1. Introduction

Seismic observations at Syowa Station (69.0°S, 39.6°E), East Antarctica were started using a short-period seismometer with 1.0 s natural period in 1959 (Eto, 1962). A long-period seismograph was installed and phase readings of teleseismic events (i.e., detection of arrival times and amplitudes for significant seismic phases) have been reported in near real-time to the United States Geological Survey (USGS) and to the International Seismological Centre (ISC) since 1967 (Kaminuma *et al.*, 1968). A three-component broadband seismometer (STS-1; Wielandt and Stein, 1986) was installed in 1989, in order to contribute to the Federation of Digital broadband Seismograph Networks (FDSN; <http://www.fdsn.org>), together with the other key stations of the PACIFIC21 Japanese regional network. A distribution map of the FDSN stations in Antarctica is shown in Fig. 1.

All of the observation systems at Syowa Station were maintained in 2008 by one of the authors (Y. Aoyama) throughout the wintering season of the 49th Japanese Antarctic Research Expedition (JARE-49). In this report, we introduce the seismic observations in 2008, scaled

read-out travel-time data and detected teleseismic earthquake list, followed by the procedures for public use via internet service.

2. Observations

The original seismic observation systems at Syowa Station were replaced with the current operating ones by one of the authors (M. Kanao) in 1997 (Kanao, 1999). A block diagram of the current recording system is illustrated in Fig. 2.

2.1. Seismographic hut and seismographs

Seismic observations at Syowa Station have been carried out mainly by two types of seismometers. One is called a short-period seismometer (HES) with 1.0 Hz eigenfrequency of the pendulum which has been operated since 1967 (Kaminuma *et al.*, 1968). The overall frequency responses and the magnifications of the HES seismographs (Hagiwara, 1958) are shown in Fig. 3. Another is a three-component broadband seismometer (Streckeisen STS-1) with digital recording system which has been operating since 1990 (Nagasaki *et al.*, 1992). The amplitude and phase responses for the velocity output (Broadband; BRB) are shown in Fig. 4 (after Streckeisen and Messegeraete, 1987).

The seismographic hut was re-constructed in 1996 and all of the sensors were moved inside it in 1997. The new hut is located about 200 m north from the old vault, with WGS84 geodetic coordinates of 69°00'24.0"S, 39°35'06.0"E and elevation 20 m above mean sea level. Since the long-period output signals from the broadband seismographs can be affected by variations in temperature and atmospheric conditions, the seismometers were installed in the thermally insulated small room of the hut. In addition, the whole surface of the hut was covered by titanium in order to maintain constant temperature.

Seismic signals of the HES and STS-1 are transmitted to the Earth Science Laboratory (ESL) via analog cables 600 m in length through the main buildings of Syowa Station.

2.2. Acquisition system at Earth Science Laboratory

Three-component analogue outputs by HES have been digitized at 200 Hz sampling frequency by a 24-bit analog-to-digital (A/D) converter, generating triggered signals of 80 and 1 Hz re-sampling data and 20 Hz continuous outputs. Signals of a three-component broadband STS-1 have also been digitized to create triggered output of 80 Hz re-sampling data and continuous outputs of 20, 1, 0.1 and 0.01 Hz data, respectively. All the waveform data were formatted as a Mini_SEED volume, which is a standard format for data exchange in global seismology. The digitized data are automatically transmitted from the A/D converter to a workstation via TCP/IP protocol. All data are stored in the 40 GB hard-disk of the workstation, then copied onto DAT or 8 mm tape at three month intervals. The recording status of the A/D converter has been continuously monitored by a personal computer via an RS-232C serial port.

Remote-centering operation of the mass position for the STS-1 sensors can be carried out by keyboard commands from the computer using ‘Kermit’ communication software. The reference clock for the new system has been calibrated to Universal Time Coordinated (UTC) by detecting time codes by GPS. Long-term analog-recorders for the HES and BRB output of the STS-1 have been operated for monitoring at ESL. Boom-POSition output (POS) of the STS-1 seismograph has been monitored by RD2212 type analogue-recorder, together with the temperature in the sensor room.

2.3. Data transmission via INTELSAT

Digital waveforms of both broadband and short-period seismographs have been transmitted via INMARSAT telecommunication link from Syowa Station to the National Institute of Polar Research (NIPR) since 1993. Waveform data transmission was greatly improved by using an INTELSAT communication link established in February 2004. During the 2008 winter season,

continuous data of both HES and STS-1 with 20 Hz sampling were automatically transmitted to NIPR once a day from the acquisition workstation. The UUCP protocol has been used for the data transfer.

In addition to remote monitoring operation of the data acquisition system from NIPR, Internet access to Syowa facilities has significantly advanced since 2005 via the INTELSAT system. Moreover, a web-camera using the Station LAN was installed inside ESL, followed by improvement of monitoring of the analogue recorders when nobody can access the ESL during bad weather.

3. Data

By using the waveform data transmitted via INTELSAT, the arrival-time information on the major seismic phases (here we say ‘read-out data’) is regularly reported from NIPR to USGS/NEIC (National Earthquake Information Center) via email, for contributions to the Preliminary Determination for Epicenters (PDE) weekly & monthly bulletins. The Quick Earthquake Determination (QED) services offered from NEIC have been used to identify the seismograms of teleseismic events. The arrival-time data and corresponding hypocentral data of the teleseismic events are listed in this report.

The phase arrival-times of teleseismic events were detected on the short-period digital monitoring seismograms. Most phases were scaled on the vertical component; only clear phases of shear waves were scaled on the horizontal components. These phases were identified by comparing the observed travel-time with the calculated time within a time difference of 3 s. The phases identified as *P*- and *S*-waves are listed in Table 1. The phase *K* denotes the *PKP* phase, which can be identified within 3 s of the time difference by comparing the observed travel-time with the calculated time. *X* denotes the clear phase whose wave type

can be identified but the observed travel time was within 3-10 s of the calculated time. Symbols *E* and *I* in the phase column denote emergent and sharp onsets, respectively. The initial ground motion is denoted by + for upward and - for downward motion. Arrival time is given in UTC and the accuracy of the read-out data is 0.2 s. The teleseismic events identified in the PDE are labeled by the serial numbers (#-xxx) in the table. These serial numbers correspond to those in Table 2. The events without serial numbers are teleseisms whose locations have not been determined by NEIC.

The list of hypocentral parameters for individual teleseismic events is presented in Table 2, identified by the same serial numbers as given in the remarks in Table 1. Fig. 5 shows the hypocenters of the teleseismic events whose initial phases were detected at Syowa Station.

4. Publication

The seismic waveform data are continuously transmitted to NIPR and stored in the data library server, and are accessible upon request by Internet service and/or UNIX formatted media (*i.e.*, CD-R, DAT, 8 mm-tape, *etc.*). The present authors hereby grant permission for use of these data in scientific papers. All kinds of archived seismic data (arrival times, hypocenter, waveform data by analog & digital, related document reports) of Syowa Station have been accumulated and are available from the data library server (POLARIS, URL; <http://polaris.nipr.ac.jp/~pseis/syowa>). These can be accessed by use of the 'ftp' command with password. If you are interested in using these data for scientific purposes, please contact *kanao@nipr.ac.jp* concerning availability.

Archived data that have passed two years since the JARE observation period are stored and freely available from both the NIPR ftp site and the PACIFIC21 center of the Japan Marine Science and Technology Agency. Any questions concerning data availability from PACIFIC21 shall be directed to *y-ishihara@jamstec.go.jp*.

5. Data Processing Staff

The seismic observation system at Syowa Station was designed by M. Kanao and K. Shibuya of NIPR. The authors express their sincere thanks to Ms. A. Ibaraki of NIPR for her efforts in scaling the seismic data. Readers can refer to the following URL for the data access:
<http://polaris.nipr.ac.jp/~pseis/syowa>.
