidth	10 kHz
Receiver noise figure	less than 4 dB
Display and recorders	A - scopé display, A'- scope display, pen recorder and digital MT

5. Explanation of Diagrams

Backscattered power intensities observed with the 50 MHz auroral radar were sampled every 1 second and stored by a digital data logger and plotted by a chart recorder. A series of figures show correlation plots of radio auroral intensities, magnetogram and riometer observed in the years of 1993 and 1994.
