

Kazuo SHIBUYA

(National Institute of Polar Research, Itabashi-ku, Tokyo 173)

1. Introduction

The optical-electromagnetic seismographs at Syowa Station were replaced by the digital seismic data acquisition systems with event detection algorithm in February 1980. The outline of the introduced system is schematically illustrated in Fig. 1. There are two types of seismometers, called SP (short period) or HES with the natural period of 1 second and LP (long period) with the natural period of 12 seconds. The seismic observation system was maintained by H. Sakurai through the wintering of JARE-24 (February 1983 - January 1984).

The coordinates of seismographic vault are $69^{\circ}00'31.7''S$ in latitude and $39^{\circ}35'31.6''E$ in longitude. The elevation is 20 m above the mean sea level.

2. Data

The over-all frequency response and the magnification of the short-period and long-period seismographs (Z, N-S and E-W components) are shown in Fig. 2. The system clock was not connected to the recovered UTC from NNSS satellites (see Fig. 1) and the calibration was made by the short-wave receiver. The accuracy of the read-out data can be estimated as ± 0.2

seconds. Considering the delay time of 1-2 years between the publication of this report and the observing wintering period, which is inevitable from the restriction of transport ability between Tokyo and Syowa Station, the PDE reports by NEIS were referred and only the tele-seismic events were edited. The graphic display outputs of the local events around Syowa Station were excluded from this report.

2.1. Read-out data

The onset of the events was picked from the pen-monitor records. Figure 3 shows examples of pen-monitor records of the Z component seismograph (4-mm/s pen-speed for SP and 2-mm/s pen-speed for LP). The onset times of tele-seismic P-arrivals were read by R. Sakai and they are listed in Table 1. Symbols E and I in the phase column denote weak and sharp onsets, respectively. The direction of ground motion is denoted by + for the upward direction and - for the downward direction. Arrival time is in UTC.

2.2. Digital data in a 9-track computer compatible tape

The current seismic observation system at Syowa Station can give us tele-seismic wave forms in a large computer compatible 9-track digital tape. Amplified seismic signals in Fig. 1 are analog-to-digital converted with the sampling rate of 10 points per second for the short-period and 1 point per second for the long-period components. The relation between the input voltage to the computer and the hexadecimal number is given in Table 2. The digital data acquisition system is controlled by the event-triggering method of STA/LTA ratio

(Peterson et al., 1976) which is programmed in a micro-computer. The obtained original data consisted of 10 volumes of 1200 ft (1600 bpi) magnetic tape and the tele-typewriter message of the triggered events (see an example in Fig. 4). The original tapes were compiled by considering the PDE reports and edited into one volume of Non Label tape for the user. The edited tape contains tele-seismic wave forms of 77 events detected at Syowa Station. The 77 events are listed in Table 3 and their locations are mapped in Fig. 5.

The data on an edited tape has a block structure. The tape format is specified as follows:

- (1) Volume constitution of the edited tape is specified in Fig. 6-1.
- (2) The data structure in Fig. 6-1 is specified in Fig. 6-2.
- (3) Header of the event in Fig. 6-2 is specified in Fig. 6-3. Numerals in content column are written usually by binary number.
- (4) One block of A/D data in Fig. 6-2 is specified in Fig. 6-4. It consists of 768 bytes and contains 10 seconds' wave data for short-period and 2 minutes' wave data for long-period (rec. 2 - rec. 11).
- (5) One data in Fig. 6-4 consists of 3 channels (N-S, E-W and Z components). Data format of each channel is specified in Fig. 6-5.
- (6) Time data in Fig. 6-3 (record number 6) and in Fig. 6-4 are specified in Fig. 6-6.

In the appendix, examples of waveform output of each event (10 blocks) to the graphic display are shown. Explanation of the output is given in the No. 1 sheet. As inferred from the graphic display outputs, some events have an erroneous gap of 1 block data-length just after the onset portion of 1 block data-length seismic signals, which might have come from the malfunctioning of the micro-computer and may be corrected by the users' software programs. We here apologize and report that the erroneous gap can also be found in the previous data reports (No.72, No.83, No.92).

This report was compiled with the help of R. Sakai, Support Section for Geophysical Observations, National Institute of Polar Research.
