# Book of Accepted Abstracts

## ACSP 2021 Annual Conference

*This book includes the abstracts accepted for presentation at the 2021 Annual Conference. This book was completed and posted to [www.acsp.org](http://www.acsp.org) 06/22/21; then updated 7/13/21.*

*Compiled by Camden Miller, PhD Candidate, University at Buffalo, working for the ACSP 2021 Conference.*

# Notes about this Book

This book includes only the abstracts accepted for presentation at the 2021 Annual Conference. This book was completed and posted to [www.acsp.org](http://www.acsp.org) on June 22, 2021, then updated July 13, 2021.

## Abstract ID #

When submitted to the abstract management system, each abstract was assigned an abstract submission ID number for administrative search/find purposes. This is the number authors should reference to staff with any questions regarding their abstract, their presentation, or their final paper submission. This number stays with the abstract throughout the process and becomes the ID of the presentation of the research at the conference.

## Proposal #

Organizers of groups of authors intending to submit as a pre-organized session used the abstract submission system to provide an overview or intent of the session, the name of a proposed discussant, and the authors and paper titles of those confirmed to be part of the session. The system assigned a proposal number to the grouping of these abstracts. This number stays with the session throughout the conference. When scrolling through this book and through each track, you'll find the pre-organized session proposals. Each proposal will indicate which of the abstracts in the track belong to that session. After the pre-organized session proposals are all of the numerically ordered accepted abstracts within that track. The abstract will also indicate if it is related to a pre-organized session.

## Indexes Available

Separate indexes for Author Name and Keywords reference the Abstract ID #. These indexes can be found at the end of this book.

## Order of Abstracts within Each Track

Abstracts are first ordered by the type of abstract, then sorted numerically by abstract ID.

- 1) Pre-organized Session Summaries –the overview describes the intent of the session and lists the abstract ID numbers for the included abstracts.
- 2) Abstracts with the pre-organized sessions
- 3) Roundtables
- 4) Paper abstracts
- 5) Posters

## Order of Authors

The abstract management system used by ACSP allows for author role declaration.

- **For papers (individual paper abstracts, and abstracts within pre-organized sessions) and poster abstracts** - Authors of abstracts in this book and in the final program will be indicated as presenting, primary, or co-authors of the paper. The presenting author is always listed first. No more than eight authors for one paper are included.
- **Roundtables** will have a moderator and participants. The names listed are confirmed participants of the discussion. Anyone in the audience can also participate in the discussion. There is a maximum of eight names listed for each roundtable.
- **Pre-organized sessions** will have an organizer included with the summary abstract.

## Multiple Program Placement Policy

Multiple abstract submissions on behalf of one author will be reviewed and may possibly be accepted and included in this book. However, more than one presentation of a paper and more than one appearance as a roundtable participant during the conference will not be allowed on the final schedule of presentations. It is, however, possible to present both a poster and a paper, if both proposals are accepted.

Participants on the final program will be limited to:

- one presentation of a paper whether in a formed paper session, or involved in a pre-organized paper session;
- one placement on a roundtable;
- one placement as a discussant of a paper session; and
- one placement in the poster session.

These roles are not interchangeable. If you have more than one submitted paper abstract accepted and are invited to participate on more than one accepted roundtable, in fairness to everyone, we will ask you to limit your participation.

## Requests for Edits

All abstracts in this book are unedited and published as submitted by the author(s) for peer review. It is the policy of the ACSP that the text within the abstracts will not be edited. This book is edited only for formatting consistency. We do understand the importance of names; that paper titles change as time goes on; and authors are added or dropped. In these instances, any necessary changes for the final program should be sent to [abstracts@acsp.org](mailto:abstracts@acsp.org).

## Searching this PDF

This document well more than 1000 pages including the Author Index and Keyword Index. In order to find something quickly, copy and paste the titles below in the search box, or use the indexes to search for abstract ID numbers or authors by last name.

To access the search box, use your keyboard Ctrl F.

- Search by Abstract ID: Type the words “Abstract ID:” with one space followed by the number. If you try to search for just the number, you’ll likely find it in many of the bibliographical references provided by authors. Sample: “Abstract ID: 12”
- To scan an entire track, use the word Track followed by a track number 1-16. Sample: “Track 14”
- To get to the Author Index, search for Author Index
- To search by keyword, search for Keyword and then scroll alphabetically.

# Track 1 – Analytical Methods, Technology and Society

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### 1.7 PRE-ORGANIZED SESSION - DATA INNOVATION FOR URBAN CHINA RESEARCH

Pre-Organized Session 7 - Summary

Session Includes 291, 292, 293

HARTEN, Julia [University of British Columbia] julia.harten@ubc.ca, organizer

The use of new data sources and urban analytics remains geographically uneven with most of the recent, innovative work focusing on cities in the Global North where quality data is often already available. This pre-organized session aims to highlight the state of the art in a context where data is both abundant and scarce: the contemporary Chinese city. While pervasive cell phone and mobile internet use as well broad adoption of technological advancements and digital innovations produce a plethora of new data at unprecedented scale and speed, representative data available for research is often low-resolution, lagging in time and/ or incomplete. Participants in this session show with their research how data innovation can uncover new knowledge about urban China while at the same time discussing the unique challenges that arise with data innovation within China's socio-political context.

Objectives:

- Learn about innovative data solutions in a Global South context
- Appreciate data challenges in contemporary urban China

### AMENITY, HUMAN CAPITAL, AND THE LABOR MARKET IN SHANGHAI: AN ANALYSIS BASED ON OPEN DATA AND BIG DATA TECHNOLOGY

Abstract ID: 291

Abstract within Pre-Organized Session 7

LI, Han [University of Miami] han.li@miami.edu, presenting author

Human capital theory argues that by attracting skilled workers, urban amenities are increasingly important to the location decisions of firms and to employment agglomeration. However, this hypothesis has been questioned with respect to the direction of causality at the interurban level, the existence of endogeneity, and confusion between revealed and actual preferences of consumers. In this research, to contribute the existing debate over the relationship between amenities and jobs, we develop a new measurement of private service amenities based on the comments about facilities from Dianping.com, and further relate it to labor markets in Shanghai at the intra-urban level. We find that human capital theory and the distribution of amenities can partially explain the employment agglomeration in Shanghai, and their applicability is also influenced by types of amenities and sectors. Private service amenities, such as entertainment, shopping, for-profit healthcare facilities, and restaurants, are largely associated with the employment agglomeration of producer services at the subdistrict-level, which supports human capital theory, while the agglomeration of manufacturing employment is more likely associated with the development of public facilities such as transportation systems. Our study provides an innovative way to examine urban theories in the context of the social data revolution. It also suggests that the Chinese government has to encourage the decentralization of service amenities to overcome the increasing centrality of producer services and the accelerating marginality of manufacturing employment. Based on this study, we further argue that open data and big data technologies can enhance our knowledge of cities from three perspectives: 1) filling research gaps

caused by data gaps and data barriers; 2) providing an opportunity for urban planners and geographers to revisit existing urban theories; 3) propagating new data processing and spatial modeling methods.

### **BEHAVIORAL AND DISTRIBUTIONAL IMPLICATIONS OF AIR POLLUTION INFORMATION ON URBANITES' OUTDOOR PHYSICAL EXERCISE**

Abstract ID: 292

Abstract within Pre-Organized Session 7

FAN, Yichun [Massachusetts Institute of Technology] ycfan@mit.edu, presenting author  
ZHENG, Siqi [Massachusetts Institute of Technology] sqzheng@mit.edu, co-author

Air pollution is one of the most significant public health hazards worldwide. Governments usually advise citizens to reduce outdoor activities when ambient air pollution is high through publicizing air quality index (AQI) and pollution avoidance guidance. Despite the wide adoption of such information policy worldwide, there is limited causal evidence of how urbanites' engagement in outdoor activities changes in response to air pollution, as well as the distributional impacts across socio-economic groups. To fill in this gap, the key research questions asked by this research are: (1) How do people adjust outdoor physical exercise in response to information about ambient air quality? (2) How do the effects vary by socio-economic status and why?

We built a unique panel dataset using 22.4 million outdoor exercise records from smartphone App to track exercise activities of people all over China. The primary data are obtained from KEEP (<https://www.gotokeep.com/>), the most popular exercise App in China, from 2017-01-01 to 2017-12-31. This dataset tracks individuals over time and has rich individual characteristics, including location, age, gender, weight, and exercise history. We coupled this data with hourly meteorological and pollution data from thousands of monitoring stations all over China.

To properly identify causal effects, we develop an instrumental variable (IV) based on daily variation in wind directions and air pollution levels of upwind cities, which is exogenous to local activities. Based on IV analysis, we show that a 10  $\mu\text{g}/\text{m}^3$  increase in ambient PM2.5 concentration reduces the proportion of people doing outdoor exercise by 1.31%. In addition, we use regression discontinuity design (RDD) to test threshold effects and find that people respond to air quality index discontinuous around the "heavy pollution" threshold, suggesting that public pollution information plays a role in guiding avoidance behaviors.

Further results from subgroup analysis show that people in wealthier or better-educated neighborhoods have steeper response elasticity to ambient air pollution in reducing outdoor exercise. Such disparity is enlarged rather than narrowed when city governments issued air pollution alerts in advance. Using a large-scale survey, we find clear evidence that respondents with high income or college degrees have more negative perceptions of air pollution and its health impacts than others. These findings suggest that subjective awareness of pollution impacts can cause a significant disparity in avoidance behavior across socio-economic groups, even when access to objective pollution information is available to all.

This study provides three primary contributions to the existing literature. First, it adds to the literature of pollution avoidance behavior by providing the first large-scale causal evaluation of how urbanites' outdoor physical exercise responds to ambient air pollution. Previous research linking air pollution and physical activity primarily relied on self-reported cross-sectional surveys, which are susceptible to reporting bias and omitted variable biases. Second, this study adds to the emerging literature on environmental justice. Previous literature mainly focuses on the market-driven pollution exposure inequality like housing-price induced residential sorting or differential purchase power for defensive equipment. This paper provides evidence that awareness differences can cause people of lower socio-economic status to take up less zero-cost avoidance behaviors in their day-to-day activities, which should be integrated into policy considerations when balancing between public mitigation and private avoidance efforts. Finally, as physical exercise itself is an important health behavior, this research connects with the literature on the pollution's health impacts by adding an indirect pathway of pollution on health through avoidance behaviors.

#### **WHO GETS FIRST-TIER CITY JOBS AND WAGES? LEVERAGING WECHAT TO UNCOVER WHAT SHAPES ACCESS TO SOCIAL MOBILITY PATHWAYS FOR COLLEGE GRADUATES IN URBAN CHINA**

Abstract ID: 293

Abstract within Pre-Organized Session 7

HARTEN, Julia [University of British Columbia] [julia.harten@ubc.ca](mailto:julia.harten@ubc.ca), presenting author

Migration and education are generally regarded as the two main strategies for social mobility. For China, a country marked by fast but uneven development, both have been fundamental to its social contract and its national development strategy. The Chinese household registration system hukou, which ties access to government service to place of birth, has been documented to shape both education and migration outcomes. However, the policy promise was that once attained, education would override any barriers related to background and birthplace when entering the job market. But, as more and more people are accessing tertiary education, precarity among some college-educated job market entrants has been growing as well as. Could it be that structural inequalities related to hukou and class are carrying over into labor market access and outcomes of the educated?

This study highlights city size and place of origin (hukou) for explaining differential job market experiences among China's urban young professionals. China groups its cities into tiers with tier 1 cities (Beijing, Shanghai, Guangzhou, and Shenzhen) being the largest and economically most successful with the highest paying jobs. To investigate how education and migration interact for this growing demographic, I draw on data collected via a cell phone social media survey distributed on 'WeChat,' China's largest messaging app with over 1 billion active users. Such online opt-in surveys have gained popularity among urban China researchers because detailed representative data on social issues is often not available, but the use of mobile internet and WeChat is pervasive. Repackaging a life history approach to ask about demographics, educational profiles, as well as employment and housing trajectories, my

survey instrument reached more than 25,000 respondents from cities all across China. To improve representativeness, I developed a scheme of iterative releases and what I call 'multi-pronged snowballing.' Prior to analyzing data, I also employed iterative proportional fitting (raking).

Using subpopulation and logistic regression analysis, I find that working in a tier 1 city more than having a degree from an elite university increases the odds of higher real income. Labor economists had previously stressed the role of educational quality in explaining horizontal stratification in returns to education. Adding a spatial lens, however, shows the central role of city size, in line with what the urban wage premium and human capital externalities literatures have documented for "the West." Importantly, further analysis shows that hukou more than elite education explains who works in tier 1 cities. Among those with first jobs in tier 1 cities, the number of tier 1 city hukou holders is 12 times that of non-tier 1 city hukou holders and the difference is statistically significant. Jointly, these results suggest that accessing the labor markets in China's superstar cities matters, but that this access is highly structured by place of origin. The findings add a new perspective to our understanding of social mobility and contemporary inequality in urban China.

### **1.16 PRE-ORGANIZED SESSION - PLANNING AND THE PANDEMIC: REFLECTING ON PHYSICALLY DISTANT PARTICIPATORY PLANNING**

Pre-Organized Session 16 - Summary  
Session Includes 841, 842, 843, 844

MILZ, Dan [University of Hawaii] [dmlz@hawaii.edu](mailto:dmlz@hawaii.edu), organizer

The Covid-19 Pandemic induced a wholesale shift to hosting public meetings online. This transition was made possible by the availability of reliable video conferencing platforms and other synchronous online participatory technologies (Afzalan & Muller 2018, Milz & Gervich 2021). Despite limited practical experience, planners took part in a global field test of these tools, adapting their processes and practices on-the-fly. Some of the more colorful experiences have been covered in the popular media, but this pre-organized session seeks to go beyond superficial anecdotes to offer researchers and practitioners a chance to reflect on our collective experience engaging the community digitally. In this session, we would like to explore a wide range of questions that focus, empirically, on how planners used OPT to continue hosting public meetings, workshops, charrettes, etc. during the pandemic. We'd like to talk about our experience with those activities and tools, and we'd like to talk about how this experience may or may not impact planning practice in the future.

#### Objectives:

- Document the use of synchronous online participatory technologies

- Describe how planners have adopted to conducting participatory planning online
- Discuss the future of participatory planning and online participatory technologies

## **FACILITATING VIRTUAL PARTICIPATORY PLANNING MEETINGS**

Abstract ID: 841

Abstract within Pre-Organized Session 16

MILZ, Dan [University of Hawaii] [dmilz@hawaii.edu](mailto:dmilz@hawaii.edu), presenting author

POKHAREL, Atul [NYU] [pokharel@nyu.edu](mailto:pokharel@nyu.edu), co-author

GERVICH, Curt [SUNY Plattsburgh] [cgerv001@plattsburgh.edu](mailto:cgerv001@plattsburgh.edu), co-author

COLEMAN, Kimberly [SUNY Plattsburgh] [kcole014@plattsburgh.edu](mailto:kcole014@plattsburgh.edu), co-author

Internet-based video conferencing technologies have been available for at least a decade, yet have not been widely used for the purposes of conducting participatory planning processes (Milz & Gervich 2021). Despite their growing use and popularity for garden-variety business meetings, planners and other “process managers” have preferred instead to convene public meetings face-to-face. In the past, many communities may have live streamed or broadcast public meetings, but participation was almost always limited to in-person interactions. Online participatory technologies, where they have been used and studied, traditionally refer to asynchronous, distributed tools that can support but not replace face-to-face community engagement meetings (Afzalan & Muller 2018; Conroy & Evans-Cowley 2006). However, the COVID-19 Pandemic prompted a nearly universal and immediate adoption of video conferencing technologies for hosting and facilitating meetings with the public, synchronously and remotely. Planners were tasked with developing and implementing online meetings with little practical experience or guidance from the peer-reviewed literature. This paper describes how some planners navigated this transition.

During the summer and early fall 2020, we interviewed over thirty professional planners and facilitators. We asked them to tell us about their experiences convening face-to-face meetings and to describe how they have adapted their practices to virtual participatory planning meetings. The one-hour interviews were transcribed, verbatim, and coded inductively to identify topics and themes from across all the interviews. Findings from our interviews speak to both the strengths and weaknesses of the transition to online civic engagement. For example, our findings demonstrate the relatively seamless transition experienced by the professionals to whom we spoke, while also referring to initial obstacles or missteps. In terms of the technology, the interviewees noted that, despite the popular obsession with “Zoom,” they built a toolkit of applications and then used them in different combinations to meet the varying needs of unique clients/communities. Nevertheless, respondents struggled to adjust to the impersonal nature of video conferencing, reflecting on the loss of important communication signals like body language (Walther 2011). In many cases, our interviewees noted that virtual meetings were poor facsimiles for face-to-face public meetings. Our findings also reaffirm concerns about the digital divide and equitable access that have been particularly salient during the pandemic. Our paper addresses an important and previously overlooked aspect of how technology can play a role in participatory planning, and we discuss the theoretical and practical implications of our work.

## **PROPS AND PERFORMANCE: HOW VIRTUAL PARTICIPATORY PLANNING TRANSFORMS RITUALS AND SYMBOLS IN COMMUNITY ENGAGEMENT**

Abstract ID: 842

Abstract within Pre-Organized Session 16

GERVICH, Curt [SUNY Plattsburgh] cgerv001@plattsburgh.edu, presenting author

MILZ, Dan [University of Hawaii] dmilz@hawaii.edu, co-author

COLEMAN, Kim [SUNY Plattsburgh] kcole14@plattsburgh.edu, co-author

POKHAREL, Atul [New York University] pokharel@nyu.edu, co-author

Rituals are common features of participatory planning workshops. Filling out name badges, sharing snacks or coffee, participating in icebreaker activities, jotting ideas on sticky notes, and similar activities are all common performative elements of public engagement meetings. Planning meetings also often include objects that carry symbolic purposes and meanings. Flip charts, lecterns and maps, among other objects, provide signals that help planners and participants interpret and create meaning as they experience a planning event. The body of research regarding rituals and symbols in the public sector often views these elements as tools for reinforcing roles and responsibilities, emphasizing power dynamics, creating shared meaning among groups, and constructing norms of interaction among participants (Kertzer, 1988; McComas, Besely and Black, 2009). Durkheim (1912), for instance, saw rituals as a way to reaffirm the moral consensus of citizens within a community, as communities in the early 20th century underwent rapid growth, expansion and diversification (McComas, Besely and Black, 2009). Forester (1997) emphasized the role of ritual in helping participants in planning processes make judgements about development opportunities. And, Innes and Booher (1999) explored one common ritual used in planning engagement: role-playing simulations.

Planners depend on rituals and symbols to facilitate public input, decision making, and plan making. Yet, many of the objects and ritualistic elements planners draw upon are invisible or nonexistent when planning moves online, as it did in March, 2020 due to the COVID-19 pandemic. This research begins from the premise that Synchronous Online Participatory Technologies, such as Zoom and GoToMeeting, significantly alter the dynamics of interactions in planning meetings (Milz and Gervich, 2020), and may, consequently, alter planning outcomes. This paper explores the roles of rituals and symbolic artifacts in planning processes and the changes that take place when these elements are no longer visible or usable. We ask: how are online planning processes and outcomes altered by the loss or transformation of common planning-related rituals and symbols?

This work draws from two data sources: interviews with 30+ planning professionals that are facilitating online meetings during the pandemic, and; a case study of planning processes in Plattsburgh, NY. Using grounded theory, we seek to understand how remote meeting technology alters the common rituals and symbols of participatory planning events, and the impacts of these changes on participant interactions and meeting outcomes. Specifically, we explore shifting roles and responsibilities; power dynamics; patterns of communication; and the development of trust. Ultimately, we aim to observe whether altered rituals and symbols influence the decisions and other outcomes of planning engagements. This paper will provide an overview of the literature on rituals and symbols in urban, regional and environmental planning. We will provide an overview of the case studies and interviews at the heart of the research. We will also provide conclusions from our empirical analysis and recommendations for planners seeking to continue using virtual platforms to engage their stakeholders.

It is very likely that virtual community engagement will remain a component of planners' work when the immediate

risks of the COVID-19 pandemic are reduced. New rituals and symbols may evolve for this medium, and planners may learn to adapt the common elements of face-to-face engagements to this virtual space. Yet, if the dynamics of online and in-person events are varied enough that they frequently yield different outcomes, planners will need to reconcile these two tracks of engagement.

#### **PRACTICING PLANNERS' REFLECTION ON INCLUSIVE PARTICIPATION DURING COVID-19: NEURODIVERGENCE AND ACCOMMODATION**

Abstract ID: 843

Abstract within Pre-Organized Session 16

KORNIYENKO, Gala [The Ohio State University] [korniyenko.1@buckeyemail.osu.edu](mailto:korniyenko.1@buckeyemail.osu.edu), presenting author

Global pandemic has radically changed the course of participation and decision-making process: society has turned to online technologies to continue to conduct meetings where the digital divide and community engagement for meaningful participation becomes challenging. People with different abilities (e.g.: visual, sensory, hearing, neurodivergent, ADHD) and needs communicate and engage in different ways. Planners apply different sets of tools of engagement depending on the end goal, and, while the disability community is increasing, planners have yet to fully and meaningfully engage people with different abilities (PWDA). Meeting ADA accommodations shouldn't be an afterthought that causes angst. Planners are exposed to different tools and approaches based on common needs that are universal technology engagement practices that can be applied both online and as we pivot toward in-person community meetings and systematic inclusivity.

People with disabilities are not purposefully engaged in community meetings and are marginalized from participating for various reasons (e.g., lack of expertise, budget, training, transportation, time, etc.), but, through online platforms, opportunities are emerging to include/engage through universal technology engagement practices we have tested, implemented and incorporated into increasing inclusivity.

This research paper is based on the findings from semi-structured interviews of 31 practicing planners conducted during pandemic (August-November 2020). Planners reflected on peculiarities of public engagement during COVID-19, what 'inclusive participation' means to them, and how they think about neurodiversity and disability in terms of engagement. Several planners identified themselves as being neurodivergent, and/or having relatives who are neurodivergent.

## ONLINE CIVIC ENGAGEMENT AND THE ANTECEDENTS OF TRUST DURING THE COVID-19 PANDEMIC

Abstract ID: 844

Abstract within Pre-Organized Session 16

COLEMAN, Kimberly [SUNY - Plattsburgh] kcole014@plattsburgh.edu, presenting author

Covid-19 precipitated numerous changes in civil society, including participatory planning processes. Planners across the county amended their practices in order to convene public meetings remotely via video conferencing or live streaming (Milz & Gervich 2021). Developing trust is a crucial goal for participatory planning and consensus building (Coleman & Stern 2018), yet because very little research has explored the use of online participatory technologies for conducting public meetings, it has even less to say about how these tools support or inhibit the development of trust between planners and the public. Because trust is critical for successful governance and democracy (Innes & Booher 2000), it is important to understand the ways in which online civic engagement engenders trust or activates distrust. Therefore, the goal of this work is to understand how these changes have affected the creation and maintenance of certain forms of trust in online meetings.

Between June and October 2020, we interviewed thirty-two facilitators, planners, and other dispute resolution specialists to ascertain how professional process designers and meeting managers are handling transition to online public engagement. Through qualitative analysis, we explore how trust is engendered in this online context. Overall, we found that our interviewees were skeptical of their ability to build trust in online meetings. They prefer instead the intimate, interpersonal interactions that only occur in face-to-face settings. In spite of this preference, many respondents identified different approaches they had adopted to maintain and/or build trust while meeting remotely. This research will extend existing theory about trust and public participation, and will additionally offer useful guidance for professionals designing and running online meetings.

#### **1.47 PRE-ORGANIZED SESSION - PARTICIPATORY PLANNING IN EXTENDED REALITY**

Pre-Organized Session 47 - Summary

Session Includes 388, 389, 390, 391, 392

MEENAR, Mahbubur [Rowan University] meenar@rowan.edu

As our social interactions are gradually extending to the virtual world, the essence of planning and placemaking process is also shifting to a hybrid model of physical and virtual decision-making process. Therefore, a consideration for the future of planning is the integration of technologies such as Extended Reality (XR) in the urban design and planning practice. XR includes Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR). The use of immersive technologies like VR, AR, and MR allows for users to experience what a development proposal may look or feel like. XR can be used as a tool for planners, and community members to communicate their perspectives on a design and planning proposal. However, all forms of XR require a certain level of technical competence and resources. Thus, the integration of this technology into the planning process should focus on inclusivity and access of all potential users and participants. In this session, we explore a range of research questions, related to the applications of XR, from technical to professional perspectives.

Objectives:

- Learn from the best practices in the implementation of XR throughout the design process of participatory planning, from initial ideation phase to community engagement efforts.
- Understand the technical and ethical opportunities and limitations of XR in participatory planning.
- Learn how to expand the inclusivity of XR in terms of digital literacy and access in both academic and professional settings

#### **INTEGRATING VIRTUAL REALITY IN THE URBAN DESIGN PROCESS**

Abstract ID: 388

Abstract within Pre-Organized Session 47

HAJRASOULIHA, Amir [California Polytechnic State University, San Luis Obispo] Ahajraso@calpoly.edu, presenting author

With the growing industry of extended reality (XR), we can expect XR to become more intertwined with urban planning and design, whether that means engaging public with the design scenarios, or understanding how potential designs can interact with a current space (Jamei et al, 2017). Thinking critically about the users/participants, and those who are involved in the creation and presentation of Extended Reality (XR) and have access to associated hard-ware and software technologies, will be crucial to understanding XR technology's capabilities and limitations for its application in planning (Çöltekin et al., 2020). The focus of this research is on Virtual Reality (VR), and not the other forms of XR that encompasses Augmented Reality and Mixed Reality.

In recent years, a number of applications have been released that allows creating and porting digital models directly to VR without the need for game engines such as Unity. This is a game changer for participatory planning and design, due to the simplification of the VR implementation and minimizing project costs. This opportunity opens new frontiers for creativity in disciplines such as urban planning that traditionally were less accustomed to advanced visualization tools in comparison with Architecture or Landscape Architecture. With appropriate plugins and apps, modeling applications such as SketchUp and CityEngine, and mapping applications such as ArcGIS can be used to recreate a space in virtual reality, incorporating real-life elements (Meenar & Kitson, 2020).

In this research a number of VR applications have been evaluated to test their use in the urban design process, from ideation phase, to public communication, and final presentation. A new workflow of design process has been conceptualized to use a selected number of VR apps at different stages of planning and design. The proposed workflow is applied in the zoning and urban design project of a commercial corridor in the City of Gilroy, California, as part of an academic urban design Studio.

The selected apps have been applied in five stages of the urban design process: 1- Interact in VR with partners to organize information, 2- View conceptual models in VR, 3- Edit models in VR collaboratively, 4- Engage public by presenting multiple design scenarios in VR, 5- Present the final design in VR. The VR creators and participants' experiences are compared with the control group's experiences that were involved with the same project without the application of VR throughout the planning and design process. The benefits and limitations of VR at each stage are discussed and a set of recommendations for participatory planning using Virtual Reality are suggested.

#### **UNDERSTANDING CITY IMAGEABILITY IN A MULTI-SENSORY AND MULTI-DIMENSIONAL IMMERSIVE VIRTUAL REALITY ENVIRONMENT**

Abstract ID: 389

Abstract within Pre-Organized Session 47

MEENAR, Mahbubur [Rowan University] meenar@rowan.edu, presenting author

Lynchian city imageability analysis and its affect in urban planning and design processes have been widely presented in the planning literature. City imageability is the quality of the city elements (e.g., nodes, paths, edges, landmarks, and districts) that trigger lucid images in an observer (Lynch, 1960). Lynchian techniques can be useful for planners and urban designers to understand public images of a city, create memorable and legible places, and advance people's sense of attachment to places. Lynch used mental mapping technique, which represents people's mental constructs, perceptions, or processes of geographical settings, as well as the tangible map products (e.g., sketch showing a rapid description of the city) they create (Lynch, 1960; Curtis 2016). Following Lynchian methodology, practitioners have explored city imageability mostly through field observations. A recent study has explored the role of digital technology, such as virtual mapping environments, in assisting planners conduct city imageability analysis and identify city elements (Meenar et al., 2019). The literature, however, is limited in identifying people's perception of city elements by using other types of technology such as Virtual Reality (VR).

A major aspect of VR technology is the degree of immersiveness of a simulation, exploring how much it can engage the mind and body of participants through visuals, sound, and/or touch (Isar, 2018). Research has shown that the planning and design process can be benefitted by the use of VR technology in several ways. It can increase public understanding of a development scenario; increase the volume, quality, and diversity of public participation and feedback; and offer an almost-real immersive environment by adding sensory stimuli to VR.

The purpose of this research was to explore how people understand city imageability using a multi-sensory and

multi-dimensional immersive virtual reality (IVR) environment. In this paper, I address two research questions: (1) how do people perceive Lynchian city elements by experiencing an IVR simulation of a future redevelopment scenario? (2) how does this perception vary when people are only exposed to standard presentation formats of the same scenario?

This paper is based on a follow-up study of an original project conducted in Glassboro, a historic small town in southern New Jersey, in 2018. As part of the original project, a redevelopment scenario was created for a few blocks in the downtown area and IVR simulations were created using Google Earth, Google SketchUp, Maya, and Unity software, in partnership with the Virtual Reality Center of Rowan University, NJ (Meenar & Kitson, 2000). Four focus groups were recruited in that study to do various activities. Among them, 20 participants experienced multi-sensory and multi-dimensional IVR simulation, while another 10 participants reviewed the scenario using standard presentation formats (e.g., plans, perspectives, and drive through/walk-through video of a 3D model). In this follow-up study, additional 10 people were recruited to review standard presentations. This paper is based on inputs from these 40 participants. In both stages, mental mapping technique was used to experiment how participants observed and understood Lynchian city elements of the redevelopment scenario.

A qualitative content analysis of 40 mental maps (sketches), memory recalls, and follow-up conversations revealed interesting findings. Overall, people who experienced IVR simulations, coupled with multi-sensory and multi-dimensional prompts, were able to identify more city elements and create more detailed mental maps. Participants explained how they were able to perceive and recall certain elements. However, several factors acted as barriers to their perception or interpretation process, including people's familiarity with VR technology; levels of physical and mental comfort with the technology; and levels of understanding the redevelopment scenario itself. The paper concludes with major takeaways for planning practice and research.

#### TRANSFORMING CITY OF CHARLOTTE WITH IMMERSIVE VISUAL DATA

Abstract ID: 390

Abstract within Pre-Organized Session 47

LEE, Ming-Chun [University of North Carolina at Charlotte] Ming-Chun.Lee@uncc.edu, presenting author  
AHMADI OLOONABADI, Saeed [North Carolina State University] sahmadi2@ncsu.edu, co-author  
STARK, Rachel [City of Charlotte] rachel.stark@charlottenc.gov, co-author

Scenario planning that uses geographic information mapping to enable data input/analysis and facilitate communications has been frequently used in regional land use and transportation planning projects. Charlotte's current city-wide comprehensive planning project, Charlotte Future 2040, uses scenario planning as a tool to develop alternative plans for comparisons and dialogues. Conventional scenario planning relies on digital mapping software to provide contextual information and enable "painting" on digital maps to design a range of future development scenarios. This approach often leaves much information unexplored as 2D mediums may seem

confusing to participants who are not capable of reading and interpreting maps with mostly graphical symbols or 2D graphs. It does not offer real-time 3D visualizations nor allow for multi-user interactions.

In this presentation, we introduce the “Transforming City of Charlotte with Immersive Visual Data” project, funded by John S. and James L. Knight Foundation’s Smart Cities initiative to foster public participation through Extended Reality (XR) technologies. For this project, we develop an XR platform to assist in two critical scenario planning activities, including (a) using 3D visual data and immersive visual effects to reveal and communicate planning intentions and development goals and (b) engaging stakeholders and community members in meaningful decision-making roles. Our platform, which can be used in desktop computers, handheld devices, and head-mounted displays, will leverage XR technologies, geospatial data analytics, and scenario-based methods to create a new user interface to support these two critical community outreach activities for the on-going Charlotte Future 2040 Comprehensive Plan. This project is carried out by a collaborative partnership from university partners at UNC Charlotte, NC State University, local community leaders, app development consultants, and the City of Charlotte’s Planning, Design, and Development Department.

All citizens who are concerned with the future of Charlotte are the main audience of this project and we envision that the XR platform will be widely available to the public. Whoever wanting to be a part of Charlotte Future 2040 can use the XR platform to learn about how it may (re)shape the physical fabric of their neighborhoods, see the future urban form via this immersive experience offered by the platform, and in turn share their ideas with the staff in Charlotte Planning, Design, and Development. We have identified three use cases for the XR platform to be used at home, in the meeting venue, and outdoor. We are currently focusing on content production, including 3D immersive experiences for building types representing possible future development scenarios in Charlotte Future 2040 for the proposed use cases. Our team is working with local developers and a leading XR technologies provider to use their flagship immersive solution to build our XR platform. We have also developed a workflow of content production that enables us to generate immersive experiences with the most recent industry-level standards. In the next phase of the project, a pilot study with volunteer residents from several neighborhoods across Charlotte will be held to test the XR platform capabilities in providing immersive experiences for alternative development scenarios as proposed by Charlotte Future 2040. Information from these meetings will provide important insights to refine the platform, eventually made available to all Charlotteans to empower them to play active roles in Charlotte Future 2040.

The formal adoption of the Charlotte Future 2040 Comprehensive Plan by the City Council will only signal a new beginning of yet another round of planning efforts. The XR platform will continue to function in the next round of planning activities as a tool to assist in visualizing, collecting, and analyzing data at the neighborhood scale with a goal of revising city-wide unified development ordinance in mid-2022.

## **A MOBILE AUGMENTED REALITY PLATFORM FOR COMMUNITY ENGAGEMENT**

Abstract ID: 391

Abstract within Pre-Organized Session 47

AHMADI OLOONABADI, Saeed [North Carolina State University] [sahmadi2@ncsu.edu](mailto:sahmadi2@ncsu.edu), presenting author  
BARAN, Perver [North Carolina State University] [kperver@ncsu.edu](mailto:kperver@ncsu.edu), co-author

Socio-ecological models and human-scaled urban design approaches assert the influence of the built environment on physical activity and how improving built environment features, such as sidewalks, may enhance physical activity. However, many racial/ethnic and low-socioeconomic status communities have limited access to environments that encourage physical activity, causing a myriad of health and environmental discrepancies. Engaging communities may mitigate such disparities by incorporating residents' knowledge in decision-making and well-being promotion. The emergence of digital participatory planning methods, such as public participatory GIS (PPGIS), has created new opportunities to improve community engagement by fostering active citizen-government communications, saving participants' time, and reducing engagement costs. Despite these benefits, more improvements are needed to make current digital participation methods more intuitive for novice users and more capable for two-way communications between residents and decision-makers.

This presentation introduces a novel participatory platform that integrates mobile augmented reality (AR) into community engagement. AR blends real and virtual worlds by superimposing digital content on the real world. Mobile AR combines AR with smartphones' wireless communication and location-based services and enables users to point their smartphones to objects in their surrounding area and let the device augment digital information onto the environment. The ubiquity of smartphones makes them powerful tools to collect and share user-generated content and accelerate concurrent interactions of stakeholders and decision-makers. MAR has shown promise in visualizing designs at their final locations, resulting in enhancing the understanding of future designs for lay citizens, especially when it is used outdoors. The AR platform goes beyond current participatory planning methods by offering a visually intuitive tool for more effective participation, particularly among disadvantaged populations. Besides enabling community members to provide data to decision-makers, the AR platform facilitates presenting design scenarios developed by decision-makers to the community, enhancing two-way communications between residents and decision-makers.

The AR platform has three components: a mobile AR app called CommunitAR, a mapping service to visualize geo-tagged data generated through CommunitAR in real-time, and a cloud database to handle such data. CommunitAR is the core of the AR platform and consists of two main modes, COM and VIZ. In the COM mode, users can select an array of street features, place them in the environment, and manipulate their scale and placement instantly. Users can also capture screenshots of scenes and share them with their comments on social media. The VIZ mode enables users to visualize the entire design(s) in the corresponding location(s), vote on their preferred design(s), indicate the reasons for their selections, and share them with fellow residents and decision-makers.

We established a partnership with a group of communities of color in Charlotte, NC, with inequitable access to streetscape features important in improving physical activity. We implemented the AR platform through a series of participatory activities and evaluated its participatory aspects by comparing it to a conventional participatory method using printed maps. Our findings suggest that the AR platform is a valuable addition to current participatory planning methods. It provides an intuitive way to interact with the surrounding environment, visualize future designs at their actual locations, and enhance users' understanding of designs in situ. It also makes the community engagement inclusive by providing the opportunity for participation to those who are not able or not willing to engage otherwise. A broad range of qualitative and quantitative data collected from community members made the findings rich and uniquely useful in understanding residents' needs to improve neighborhood conditions, utilizing a novel digital participation method. The AR platform can be used in any participatory planning effort related to the

built environment, such as new housing projects, public plazas and parks redevelopments, and master planning.

#### EFFECTIVE AND ETHICAL EXTENDED REALITY FOR PARTICIPATORY PLANNING - THE CURRENT STATE OF PLAY

Abstract ID: 392

Abstract within Pre-Organized Session 47

BOYCO, Morgan [University of Waterloo] mwboyco@uwaterloo.ca, presenting author  
LEWIS, John [University of Waterloo] j7lewis@uwaterloo.ca, co-author

Twenty years ago, Stephen R.J. Sheppard called on the "crystal ball gazers" who were preparing three-dimensional views into the future using emergent visualization technology to pay mind to the power of these new tools to influence decisions (Sheppard, 2001). Visualizations of planned urban and environmental change have long been touted for their capacity to improve public access to and understanding of planning projects. More specifically, visualizations can convey more powerfully than two-dimensional plans the aesthetic, emotional and experiential qualities that the public associate with their environment and can help predict community reactions to planned environmental change (Sheppard, 1989). Despite these benefits, planning academics and practitioners have pointed to the potential of visualizations (either deliberately or inadvertently) to provoke uncertainty and confusion or, at worst, bias planning decisions. They have called for the use of professionally recognized standards and codes of ethics to ensure that visualizations are "effective" or, in other words, capable of facilitating the process of information exchange that is essential to participatory planning (Downes & Lange, 2015; Groulx & Lewis, 2019).

The implications for visualization use in participatory decision-making in planning practice remain significant, particularly as these increasingly powerful technologies become more immersive, interactive, and accessible, from a usability perspective, to any planner or urban design practitioner. However, the technical thrust that has conventionally driven visualization development and practice has contributed to concerns that developments in Extended Reality (XR) in particular are outpacing our understanding of how to use the technology effectively and the extent to which it can bias interpretations of planning proposals. This presentation serves as a timely reminder of the potential of immersive visualization technologies to support better decisions, and the implications for their misuse. We revive the evaluative framework proposed by Sheppard by examining its relevance to current XR use in planning and urban design practice. Through an environmental scan of the state of current practice that looks at contemporary use of XR technology in participatory planning and urban design across North America, we build the case for the continued application of ethical principles in the use of immersive and interactive visualizations. More specifically, we ask whether Sheppard's general principles of effective visualization communication, including

accuracy, representativeness, visual clarity, interest, legitimacy, and access, as well as his proposed code of ethical conduct can inform the ethical use of XR technology in planning practice. In addition, we ask whether the principles developed by Sheppard and used by planning and design practitioners ought to be refined to reflect the immersive and interactive capabilities of XR technology.

We find amidst the explosive growth in the power of XR technologies, and what we anticipate is coming over the next decade, that asking these critical questions is all the more vital. We reflect on our own project-based experiences in applied research and professional practice with XR technologies as well as findings from our state of play environmental scan to conclude that the XR technology cart may be leading the participatory horse. Planners need to think carefully about how to use these new and powerful visualization technologies ethically by incorporating well-established effective visualization principles in assessing and deploying new technologies for participatory process.

## **ROUNDTABLES**

### **1.123 ROUNDTABLE - EXPLORING NONLINEAR RELATIONSHIPS WITH MACHINE LEARNING**

Abstract ID: 123

CAO, Xinyu [University of Minnesota] Cao@umn.edu, organizer, moderator  
TAO, Tao [University of Minnesota, Twin Cities] taotao@umn.edu, participant  
SABOURI, Sadegh [University of Utah] Sadegh.Sabouri@utah.edu, participant  
CHEN, Peng [University of South Florida] pengchen@usf.edu, participant  
YAN, Xiang [University of Florida] xiangyan@ufl.edu, participant

Statistical modeling has been widely used in travel behavior research. Previous studies often assume that independent variables have a pre-defined (e.g., linear, log-linear, quadratic, and generalized linear) relationship with travel behavior. Although generalized linear models enable scholars to illustrate nonlinear relationships between variables, these models impose certain assumptions that may not reflect the true relationships between variables.

Recently, some studies have employed machine learning algorithms and advanced analytical approaches (e.g., random forest, gradient boosting decision tree, as well as generalized additive models) to predict nonlinear relationships between variables (Sabouri, Brewer, and Ewing 2020, Wang and Ozbilen 2020, Xu et al. 2021, Hu et al. 2018, Tao et al. 2020). These studies show that nonlinear relationships are prevalent in travel behavior research, and that the patterns of nonlinearity vary by variable. The nature of the irregular nonlinearity renders traditional methods that model nonlinear relationships inefficient. Furthermore, these advanced methods enable researchers

to relax restrictive assumptions and illustrate the relationships between variables more robustly than before. Some of the recent findings also challenge the conventional understanding of travel behavior and provide nuanced implications for planning practice.

As the number of nonlinear studies grows to a couple dozen, it is time to summarize the progress that has been made and to consider future development of this niche area. In this roundtable, four pioneer scholars will discuss the pros and cons of different approaches in addressing the irregular nonlinearity, novel findings compared to traditional methods, planning implications of the new findings, and caveats related to the recent development. We expect that this roundtable will enable planning scholars to have a better understanding of the nonlinear issue and adopt these approaches in their research, no matter whether it is about travel behavior or any other planning topics.

### 1.1040 ROUNDTABLE - AI IN PLANNING

Abstract ID: 1040

YE, Xinyue [Texas A&M University] xinyue.ye@gmail.com, moderator, organizer

SANCHEZ, Tom [Virginia Tech] sanchez@vt.edu, participant, organizer

LI, Wei [Texas A&M University] wli@tamu.edu, participant, organizer

In recent years, artificial intelligence (AI) methods have been widely used for urban informatics and computing, spurring novel thoughts for data-driven urban theories, planning, and decision-making. The movement towards smart/intelligent systems, which is closely related to progress in research areas such as control and automation systems, also creates new challenges to the economic, social, cultural, legal, and environmental systems in today's urban landscape. On the one hand, AI technologies present an unprecedented potential to the developments of smart cities, particularly the design, planning, simulation, and visualization of neighborhoods and cities. On the other hand, technological advances have brought up new challenges and opportunities about both theories, practices, and education on urban and regional planning. This is an opportune time to explore how AI should function and thrive in the context of planning, and vice versa, through a roundtable discussion of planning researchers.

## **INDIVIDUAL PAPER SUBMISSIONS**

### **THE PROSPECTS FOR ARTIFICIAL INTELLIGENCE IN URBAN PLANNING**

Abstract ID: 18

Individual Paper Submission

SANCHEZ, Thomas [Virginia Polytechnic Institute and State University] sanchez@vt.edu, presenting author

Since the late 1960s, urban planning has encountered a variety of advanced analysis methods with greater and lesser degrees of adoption. Geographic Information Systems (GIS) is probably the most notable, with others such as database management systems (DBMS), decision support systems (DSS), planning support systems (PSS) and expert systems (ES), having mixed levels of recognition and acceptance (Han and Kim, 1989; Pettit et al, 2018). The adoption of GIS, some will argue, has been primarily related to its cartographic capabilities and less so for sophisticated spatial analysis techniques. More recently there has been a re-emergence of artificial intelligence (AI) related methods. Applications of AI have been rapidly increasing, especially with respect to consumer goods and services. Amazon, Netflix, Google, and other companies have invested significant sums in these technologies to gain insights on consumer characteristics as well as improve supply chains and distribution. This paper reviews the literature (1960s to current) on AI-related methods to assess how language and perspectives have changed over time relative urban planning applications. Several interviews with urban planning methods experts were also conducted to add further nuance to the discussion and identification of the primary challenges involved. Increased data availability, increased processing speeds, and increased accessibility to AI methods have the potential to reconnect with urban planning processes and decision-making. But will it be different this time? The paper also draws on Lee's assessment of large-scale models from 1973 as a lens for evaluation. While it is only possible to speculate about the prospects of AI in urban planning, familiar cautions remain alongside optimism for new opportunities and possibilities.

## **USING MACHINE LEARNING TO REPLICATE URBAN MODELS IN DIFFERENT SETTINGS: THE CASE OF DEEP CNNs-BASED PARK IMAGE CLASSIFICATION**

Abstract ID: 42

Individual Paper Submission

CHEN, Si [University of Illinois at Urbana-Champaign] sichen12@illinois.edu, presenting author  
DEAL, Brian [University of Illinois at Urbana-Champaign] deal@illinois.edu, co-author

Computational urban models can enable a more forward-thinking, data-based, and transparent planning process. The adoption of these (sometimes complex) models across domains is difficult. Large-scale urban models can be spatially sensitive, data-hungry, with highly complex model parameters trained to a specific task (Deal, Pan, Pallathucheril, & Fulton, 2017). They are also typically built and tuned to a single context, so that their application to different places can require extensive data, time and financial resources to manually process input data, rescale and reset parameters (Manninen, Aćimović, Havela, Teppola, & Linne, 2018). For these reasons there are very few studies that have focused on replicating urban models using a universally applicable approach (Plesser, 2018). We suggest that machine learning techniques can help overcome these obstacles to model replication and adaptation.

In this study we apply deep machine learning processes (i.e. transfer learning), embedded with fine-tuning and data augmentation strategies, to test the replication of a geographically specific urban planning land use classification model. Transfer learning is a state-of-the-art computer science based approach for addressing cross-domain tasks. The technique is constructed to transfer knowledge across domains (or contexts), lower data requirements, reduce data variation issues, and simplify hardware environments –while maintaining valid outcomes (Tan et al., 2018). Reducing data and data manipulation requirements can improve adaptability and replicability by reducing time and resource requirements.

The proposed park classification framework is a first step toward testing the efficiency a transfer learning approach to model replication. It uses deep convolutional neural networks (CNNs) to classify urban parks based solely on public image data. Classifying urban parks and understanding how parks are used and for what purpose, is a fundamental principle behind urban green space planning and design. Current urban park classification approaches typically depend on local knowledge, manual labeling, and empirical (subjective) benchmarks (eg. park size and recreational activities) (Ibes, 2015). Geo-located images collected from online sources (e.g. social media) have the potential to provide robust and comprehensive information, but are seldom used because of the difficulty in collecting and parsing data. For example, image datasets can be sparse and of varying quality, come from diverse points, and the similarities between images even in different parks, are naturally high and difficult to differentiate.

To address these challenges, we use transfer learning techniques to pretrain deep CNNs to learn generic park features using a large and varied dataset. We integrate fine-tuning and image augmentation strategies to further decrease overfitting problems caused by low-quality and small datasets in the target domain. A park image dataset for Seattle, Washington is used to test our proposed park classification model and replication approach. Our model comparison results show that the classification framework is able to discern park usage with 73.34% accuracy. This is a relatively good performance considering the entire dataset only has only 122 images that represent 55 different parks.

This work focuses on exploring universally efficient approaches to allow easy replication and adaptation of models in different urban settings. It uses a transfer learning based deep CNNs, combined with image augmentation and fine-tuning strategies to maximum performance and to address the challenges of low-quality and small datasets. Our

results suggest deep machine learning techniques can assist in large-scale, complex urban model replication that can ultimately better support urban planning practices.

### **DETECTING VACANT, ABANDONED AND DISINVESTED (VAD) PROPERTIES IN SAVANNAH, GEORGIA USING MACHINE LEARNING**

Abstract ID: 68

Individual Paper Submission

LIANG, Xiaofan [Georgia Institute of Technology] xiaofan.l@gatech.edu, presenting author  
ANDRIS, Clio [Georgia Institute of Technology] clio.andris@design.gatech.edu, co-author  
BRAINERD, Brian [City of Savannah] bbrainerd@savannahga.gov, co-author

Vacant, abandoned, disinvested (VAD) properties are known to lower the neighborhood property values, increase crimes and taxpayer costs, and disproportionately impact the communities of color (Branas, Rubin & Guo, 2012; Akers, & Seymour, 2019; Sun et.al, 2019). In 2018, Savannah, Georgia passed a \$10 million special-purpose local-option sales tax to help redevelop at least 1,000 vacant, abandoned and disinvested (VAD) residential properties over the next 10 years. Once a VAD property is identified, the city or the land bank can acquire the property and regenerate the properties for affordable housing. This initiative is implemented with hopes that residents can benefit from cleaner, safer, and more prosperous neighborhoods.

Before redeveloping these properties, planners need a standardized, transparent method for detecting and prioritizing the VAD properties. To detect these properties, we use a machine learning model (following Hillier et.al, 2003; Appel et.al, 2014) to find the characteristics of a parcel that best predict whether it should be prioritized for intervention. This particular study will focus on how the model is implemented and applied, as well as how missing civic data problems are solved.

In this study, we build a random forest model for detecting VAD properties based on characteristics of 9,321 parcels of interest per the City of Savannah. We first construct an index of VAD by combining civic data such as crime and fire records, tax delinquency, utility status, and code violations in 2019. These attributes are legal criterions for the City of Savannah to initiate acquisitions. Each parcel is then ranked based on the VAD score (ranging from 1-1,574 for lots and 1-7,747 for lots with structures), where lower numbers indicate more blight. The predictor variables for the VAD index include lot size, year built, years since last sale, number of bedrooms, median neighborhood property value, property growth rate, location within a floodplain, and evidence of historic redlining.

We find that the most salient indicators of VAD properties are related to the property values and lot size, for parcels

with and without structures. Partial dependence plots further reveal that parcels valued at 6-13K USD are particularly conducive to a high VAD. We also find that location in a floodplain or a historic redlining area did not predict VAD well. In implementing this model, results helped planners quickly identify VAD properties and narrow the range of field surveys. Some parameters were counter-intuitive to planners' in-depth knowledge while most matched their intuition.

Lessons learned include a challenge in civic data fusion, as parcel characteristics were sourced from multiple city offices and service departments, each has its own biases at recording data for parcels. These data also had many N/A values across categories--compromising the integrity of the input variables for the random forest model, and we take different approaches to dealing with this issue vis-a-vis statistical learning. We also describe how this research benefited the City of Savannah.

Ongoing work on this project includes the administration of a neighborhood sentiment survey to engage with the community and collect community members' suggestions for properties. These responses will help contextualize VAD properties--adding dimension to an index score that is tabulated only with passive data. The integration of these results requires careful balancing of qualitative and quantitative variables in indexes as we integrate tacit knowledge from the community into a machine learning model. A major takeaway from this project is that cities struggle to define and detect blighted properties, and that machine learning can be used to predict properties in need of intervention.

#### **USING DATA MINING TO EXPLORE THE SPATIAL AND TEMPORAL DYNAMICS OF PERCEPTIONS OF METRO SERVICES IN CHINA: THE CASE OF SHENZHEN**

Abstract ID: 71

Individual Paper Submission

LUO, SHULI [The Chinese University of Hong Kong] candyluo5@link.cuhk.edu.hk, presenting author  
HE, YING [The Chinese University of Hong Kong] sylviahe@cuhk.edu.hk, co-author

Improving perceptions of service quality is a promising planning strategy for increasing the attractiveness and retaining the ridership of public transport systems. The widespread use of social media presents an opportunity to investigate the performance of transport services from the customer's perspective. This study proposes a framework for integrating quantitative and qualitative analyses to investigate the perceptions of transport services by mining data from social media. We utilise Sina Weibo data related to the Shenzhen metro system to illustrate a

text mining process categorised by semantic, spatial and temporal information. On the semantic front, in addition to identifying service attributes and sentiment polarity consistent with previous literature, we find attributes specific to the Chinese context. We also identify clear temporal variations among different service attributes by visualising the number of corresponding microblogs across varying time scales such as hours, days and weekdays. The spatial variations reveal five main clusters around central business districts and transport hubs, which produce the highest density of reports about crowdedness, waiting times, reliability and frequency. However, microblogs that report on perceptions of safety and personnel behaviour present a different spatial pattern. This research offers insights into the ways in which we can use social media data to identify key service areas for immediate improvement and to monitor and manage metro systems more effectively over the long term.

#### **DETECTING ABANDONED FARMLAND THROUGH HARMONIC ANALYSIS AND GRAY-LEVEL CO-OCCURRENCE MATRIX (GLCM); IN THE CASE OF YEONGDEOK-GUN, NORTH GYEONGSANG PROVINCE, SOUTH KOREA**

Abstract ID: 92

Individual Paper Submission

BAEK, Seungjoo [Seoul national university] s\_joo94@snu.ac.kr, presenting author  
YOON, Heeyeun [Seoul national university] hyoon@snu.ac.kr, primary author

Abandoned farmlands refer to the agricultural lands which has not been cultivated for more than 2 years. The presence of the abandoned farmland has negative impacts on human and natural environments, for example, reducing agricultural production, deteriorating local communities, and increasing the probability of wild fires and soil erosion. While appropriate managements are required, detecting those via field surveys or any type of manual works always involves a great level of efforts, time and budget.

Remote sensing technique is used as a supplement to the manual efforts. Commonly adopted method is to detect the abandoned farmland from other types of land use, using attributes derived from the satellite or aerial imageries. The choice of the attributes determines the accuracy of the classifications. Commonly, the attributes are two types; temporal and spatial. Examples of temporal features are vegetation phenology extracted from Vegetation indices (VIs). Examples of spatial features are spatial distribution extracted from texture information. While each type is used for classification separately, only a few studies took advantage of the diversification of attributes by adopting the two types together.

Under a belief that the detection accuracy can be improved by using both of the temporal and spatial characteristics, in this study we aim to detect abandoned farmlands through attributes extracted time-series analyses, as well as the attributes from the textural analysis. For temporal features, Harmonic analysis is used to decompose a vegetation index time series into multiple sine and cosine components of various frequencies, and extracted the magnitude of each. For spatial features, Grey Level Co-Occurrence matrix (GLCM) is used to extract fourteen texture features considering four directions. We use Sentinel-2 satellite imagery data and compare the accuracy from Support Vector Machine and Random Forest classification.

The study site is Yeongdeok-gun, North Gyeongsang province, South Korea, the province with the second largest agricultural land in the country. Although the main industry in Yeongdeok-gun is agriculture, the cultivation area decreased from 3,139 (ha) in 2000 to 2,048 (ha) in 2020 and rice production also decreased from 14836 (ton) in 2000 to 8650 (ton) in 2020. The study period is from Jan. 2018 to Dec. 2020. Abandoned farmland tends to have a good quality of natural resources, so there is a need for strategy to reuse abandoned farmland. The finding of this research would give guidance to local governments when detecting abandoned farmlands, and establishing the local policies of abandoned farmlands to prevent possible negative consequences. Our study can contribute to improve effective land use for policy for policy makers and city planners.

This work was supported by Creative- Pioneering Researchers Program through Seoul National University, and the Korea Environment Industry & Technology Institute (KEITI)/ the Korea Ministry of Environment (MOE) (2020002770003).

#### AN ONLINE PLANNING SUPPORT TOOLKIT

Abstract ID: 101

Individual Paper Submission

KLOSTERMAN, Dick [University of Akron] dick.klosterman@gmail.com, presenting author

Planning support systems (PSS) have attracted a great deal of academic interest since they were introduced more than thirty years ago (see, for example, Brail and Klosterman 2001 and Brail 2008). Unfortunately, these systems have not been widely used in planning practice, largely because they generally provide sophisticated and hard-to-use analysis and spatial modeling systems that do not meet user's needs (Vonk, Geertman, and Schot 2005).

This paper illustrates a different approach to PSS development and use. It describes a collection of online planning support tools that make simple, easy-to-use urban and regional analysis and projection methods at the core of planning education and practice readily available on the Web. The methods provided in the toolkit are thoroughly described and applied to a real community in a published text (Klosterman et al, 2018), which identifies data sources for applying the methods in the United States. The computational routines provided in the tools are fully documented in a collection of spreadsheets that are also available online.

The tools have been developed in the popular R programming language and only require users to upload their data from simple spreadsheet files. The tools allow users to instantaneously see the results of using different data sets and assumptions online. The analysis results can be viewed onscreen as graphs and tables that can be downloaded

to the user's computer. The paper describes and illustrates the online planning support toolkit and considers its advantages and limitations for planning education and practice.

#### **YOUTUBE JOURNALISM AND HOUSING STUDIES: MINING INFORMATION DELIVERY AND CONSUMPTION PATTERN IN YOUTUBE**

Abstract ID: 121

Individual Paper Submission

OH, JI HUN [Ulsan National Institute of Science and Technology] wlgnssl414@gmail.com, presenting author  
KIM, JEONGSEOB [Ulsan National Institute of Science and Technology] jskim14@unist.ac.kr, co-author

Background: In making housing-related decisions such as housing purchase or residential choice, we rely not only on personal experiences but also on a variety of information from others (McCray et al., 1987). Among them, in large part, we are exposed to and influenced by information from various media (McCollough & Karani., 2014).

Meanwhile, as the Internet environment becomes common, the way the people consume the information is changing substantially. In this trend, one of the most remarkable changes in recent years is the rise of YouTube journalism, suggesting that the role of information delivery as a media is gradually being replaced by YouTube from newspaper or TV (Paulssen & Harder, 2014). The information delivery and consumption pattern in YouTube differs from the existing media in several ways, which may further influence the housing-related perception and behaviors of YouTube viewers. For example, YouTube viewers have a relatively wide range of information choice compared to existing media. Rather than just being exposed to information, they tend to choose the information they want via selecting YouTube channels and contents. Some housing-related information, such as housing market situation or government policy, can be delivered in different forms and methods depending on the YouTube content creator's frame. In this case, their perception on housing can be further reinforced by repeatedly consuming only the information they believe (Tsfati & Cohen, 2003). Thus, this study aims to investigate the information delivery and consumption pattern by mining YouTube contents related to housing issues, and further discuss the potential influences on individual's housing-related perception and behavior.

Method: First, to identify what kind of housing-related information is being provided in YouTube, we collect the relevant YouTube contents for the last year by web-crawling. By mining the video titles, we categorize the information type and examine the differences by information providers. As an example, besides the user created video contents, some broadcasting companies have recently begun uploading TV news to their YouTube channels as an information provider. Second, to further examine how the information is delivered in YouTube, we extract the sentiments in the YouTube video contents. The sentiment reflects the purpose and belief of the information provider and it is expected to vary depending on the information type and the nature of information provider. Here, the voice information in the video is converted into text format to be analyzed. Third, since the comments represent how viewers react to the video contents, we intend to find some implications for information consumption pattern in YouTube by through the sentiments revealed in the comments. Lastly, we present a discussion about how the

distinctive information delivery and consumption pattern in YouTube affect the individuals' perception on housing and their behavioral outcome.

Expected result & Implication: As housing-related YouTube contents continuously expand, and since the information is delivered in a way that is more easily understood through video format, it is expected that information consumption will be expanded in terms of quantity. On the other hand, since many YouTube contents are made by individual creators, it may tend to express their argument more directly and explicitly. Moreover, continuously watching videos of certain YouTube channels that only specific information on housing market can cause confirmation bias. We expect that this study provides some empirical implications to investigate the above possible outcomes by changes in information delivery and consumption pattern around YouTube. This knowledge of individual perception and behavior at the micro level is also helpful to understand the inherent mechanism of housing market at the macro level.

## ESTIMATING DIVERSITY AT POINTS OF INTEREST (POIS) IN ATLANTA, GEORGIA USING ORIGIN-DESTINATION TRIP DATA

Abstract ID: 151

Individual Paper Submission

LEE, Seolha [Georgia Institute of Technology] seolha.lee@gatech.edu, presenting author

ANDRIS, Clio [Georgia Institute of Technology] clio.andris@design.gatech.edu, co-author

Segregation in cities has led to disinvestment and inequality in education, public health, and other opportunities, and a potential lack of social mixing across the city. However, residential segregation is only one part of segregation in a city. The location of jobs and third places (i.e. points of interest (POI)) may also perpetuate a lack of mixing among populations of different races, ethnicities and income groups. Analysis of individuals' activity spaces shows that segregation is not just residential, but that activity spaces are segregated as well (Farber et al., 2015; Wang et al., 2018). Furthermore, segregation of activity spaces can be more intense than expected by residential geographic segregation (Dong et al., 2020), and perhaps explained by residents forgoing nearby POIs for more socially and culturally-attractive POIs (Arentze & Timmermans, 2008; Etmnani-Ghasrodashti & Ardeshtari, 2015).

In this research, we ask which kinds of POIs (by neighborhood location and by category) have a more diverse set of visitors, defined as the proportion and number of visitors from neighborhoods of varying racial compositions and median annual income composition. We use 4,952 POIs within the city limits of Atlanta, Georgia as destinations. POIs are categorized as food outlets, retail, health/care services, personal services, or recreation. For each POI, we record the number of trips that originated in block groups of certain racial compositions and income compositions (from U.S. census data at the block group level) from March to June 2019. Trip data is provided by Safegraph at the block group-to-point level, and all trips are within the city of Atlanta.

We find that POIs in the downtown area, in nearby Midtown, and in adjacent gentrifying neighborhoods had a more diverse set of POI visitors. Our results also show that food outlets (restaurants, bakeries, bars, cafes, etc.) had the most diverse visitor populations in terms of both race and income. Additionally, many food outlets and recreation destinations had more frequent visitors from majority-white neighborhoods. Conversely, healthcare and retail POIs (supermarkets and other goods retail shops) attracted visitors from more homogeneous neighborhoods. The result was similar regarding income level. Lastly, residents in majority-Black or lower-income neighborhoods frequently visited places in an opposite socio-demographic setting of their own neighborhood, while residents in majority-white or higher-income neighborhoods did so less frequently.

We note limitations regarding potential ecological fallacy issues; that trajectories could represent workers and not patrons; and that the data may not capture most travelers or have spatial errors. Nevertheless, this research supports efforts to understand how POIs serve as potential mixing areas in the city and to serve urban residents more equitably with amenities and services. Urban planners seeking to facilitate connections across communities may be interested in how POIs may play a role in fostering new and existing social relationships and equitable services. In the future, we hope to perform similar analyses across multiple cities, and with more racial and ethnic groups, to find commonalities among locations that equitably attract visitors from across the community.

## EXAMINING EQUITY AND RESILIENCE TO EXTREME HEAT IN PHILADELPHIA USING GPU-ACCELERATED URBAN MICROCLIMATE MODELLING

Abstract ID: 161

Individual Paper Submission

LI, Xiaojiang [Temple University] [lixiaojiang.gis@gmail.com](mailto:lixiaojiang.gis@gmail.com), presenting author

The increasingly frequent and intense extreme heat events in large U.S. cities cause more climate-related mortalities than any other hazardous weather event (Stone et al., 2010). In the context of global warming and urban heat island, heat waves are supposed to be more frequent and intense in many cities. The extreme urban heat is not distributed evenly across neighborhoods of cities, and not all populations are impacted by the extreme heat equally (Reid et al., 2009). A fine level of quantitative information about where and which populations are vulnerable to heat is important to identify the most vulnerable neighborhoods and populations in order to mitigate the negative impacts of heat on urban residents. The ground surface temperature estimated from remotely sensed thermal imageries has been widely used to map the intensity of the heat at large scales (Shandas et al., 2019; Harlan et al., 2006). However, the land surface temperature derived from remotely sensed imageries cannot fully represent human actual outdoor heat exposure because factors, such as shade, wind speed, humidity that impact human thermal comfort are not considered. In addition, the coarse resolution remote sensing-derived land surface

temperature usually cannot show the fine-level spatial variations of urban heat across neighborhoods.

This study proposed to use the mean radiant temperature ( $T_{mrt}$ ) to indicate the distribution of urban heat in Philadelphia. Since the  $T_{mrt}$  considers the urban form and meteorological parameters, it is more reasonable to indicate the human actual heat stress level. In this study, the SOLWEIG (SOLar and LongWave Environmental Irradiance Geometry) model was applied to map the  $T_{mrt}$  in Philadelphia based on the high-resolution (1m) urban 3D model and meteorological data using the Graphics Processing Unit (GPU) parallel computing. This study further investigated the different heat exposure levels of different neighborhoods and population groups in Philadelphia. Results show that there is no significant disparity in terms of outdoor heat exposure levels for different racial/ethnic groups in Philadelphia. Generally, the elderly, who usually are more vulnerable to extreme heat, tend to live in neighborhoods with less outdoor heat exposure in summer. The higher-income people tend to live in thermally more comfortable neighborhoods. The GPU-accelerated urban microclimate modeling based on publicly accessible high-resolution urban 3D models is a generalizable and scalable method to examine the vulnerabilities to extreme heat for cities across the US, which would benefit urban heat management and building thermally equitable and resilient cities. The fine-level urban heat maps generated by the modeling would be directly applicable for guiding urban landscape design and urban planning for mitigating the negative impacts of extreme heat.

Pedestrian accessibility refers to the extent to which the built environment supports walking access to destinations of interest. Monitoring spatial indicators of pedestrian accessibility helps planners and policymakers evaluate the impacts of urban planning and transport interventions, and guides targeted interventions towards creating healthy, sustainable cities. However, measuring spatial indicators of built environment features around the world to enable cities to be compared is challenging because local official data are either unavailable, not accessible to the public, or vary widely in coverage and format. Subject to data availability, indicators can be defined at very different scales of spatial aggregation by different government agencies, and the quality and usage of these indicators can be affected

by local contexts. Indicators developed with proprietary GIS software and non-comparable types of data often lack reproducibility and replicability. Existing spatial analysis tools can have limited functionality and transparency, or be expensive to use. These limit the ability of policymakers and researchers in resource-constrained contexts to derive indicators, reproduce results, or monitor change over time, further contributing to inequities in the ability to develop evidence-informed policy.

To address these challenges, this study develops a framework using open source software and open data (e.g. OpenStreetMap) to deliver a generalized method for measuring pedestrian accessibility indicators within and between cities in diverse contexts. The method developed in this research enables calculation of the key indicators of pedestrian accessibility, including but not limited to street connectivity, population density, daily living amenities access, and overall walkability. The open data approach allows researchers and practitioners to obtain relatively consistent data across cities and use them to calculate, analyze, and compare the indicators at both the local neighborhood scale and the spatially aggregated city level. To address data quality questions, methods for open data validation have been developed to investigate real-world representation and suitability for indicator calculation.

We describe the method using a case study project involving analysis of the 25 cities across 19 lower-middle- to high-income countries, representing a diverse range of urban contexts. Using the present method, we calculated pedestrian accessibility indicators for the 25 cities at two distinct geographical scales: fine-grained hexagonal grid level and city level. The present framework has been validated with local knowledge from collaborators in our case study cities. The validation results confirm that neither official nor open data are a perfect representation of the real world. While the open data displayed some divergence from approximately comparable official data, there was a relatively high correspondence such that local contexts were considered to have been represented adequately in most instances; thus, open data was found to be broadly suitable for the purposes of deriving indicators of pedestrian accessibility in urban contexts.

The present method framework is made publicly available for reuse in an open repository. The methods are scalable and customizable for inclusion of alternative data sources and study regions, helping to remove barriers to application of indicators in policymaking for low resource settings. The indicator output generated from the tool can be used to compare and track within- and between-cities' inequities, planning progress, and to support public health, urban development, and transportation research. This research points out the need for more work toward understanding the underlying mechanisms for measuring built environment indicators to guide city development.

## IMPACTS OF NEIGHBORHOOD AND HOUSEHOLD DYNAMICS ON CENSUS RESPONSE RATE; EMPIRICAL EVIDENCE FROM THE STATE OF ILLINOIS

Abstract ID: 201

Individual Paper Submission

SHIN, Jaeyong [University of Illinois at Chicago] jshin75@uic.edu, presenting author

The 2020 Census is a key venue which aims to collect critical data from every individual living in the U.S. The massive effort and investment in Census success can support employment of these datasets in allocation of federal funding and resources, establishment of policies, determination of the number of congressional seats, and many other critical policy actions. Thus, many states had strived to increase response rates of people to avoid omitting population. Illinois is one of the states that created a metric and platform to build strategies for outreach to encourage census participation.

According to the analysis (1), the census self-response rate computed by residents' responses vary across different geographies in the state of Illinois. For instance, the response rates in big cities are lower than the rates in small rural areas. It is possibly affected by the different demographic and socio-economic factors associated with different geographies such as racial composition, jobs, or education level. However, the census participation can be also different by individual and household characteristics. Individuals even though live in the same neighborhood, they might have different attitudes towards census participation. The key question is whether and to what extent the participation attitude or tendency of people could change by moving to a different neighborhood, e.g., an individual who moved from a rural area to a big city or from a poorer neighborhood to wealthier. This study focuses on this question. The results can contribute to understanding the mechanism of the census participation. It also provides bases to build more effective strategies for national level surveys at the state level.

To analyze the attitude or tendency changes, this study uses 2010 and 2019 individual and household data in Illinois, created by Infogroup. We also use 2010 and 2019 American Community Survey 5-year estimate data, and self-response rates of the 2010 and 2020 Census from the Census Bureau. First, we extracted households who had moved to a different census tract between 2010 and 2019 from Infogroup data. Then, in order to capture neighborhood characteristics using ACS data, we employed PCA (Principal Component Analysis) which is one of the widely used techniques to reduce the dimensions of variables. PCA is particularly more effective among highly correlated variables like neighborhood characteristics. Last, we built a multiple regression model using a difference in the self-response rates between 2010 and 2020 as a dependent variable. Independent variables are 1) principal components from PCA of the neighborhood variables, 2) two types of the household variables (unchangeable characteristics such as race and changeable ones such as marital status or household income, and 3) geography changes by their intra-state move. We added interaction terms to see the neighborhood effects by household characteristics.

Our findings reveal three points. First, the changes in a neighborhood dynamic have an influence on the self-response rate changes after controlling the geography change. If a person moves to a neighborhood with more white population or higher household income, the response rate in the new place increases. Second, the changes in household characteristics also influence the response rate changes. The change in marital status from single to married increases the response rate, compared to households remaining single. Finally, the interaction terms are significant and influence the response rates. The results show that if a black household moves to a higher income neighborhood with more white population, the household's response rate increases more than other races. This result explains different census participation by neighborhood and household characteristics as well as difference in the characteristics between the previous and current location and time regardless of living in the same neighborhoods.

Citizens require outdoor space for their daily activities, such as socialize and exercise, while people tend to stay in the spaces that satisfy their needs to perform their activities. In order to vitalize urban open spaces to attract more people, high quality space should be designed and constructed. The quality of an outdoor space encompasses many factors. The spatial distribution of some factors, like such as convenience, view connectivity, and microclimate, can be quantitatively analyzed through computational techniques, such as mapping the depth distance in Space Syntax and visualizing the thermal stress distribution by Computational Fluid Dynamics (CFD). However, a comprehensive mapping of the integrated space quality was still lacking. This paper proposed a method for the generation of an integrated outdoor space quality map by encompassing traffic accessibility, connectivity and microclimate.

A neighborhood park in Shanghai, China with 60,600 m<sup>2</sup> was chosen as the target of investigation to perform the integrated mapping. Depth value and connectivity was mapped in Space Syntax program Depth map as the indicator for traffic accessibility and pedestrian level sight. Spatial distribution of microclimate variables, such as air temperature, thermal radiation, humidity, and wind speed, were simulated by the CFD program ENVI-met in a summer afternoon. The Physiologically Equivalent Temperature (PET) was employed as the index to indicate the effect of microclimate. After the fields of depth value, connectivity, and PET were obtained, the values of different indicators were normalized, weighted, and summed up to represent the integrated space quality. With the calculated integrated space quality values in each grid, MATLAB visualized its distribution for the neighborhood park.

Since the park only have one entrance, the depth value increases as the space moving away from that entrance, indicating poor traffic accessibility. Residents, especially the elderly may be hard to reach the other end of the park. The high connectivity found in the central areas of the park indicate that people may easily notice the central spaces and conduct activities there. The PET map, which denotes the microclimate, shows that in summer Shanghai, the distribution of heat stress was mainly dominated by shading of solar radiation. In other words, spaces with shading had a better microclimate than those without. By integrating the maps of depth value, connectivity, and microclimate, it can be found that some spaces had a better space quality than others.

This study has several limitations. The microclimate analysis neglected other seasons and was only determined in summer afternoon because the simulation is computational expensive. In fact, it is more reasonable to conduct an annual analysis of microclimate if possible. The integration of space quality factors did not include other important

aspects such as facilities and aesthetics. Future studies should consider the above aspects. In addition, validation studies should be conducted to test if high quality spaces identified by the integrated map have more occupant and higher vitality. Nevertheless, this study had outlined a general method to create an integrated space quality map. The generated map is useful in many aspects. For example, the method can be used to locate the best position for commercial amenities. Moreover, during the design stage, the method can be employed to comprehensively evaluate the space quality. Retrofit project can also benefit from integrated space quality map to identify the target areas for improvement.

#### USING EMERGING HOT SPOT ANALYSIS TO EXPLORE SPATIOTEMPORAL PATTERNS OF HOUSING VACANCY

Abstract ID: 259

Individual Paper Submission

MORCKEL, Victoria [University of Michigan] morckel@umich.edu, presenting author

DURST, Noah [Michigan State University] durstnoa@msu.edu, co-author

Sophisticated methods for studying changes in the physical forms of shrinking cities (i.e. cities that are losing population) are lacking in the literature. In their review of spatial metrics, Reis et al. (2016) found 123 methods for studying urban growth, but only 15 for studying shrinkage. Therefore, in this study, we highlight the use of a newer method—emerging hot spot analysis of space-time cubes from defined locations—for examining the spread of housing vacancy (a common indicator of shrinkage) in large, Ohio MSAs. This method has not been previously applied to the study of vacancy, and it differs from traditional hot spot methodologies by identifying statistically significant spatiotemporal relationships. We also contribute to the literature by simplifying ArcGIS Pro’s auto-generated emerging hot spot results from 17 nominal categories to 7 ordinal categories, providing more options for subsequent data analyses.

In this presentation, we begin with a description of why vacancy is a salient issue and how researchers have previously studied its spatial patterns. We then describe the aforementioned method in detail, and investigate how the spread of vacancy relates to population change (another indicator of shrinkage) at three geographic scales (tract, city, and MSA). Then, we present the results of our analyses, as well as the urban planning and policy implications of our methodology and findings.

By using the aforementioned methodology, we found variation in the extent and location of the spread of housing vacancy within and between Ohio MSAs. In alignment with prior literature, vacancy spread in our study was most pronounced in central cities, particularly in shrinking cities located within shrinking MSAs. However, unlike prior literature that presumes a relatively uniform spread of vacancy from a cluster of vacant housing units (Morckel, 2014), we discovered that many Ohio MSAs concurrently experienced spread, contraction, and vacancy stabilization in tracts located adjacent to, or within close proximity of, one another. These results indicate that how vacancy proliferates is not solely a matter of geographic determinism, whereby high vacancy in one tract predicts high vacancy in neighboring tracts in future years.

We also found potential relationships between vacancy spread at a small scale (the tract) and the interaction of population dynamics at much larger scales (city and MSA). As such, our results run counter to much of the housing literature that theories vacancy as a neighborhood-level phenomenon. Our results further suggest that initiatives intended to reduce vacancy (e.g. foreclosure prevention programs, demolition funding) should account for population trends in adjacent neighborhoods, the city as a whole, and the MSA—and not just physical conditions within a particular neighborhood. Two neighborhoods that are located in different contexts (different cities with different population dynamics) may not respond similarly to a vacancy reduction strategy, even if vacancy levels are comparable at the time of intervention.

Overall, our work is an early contributor to a better understanding of the spatial patterns of vacancy proliferation and the relationships between population dynamics and city shrinkage. Because there is mounting evidence that grow-oriented urban planning strategies do not work in a context of shrinkage, there is a need to better understand the physical manifestations of shrinkage such as housing vacancy. When combating neighborhood decline, researchers and practitioners should carefully consider concepts like Seger et al.'s (2020) “shrinkage in growth,” and what we might term “shrinkage in shrinkage” (i.e. shrinking neighborhoods located in a broader context of shrinkage). Urban planners and policy makers must view the city as an intricate system with interventions at one geographic scale potentially affecting all others.

#### **SPATIO-TEMPORAL MODELING OF LAND-USE CHANGES INCORPORATING TRAFFIC NETWORK AND SOCIO-ECONOMIC INDICATORS**

Abstract ID: 278

Individual Paper Submission

TEPE, Emre [University of Florida] emretepe@ufl.edu, presenting author  
 YANG, Xinyuan [University of Florida] poppyyang@ufl.edu, co-author

Land use change models provide vital information about land development dynamics. Different land use change models have been developed, incorporating characteristics of built and physical environments, neighborhood structures and basic socio-economic indicators (Bell & Irwin, 2002; Carrion-Flores & Irwin, 2004; Carrion-Flores, Flores-Lagunes, & Guci, 2009; Nahuelhual et al., 2012; Deng & Srinivasan, 2016). However, road infrastructures, traffic volume, and comprehensive socio-economic indicators can play a significant role in achieving robust land use change models. For instance, transportation systems have impacts on land use change potentials through the possible effects of relative accessibility and congestion (Iacono et al., 2008). Also, better representation of human decision-making processes using comprehensive socio-economic indicators such as; household income, education levels, occupations, age, financing options, etc. are likely to improve our understanding about the land use changes

in cities. In this research, relationships between land use change potentials and components of traffic network and comprehensive socio-economic characteristics are investigated using spatio-temporal statistical modeling approaches.

There are mainly two goals in land use change models: (1) discovery of transition rules using statistical methods, (2) prediction of future land use changes using simulation-based, Machine Learning (ML), and Artificial Intelligence (AI) methods. Due to the well-established statistical inference methods, factors behind land developments can be effectively investigated using such methods. A successful statistical analysis of determinants behind land use changes improves predictive power of simulation-, ML-, or AI-based models. Another important component in land use change modeling is to account for spatial and temporal dynamics. Recent studies show the importance of these dynamics on land use change models (Ferdous & Bhat, 2013; Tepe & Guldman, 2017; Tepe & Guldman, 2020; Wang et al., 2012).

In this study, Florida land development dynamics at the block group level were derived from the statewide parcel database between 2010 and 2019. Traffic network and annual traffic volume information were obtained from Florida Department of Transportation (FDOT). Five-years estimates of American Community Surveys are used for gathering detailed socio-economic indicators at the block group level. In this study, introduced modeling framework is used to test 200+ potential explanatory variables while accounting for both contemporaneous dynamics in neighborhoods and temporal lag effects. Also, our modeling approach include network dynamics in traffic volume at the state level. Spatial Lag, Error and Seemingly Unrelated regression models are tested to achieve robust model results. Our preliminary results indicate benefits of incorporating traffic network and socio-economic indicators in land-use change modeling. This study improves our understanding about the relations between traffic network and land developments. Also, the study highlights the importance of socio-economic factors in land developments. Robust land use change models provide essential information to practitioners and policymakers about potential future land developments.

#### **VALUE OF COMMUNITY BASED APPROACH TO UNDERSTAND POLICY AND PLANNING NEED FOR EXTREME HEAT ADAPTATION AMONG MARGINALIZED POPULATIONS.**

Abstract ID: 303

Individual Paper Submission

KANDEL, Sajani [University of Massachusetts, Boston] Sajani.Kandel001@umb.edu, presenting author

Recent observational studies report the decreasing trend of heat sensitivity, due to the advancement in meteorological forecasting and structural adaption such as air conditioning. Despite the decreasing trend of heat-related mortality and the public health developing pathways to address individual heat-related health issues, heat

persists as a major public health concern in the United States. This is mainly attributed to increasing temperature from climate change coupled with the Urban Heat Island (UHI) effect. Exacerbating the effects of climate change are increasing disparities in heat-related mortalities across racial and ethnic groups due to increasing socio-economic and health disparities that limits the capacity of low-income and people of color to adapt, and a larger system of structural inequality that shapes access to amenities like parks/green space and the benefits it provides. While a growing number of communities have implemented heat action plans, distribution and utilization of the municipal heat intervention remain questionable and largely unevaluated in practice. In addition, mainstream extreme heat planning efforts often have to compete for limited time and resources with other competing climate threats or urban problems which are often seen as higher priority.

While traditional prescriptive approach in heat planning have failed to capture the complexity of impacts among vulnerable communities, uncertainties and complex socio-economic conditions, there is a greater need on the representation of diverse ways of thinking to better understand challenges marginalized communities face during heat events. This research uses Value Focused thinking (VFT) to engage high heat risk vulnerable population in Boston Metro Area and applies multidisciplinary approach to bridge people, planning and policies to formulate socially sensible heat adaptation practices at the local level. While eliciting residents' 'visceral experiences' of heat, the community based research generate policy and planning insights regarding the heat adaptations needs, resource and services preference of communities during high temperature days and extreme heat events. The study highlights the novel methodological framework that priorities residents "lived experiences" as vital indices and marginalized communities as "context experts" for policy and planning in urban heat management. The study contributes to the extension of methodologies for meaningful engagement of vulnerable communities to develop heat adaptation interventions for effective and socially sensible climate resilience strategies.

REN, XIYUAN [NYU Tandon School of Engineering] [xr2006@nyu.edu](mailto:xr2006@nyu.edu), presenting author

GUAN, ChengHe [New York University Shanghai] [cg157@nyu.edu](mailto:cg157@nyu.edu), primary author

Urban parks are deemed as having the potential to provide both physical and psychological health benefits for residents, as well as improving social and environmental quality. Given that urban park resources cannot be allocated with absolute equity in the city, examining whether disadvantage groups—defined according to individuals' gender, age, income, socioeconomic status, ethnic-racial characteristics or many other factors, are discriminately treated in park access became the primary issue of social and environmental justice. However, evidence from empirical studies on urban park equity are quite mixed due to the measurement of park accessibility

and the definition of disadvantage groups. Our study aims to re-discuss the park accessibility and inequity in the big data context. We took advantage of a big dataset of 23 million anonymous mobile phone users in 2014 to identify low-mobility groups, which had lower values of mobility indicators and were defined as disadvantage groups in our study. Focusing on the 395 selected parks in Shanghai, we compared actual park usage of low-mobility groups and the total population. We propose to answer the following questions: (1) How to measure park accessibility and identify low-mobility users using mobile phone data? (2) To what extent were activity-based park accessibility different from GIS-based park accessibility. (3) In Shanghai, were low-mobility users treated discriminately in urban park resources? To address our research question, we proposed an analytical framework including three parts: (1) "Identifying low-mobility users". We built three mobility indicators, including Miles Traveled for Recreation (MTR), Time Spent on Recreation (TSR), and Destination Diversity of Recreation (DDR), and low-mobility group was defined as mobile phone users whose values of three mobility indicators are all below 30% quantiles; (2) "Linking parks to mobile phone towers". We linked parks and mobile phone towers one to one. For each park, we chose its closest mobile phone tower within 500m buffer as the matched tower, whose recorded activities were defined as park activities; (3) "Measuring park accessibility and social equity". We built three activity-based indicators to measure park accessibility at the Jiedao tract level, including Frequency of Park-activity per day (F\_PA), Average Trip Length for Park-activity (TL\_PA), and Average Time Duration of Park-activity (TD\_PA).

To reflect the relative park accessibility for low-mobility groups compared with the total population, we introduced Gini Index and Location Quotient. The results showed that: (1) Park accessibility measured by activity-based approach presented an obvious smaller Gini Index compared with that measured by geo-based approach. The reason could be that people's self-selection and self-movement have weakened the disparity of park distribution; (2) Compared with the total population, the low-mobility group was not found to be spatially discriminated in park resource, being proved by the average Location Quotient of each Jiedao tract is slightly larger than 1.0; (3) Though low-mobility users were not spatially discriminated in park resources, their average park-activity frequency was only one-third of the total population, which means other factors (e.g. socioeconomic factors) might influence their park usage and consequently bring inequities. Accordingly, our study provides new visions for park resource management. On the one hand, self-movement helps to relieve disparities in park distribution, which implies policy makers to first differentiate low self-movement areas from high self-movement areas, and then take policy interventions mainly in low self-movement areas with poor park resources. On the other hand, due to self-selection, building new parks might have limited effects. Time budget, income level, and other socioeconomic factors might influence an individual's park preference besides distance

#### HAVE THE FACTORS ASSOCIATED WITH THE USE OF ONLINE SHOPPING CHANGED OVER TIME?

Abstract ID: 320

Individual Paper Submission

YOUNG, Mischa [University of California, Davis] mwyoung@ucdavis.edu, presenting author  
SOZA-PARRA, Jaime [University of California, Davis] jsozaparra@ucdavis.edu, co-author  
CIRCELLA, Giovanni [University of California, Davis] gcircella@ucdavis.edu, co-author

While the ability to purchase goods and services online has existed for quite some time, online sales have experienced a sudden growth as of late with the advent of COVID-19. Pandemic-related stay-at-home orders, lockdown measures, and a general reluctance to shop in person lead to a meteoric rise in online shopping, which now accounts for as much as 14% of total retail sales in the US (U.S. Department of Commerce, 2021). Despite this rapid growth, much uncertainty surrounds the ways in which this newform of commerce may transform our day-to-day activities, travel behaviors, and urban landscapes. At the heart of these many unknowns lies the fundamental question of who is responsible for the recent rise in e-commerce. Is it caused by an increase in units purchased by experienced online shoppers, or rather the result of this industry reaching a broader share of the population? Understanding this distinction will help determine whether the recent increase in online shopping has improved or exacerbated economic inequalities.

Using a unique longitudinal dataset, we investigate the factors that influence the use and frequency of online shopping both before and during the pandemic to establish whether these have changed over time, and ultimately determine who is responsible for the recent growth in e-commerce. Benefiting from a longitudinal dataset, this analysis further compares the short- and longer-term impacts of the COVID-19 pandemic on online shopping behaviors, by examining the use and frequency of e-commerce services during the spring 2020 and fall 2020 periods and will offer insights as to whether this increase in online shopping is likely to persist beyond the pandemic. Findings from this study will prove valuable to researchers interested in the economic ramifications of the pandemic, and to policymakers seeking to properly regulate the online shopping sector to ensure it aligns with cities equitable and sustainable objectives.

Increasingly ubiquitous sensor networks and passive data collection are becoming a norm in planning research and city management (Singleton, Spielman, and Folch 2018). Unlike traditional research that relied on surveys, participant observation and other curated data collection enterprises, lately we are relying on large public and private administrative datasets such as parcel maps (Lester, Kaza, and Kirk 2013), sales and property records (Holt and Borsuk 2020), cell phone usage (Ratti et al. 2006; Zhou et al. 2021). Some key advantages of these datasets are their high temporal and spatial resolution, exhaustive coverage as well as their currency. However, it is unclear if these advantages outweigh the advantages of active data collection enterprises that try to ensure representativeness and the expense of exhaustiveness. In this paper, we try to excavate the hidden missingness in a specific case -Safegraph Weekly Patterns dataset- and understand the implications of this bias on our understanding of travel pattern changes during COVID-19 pandemic.

We developed CarolinaTracker, a website and a visualization platform (<https://carolinatracker.unc.edu/>), to provide easy access to critical and timely information on the economic and social health of North Carolina counties during the COVID-19 pandemic. Collating information from different public and private data providers in five domains, we continually monitor, update and visualise over thirty different indicators. One of the key datasets, we rely upon is the patterns dataset from SafeGraph which covers ~6.3 million points of interest (POI) in the United States. The dataset is the about hourly visits to each of these POI and is updated on a weekly basis. The data is collected from unspecified applications on cellphones that continually track location information of the users. Anonymised data is provided to the researchers to study the impacts of COVID-19 pandemic on places and businesses. This data is used to study how the patterns of visits have changed during the pandemic at relatively high sectoral and spatial resolutions.

However, the conclusions drawn from this dataset might be problematic because of opaque data collection and adjustment protocols (e.g. cellphones drop in and out, inaccurate GPS). The collection of POIs are not stable either (e.g. opening and closure of businesses or just business practices). In this paper, we demonstrate the validation of this dataset by comparing it with other administrative datasets (such as hospital records), government records and try to assess the representativeness and exhaustiveness of the Safegraph data. We follow and extend the methods proposed by Coston et. al (2021) to excavate the hidden biases in this dataset that might color our conclusions. This effort is ongoing and results are expected in early in the summer.

# MEASURING POLYCENTRIC URBAN SPATIAL STRUCTURE IN CHINE PREFECTURE-LEVEL CITIES, 2000 TO 2020

Abstract ID: 329

Individual Paper Submission

LI, Wenzheng [Cornell University] wl563@cornell.edu, presenting author  
SCHMIDT, Stephan [Cornell University] sjs96@cornell.edu, co-author

Polycentric spatial development has become a topical issue in the scholarly debate in recent years. Polycentricity has evolved from an analytical concept to explain urban structure to a normative agenda in spatial plans and policies, where the concept is promoted as means of achieving more efficient, balanced, and sustainable development patterns as well as reducing the agglomeration diseconomies such as air pollution and traffic congestion. As a country experiencing rapid urbanization, China has implemented a set of policies to promote city (sub)centers and the growth of medium- and small-size cities to achieve more integrated and polycentric cities and regions.

The most recent poly-centricity studies in China have focused on two consecutive questions: the measures of poly-centricity and the empirical justification of its benefits in facilitating regional development. There are, however, two potential methodological gaps that may undermine the validity of these studies, especially those focusing on empirical justification. The first is a lack of comprehensive studies on poly-centricity measures at the intra-city scale. The existing studies usually utilize a single data resource and method to identify (sub)centers, for example, nightlight imagery and minimum threshold methods, which seems arbitrary and lacks validation from other data resources and methods (Lee, 2007). Second, recent studies have shown that the degree of poly-centricity is highly sensitive to the number of (sub)centers (Zhang and Derudder, 2020), which further indicates that existing studies in identifying (sub)centers may derive invalid polycentric index and, consequently, lead to biased regression estimates in quantifying the marginal benefits of poly-centricity.

We address these methodological gaps by developing more robust poly-centricity measures utilizing multiple data sources and methods. Specifically, we intend to apply both Chinese township level decennial census, nightlight imagery, and land price transaction records at two time periods, 2000 and 2010, to operationalize poly-centricity. Four center identification methods are proposed, including the minimum density threshold method (Liu and Wang, 2016), the non-parametric GWR regression (McMillen, 2003), the local indicators of spatial autocorrelation (LISA) (Arribas and Gracia, 2014), and finally, the local municipality as city (sub)centers. The identified (sub)centers will then be analyzed using a stepwise polycentric measure which allows for a sensitivity check of the degree of poly-centricity to the number of (sub)centers. The contributions of our research are twofold. First, we compare the performance of different data sources and methods in identifying (sub)centers to develop a more comprehensive and robust measure of Chinese intra-city poly-centricity. Second, we are able to operationalize poly-centricity at multiple time points to examine polycentric development in China from a dynamic perspective.

## CITIZEN-CENTRISM IN SMART CITIES: REALITY OR RHETORIC?

Abstract ID: 393

Individual Paper Submission

BENSON, Thomas [University of Delaware] tsbenson@udel.edu, presenting author

DAVID, Nina [University of Delaware] npdavid@udel.edu, primary author

Smart cities have often been portrayed as cities that effectively utilize information and communication technologies to tackle many contemporary urban issues, such as dwindling economic growth, lack of sustainability, and poor citizen participation. Following critiques of overly top-down and technocratic urban governance, smart cities have re-branded themselves as citizen-centric, promising enhanced citizen participation (Joss et al. 2017; Pereira et al. 2017). However, few studies have examined whether this citizen-centrism rhetoric materializes into reality. In turn, we ask whether citizen-centrism employed by Washington D.C., as a case study of a smart city, materializes into reality. To do this, we start by assessing the literature on smart cities, citizen centrism, participation, urban governance, the role of information and communication technologies in participation, and how urban governance is being radically transformed by technology. We cut through the (re-)branding efforts of neoliberal strategies to simply induce investment and economic development and ask, what should genuine participation in smart cities look like?

To examine whether Washington D.C.'s citizen-centric rhetoric materializes into reality, our methodology focuses on developing a holistic approach to assess citizen-centrism claims in smart cities. We employ content and discourse analysis – the latter of which is a novel approach to assessing citizen-centrism rhetoric, especially in first asking whether such rhetoric exists, rather than presuming it is an inherent aspect of smart cities. The content analysis includes an examination of existing academic literature, city indexes and reports, and official city documents and webpages explicitly related to the case study. Additionally, we develop a conceptual and evaluative framework – using Arnstein's ladder of participation (1969) and Cardullo and Kitchin's (2019) scaffold of citizen participation as a foundation – that allows us to effectively probe and analyze e-participation mechanisms. Our analysis spans a period of 2014 (when Washington D.C. first floated the smart city concept) to 2021 (the time of writing). In turn, we critically examine the discourse used within two Washington D.C. planning documents, as well as their official smart city website.

Our findings, based on the application of the framework and discourse analysis, illustrate that Washington D.C. does not offer genuine citizen participation mechanisms in line with the smart city rhetoric that it espoused and within the narrative of citizen-centrism. The e-participation mechanisms are limited to the provision of information electronically, including city-level data, and watching meetings live. Furthermore, civic paternalism and top-down technocratic governance are prevalent due to the aforementioned neoliberal underpinning. Such paternalism, according to Arnstein, is one of the most significant roadblocks to achieving genuine levels of participation (Arnstein 1969). We argue that citizens ought not to be treated as mere recipients of information and re-branding exercises (smart city or otherwise) and ought not to be employed as a means of silencing detractors. Finally, our paper makes particular headway in that there is very little literature on citizen participation in Washington D.C. – the smart capital city of the U.S.

## IDENTIFYING AND MEASURING STAYING ACTIVITIES IN URBAN PUBLIC SPACE THROUGH WIFI SENSING TECHNOLOGY

Abstract ID: 395

Individual Paper Submission

PARK, Juhyeon [Ulsan National Institute of Science and Technology] juhyeon92@unist.ac.kr, presenting author  
KIM, Jeongseob [Ulsan National Institute of Science and Technology] jskim14@unist.ac.kr, co-author

Vibrant public spaces are an indicator of the quality of urban life in an area, and their success or failure depends on how people use and interact with others in these spaces. As a primary tool, direct observation has traditionally been used to observe public life; however, it has been implemented mainly for a small sample size at single points in time and place due to its high cost. In order to reduce the effort, various automation tools with advanced technologies have been proposed to digitally measure people's behavior. WiFi sensing technologies is one of them as a non-invasive tool for monitoring pedestrians outdoor by analyzing MAC addresses in WiFi signals sent regularly by access points (APs) and WiFi-enabled devices.

While WiFi sensing technologies open up a range of possibilities, their applications in urban design and planning are limited to measure only moving activities, a part of public life. Most of them are intended to estimate the pedestrian volume and flow around sensors (Duives et al., 2020; Johnson et al., 2019; Soundararaj et al., 2019). This helps identify the pedestrian activity as an indicator of a city's vibrancy over a long period of time, such as a 24-hour pedestrian counting system installed in the City of Melbourne (Doan et al., 2015). However, the WiFi applications may not be enough to support in decision-making in planning and design processes except measuring another important part of public life: staying activities. Few studies have attempted to mining people's behavior with WiFi data, but they are either simulation-based or not validated. (Chilipirea et al., 2018; Zhou et al., 2020).

In this study, we aim to fill this gap by presenting a methodology to determine stationary and moving activities through WiFi sensing data. With the deployment of 26 WiFi sensors over 26 days, we collected all anonymous WiFi signals on the UNIST campus along with the GPS and WiFi MAC addresses of 100 students which were used as ground truth datasets. Our proposed algorithm infers people's behavior (staying and moving) based on a similarity of consecutive patterns of WiFi signals; if staying, WiFi communication continues with similar APs, resulting in a consistently high similarity score. The results indicate that our algorithm outperforms baseline approaches. Next, we applied the algorithm for a total of 13,491 unique devices to identify their staying activities and mapped their spatiotemporal patterns. It showed that staying activities decreased overall during the midterm week and concentrated near food booths during the festival.

We demonstrate the feasibility of WiFi sensing as a tool for public life studies. WiFi sensor network in a city with the developed algorithms allows 24 hours to measure people moving and staying, as well as the stickiness index, the ratio of the two, at the site- and neighborhood- level. This provides insight into how design elements, amenities, and programmed events make public spaces sticky by providing longitudinal evidence regardless of day or night. Afterwards, applications on other key aspects technologies (e.g., moving together patterns) will raise the value of the technologies as an evaluative and analytical tool.

## THE GERRYMANDERED AMERICAN CITY

Abstract ID: 396

Individual Paper Submission

DURST, Noah [Michigan State University] [durstnoa@msu.edu](mailto:durstnoa@msu.edu), presenting author

### The Gerrymandered American City

Decades of research on the local government boundary problem in metropolitan areas has highlighted the important role of jurisdictional boundaries in determining local authority over taxation, spending, and land use and in shaping patterns of residential segregation and the efficiency of service delivery (Dawkins, 2005; Kim & Jurey, 2013; Kübler, 2018). Although this research has examined jurisdictional fragmentation (i.e., the number of local governments) in detail, relatively little attention has been paid to an equally problematic local boundary problem: the gerrymandering of jurisdictional borders. Prior research suggests that the redrawing of city borders via the process of municipal annexation often occurs in ways that lead to the exclusion of communities of color from cities (Durst, 2018).

In this study, Python Programming Language is used to develop a method to identify areas that have been systematically excluded from cities via the gerrymandering of their jurisdictional borders. The method uses a series of expanding and contracting buffers of differing distances to identify unincorporated enclaves located in close proximity to but outside of the jurisdictional boundaries of cities. Results are presented for a first-ever nationwide analysis of the gerrymandering of cities in the United States. The study then examines the potential implications of municipal gerrymandering by presenting an analysis of the socioeconomic and demographic characteristics of neighborhoods that have been excluded from cities via the delineation of their jurisdictional border. The results illustrate that unincorporated enclaves created via the gerrymandering of cities have higher shares of people of color and lower shares of white residents than do other areas along the unincorporated fringe, suggesting that the racial gerrymandering of cities' jurisdictional boundaries is much more common than previously understood. The paper concludes by discussing the policy and planning implications of these findings, with an emphasis on issues such as voting rights and equitable access to housing and infrastructure.

This research investigates the community perspectives of a smart mobility pilot program in Columbus, Ohio. As transportation engineering disciplines emphasize research on the scope of what is technically possible and economically feasible, planning scholarship remains a leader in questions of why, when, and for whom such technologies are deployed. This work aims to contribute to this discussion by continuing to explore the tension and synergy between the smart and the sustainable, specifically from the perspective of an historically underserved and marginalized community.

Throughout 2020-2021, the City of Columbus oversaw the daily operation of an autonomous electric shuttle named ‘Linden LEAP’. The shuttle is part of a suite of transportation technologies led by Smart Columbus and partially funded by the US Department of Transportation. This technology demonstration is among the first of its kind in the United States, where an autonomous shuttle is permitted to operate in the public right-of-way in a residential neighborhood. One of the primary purposes of the autonomous program was to provide a mobility service that enhances equitable access to resources for an underserved community. The city selected the Linden neighborhood on the east side of Columbus as the experimental deployment district. Prior to the COVID-19 pandemic, the shuttle briefly operated as a 1-mile fixed-route passenger transit loop. After the pandemic, the shuttle operated as a mobile food pantry distribution site, distributing approximately 40 food pantry packages each weekday.

The study sampled community members who used the Linden LEAP mobile food pantry service. The goal of the research was to understand: What are the perceptions of autonomous technology among the Linden LEAP patrons and community members? Researchers obtained responses from 80 Linden LEAP patrons via an online survey and via 17 one-on-one interviews conducted over the telephone. Respondents described their: demographics, overall access to transportation resources, overall access to food resources, most recent trip to the mobile pantry site, most recent trip to the nearest food pantry, service satisfaction, and their opinions on autonomous shuttle operations, safety, and community impact. Due to COVID-19, researchers did not have any in-person contact with the food pantry patrons or staff. Survey and interview participants were compensated with mobile grocer vouchers and/or grocery store gift cards.

The researchers found that the community members largely described the food pantry distribution service

favorably, but that did not lead to total acceptance of fully autonomous technology. When compared to the nearby ‘brick-and-mortar’ food pantry site, the percent of patrons who walked to the site increased from 4% to 14% and the percent of patrons who waited less than five minutes for their food pantry items increased from 33% to 64%. In the in-depth interviews, all 17 participants indicated a positive overall experience and elaborated on a variety of factors influencing their overall positive experience. These factors included positive feelings regarding the customer service provided by staff working at the site; ease of use, variety of food products, timelines of service, and the importance of the service for providing food access to those without a vehicle. Even with overwhelming positive views of the social service, varying opinions persisted on children’s safety and the way the vehicle should operate on neighborhood streets (some vs any street, separate vs any lane). Further, participants overwhelmingly reported the continued need for an on-board operator (77%) even when largely reporting that their trust in self-driving technology had improved after interacting with the shuttle (80%). These results demonstrate the role of the human factor in provisioning social services and enhancing community cohesion, reinforcing that autonomous vehicle operators have an inherent social value that is not replicated with full automation.

#### **ANALYZING THE SPATIOTEMPORAL VARIATION OF URBAN HEAT ISLANDS IN WINTER CITY NEIGHBOURHOODS: A CASE OF EDMONTON, CANADA**

Abstract ID: 498

Individual Paper Submission

WELEGEDARA, Nilusha [University of Alberta] yalingas@ualberta.ca, presenting author

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author

LOTFI, Ghazal [University of Alberta] lotfi@ualberta.ca, co-author

Urban heat island (UHI) refers to an area in a city that is warmer than its rural surroundings (Fischer et al., 2012; Stewart and Oke, 2012). UHIs occur in almost all cities around the world and have close relationships with new urban developments and changing climate (Stewart and Oke, 2012). Despite numerous studies on this topic, very few quantify the influence of various contributing factors such as presence of greenery, characteristics of the city, and anthropogenic heat (Sangiorgio et al., 2020) particularly in winter cities. In Canada, the UHI effect has been studied only within a few cities such as Toronto and Montreal and only one study in Toronto (Rinner and Hussain, 2011) focused on the neighbourhood level.

This study focuses on Edmonton, North America's northernmost city, sitting at about 54th parallel, with a metropolitan population over one million. Among large Canadian census metropolitan areas, the built-up area in Edmonton increased multiple folds during the 1971-2011 period (Agrawal, 2016). Our assumption is that this increased built-up contributed to the UHI effect of the city as the built surfaces tend to absorb and store a large

quantity of solar radiation (Fischer et. al., 2012). Also, removal of vegetation cover could have further hastened this phenomenon in the city. However, no study in Edmonton has focused on temporal UHI changes and intra-urban UHI patterns. With this background, the study strives to answer the following questions: (1) Was there a significant UHI change across the city of Edmonton over the last two decades? (2) Does UHI vary across neighbourhoods within a high-latitude, winter city, such as Edmonton? (3) What factors affect UHI at the neighbourhood level?

We are pursuing both qualitative and quantitative methods to improve the understanding of the nature of the UHI phenomenon in Edmonton. Within the quantitative analysis, we use Landsat 5 and 8 satellite images from 2000 to 2020 acquired during summer and winter periods to generate neighbourhood land surface temperatures (LSTs) and land use maps. In qualitative analysis we will use relevant City documents, field observations, and residents' feedback to understand possible contributing factors such as land uses, population density, green spaces, and impact of UHI on residents in different neighbourhoods in the city.

Our preliminary results show a significant UHI increase within residential neighbourhoods particularly in developing neighbourhoods over the last two decades. Developing neighbourhoods are essentially master-planned communities developed on greenfield areas in the last decade or so. The temperature increase in these neighbourhoods was strongly linked to the reduced vegetation and increased built-up areas. We also noticed that in summer, surface temperature difference in some industrial and residential neighbourhoods within the city core showed increase of 4-9 °C compared to surrounding rural areas. These results demonstrate that high latitudes winter cities exhibit significantly amplified UHIs. Our statistical analysis quantifies the influence of major causing factors on formation of UHI such as percentage of natural landscapes, characteristics of built-up areas, road network density and traffic volumes and air quality at neighbourhood scale.

This outcome will help municipal planners and policy-makers to develop heat mitigation and adaptations strategies for existing neighbourhoods. It will also inform the planning and design of new neighbourhoods, so they elicit minimum UHI effects.

#### THE CHALLENGE FOR CITIES OF GOVERNING SPATIAL DATA PRIVACY

Abstract ID: 505

Individual Paper Submission

SUN, Feiyang [University of Washington] fs377@uw.edu, presenting author

WHITTINGTON, Jan [University of Washington] janwhit@uw.edu, co-author

The emergence of new data sources and analytical techniques enables the collection, recording, and analysis of unprecedented amounts of information, both online and offline, by city administrators as well as the general public.

As society attempts to capitalize on these new developments in pursuit of smarter urban governance and socio-economic progress, they encounter growing data privacy challenges, which can impede data sharing, cause economic harm, and exacerbate social inequity. In particular, recent research and prominent court cases highlight the ease with which spatial trace data can be used to identify individuals, and thus compromise privacy. This paper examines associations of reidentification vulnerabilities of spatial data and the urban built environment in the City of Seattle, and discusses how such empirical findings can be integrated into current practices by the City in governing spatial data and associated technology.

Studies have shown that anonymized spatial traces remain uniquely distinguishable due to the high dimensionality of spatial data, created by the tuple of coordinates and time stamps. Yet, to implement their findings in practical applications, there are two major limitations. First, most studies only assess the privacy risk within a single dataset without considering the possibility of combining it with external information. This especially becomes an issue in a data-rich environment where publicly available datasets with spatial attributes abound. The datasets can be easily linked with mobility data to reidentify people and reveal sensitive personal information such as family income, medical records or political alignment. Second, existing studies lack a general understanding of how privacy risks are associated with built environment characteristics. Municipalities make regular sustained use of spatial data for city operations, and cities are increasingly adopting practices for governing municipal data with the privacy of residents in mind. However, the computational complexity of privacy assessment algorithms required to exhaust all possibilities of reidentification limit its practical application in municipal-level public agencies.

This paper demonstrates the role of variation in the features of the built environment in heightening privacy risk, and highlights the heterogeneity of identification vulnerabilities across different types of built environment in the City of Seattle. Utilizing a Global Position System (GPS) mobility dataset, this paper measures the risk of re-identifying individuals from anonymized datasets with common privacy measurements, such as k-anonymity, and investigates the associations between measured privacy risks and built environment characteristics, including urban density, property value, and walkability. The results demonstrate that, due to consumers' accumulated routine behaviors, the privacy vulnerability of spatial data is not idiosyncratic to each dataset but follows a systematic pattern across urban space.

Next, this paper places the problem posed by reidentification from spatial data within the context of the City of Seattle's practices for governing municipal data for privacy. The paper reviews the current practices by the City of Seattle, through processes such as the administration of the city surveillance ordinance, privacy policies, open data system, application review process, and data inventory, for their relationship to the heightened risk of reidentification posed by spatial data. Seattle has been a pioneer among municipalities in actively managing potential privacy risk of its data and technology repositories through the surveillance ordinance act and privacy impact assessments across municipal departments, including planning. The paper discusses how Seattle and other cities could benefit from a more systematic understanding of the associations between privacy risk and urban space and play a more proactive role in the design and location choice of various urban sensors and location-based services, which will have a direct impact on data privacy in the public interest.

## UNDERSTANDING THE PSYCHOLOGICAL BENEFITS OF WALKABLE AND ACCESSIBLE NEIGHBORHOODS USING SOCIAL MEDIA

Abstract ID: 514

Individual Paper Submission

LEE, Narae [University of California, Irvine] narael1@uci.edu, presenting author

Given the increasing popularity of urban lifestyle and growing awareness of environmental issues caused by suburbanization, making urban environments inclusive, healthy, livable, and salubrious has become a critical issue for urban planners. As one of the planning practices to make urban healthy, urban planners and scholars have stressed the importance of making communities walkable and accessible. Walkable design can bring in manifold benefits to communities in terms of social, economic, and environmental aspects. However, the impact of walkable and accessible design on the level of community-wide psychological well-being has been still understudied. Therefore, this case study is designed to understand the impact of accessible and walkable neighborhood design on the psychological well-being of urbanites while considering other neighborhood contexts in the City of Los Angeles.

This study used tweets to measure the level of mood as a proxy for psychological well-being; using sentiment analysis, this study translates tweets into the level of positive mood. This study also accounts for other neighborhood characteristics, such as the level of walkability, the number of consumer-facing businesses, violence, natural places, and socioeconomic status. Using geospatial analysis, this study proposes three different models to understand the relationship between the level of psychological well-being and the number of accessible local businesses and walkability.

The first set of the models revealed that communities with better walkability and more accessible local businesses are likely to support the better psychological well-being of people who live in or visit the environments when it is compared with less walkable and accessible communities, controlling for other neighborhood characteristics. Moreover, the second set of the models found that third places not only within communities but also in surrounding neighborhoods have an important role in the psychological well-being of urbanites, holding other variables constant. Lastly, the presence of consumer-facing businesses in the surrounding neighborhoods can be more important for people who live in or visit less walkable communities.

This study highlights the importance of making communities walkable and accessible for better life quality of urbanites. Also, this study contributes to the existing literature by providing empirical findings that support the proposed impact of walkable design on mental health and psychological well-being.

## URBAN-SEMANTIC COMPUTER VISION: A FRAMEWORK FOR CONTEXTUAL UNDERSTANDING OF PEOPLE IN URBAN SPACES

Abstract ID: 530

Individual Paper Submission

VANKY, Anthony [University of Michigan] avanky@umich.edu, presenting author

Increasing computational power and improving deep learning methods have made computer vision technologies pervasively common in urban environments. Their applications in policing, traffic management, and documenting public spaces are increasingly common (Ridgeway 2018, Coifman et al., 1998, Sun et al., 2020). Despite the often-discussed biases in the algorithms' training and unequally borne benefits (Khosla et al., 2012), almost all applications similarly reduce urban experiences to simplistic, reductive, and mechanistic measures. There is a lack of context, depth, and specificity in these practices that enables semantic knowledge or analysis within urban contexts. This paper will critique existing uses of artificial intelligence and computer vision in urban practices to propose a new framework for understanding people, action, and public space.

This paper revisits Geertz's (1973) use of thick descriptions in generating interpretive theories of culture and activity and uses this lens to establish a framework to approach evaluating the varied uses of computer vision technologies that weigh meaning. By discussing cases of implemented examples of urban computer vision—from LinkNYC and Numina's urban measurements to the Detroit Police's use of DataWorks Plus's facial recognition technology—we propose a framework for evaluating the thickness of the algorithm's conclusions against the computational method's complexity required to produce that outcome. Further, we discuss how the framework's positioning may differ between different users of the technology, from engineer to urban planner and policymaker, to citizen.

This paper also discusses how the current use and training of deep learning algorithms and how this process limits semantic learning. Through this description, this paper proposes two methods by which technology developers can gain a thicker understanding of activities in urban spaces: a priori by creating a spatio-specific library that contains descriptions of actions that are distinct and calibrated to urbanism; and a posteriori whereby an algorithm clusters similar activities from recorded images and humans verify and label tag these clusters with thicker descriptions. Further, we discuss how the latter method could be a method by which we can identify new, unknown meanings from existing phenomena, similar to how William H. Whyte (1980) identified both repetitive behaviors and eccentric quirks in small urban space.

This paper contributes to the critical conversations regarding the proliferation of artificial intelligence by challenging the current applications of these technologies in the urban environment by highlighting their failures within this context while also proposing an evolution of these algorithms that may ultimately make them sensitive and useful within this spatial and cultural milieu.

## THE SOCIAL EXPOSURES OF GENTRIFYING NEIGHBORHOODS

Abstract ID: 565

Individual Paper Submission

XU, Wenfei [Columbia University, GSAPP] wx2133@columbia.edu, presenting author

Does gentrification pave the way for more diverse social mixing? Existing research is ambivalent about its influence on reducing race and class segregation. Schoon (2001) cites potential benefits such as better resources, a stronger local economy, social cohesion, and potential economic opportunity as. However, the realities of social mixing have been questioned in multiple respects. Many have argued that social mixing is a rhetorical instrument for gentrification (Huning and Schuster 2015; inter alia) while the social “tectonics” of neighborhood dynamics remain parallel and un-integrated (Robson and Butler 2001). Other quantitative research (Freeman 2009) has shown that while gentrification does not precede a decrease in diverse mixing, it also may not increase it.

New forms of data can contribute to this debate through describing a wider range of social activities and social mixing opportunities previously unaccounted for in traditional residential census data. Using high density anonymized mobile application GPS data in Chicago that shows dynamic mobility activity, this study examines whether gentrification relates to more opportunities for racially and socioeconomically diverse interactions. It characterizes these opportunities through addressing the following questions: How does the duration and frequency of interaction potential, which both signal stronger potential for social bonds, vary between different groups of people? Do members of the same racial and socioeconomic group or residents of the neighborhood have longer and more frequent interactions? Do some groups have more exposure to diversity than others, as suggested by previous research (Wang et al. 2018)? This research has both methodological and policy implications: It can allow us improve our measurement social-spatial processes as scale as well as address questions of the social impacts of gentrification.

## AN URBAN INFORMATICS RESEARCH FRAMEWORK FROM AND FOR URBAN PLANNING

Abstract ID: 571

Individual Paper Submission

BAI, Shunhua [University of Texas at Austin] shunhua@utexas.edu, presenting author  
JIAO, Junfeng [University of Texas at Austin] jjiao@austin.utexas.edu, co-author

The emergence of urban informatics attributes to many technological advancements in information and communication technology (ICT) and Internet of Things (IoT). While these applications largely improve people's daily life, they also generate enormous data for urban researchers. Urban informatics is a growing interdisciplinary academic field involving urban planning, information science, computer science, and data science. However, as an emerging interdisciplinary area, the academic has not yet reached a consensus in answering a critical question: which science, if any, should urban informatics belong to? Is it computational social science or applied data science? Albeit the nuanced difference, they are two sides of the same coin. The former addresses urban problem-solving more than the computational means, while the latter is more focused on the data and effective methods to transform data to information in the urban setup (Kontokosta, 2018).

Early definitions of urban informatics allude to the second viewpoint that it should be a computational social science. Foth defines urban informatics as an emerging interdisciplinary field in which researchers understand people and places in cities using data from locative media and mobile technology (Foth, 2009). Based on Foth's definition, Kontokosta defines urban informatics as studying urban phenomena through a data science framework and addressing domain-specific urban challenges (Kontokosta, 2018). Thakuriah et al. unpack the domain-specific urban challenges in their definition. They state that urban informatics should analyze and interpret big urban data to develop dynamic resource management strategies, improve received wisdom, promote public engagement, and facilitate urban planning policy decision-making (Thakuriah et al., 2017). In the urban informatics context, big urban data extends the focus on the massive volume in big data and places a particular emphasis on its inclusion of spatiotemporal information (Batty, 2013). Other scholars have pointed out that compared to traditional survey-based data, big urban data is usually passively collected without a predefined purpose but can potentially be used in research by adopting data mining and machine learning techniques (Chen et al., 2016).

Albeit the emphasis on the urban perspective, the body of urban informatics literature has mainly focused on using new big urban data and computational techniques in solving urban problems. Few have applied a theoretical lens to urban informatics and examined its root in urban research. Without a clear understanding of where urban informatics posits in the scholarship, researchers might risk losing the essence of its urban problem-solving origin in their work and find themselves drowning in the data ocean and blinded by the buzzy technologies. To bridge this knowledge gap, we propose a research framework for urban informatics studies by tracing its origin in the urban planning scholarship. We identify four major topics through a review of urban informatics research: human activity, human/environment interaction, quality of life, and public participation. We then identify seven commonly used techniques in computer science, data science, and information science. We find the dominant planning theories that articulate the conceptual framework in previous empirical work for each topic. In particular, rational planning theory, complexity theory, and the engineering science tradition are found in close relation to urban informatics research in human activity and human/environment interaction. The just city theory, communication action theory, and crowd wisdom tradition play important roles in the research on the quality of life and public participation. By proposing the research framework, we argue that urban informatics follows the rational planning paradigm in the information era that nurtures new opportunities to build smart cities but bears long-standing data-determinism and technocracy challenges. Future urban informatics researchers should place enough emphasis on the planning origin in their empirical work and reclaim the problem-solving essence in times of confusion.

## **WORKING IN THE SMART CITY**

Abstract ID: 576

Individual Paper Submission

ANDREWS, Clinton [Rutgers, The State University of New Jersey] cja1@rutgers.edu, presenting author

Not since the era of the family farm has such a large fraction of the employed population worked from home. The spike in remote work due to COVID-19 pandemic is temporary, but it highlights an underlying trend. Remote work at home and in “third” places such as cafes, hotels, and airports has been enabled by access to wireless networks and mobile cloud computing collaboration software. Such a spatial and temporal fragmentation of related work activities is not available to everyone, but it affects an increasing fraction of the population. It features prominently in popular images of the future of work. This paper examines how the relationship between space, technology, and the workplace has developed over time, how power relations embedded in these overlapping physical and cyberspaces constrain our behavior, and what novel ethical and equity concerns arise in the emerging smart city. It relies on original interview and observation data from the New York (USA) metropolitan area augmented by national statistics. Findings include identification of multiple points where control of overlapping physical and cyberspaces either enables or prevents the fragmentation of work activities. These carry important implications for those who work in the smart city and those who design it.

## **TRANSFER LEARNING USING SATELLITE IMAGES FOR TRAVEL DEMAND MODELING IN DISADVANTAGED REGIONS**

Abstract ID: 581

Individual Paper Submission

ZHENG, Yunhan [Massachusetts Institute of Technology] yunhan@mit.edu, presenting author

WANG, Shenhao [Massachusetts Institute of Technology] shenhao@mit.edu, co-author

ZHAO, Jinhua [Massachusetts Institute of Technology] jinhua@mit.edu, co-author

Accurate prediction of transport demand and the competitive and complementary relationships among transport modes are crucial inputs for the public authorities to plan transport infrastructures and for the transport firms to determine what services to provide (Tsekeris and Tsekeris, 2011). Today, travel demand estimation still primarily relies on the collection and analysis of travel survey data. However, acquiring reliable travel survey data faces some

critical challenges: firstly, the collection of high-quality survey data is usually costly; secondly, the response rates of large-scale surveys such as the National Household Survey (NHTS) have been falling (Lawson, 2018). This challenge is particularly striking in the disadvantaged area, which consequently leads to the data-deprivation problem in these regions.

Given the difficulty in collecting high-quality survey data, it is crucial to find alternative data source for travel behavior estimation. With this regard, this research considers satellite images and OpenStreetMap (OSM) images as potential data for travel demand estimation, as these passively collected images have increasingly become widely available and were proven to have great potential for estimating socio-economic indicators such as poverty outcome with the adoption of machine learning techniques (Jean et al., 2016). Satellite images contain plentiful landscape information that could be correlated with people's travel behaviors. In fact, a sizable amount of existing literature has shown that urban form, urban design and built environment can impact people's travel habits. The novel convolutional neural network (CNN) techniques enable automatic extraction of features that are predictive of people's travel behavior from the satellite images, thus can greatly facilitate travel behavior prediction particularly when the survey data is absent.

On the other hand, acknowledging the regional disparity that rich regions are usually flooded with data while poor regions often lack for data, it is important to find approaches that can utilize the knowledge learned with the abundant data in the rich region to assist the prediction of travel behavior in the poor areas where the travel demand data is often unavailable. Luckily, this goal can be achieved with a transfer learning technique. In this study, we first use a CNN model to predict the car and non-car mode share in the high-income regions using the aerial and OSM images, with an autoencoder added to the classic CNN model to make the feature representation transferable. We then fit the model trained in the high-income regions to the images of the low-income regions to predict the car and non-car mode share in these regions by fixing the common layers between the rich and poor regions and retraining the layers that are specific to the poor regions.

The results show that the standard transfer learning approach can be effectively adopted for travel behavior modeling. With aerial and OSM images, transfer learning at the census-tract level for the estimation of car and non-car mode share in the low-income regions can explain a large amount of the total variation of the dependent variable. If the basic socio-economic data is added to the model, the model performance is even better, exceeding the traditional models using only the socio-economic data as inputs. Our results also show that transferring at the census tract level is most effective, compared with transferring at the city-level or state-level. Overall, this work demonstrates that the aerial images in combination with deep learning approaches can relieve the travel data deprivation in the poor areas, at least based on the NHTS 2017 data set. By using the aerial images to infer people's travel demand, the reliance of policymakers on conducting survey will be largely reduced, particularly in the poor regions.

#### INFILL OR RESILIENCE? ESTIMATING THE LOSS OF URBAN TREE CANOPY USING AUTOMATED FEATURE EXTRACTION OF SATELLITE IMAGERY

Abstract ID: 586

Individual Paper Submission

KAMAL, Azza [University of Florida] azzakamal@hotmail.com, presenting author

The city of San Antonio in Texas is Bexar County's urban center and the seventh largest city in the United States. Between 2011 and 2016 the city's population grew by 10 percent to reach a total of 1,439,358 because of rapid urbanization, particularly in existing neighborhoods in areas around the city's urban core. For the past decade, in most of these areas, several infill projects were added. Infill development studies largely focus on the benefits of infill development including enhancing the conservation of environmental resources and economic investments and strengthening social fabric by absorbing growth into existing communities. In historic neighborhoods, the city of San Antonio imposes additional guidelines stemmed from the Secretary of the Interior's "Standards for the Treatment of Historic Properties" including preserving some degree of pervious land. Nevertheless, and despite the evident rapid urbanization of its 31 historic neighborhoods, the city fell short on adopting measures to estimate and mitigate the impacts of urbanization on resilience, particularly the changes in pervious land covers and urban tree canopy (UTC). Due to its critical role in tempering land surface temperature (LST) that causes surface urban heat island (SUHI) effect, any loss of UTC could have major consequences. In urban areas in particular, SUHI poses a threat to human health and thus maintaining UTC coverage helps to improve health and reduce energy consumption in cities.

This paper questions whether standard federal guidelines in historic neighborhoods have failed to address the loss of pervious land covers and UTC. In San Antonio Dignwity Hill historic neighborhood, trees tend to be old and mature. These trees often capture, filter, and store more precipitation than typical UTC, thus they regulate the volume of runoff water, which protects water quality of watersheds and surface waters. They also preserve air quality, mitigate climate effects, provide spiritual and cultural resources, and offer unparalleled opportunities for passive recreation. As such, any decrease in UTC of old and mature trees raises an alarm to climate change as it increases SUHI effect in the city's urban center.

With the advanced geotechnology, surface types including UTC can exclusively be determined by aerial or satellite-based remote-sensing techniques. Availability of satellite imagery through open sources of Texas Natural Resources Information System (TNRIS), spatial analysis of geographic information systems (GIS), and standardized interpretation techniques has today become simple to implement by researchers and local governments. This study utilized an automated feature-extraction method using Object-Based Image Analysis (OBIA) tools that were integrated in eCognition Developer 9.1 software. Three types of fine spatial resolution (0.5 m) images were analyzed including 2010 National Agriculture Imagery Program (NAIP), 2015 Texas Orthoimagery Program (TOP), and the 2010 Strategic Mapping Program (StratMap) LiDAR point data. A feature-extraction was created using a rule-set workflow in eCognition, a programmed process to segment and classify land cover of Dignowity Hill historic neighborhood. By comparing 2010 and 2015 results from the two satellite imageries, the author detected the locations and changes -in square foot unit- in pervious land cover and UTC. The automated model was also assessed for accuracy and future improvement.

The results yielded a 38.1 percent decrease in UTC area, and an overall 52.6 percent decrease in pervious land cover, which should be mitigated by adopting more strict Low Impact Development (LID) guidelines. The error matrix of the eCognition process showed an 81 percent accuracy. The study recommends integrating additional rules and thresholds in eCognition workflow to improve the detected objects' boundaries, enhance the level of accuracy, and thus the results. Nuisances and challenges of mapping multifaceted elements in complex urban settings of historic neighborhoods are also discussed.

## THE EFFECT OF COVID-19 ON SALES REVENUE IN SEOUL, SOUTH KOREA: AN AGENT-BASED MODELING APPROACH

Abstract ID: 606

Individual Paper Submission

YOON, Heeyeun [Seoul National University] hyyoon@snu.ac.kr, presenting author

COVID-19 or coronavirus disease 2019 pandemic has struck the world. As of March 2021, the cumulative confirmed cases amount to 125.42 million in 213 countries, among whom more than 2.75 million have died. The pandemic has changed our economy. Sudden modifications of conventional routines, such as adopting remote-work strategies, may have lowered workers' effectiveness and hence lowered productivity. Some industries, such as manufacturing, are unable to adapt to the new norm at all. In the second quarter of this year in the United States, gross domestic product (GDP) declined by 32.9%, and the World Bank projects that the global economy will shrink by 5.2% in 2020.

While macroeconomic projections have begun to be presented cautiously, the microeconomic consequences of COVID-19 in everyday lives—especially changes in individual consumption activities—have been relatively less studied. COVID-19 has brought about new customer behaviors. The demand for necessities of life, essential goods, and groceries has increased as a part of panic buying and online shopping has become preferable to traditional methods.

Studies of this type, however, have been made on the basis of descriptive statistics of data collected for various periods, such as simple before-and-after comparisons. From these, it is not possible to understand more direct and detailed consumer behaviors in response to the spread of COVID-19 on a daily basis, controlling for all other factors that simultaneously affected the consumption. How does the information on daily confirmed cases of COVID-19 in the neighborhood or in the country alter individual consumption behavior in retail sectors? Also, how do the preventive measures enforced by public authorities alter individual consumption behavior in retail sectors? And do those behavioral changes differ by age group?

Against this backdrop, we investigate the effect of COVID-19 —the case confirmations and the relevant public measures—on daily consumption behavior of different age groups in food-service retail sector, using agent-based modeling. Agent-based modeling is a computational tool that enables simulation of complex geographical systems within which individuals can be centered and reacting to environments.

To the best of our knowledge, this study is the first attempt to assess the immediate response of consumers to COVID-19 outbreaks with a big data on the daily credit-card transaction and records of a public alert system. The study site is Seoul, South Korea, where the pandemic swept through in the initial phase of global spread and where reportedly an early control has been successfully achieved. The study period is from January to December, 2020.

LEE, Hyekyung [Dankook University] hkleee@dankook.ac.kr, presenting author

JIAO, Junfeng [The University of Texas at Austin] jjiao@austin.utexas.edu, co-author

CHOI, Seung Jun [The University of Texas at Austin] jun.choi@utexas.edu, co-author

The COVID-19 pandemic and social distancing restrictions have had a significant impact on urban mobility. As micro mobility offers less contact with other people, docked or dockless e-scooters and bike-sharing have emerged as alternative urban mobility solutions during the pandemic. Despite previous studies on the benefits of micro mobility and the impact of COVID-19 on other public transportation services (Shaheen & Chan, 2016; Griffin & Jiao, 2019; Wang & Zhou, 2017; Bai & Jiao, 2020), little empirical research on the relationship between diverse factors in urban environments and micro mobility ridership during the pandemic has been conducted. In recent years, data collections of real-time dynamic spatial information (telecommunication floating population, metro, bus, and micro mobility ridership) have become possible in a few cities and have gained attention in smart mobility research. However, there is a lack of research on how real-time spatial-temporal movements of the population affects micro mobility ridership during the pandemic. To address this gap and the importance of micro mobility as an alternative public transportation solution during and after COVID-19 in urban areas, this research aims to study how COVID-19 affects bike-sharing services and how other factors impact bike-sharing ridership. The data in this study was analyzed in two phases. First, we investigated the spatial-temporal patterns of docked bike-sharing service in Seoul, South Korea by utilizing daily urban big datasets. Second, we conducted a stepwise negative binomial (NB) panel regression model that tested the consequences of 1) climate factors, 2) transportation factors, 3) land use factors, 4) social factors, and 5) COVID-19 factors on the two key indicators of bike-sharing ridership - total number of ridership and total time duration of ridership - for 488 days between March 1, 2019 and June 30, 2020.

This study empirically tested the consequences of the COVID-19 pandemic on bike-sharing ridership. When the passenger volumes of other public transportation modes decreased from the direct impacts of the COVID-19 pandemic, Seoul bike-sharing ridership was empirically analyzed to show increases during the COVID-19 period. Our results also showed that open space areas and green infrastructure had statistically significant positive impacts on bike-sharing usage. Therefore, open space and green infrastructure strategic planning should be prioritized to develop better urban environments for bike-sharing usage. Especially during COVID-19 and post COVID-19, people are more likely to visit open spaces and prefer green infrastructure in urban areas where there is less close contact with other people. Moreover, this study is significant in that it utilized real-time telecommunication floating population datasets. Compared to registered population factors, real-time telecommunication floating population had a significant positive relationship with both bike trip count and trip duration. Traditional urban planning data analysis usually utilizes census or registered population data which does not represent peoples' actual movements. Registered population data is not enough to explain how people move around or to study direct impacts of spatial and temporal patterns of population on micro mobility ridership. Specifically, because there were not any city-level lockdown social distancing measures in Seoul during COVID-19, consideration of real-time big urban data from

telecommunication floating population was able to explain the consequence of social factors on bike-sharing ridership in this study. Also, this research considered other big urban datasets to test the consequences of climate factors and transportation factors on bike-sharing usage. Thus, diverse aspects of urban environments that might affect bike-sharing ridership were analyzed in this study. As micro mobility has emerged as an alternative urban mobility solution, these findings could offer useful guidelines for emerging shared mobility planning during and post COVID-19 in many cities.

#### **AN ARTIFICIAL INTELLIGENCE-AIDED AND DATA-DRIVEN DESIGN (AIDD) FRAMEWORK FOR URBAN DESIGN COMPUTATION**

Abstract ID: 631

Individual Paper Submission

QUAN, Steven Jige [Seoul National University] [stevenchuan6656@gmail.com](mailto:stevenchuan6656@gmail.com), presenting author

The recent advances in artificial intelligence (AI) and big data provide new opportunities for urban design computation. An increasing number of studies have been emerging in this field adopting these new techniques and data, which can be generally categorized into two research streams based on their focus: design optimization studies that focused on generative design with advanced AI search algorithms such as genetic algorithms, and data-informed design studies that used big data such as Streetview images to understand the site to inform design. But both streams encountered difficulties in their representation and process, two major parts in design computation. Design optimization studies often struggled with the symbolic representation limited for the complex physical form, and the shortage of well-developed simulation models necessary for the design process, especially perceptive or complex performance models. Data-informed design studies, on the other hand, usually either adopted the parametric design that has the same representation issue and unclear evaluation criteria for the design generation process, or relied heavily on manual representation and design process. A few studies in the field tried to use the raster (sub-symbolic) representation to better represent physical form in the design process, but generated designs in raster were often hard to use even after their direct conversion to vector. Moreover, both streams focused on one of AI and big data, without integrating the two technological advances to address the emerging need to synthesize data, science, and design: Design optimization studies often relied on simulated data based on available scientific models rather than more informative and real big data in design generation, and data-informed design studies mostly had difficulty in applying scientific knowledge from big data analysis to guide the design process. This study aims to fill the research gap by developing an artificial intelligence-aided and data-driven design (AIDD) framework. The AIDD framework adopts AI techniques to facilitate representation conversion, learn scientific models from big data, and apply the data-driven models and expert knowledge to guide the design process, thereby integrating data, science, and design. The framework contains six stages. In the problem formulation stage, design

objectives and reference areas are defined. In the data preparation stage, physical form vector data and performance data are collected, integrated, and converted to a training dataset with form raster as features and performances as labels. ResNet, a widely used deep learning method, is adopted to learn a raster-vector conversion model and performance models based on the training dataset in the model learning stage. In the design generation stage, NSGA-III, a well-known multi-objective optimization method based on genetic algorithms, is used to find equally optimal designs with learned performance models as objective functions and expert knowledge as constraints. Those raster designs are then converted to vector using the learned conversion model in the design reconstruction stage, which are further presented to stakeholders in the design decision stage. The AIDD framework will be demonstrated in a hypothetical urban design case in New York with improving safety perception and mitigating urban heat island effect as design objectives. The dataset includes the physical form, safety perception, and surface temperature collected from the city open data portal, MIT Place Pulse dataset, and Landsat imageries. A total of 30,000 training samples of 512 x 512 m size will be drawn from the dataset for model learning. Urban design schemes will be produced in vector as equally optimal solutions to the design objectives. The proposed AIDD provides a new and comprehensive framework for urban designers to better utilize and synthesize the power of both AI and big data in generating well-represented and highly-performative design schemes to support design decision making.

#### **REKINDLING HENRI LEFEBVRE'S RHYTHMANALYSIS: MEASURING DISASTER RECOVERY RHYTHMS WITH SOCIAL MEDIA POSTS FROM THE U.S. ATLANTIC TERRITORIES**

Abstract ID: 642

Individual Paper Submission

MILLS-BOCACHICA, WANDA [InFusion, An Indigenous Community Research Organization]  
wmbconsulting@gmail.com, presenting author

Rhythmanalysis examines repetitive patterns found in nature and human-related phenomena as recorded through the Arts, Humanities, Social Sciences, and the Physical Sciences. Urbanist Henri Lefebvre's 20th Century explanations on everyday living – including the use of Rhythmanalysis as a research theory and method – are examined in the second decade of the 21st Century for their relevance and applicability. This open-ended, participant observation research initiative explores how everyday people from two contrasting, complex, and peripheral societies – namely Puerto Rico and the United States Virgin Islands – resiliently respond to loss and uncertainty following Hurricanes Irma and Maria (2017). The aim is to rethink ordinary people's creative capacity to organize disaster recovery initiatives individually and collectively, notwithstanding the day-to-day challenges. Social media platform capabilities, millennial ingenuities, timely donations by mega-star philanthropists, and indigenous knowledge systems figure prominently. Unconventional examples of social entrepreneurship supplement for governmental, material, and financial shortcomings. Near real-time analyses of conceived, perceived, imagined, and lived actions

clarify the complex realities of human impulses and exertions over time. Dualistic scenarios such as observed graceful resilience and character, or unforeseen disruption, are common. Both case studies serve as living laboratories for finding common ground amidst difference through social media dialogue, sensory experiences, and creative problem solving. Distinct and similar rhythmic patterns and creative opportunities are observed in the thirdspace, a definable void between fixed rhythmic beats, acts, or occurrences. Research findings support the invaluable bottom-up disaster recovery contributions by ordinary people through increasingly independent, innovative, and sustainable community rebuilding processes and practices. This work contributes to the growing toolbox of research methods associated with the Indigenous Planning paradigm.

#### **PROMOTING HEALTH SOCIAL NORMS IN ONLINE COMMUNICATIONS IN COVID-19: A DATA-DRIVEN SYSTEM DYNAMICS MODELING**

Abstract ID: 651

Individual Paper Submission

GAO, Shangde [University of Florida] gao.shangde@ufl.edu, presenting author  
WANG, Yan [University of Florida] yanw@ufl.edu, co-author

Social norms are the shared belief systems within a social group that provide information on how to behave and manage relationships (Lapinski and Rimal, 2005). Health-related social norms can promote COVID-19 preventive measures, e.g., wearing masks and social distancing, by influencing individuals' compliance with the adoptions of these measures (Olivera-La Rosa et al., 2020; Ridout and Campbell, 2014). In the online discussion about COVID-19 preventive measures, health-related social norms can influence individuals' social media messages on the content, attitudes, and behaviors related to sharing and adhering to related online information (Rösner and Krämer, 2016). Individuals can perceive the online social norms from multiple sources, especially their social network including the users they have followed. Specifically, individuals perceive online social norms based on the received normative information, which contains the belief towards specific issues and is widely regarded as normative (Rogers et al., 2019). However, some widely accepted "normative" information in their networks is not factual. Individuals may easily perceive the counterfactual information as social norms and their attitudes towards specific issues (e.g., preventive measures of COVID-19) could then be misguided. To mitigate this potential condition, it is necessary to understand the relationships between the factors of normative information (i.e., virality and the attitudes contained in online messages) and the mechanisms of how these factors influence individuals' information-related behaviors. Specifically, virality refers to features of message spreading while the contained attitudes describe users' belief towards related topics.

Therefore, this research aims to explore: how are individuals' attitudes and information dissemination behaviors toward COVID-19 prevention measures influenced by the virality and contained attitudes of the perceived normative information in their individual social networks? We utilized System Dynamics as the basic model, which included normative information that was factual or misinformation. The model was established based on the Twitter messages about the prevention measures of COVID-19, and the tweet dataset was collected with Twitter API. In general, the System Dynamics model consists of the attitudes and virality factors of online information from Twitter users and the perception of social norms from their social networks. With this model, we quantified and evaluated the relationships in the research question by extracting and analyzing the tweets from general users, their peer users, and the whole discussion regarding the COVID-19 preventive measures, and we mainly analyzed the contents and data volume of these tweets.

We expect to identify the relationship between (i) Twitter users' information dissemination behaviors and attitudes about the COVID-19 preventive measures and (ii) the attitudes and virality factors of messages from the Twitter users' peers and the general discussion about the COVID-19 preventive measures. This research provides a reference for future practices that aim to help the public form appropriate perceptions of health and other crisis events and encourages them to perform preventive measures. This research advances existing crisis communication studies because it examines the feasibility and applicability of improving online crisis communication from the norm perspective instead of the information level, which can essentially influence the public's crisis perception and their response behaviors. With System Dynamics modeling, our study offers a novel approach for urban informatics studies to model online information and the social media population in the complex digital world.

#### **MASSIVE LAND-USE SUITABILITY ANALYSIS BASED ON PARALLEL COMPUTING: A CASE STUDY IN ORANGE COUNTY, FLORIDA**

Abstract ID: 652

Individual Paper Submission

CHEN, Changjie [University of Florida] [chj.chen@ufl.edu](mailto:chj.chen@ufl.edu), presenting author

#### Research Question

Land-use planning is one of the most influential planning routines in directing and managing the development of a city. Although its introduction dates back to the late 1960s, Geographic Information System (GIS)-based suitability analysis still plays a crucial role in contemporary practices of land-use planning. The notion of suitability wins favor

with land-use practitioners because of its capacity for effectively synthesizing community values, planners' expertise, and results from GIS analysis. However, the time cost of performing such analyses conventionally—working with GIS software on a desktop computer—largely constrains land-use practitioners' ability to sift through a variety of alternative future land-use scenarios to make better informed decisions about land use. To help overcome this obstacle, I present a case study integrating parallel computing with land-use suitability modeling. The noticeable speed gain in rapidly simulating large numbers of land-use scenarios demonstrates a promising application of the technology in land-use planning.

## Methodology

This study chose the Land-Use Conflict Identification Strategy (LUCIS), developed by Peggy Carr and Paul Zwick at the University of Florida in the early 2000s, as a platform on which to integrate high-performance computing with land-use suitability analysis. LUCIS is a goal-driven GIS model—initially developed with ModelBuilder in Esri ArcGIS software—that supports land-use decisions through measuring and analyzing suitability based on various sets of criteria for different land-use types. To implement parallel computing in the LUCIS model, I first developed Python for Land-Use Suitability Analysis Tools (PyLUSAT), a cross-platform open-source Python package that contains a series of vector-based functions for geospatial analysis. Built on these functions, a set of analyzing modules was developed for each land-use type that: (1) transforms LUCIS from raster-based to vector-based GIS; (2) empowers the model to work across different operating systems; and (3) can be run in parallel via any pythonic and/or system-specific means.

The computational efficiency raised by parallel computing also enables fast simulation of many future land-use scenarios. Since LUCIS uses the Analytic Hierarchy Process (AHP) to perform multiple criteria decision making (MCDM), one possible approach to conduct massive simulation is through randomizing the priority vector (a vector of weights) generated by AHP. Moreover, to allow concurrent data connections and to secure high-speed data reading, the study introduced the PostGIS/PostgreSQL database as the mechanism for both spatial and non-spatial data storage.

## Case Study

A job that involved 45,909 land parcels in Orange County, Florida, was assigned to the parallel-computing-enhanced version of LUCIS—pLUCIS. Specifically, I tested and compared the performance of running this job in both a symmetric multiprocessing (SMP) environment—a quad-core desktop computer—and a cluster computing environment—a computing cluster with ninety-five cores on HiPerGator (a high performance computing cluster) at the University of Florida.

## Implication

It cost roughly five and a half minutes to run the LUCIS model on HiPerGator for the study area. The substantially diminished runtime for modeling established the viability of integrating parallel computing into land-use suitability analysis, which in turn assured that the method I implemented is broadly replicable. Moreover, during these 5 and a half minutes, I conducted a simulation of 120 scenarios within the study area. This capacity of massively simulating alternative scenarios gives rise to a new strategy of practicing land-use planning that is based on probabilistic models and statistical inference and can be applied on multiple scales. For individual parcels, the method can be used for site search/selection. And on a regional scale, it can be used to support the formulation of land-use plans for entire municipalities.

## **PREACT: PLANNING FOR RESILIENCE AND EQUITY THROUGH ACCESSIBLE COMMUNITY TECHNOLOGY**

Abstract ID: 707

Individual Paper Submission

ROSAN, Christina [Temple University] [cdrosan@temple.edu](mailto:cdrosan@temple.edu), presenting author

HECKERT, Megan [West Chester University] [mheckert@wcupa.edu](mailto:mheckert@wcupa.edu), co-author

The climate crisis is not only a crisis of nature, but also of people, understanding, and action. Today, many of our most pressing challenges lie around information, decision-making, collaboration, and design for inevitable adaptation. Data analytics can have a significant impact on helping the public response, but translating data insights into effective policies with public support has been challenging, especially when trade-offs are involved. It's essential that we develop ways to better communicate the trade-offs associated with planning for climate change – one way to do this is by visualizing the results in a way that is accessible to the public.

In Philadelphia, a city that we expect will be much hotter and wetter in the future due to climate change, low-wealth communities face the very real and on-going legacy of disinvestment, discriminatory land use, and exclusionary planning combined with the pressures of rapid gentrification making it hard to focus on issues around climate change. Many residents in these neighborhoods are dealing with a wide range of pressing day-to-day challenges including, but not limited to, under and unemployment, difficulty paying rent and mortgages, evictions, food access, rising utility costs, underperforming neighborhood schools, childcare access and costs, overabundance of vacant lots, crime and drug use, illegal short-dumping, lack of access to parks and recreation, and health concerns.

The types of planning changes we make today for a sustainable future often don't align with very real community concerns — especially in low income communities. Scientific research is pointing to the severity of urban heat island effects, the climate pressures on aging housing and civic infrastructure, the need for a transition to distributed and renewable energy resources, the challenge of weatherization of buildings, and the need to invest now in resilience planning such as green space and flood protection and mitigation [1-2]. However, residents may view the focus on long-range planning and climate as ignoring their immediate needs, and thus feel further excluded from planning decision-making and priority setting. Or they may perceive investments in sustainability as contributing to green gentrification [3-5].

Our research bridges disconnects among academics, planners, city officials, and residents by building trust through partnerships and developing a framework for a community-centered collaborative planning tool. PREACT (Planning for Resilience and Equity through Accessible Community Technology) is a multipurpose and multi-scalar climate preparedness and neighborhood planning software application informed by community need and community assets. PREACT takes into account the needs and experiences of community members, designing a model of technology co-production that addresses community needs and allows for the integration of social and scientific data for more informed decision-making. PREACT enables users to specify a geographical area of interest, choose from and weigh the importance of a range of factors relevant to a climate planning concern, and generate a map indicating the areas of greatest vulnerability. PREACT also helps identify ways to systematically address vulnerabilities through support for existing community assets, opportunities to reinvest in social, ecological, and physical infrastructure in communities, better local enforcement of existing public health regulations, and changes

in land-use decisions and planning. The inclusion of citizen groups in the creation of PREACT ensures that the data and assumptions that underpin PREACT are more representative of community need and informed by lived experience. Through the process of creating and using PREACT, we open up opportunities for a more deliberative dialogue among citizens, scholars, government, and business about needs and preferences for policy interventions. This project creates a technological tool that empowers citizens and makes the government more responsive to community needs.

#### ADDRESSING THE METHODOLOGICAL SHORTCOMINGS OF TRANSIT-INDUCED GENTRIFICATION RESEARCH: A CASE FOR COMPLEX SYSTEMS THINKING

Abstract ID: 733

Individual Paper Submission

MCDUGALL, Emma [University of Waterloo] edmcDoug@uwaterloo.ca, presenting author

WEBBER, Kaitlin [University of Waterloo] kaitlin.webber@uwaterloo.ca, co-author

The role of public transportation has shifted over the last two decades, as planners and policymakers increasingly promote new transportation infrastructure as an economic growth tool. Because of this, transit infrastructure is valued beyond mobility, as it is successfully used to promote density, revitalize urban cores and foster a particular lifestyle. This success however has also positioned new infrastructure as driving neighbourhood change and gentrification, leading to the evolution of literature that argues for the phenomena of transit-induced gentrification. This concept can be defined as the process wherein new transit infrastructure, paired with transit-oriented development, induces neighbourhood change - characterized by socioeconomic upgrading and the eventual displacement of lower-income residents who traditionally benefit most from improved transit access (Dawkins & Moeckel, 2016; Padeiro et al., 2019). As this body of literature grows however, research has become fragmented, with scholars arguing that inconsistent methodological approaches, dominated by quantitative studies, have made comprehensive understandings of transit’s role in gentrification difficult (Barton, 2016). In response to these criticisms, researchers are calling for the integration of qualitative and mixed-methods approaches into this field, highlighting the importance of lived experiences in conversations of transit-induced gentrification (Padeiro et al., 2019). With transit-induced gentrification becoming more prevalent across large and increasingly mid-sized cities, and a lack of methodological consistency, our research asks: how can complex systems thinking be used to better understand the process of transit-induced gentrification? And further, can this methodological approach be used to produce tangible recommendations for planning practitioners?

The formal study of complex systems is becoming increasingly interdisciplinary; used to gain a deep understanding of the components contributing to a problem to generate targeted solutions to effectively alter the system's outcomes (Moffatt & Kohler, 2008; Tulier et al., 2019). In this research, we argue that a complex systems approach can be used to address 'wicked' planning problems, such as transit-induced gentrification. To test this, we undertake an in-depth analysis of scholarly literature, policy and popular media and apply a systems thinking lens to produce a number of feedback loops that break down transit-induced gentrification into its social, political and economic components. We use this methodology to illustrate the interconnectedness of the system and to demonstrate how small oversights in the planning and development process of new transit infrastructure can fuel transit-induced gentrification in a given city. We also use these feedback loops to provide recommendations useful for cities considering new transit infrastructure to minimize negative externalities to low-income and marginalized groups.

Through our analysis, we found that systems thinking is a strong tool for research exploring transportation's role in driving neighbourhood change. Beyond identifying the problem - an already complicated task in this area of study - systems thinking provides a tool to create actionable change. Ultimately, complex systems thinking can help planners and policymakers build targeted interventions tailored to the specific needs of the populations in question which leads to better outcomes than blanket policy derived from more general quantitative methodologies. This is significant for gentrification research, but also has the potential to be applied to a plethora of complex planning problems. Overall, our research functions to illustrate the potential a complex systems methodology has to become a strong resource for planning practitioners and theorists alike.

#### **WALKABILITY FOR EVERYONE? RELATIVE ASSOCIATIONS OF MACRO, MESO, AND MICROSCALE WALKABILITY ON WALKING BEHAVIOR**

Abstract ID: 752

Individual Paper Submission

KOO, Bon Woo [Georgia Institute of Technology] bkoo34@gatech.edu, presenting author  
 BOTCHWEY, Nisha [Georgia Institute of Technology] nisha.botchwey@design.gatech.edu, co-author  
 GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

Walkability is a composite concept that involves various contributing factors, ranging from macroscale urban form components to microscale streetscape details. While macroscale factors can easily be measured for large geographic areas using GIS and are studied extensively, measuring microscale factors require manual audits or surveys, which resulted in the frequent omission of microscale factors from widely used walkability indices as well as in walkability-related studies. This omission can be problematic, particularly for disadvantaged populations. Disadvantaged populations tend to be less sensitive to macroscale factors (Adkins et al., 2017; Lovasi et al., 2009; Manaugh & El-Geneidy, 2011) because they are often exposed to unfavorable microscale factors (Bereitschaft,

2017; Neckerman et al., 2009; Sallis et al., 2011). This suggests that macroscale factor-based studies and interventions may have a limited impact on these populations.

This study measures macro, meso, and microscale factors of walkability using GIS and novel methods based on computer vision and systematically collected and corrected street view images. Combined with the National Household Travel Survey 2017, this study examines their relative contributions to walking mode choice in Atlanta, GA. This study incorporates an equity perspective by examining how the relative contributions change depending on disadvantage status. Considering microscale factors are easier and cheaper to modify, the results can offer insights on how to frame policy interventions effectively for different population groups.

## VISUALIZING COMPLETE STREETS SCENARIOS GENERATED FROM 3D RULE-BASED MODELING AND TRAFFIC SIMULATION IN VR

Abstract ID: 770

Individual Paper Submission

BEJLERI, Ilir [University of Florida] [ilir@ufl.edu](mailto:ilir@ufl.edu), presenting author  
NOH, Soowong [University of Florida] [nswscott@ufl.edu](mailto:nswscott@ufl.edu), co-author  
ZHU, Cenqi [University of Florida] [cenqizhu@ufl.edu](mailto:cenqizhu@ufl.edu), co-author  
BUFKIN, Jamie [University of Florida] [jbufkin@ufl.edu](mailto:jbufkin@ufl.edu), co-author

#### Background:

Complete Streets have been adopted around the US as a street design approach to support all road users including pedestrians, bicycles, and transit. Design of Complete Streets is a complex process that requires considerations of many variables like physical street layout, streetscape, travel modes, traffic performance, and to name a few. To handle some of this complexity, various visualization and simulation tools such as procedural (rule-based) modeling and traffic simulation have been utilized to support multiple street design scenarios before construction. However, due to technical and organizational barriers, actual street design occurs in a disconnected fashion, especially during the conceptual design phases, though the process requires prompt feedback among professionals and stakeholders. To overcome some of these barriers, this study investigates a methodology to integrate rule-based modeling and traffic simulation into a VR experience to facilitate efficient communication of design ideas among various street design professionals and even the general public.

#### Study Design:

We explore integration of rule-based modeling and traffic simulation approaches by creating a set of toolchains inside a game engine and visualize it in VR. Using a case study area in Florida, we apply the following process: First, we create multiple street design scenarios using CityEngine, which is rule-based modeling application. Next, we run traffic simulation using microsimulation to compute trajectory data, which can be used inside the game engine. Finally, using the Unity game engine and the Oculus system, we develop a VR to show the street design scenarios with interactive data-driven multi-modal traffic. The VR allows for dynamic control of parameters including vehicle, pedestrian, and bicycle density which provide users to experience diverse traffic flows as well as time of the day in real world context.

#### Results:

The integration result in an interactive data-driven environment for the user to experience street designs and dynamic traffic at 1:1 scale in VR. The results demonstrate several advantages of the integrated approach including: (a) increased efficiency in modeling and visualization due to the rapid generation using rule-based modeling techniques; (b) immersive experience of the street design overlaid with the data-driven traffic simulation via the VR scenes, allows users to compare and contrast the scenarios in real scale; (c) enabling of opportunities for innovative public engagement and effective collaboration in street design proposal by using interactive VR.

#### Conclusion/Contribution:

In conclusion, we find that this integrated approach can help overcome some of the limitations of the existing approaches and demonstrates the promise to serve as an effective framework for street design, visualization, evaluation, and participatory planning and design in a true-to-life scale.

#### **ARE URBANITES LESS STRESSED IN ACTIVE HIGH-DENSITY AREAS WITH A HIGH SYMBOLIC VALUE? : AN ASSESSMENT USING SOCIAL COMPUTING AND GIS AUTOMATION.**

Abstract ID: 813

Individual Paper Submission

DUTT, Florina [Georgia Tech] florina.design@gatech.edu, presenting author

GUHATHAKURTA, Subhrajit [Georgia Tech] subhro.guha@design.gatech.edu, co-author

The existing mental health and built environment literature claims that the prevalence of mental health disorders increases in the urban areas and especially in the high-density urban cores [1, 4]. The argument is primarily based on the premise that urban cores are crowded than their rural counterparts, resulting in social and cognitive overloads

on individuals. Here crowding is simplified and measured by population density and it is linked with higher levels of anxiety, stress, and mental health disorders in people. Active high-density areas are defined as urban areas with a higher population or employment density, located closer to transit, with an improved bike-pedestrian infrastructure [2]. Commonly, these areas are very similar in their characteristics to the urban cores described as detrimental for mental wellbeing. Such construct in the mental health literature can keep the findings of the popular urbanists muddled. The big question here is whether advocacy of urban living by urbanists is best for the mental wellbeing of the urbanites? Our research addresses the controversy and disentangles the research gap by using social computing and GIS-based fine-grained computation of the built environment.

We mined social media data (Tweets) and evaluated the stress level expressed in the microblogs using Deep Learning algorithms. In the next level, we evaluate the proximate built environment characteristics for a large scale of Tweets by automating the GIS process. Our results show that the stress levels are less in the active high-density areas with a higher symbolic value, where symbolic value is a non-material value attributed to areas based on their historical significance, economic status, and perceived safety [1]. Our findings are supported by the theories on crowding, which explain crowding by itself is neither good nor bad. It intensifies certain existing social conditions but rarely causes any urban problems. In the mental health literature, crowding is not differentiated from overcrowding when explaining the cause of stress. Overcrowding primarily results from a lack of resources for livelihood, where resource limitations may result in a lack of control over one's personal space. With the inability to secure the needed privacy due to poverty, or excessive rent burden, people experience extreme stress, anxiety, and other mental health issues. Another issue of the earlier findings is that the definition of urban is kept too generic and has not been differentiated based on fine-grain built environment characteristics. Our research reinstates that "crowding by itself does not negatively impact the mental health of the urbanites." The statement only holds for the conditions of overcrowding. Higher population density, higher footfall, greater accessibility by active transportation, on the contrary, allows people to de-stress, given that they have higher symbolic value and no signs of overcrowding.

 BEYAZIT INCE, Eda [Istanbul Technical University] beyazite@itu.edu.tr, co-author

Accurate modeling of travel behaviour is an important component in transportation planning and travel demand management. For decades, extensive efforts have been devoted to identifying and improving methods in travel

behavior research, including using discrete choice models, the shift from trip-based to activity-based models, and, more recently, experimentation with “big data” and machine learning methodologies. From a social justice perspective, improving model accuracy is vitally important to understand how different people respond to different types of changes in transportation and, accordingly, how to better plan for the needs of traditionally marginalized communities. Within justice-based transportation planning, travel behaviour models help researchers predict activity and travel behaviour outcomes associated with transit investments, which help planners evaluate the equity implications of different planning scenarios. Moving beyond the typical buffering exercises involved in Title VI and Environmental Justice analyses, travel behaviour-based assessments examine how transit investments unlock potential for higher life quality. This can be done by forecasting, by population segment, behavioural responses such as changes in auto-ownership, transit mode share, and out-of-home activity participation rates.

This paper aims to assess the potential for using machine learning-based travel behaviour models to accurately predict travel behaviour responses to transit investments among marginalized populations. Since the 1980s, most mode-choice problems have been addressed and modeled by traditional discrete choice models – e.g., multinomial logit. Their simple mathematical formulation and interpretation have made them popular (Lee, Derrible, & Camara, 2018). However, Machine Learning (ML) algorithms are proving to be robust and accurate in various research contexts and have received particular attention within the travel behavior modelling literature. An ML algorithm utilizes a set of rules or models to learn complex patterns within a dataset. This is very different from traditional models that are firmly grounded in microeconomic theory. ML’s flexibility in dealing with non-linearity and capturing complex relationships between input and output variables makes them promising for modelling complex and heterogeneous patterns, even though they are popularly referred to as “black-box” estimators since they lack theoretical formalities that allow analysts to easily describe relationships between variables in the model. Nonetheless, travel behaviour researchers have been gradually adopting ML models for travel demand modeling, particularly mode-choice decisions (Xie, Lu, & Parkany, 2003; Zhang & Xie, 2008; Cheng, Chen, De Vos, Lai, & Witlox, 2019). Within this burgeoning literature, to the best of our knowledge, there have been few efforts that examine the pros and cons of using ML models within equity-focused research and planning. We hope to discover how the potential forecasting accuracy benefits of ML approaches stack up against their potential drawbacks, namely, that they are not derived from behavioural theory, and they do not provide easily interpretable relationships between input and output variables.

In this study, we test ten ML algorithms and traditional travel behaviour models to predict the transit use of low-income, carless people in the Greater Toronto and Hamilton Area, Canada. Our primary analysis reveals that conventional models have lower predictive performance – e.g., accuracy, precision, and recall – compared to ML models. We further test the models within a forecasting setting, by predicting the effects of transit investment – i.e., job accessibility improvement – on transit use within marginalized strata. Initial results show considerable disagreement among different algorithms in terms of the scale and spatial distribution of the new transit trip generations. Accordingly, our study elucidates the importance of model selection in assessing policy recommendations for socially disadvantaged groups, and leads to recommendations for transportation planners vis a vis model selection and accounting for uncertainties that stem from the choice of model specifications.

SHIBASAKI, Ryosuke [University of Tokyo] shiba@csis.u-tokyo.ac.jp, co-author

There have been lacks of understanding on visitors' activities of urban parks. The conventional wisdom generally assumed that residents living in adjacent neighborhoods are the main group of park users (Perry, 1929; Xiao et al., 2019). Also, classification of those parks are often based on physical, locational, or administrative characteristics of the parks. Except for children's playgrounds, visitor characteristics are not much of a concern. This study examines what kind of grouping appears when we classified the parks based on visitor characteristics and how those groups are related to prevailing assumptions of park visitors and to existing classification scheme.

The study area is the 23 inner wards of Tokyo, Japan. Among the over 5000 designated parks, we selected 85 parks with surface areas between 3 ha and 10 ha, which is the recommended size range for district level parks (Ishikawa, 2001). Park visitors and their home locations were estimated through cell phone GPS data. The cell phone GPS data are fully anonymized for security reasons but it is possible to retrieve two aspects of park visitors, home-park distance and visit frequency, without identifying any other demographic information (Guan et al., 2020). We performed cluster analysis taking advantage of four variables: total number of visitors, percentage of visitors from within a 4 km radius, percentage of frequent visitors (more than four times a year) from 10km or further away, and percentage of one-time visitors from beyond 20 km distance. The last three variables represent different visitor groups: neighborhood visitors, park users among commuters, and annual visitors/tourists, respectively. Although this grouping criteria may not be highly accurate, they certainly reflect different user group characteristics existing in reality.

Using hierarchical cluster analysis, we identified three to four distinctive categories. The first category, which includes 67 parks, has a high proportion of visitors from neighborhood areas, on average 46%, and is characterized by relatively small numbers of visitors. The 16 parks in the second category has the highest percentage, approximately 20%, of the 'park users among commuters' category and also exhibits small visitor volumes. The third and fourth categories consist of five and two parks respectively. They share similar visitor characteristics except that the two parks in the fourth category have the largest number of visitors among all sample parks. However, the number of visitors of the third category is large as well, ranked just after the fourth category. These parks have on average approximately 31% of one time visitor-tourist from more than 20km away. The high visitor volume and high proportion of one time visitors from far locations imply that these parks may be destinations attracting tourists for specific events or seasonal landscape.

The varying compositions of different visitor groups already tell us that not all district level parks are being used by the same ways. In the further analysis, we will map the four park categories found through the clustering process and compare their visitor characteristics with the existing administrative guidelines. This empirical approach will add meaningful information to understand visitors of parks and to disclose the gap between normative guidelines and actual usage of the parks.

The bikeshare program in Seoul, the capital of South Korea, generates more than a million trips per month with more than 1500 bikeshare stations and about 20,000 bikes operating across the city. We examine the spatial patterns of bikeshare usage in Seoul, which is a very densely populated city with a large metro system. We analyze the association between land use, subway stations, employment density, population density, and bikeshare usage with negative binomial conditional autoregressive models that account for spatial correlation. For all the models, results show a positive association of bikeshare usage with the number of subway stations and employment density, with the former having a larger effect. Agricultural and Amusement land use have negative associations with bikeshare usage in many models. We also examine different types of trips to distinguish differences between “loop trips” (starting and ending at the same station) and purposeful trips between two destinations. The former displays a pattern suggesting “loop trips” are more likely to be recreational trips.

In this research we analyze bikeshare trip patterns in Seoul. Prior works have found that various land use factors, proximity to subway stations, and bicycle infrastructure are associated with bikeshare trips. We focus on Seoul with the objective of answering the following questions: Do trips that start and end at the same station have different usage patterns than those between different stations? How do trips vary throughout the day and seasonally? And ultimately, how are various land use patterns, subway stations, employment density and population density associated with the number of trips generated from each bikeshare station?

Our reason for analyzing Seoul, beyond the fact that the data is publicly available (albeit in Korean), is that Seoul is unique in comparison to most North American and European cities where much of the research on bikeshare has been done. In particular, Seoul has a population density of 16,541 residents per square kilometers, and this extends across 605.24 sq. kms of developed land. There are multiple employment centers, and these are connected by a well-designed and extensive public transit network. Every day, about 5 million passengers use the public transit system in Seoul with a mode split of about 65% using transit versus 25% using a car. Moreover, the City of Seoul has long been encouraging people to bicycle and has improved its bicycle infrastructure, including about 961 kms of bicycle lanes and more than 145,000 bicycle racks. The park developed along the Han River is one area with extensive cycling, including 78 km of bicycle lanes and 2500 bicycle racks. The topography of Seoul can make it difficult to cycle in some areas with mountains and steep hills. Nonetheless, Seoul City initiated a public bikeshare program, and usage is high with about 52,000 trips per day, on average. This likely includes both recreational use and commuting. These unique characteristics of Seoul, in particular the large spatial extent and population density of the city, its multiple sub-centers, and a large and extensive transit network, can provide a unique case study of bike-share usage for comparison with other cities.

Our analyses follows established methods previously used to understand bikeshare trips, for example the analysis of Citi Bike in New York City in Noland, Smart, and Guo (2016). We first examine some of the patterns of daily and seasonal usage, followed by a spatial econometric analysis linking land use, subway stations and other spatial data

to trips generated at each station. We also explore some of the differences between “loop” trips (i.e., starting and ending at the same station) and those between two stations.

## FACTORS AFFECTING ELDERLY AND CHILD PEDESTRIAN CRASH HOT SPOTS: A DEEP LEARNING APPROACH

Abstract ID: 878

Individual Paper Submission

JUN, Hee-Jung [Sungkyunkwan University] [hjun@skku.edu](mailto:hjun@skku.edu), presenting author  
HEO, Jae-Pil [Sungkyunkwan University] [jaepilheo@skku.edu](mailto:jaepilheo@skku.edu), co-author

Pedestrian-friendly environment can address social equity among the transportation disadvantaged, thereby contributing to sustainable development. Thus, it is important to examine factors affecting pedestrian crash hot spots for the transportation disadvantaged. In particular, the elderly and children are among the most vulnerable groups to pedestrian fatality risks due to their physical, cognitive, and behavioral traits (Oxley et al. 1997; Gitelman et al. 2019).

Recently, computer vision techniques have been increasingly utilized as they can provide new opportunities to better understand cities through images thanks to a rapid advancement of deep learning. However, they have been mostly used on motor traffic not on pedestrian safety (Bustos et al. 2021). In addition, most studies on pedestrian crash are based on perceptual information rather than recorded and actual pedestrian crash data (e.g., Kwon & Cho 2020; Naik et al. 2014) due to data scarcity. Utilizing deep learning-based technologies on actual pedestrian crash data allows a more accurate analysis on pedestrian fatalities.

We use Traffic Accident Analysis System (TASS) data that were collected by Korea’s Road Traffic Authority to examine factors affecting elderly and child pedestrian crash hot spots in the Seoul Metropolitan Area in Korea. TASS provides pedestrian crash hot spot data including specific locations based on actual accidents. We also collected Google Street View images of pedestrian crash hot spots and non-hot spots. Then, we employed deep learning-based semantic segmentation and object detection methods to extract key variables from images, and performed a logistic analysis to examine the effect of each variable. The empirical results show that both existence of specific objects and percentage of pixels corresponding to those objects in the images affect elderly and child pedestrian hot spots.

## USING LOCAL REVIEW DATA TO ANALYZE SHIFTING “CATCHMENT AREAS” OF GENTRIFYING AND CONTROVERSIAL BUSINESSES

Abstract ID: 881

Individual Paper Submission

PAYNE, Will [Rutgers, The State University of New Jersey] will.b.payne@rutgers.edu, presenting author

Millions of people rely on digital location-based services (LBS), local review and digital mapping platforms, to navigate their world and make decisions about where to spend time and money in cities around the world. While a growing body of scientific literature uses anonymized LBS data to understand human mobility patterns and home locations (see Chen and Poorthuis 2021), most of this work uses LBS data to understand individuals and groups of people, not the local businesses that they visit and their place in shifting urban and regional economies. Drawing on Richard Ocejo’s research on the transterritorial nature of “taste communities” brought together at upscale consumption sites like gourmet restaurants, coffee shops, and cocktail bars (Ojeco 2014), this paper uses spatiotemporal analysis of LBS review activity to depict and analyze the shifting “catchment areas” (to borrow a term from economic geography) of local businesses as measured through the locations of their reviewers over time.

This paper focuses on two forms of “scale-jumping” that can lead to broader spatial distributions of reviewers over time. The first form is that of businesses deliberately targeting external taste communities as their clientele, whether tourists or newer (typically wealthier and whiter) residents in gentrifying neighborhoods, though the widespread usage of LBS platforms in both familiar and unfamiliar locations has eroded some of the differences between these groups. Put crudely, a craft cocktail bar may draw reviewers from around the country and the world, where a fast food restaurant may reach a much more targeted local audience. When one type of business succeeds the other, as is often seen in gentrifying neighborhoods, the changing geography of the new establishment’s customer base can be analyzed and compared to other measures of neighborhood change, and even used as an advance metric for communities concerned about a potential influx of wealthier residents and development interests.

The second phenomenon is the increasingly frequent and usually inadvertent enmeshing of a local business into a political controversy unrelated to normal business operations, like the hundreds of negative reviews that Washington D.C.-based pizzeria Comet Ping Pong received from believers of the Pizzagate conspiracy theory. Using GIS-based analysis of case studies encompassing national and local politics, including the 2016 and 2020 U.S. elections, the #BlackLivesMatter and #MeToo movements, and contested responses to the COVID-19 pandemic, this paper also examines how various location-based services and web mapping platforms use systems combining automated and human judgment to delineate the limits of acceptable political speech in local reviews, and shows

how these decisions forcibly restrict the “catchments” of controversial businesses to their local context even as they become subjects of national political concern.

Like other online forums that rely on unwaged user-generated content, LBS are vulnerable to coordinated inauthentic behavior, including techniques like “brigading” made common on sites like Reddit and 4chan (Marwick and Lewis 2017). On sites like Yelp that require users to declare a home location and record their review history publicly, the sudden signal of an increased rate of reviewing from users outside a business’ typical catchment area is one of the algorithmic signals to trigger an “Active Cleanup Alert” locking profile pages and warning users not to post reviews that don’t reflect “firsthand consumer experiences” (see Kuehn 2013 on Yelp’s narrow framing of “review democracy”). In the case studies in this paper, I contrast Yelp’s interventionist approach to the relatively laissez-faire attitude of competitors like Facebook, Google, and Foursquare, less reliant on local advertising revenue, and consider the consequences of this form of “algorithmic censorship” (Gillespie 2018) for the very real impact on local business performance that these reviews provide.

## INVESTIGATING SUSTAINABILITY AND RESILIENCE OF METROPOLITANS IN THE US USING ARTIFICIAL NEURAL NETWORK CLUSTERING TECHNIQUES

Abstract ID: 905

Individual Paper Submission

LIU, Haiqing [University of Cincinnati] liu2hq@mail.uc.edu, presenting author

CHEN, Na [University of Cincinnati] na.chen@uc.edu, co-author

WANG, Xinhao [University of Cincinnati] liu2hq@mail.uc.edu, co-author

The goal of promoting sustainability and resilience has never been more crucial in this era under the pressure of continued urban growth and limited resources for dealing with different urban challenges (e.g., COVID-19). While sustainability and resilience have been attracting increasing attention, there is no consistent approach to measure them and explore their relationship due to their complicated multi-dimensionalities from different concerns and fields such as urban planning, transportation, and environmental studies (Fiksel, 2006; Redman, 2014). Although the use of indicators has been adopted in urban planning models, arguments remain on the selection of appropriate indicators and relevant applications. It therefore results in the missing of a comprehensive and efficient approach to assess and compare regional sustainability and resilience, which would limit decision-makers’ capacity to design and implement corresponding practical policies to promote long-term development.

To fill this gap, this study conducts a thorough literature review to identify indicators to assess sustainability and

resilience at the metropolitan statistical areas (MSAs) level. Sustainability indicators are identified based on social, economic, and environmental aspects. In addition to these three aspects, resilience indicators also consider community capital, institution, housing, and infrastructure. 21 indicators are calculated for regional sustainability and 46 resilience indicators are calculated for 378 MSAs in the contiguous US. The indicators are compiled based on the literature review and the available data. Some of data are collected directly at MSA level while others are collected at county level and aggregated to MSA level.

Then, the indicators are analyzed using an unsupervised learning technique, self-organizing map (SOM), a type of artificial neural network, to cluster and compare the MSAs. The SOM is widely applied to address the exploration and clustering problems of representing multi-dimensional data with two dimensions (Kohonen, 2013). It is usually a “map” made by a square arrangement of  $n \times n$  hexagons. The size of a SOM affects its quality and stability. Thus, the size as well as the quality and stability of a SOM are examined using Quantization Error and Bootstrap (Cottrell, de Bodt, & Verleysen, 2001). In this study, each hexagon represents a cluster of MSAs. MSAs in one cluster are the most similar ones in terms of the given indicators. Then, the clustering results of identified sustainability and resilience indicators are geographically mapped to investigate the spatial patterns of these indicators across the MSAs in the contiguous US. The SOMs and their associated geographic maps allow us to discover and compare the spatial patterns of sustainability and resilience and evaluate the relationships between them. The weight planes generated by the SOM toolbox also help assess the relationships among all the indicators to identify their similarities and differences which could help decision-makers improve the efficiency in assessing sustainability and resilience.

Our study results can help regional planning in four ways. First, a MSA may compare with other MSAs to find the relative level in terms of sustainability or resilience and identify similar MSAs. This will help the decision-makers of a MSA identify inspiring and comparable MSAs. Second, the spatial distribution of sustainability and resilience clusters may help the MSA decision-makers identify the similarity and difference with nearby MSAs and therefore, develop strategies for regional collaborations. Third, comparing sustainability with resilience, allows a MSA to identify how to allocate resources effectively by taking differences between sustainability and resilience into consideration. Fourth, the SOM results can help identifying indicators that are highly correlated. The understanding of the dynamic relationships among different indicators should help decision-makers more effectively and efficiently develop corresponding strategies. Overall, our study shows that more insights can be gained with investigations on the consistency between sustainability and resilience assessments.

#### CLASSIFYING URBAN PARKS BY THE DAILY VISITING PATTERN DURING COVID-19 USING MACHINE LEARNING

Abstract ID: 929

Individual Paper Submission

OH, Da Won [Seoul National University] ohdawonv@gmail.com, presenting author

PARK, In Kwon [Seoul National University] parkik@snu.ac.kr, co-author

During the pandemic of COVID-19, urban parks have proved their true value in promoting urban sustainability more than ever. Since state and local governments imposed social distancing measures, the number of park visitors has increased in almost every city globally (Geng, Innes, Wu, & Wang, 2021). The demand for outdoor leisure activities such as strolling and jogging has increased to avoid contact with others in confined indoor spaces such as shopping malls and gyms. Some parks indeed have served as a buffering place as a haven for social isolation and outdoor activity, significantly restoring physical and mental health, while others have seen a decline of visitors during the pandemic. Different daily visiting patterns classify urban parks into several types during the pandemic.

This study examines the change in the visiting pattern of urban parks during the pandemic of COVID-19 to classify them, and attempts to identify their locational factors and design features that determine the typology. For this, the number of visitors to 425 parks in Seoul, Korea was tracked with mobile phone travel data provided by SK Telecom. We used the spatiotemporal data to analyze time-series changes in the number of park visitors for 366 days in 2020. The big data was analyzed using K-shape clustering and multinomial logit model.

Following Manley, Zhong, & Batty (2018) who identified the clusters of travel patterns over space and time captured by smart card big data, this study uses K-shape clustering to classify urban parks by the time-series change in the number of daily visitors. This machine learning method identifies the similarity between different time series by measuring the distance between data with the Dynamic Time Warping method. It repeats and refines the process of designating points with similar phases as one cluster to create homogeneous and well-separated cluster groups (Paparrizos & Gravano, 2015).

Some distinctive clusters of visiting patterns will be detected: 1) not drastic but constant increase, 2) volatile fluctuation, 3) increase only when social distancing measure is strengthened. Based on the time series clustering results, we build a multinomial logit model to identify the park's design features and locational characteristics that determine the clustering, such as the ratio of the green area, leisure amenities, public transportation accessibility, parking capacity, and the composition of land use in the surrounding area. The results will show which parks with what design features have successfully performed the role of COVID shelter. This will contribute to promoting the possibility of urban parks functioning as infrastructure to improve the city's resilience during health crisis.

#### **A STRUCTURAL EQUATION MODEL TO EXAMINE EFFECTS OF SOCIAL AND INSTITUTIONAL BARRIERS ON FLOOD RESILIENCE IN US COUNTIES**

Abstract ID: 941

Individual Paper Submission

HAN, Yu [Florida International University] yuh2015@ufl.edu, presenting author

Flooding has caused more damages and impacts to communities than any other natural hazards around the world. Flood risk is projected to increase monotonically in many parts of the United States due to continued urban

development in floodplains and climate change. For example, in 2017, coastal counties make up less than 10% of the total land area in the US but account for 40% population (NOAA, 2017). Effective adaptation planning focusing on reducing vulnerability and risk requires understanding the effects of the national flood insurance programs (NFIP) and federal risk mitigation projects on flood vulnerability and resilience of local communities.

Previous research has examined interactions between the NFIP and the federal flood adaptation policies. For example, Kousky et al. (2018) applied a fixed-effects model to examine causality between federal disaster aid and flood insurance and found the average amount of insurance coverage would decrease after a community receives individual assistance. Frimpong et al. (2020) also found a significant and positive effect of community rating system (CRS) participation on insurance take-up rates. Although many studies have examined effects of NFIP in pre-disaster mitigation and post-disaster recovery, whether these policies effectively enhancing community resilience is not clear. Based on previous work, this study proposes the following research questions, including (1) How vulnerable are US counties to flood risk over the past decade? (2) How do FEMA's risk mitigation programs improve community resilience? Answering these research questions would improve the decision-maker's understanding of key determinants in improving community resilience, and therefore, could facilitate more efficient local adaptation policies, such as revising building and planning codes and bridging organizations, under the changing climate (Wilby & Keenan, 2012).

This study aims to examine flood vulnerability and resilience of US counties under economic, social, and institutional barriers by integrating multiple sources of datasets. More specifically, this study will integrate FEMA's NFIP policy and claims datasets, NOAA's historical natural hazard datasets, and American Community Survey (ACS) datasets from 2009-2019 and apply the structural equation model (SEM) as an analytical method to determine causal relationships between community vulnerability, resilience, and federal risk mitigation policies. County-level flood vulnerability will be investigated through multiple variables, including the number of historical natural hazards, cumulative flood damage, the average cost of NFIP policies, the number of post-FIRM buildings, as well as socioeconomic and demographic factors. On the other hand, Population migration rate will be used as an indicator for community resilience, and impacts of potential important social, economic, and institutional factors on population change will be evaluated using the SEM.

#### **ANALYZING THE ASSOCIATIONS BETWEEN STREET-LEVEL BUILT ENVIRONMENTS AND LOCAL CRIME PATTERNS: APPLICATIONS OF GOOGLE STREET VIEW AND INTERPRETABLE MACHINE LEARNING**

Abstract ID: 961

Individual Paper Submission

LEE, Sugie [Hanyang University] [sugielee@hanyang.ac.kr](mailto:sugielee@hanyang.ac.kr), presenting author  
KI, Donghwan [Hanyang University] [ehdghks4456@hanyang.ac.kr](mailto:ehdghks4456@hanyang.ac.kr), co-author  
HIPPI, John R. [University of California, Irvine] [hippj@uci.edu](mailto:hippj@uci.edu), co-author  
KIM, Jae Hong [University of California, Irvine] [jaehk6@uci.edu](mailto:jaehk6@uci.edu), co-author

While a great deal of attention has been paid to the relationship between the built environment and crime patterns, our understanding of the relationship is far from complete. Previous research has often relied on linear models that do not allow one to capture the complexity involved in the built environment-crime relationship. Challenges also exist in measuring the built environment, even though land use mix, density, and street network-based metrics have become increasingly available over the past few decades.

This study presents a new way of understanding the association between the built environment and crime by utilizing Google Street View (GSV), semantic segmentation, and interpretable machine learning (IML) techniques that make it possible to avoid the pitfalls of black-box modeling. Specifically, the present study is conducted in three steps. First, this study acquires GSV images on a 20-m interval along with a road segment in the City of Santa Ana, CA, and quantifies the streetscape features by employing a semantic segmentation. Second, we built several machine learning models (e.g., Random Forest, Support Vector Machine, Deep Neural Network) and compare their performance in predicting crime patterns with that of a conventional negative binomial model. Lastly, the SHapley Additive exPlanations (SHAP) algorithm, one of the most promising IML methodologies, is applied to capture the potential non-linear relationship between crime pattern and built environment, which provide new insight into the relationship.

The results of this study are as follows. First, machine learning models outperform the negative binomial model in predicting the number of crimes on the road segment. In particular, the Deep Neural Network (DNN) shows the highest accuracy, which indicates that using the machine learning approach enables us to better understand the associations between the built environments and local crime patterns. Second, the results of interpreting the DNN model through the SHAP method indicate that most streetscape elements show non-linear relationships with crime. For instance, although walls and fences, which are representative elements related to CPTED, have some effects to prevent crime, analysis results indicate that the crime deterrence effect was greatest after surpassing a certain threshold. In conclusion, this study demonstrates the efficacy of streetscape big data for auditing detailed streetscape features related to crime activity as a methodological contribution. This study also confirmed the non-linear relationships between street-level built environments and local crime patterns, which can provide insights into the complicated associations between them and provide policy implications for public safety.

#### QUANTIFYING STREET VENDORS IN MEXICO CITY: APPLYING COMPUTER VISION TECHNIQUES ON GOOGLE STREET VIEW IMAGES

Abstract ID: 968

Individual Paper Submission

FARAH, irenef [University of California Berkeley] irenef@berkeley.edu, presenting author

Street vending has been a practice that goes back to pre-colonial times and it is impossible to think about Mexico City's landscape without envisioning people selling all kinds of products on the street. Despite the increase of national and transnational retail chains since the opening of the economy in the late 1980s, street vendors have also increased in quantity and variety of forms, sometimes even functioning as distributors of large companies' products. Unfortunately, until now, quantifying street vendors has been an impossible undertaking due to their suboptimal living conditions, living under daily high levels of uncertainty and fear, lacking health insurance, and left unprotected from authorities' harassment on the streets.

Most research on street vendors has focused on processes of clientelism, state enforcement, crime and displacement in cities. While all these studies have elucidated processes of vendors' claim to work in public space and wellbeing, none of them have analyzed how these processes change according to different types of street vendors and their placement in the city. Thus, the purpose of this research is twofold: 1) to generate an algorithm through computer vision that quantifies fixed street vendors at a large scale; and 2) to carry out analyses between the density of vendors and neighborhood characteristics to assess if the number of people working in public space is associated with socioeconomic status, political party, or the level of presence from vendors' associations.

While I would like to map out the heterogeneity of street vendors, I will first map out fixed street vendors outside of subway stations, commercial malls, hospitals and schools to understand the spatial distribution of vendors across different municipalities of Mexico City. In order to carry out these analyses I will use images near subway stations from Google Street View and detect street vendors' stalls by deploying computer vision techniques. While most Google Street View image processing has been mainly focusing on built environment and street measures, food outlet detection is being increasingly recognized by recent studies (Cohen, et al. 2020; Mestre, 2020). The ultimate objective is to create a scalable algorithm that is generalizable to other cities in which other type of vendors can be identified and where researchers can better understand how the distribution of public space is contested across cities.

#### WHAT ROLES WOULD TECHNOLOGIES PLAY IN AN AGING SOCIETY?

Abstract ID: 1015

Individual Paper Submission

CHEN, Xueming (Jimmy) [Virginia Commonwealth University] xchen2@vcu.edu, presenting author

At present, technologies are evolving rapidly. This trend is intersected with another trend of population aging in the U.S. and other countries. Technologies are destined to play important roles in an aging society, such as:

First, technologies could help older adults to age in place by building smart homes. Such smart homes include technology-equipped sensors, appliances, doors, windows, garages, and mesh Wi-Fi systems. These technologies would provide several aging-related monitoring services, such as physiological monitoring and cognitive and sensory monitoring and assistance.

Second, technologies could help older adults to maintain mobility and independence. For example, with smartphone apps, older adults could hail rides from Transportation Network Companies (TNCs) such as Uber and Lyft. When older adults stop driving, they have to rely on public transit, paratransit, and other alternative transportation modes. Technologies may significantly help public transit operators. For example, Global Positioning Systems (GPS), Automatic Vehicle Location (AVL), Computer-Aided Dispatch (CAD), Scheduling, Routing, and Dispatching software, and others can directly assist transit operator's fleet management and advanced operations. Technologies could help the dispatching and routing/scheduling of paratransit vehicles as well.

Third, as part of technology, coordination and integration software could coordinate and improve human services transportation catering to the growing demand of the transportation-disadvantaged population, by increasing its efficiency and reducing costs.

This research describes and examines the application of technologies in an aging society through conducting comprehensive literature review and U.S. case studies, with a focus on smart home technologies and smart mobility technologies.

#### **A SEMANTIC NETWORK ANALYSIS: WHAT ARE THE DIFFERENT GENTRIFICATION ASPECTS OF ITAEWON AREA IN SOUTH KOREA?**

Abstract ID: 1044

Individual Paper Submission

HAN, Soyoung [Virginia Tech] syhan@vt.edu, presenting author

KWON, Yoonku [Chonnam National University] ykkwon@chonnam.ac.kr, primary author

Over the last few years, the issue of "gentrification" has spread to many academic disciplines. Gentrification is a term originally proposed by Glass (1964) which usually is used to describe the processes and spatial changes in many metropolitan cities, with the suburbanization reversing around the old city centre, the return of the middle class to the city centre, and the push of the working class and the common people (Shin & Kim, 2015).

The purpose of this study is to clarify 'semantic association' and relationship structure among related key words,

focusing on 'gentrification' issue in Itaewon area in Korea. Itaewon is formed by various political, economic, and cultural contexts of Korean society. Especially, Itaewon has the parallel with the process of Town-centered development of Seoul city government after 1960s and it has established the identity as the consumption space by neo-liberalism formally introduced after 2000s. Moreover, based on the historical practice called the 'US military government', Itaewon obtains its own unique placeness as a foreigner's place and a place combined with various cultures. To examine phases and aspects of how gentrification affects to Itaewon area, this study focused on semantic network analysis applying big data and social network analysis. Semantic network analysis is a method that applies 'big data' and 'social network analysis'. This provides a useful perspective for explaining micro-behaviour and macrosocial structures by examining the behaviour of individual actors in the context of the macroscopic structure constructed through the connections and interactions between the micro-behaviours. Through the collection of big data on the data, this study has an implication in comprehensively examining the macro and micro aspects of Korean-style gentrification, especially when it is reminded that research costs, time limits, and subjective intervention in research designs set by the individual researchers may be less feasible. By doing so, we delaminate how the gentrification phenomenon was broadly reflected in the landscape of Korea, how it is being developed, and what are the differences between each stage. By entering into critical debates on gentrification, we expect to present implications for conceptual defining of the Korean-style gentrification.

As a result, gentrification in the Itaewon area is divided into four stages. The first stage of gentrification (2007 ~ 2010) is to induce revitalization of the city through redevelopment, and the main keywords are 'space' and 'life'. Gentrification stage 2 (2011 ~ 2013) is the initial stage of gentrification, and the main keywords are 'city', 'space', 'art', 'market', 'region', 'people', etc. The third stage of gentrification (2014 ~ 2015) is the period of commercialization as a gentrification growth stage, and the main keywords are 'legal system', 'Seoul', 'rental', etc. The fourth stage of gentrification (2016 ~ present) is the maturation period of gentrification, and the main keywords are 'policy system', 'urban regeneration' and 'preservation'.

The Korean-style gentrification phenomenon was revitalized through the input of public policy such as urban regeneration, and the existing commercial and neighbouring facilities were commercialized by the rapid capital entry in the process of urban regeneration. The tenants and indigenous people who contributed to the revitalization of business were displaced. In addition, housing has lost its meaning as a place of life for local residents and has become a tourist destination for outsiders. In the process, space has changed and the identity of the area has been damaged. Moreover, over time, the spontaneous migration of the gentrifier, as well as the Aboriginal people, took place simultaneously. Eventually, in order to prevent the collapse of the local community and the deterioration of the quality of life of the residents, the government puts urban regeneration projects.

#### **WHERE DO PEOPLE WOULD LIKELY TO WORK AT HOME - EXPLORING THE ASSOCIATION BETWEEN BUILT ENVIRONMENT PATTERN AND TELECOMMUTING IN THE U.S**

Abstract ID: 1076

Individual Paper Submission

CHEN, Yan [University of North Carolina at Chapel Hill] yanc@live.unc.edu, presenting author

SONG, Yan [University of North Carolina at Chapel Hill] ys@email.unc.edu, co-author

Since its emergence in 1970, telecommuting/ working from home has become an essential work mode in the United States. The COVID19 epidemic in the United States has made this working from home concept more widely accepted than ever before on an unprecedented scale. Furthermore, this change is likely to be permanent, not going away as the epidemic recedes. Many businesses such as Google and Facebook have already declared that they are sticking with remote working after the pandemic ends. The impact of this new normal on our lives and especially on our travel behavior is enormous because it no longer requires people to physically commute anymore. So how should urban planners prepare for this change? It is crucial to understand how the built environment of our cities relates to this rapidly rising lifestyle. More importantly, does this preference for space conflict with or contribute to the smart growth ideology that the urban planning field has always been promoting. When job accessibility is no longer a constraint for choosing where to live, will people re-embrace low density urban sprawl community?

Many studies have discussed the impact of telecommuting on urban form since 1990s, mainly through simulation and speculation. However, the conclusions are bazaar that both decentralization, centralization, and insignificant effect have their support (Audirac,2002; Nilles, 1991; Glaeser, 2020). This article approaches this question by using empirical methods to test their association at census block group level and contiguous U.S scale via multi-level regression. The dependent variables are the count and ratio of residents working at home in each census block group. They are extracted from Question 'A09001. Travel Time to Work for Workers 16 Years and Over' from ACS 2015-2019 database. Then a census block group level the built environment database is compiled based on factors that are expected to influence commuting choices, including land use, density, diversity, design, accessibility, and distance to transit (Ewing, 2010). The data sources contain ACS 2015-2019, Longitudinal Employer-Household Dynamics, Openstreet map, and EPA smart location database. Besides creating individual measures, we also used clustering methods to identify the holistic built environment patterns based on their characteristics to test the effect of the factor combinations. In the next step, regression is conducted to evaluate the impact of individual built environment characteristics and its overall patterns on telecommuting. The reason for using multi-level regression here is to control the group-level variance in county and state. Finally, for the significant built environment patterns in the result, we took a further case study to check their compositions and the examples in real world to illustrate what specific types of places that telecommuting like or hate to live.

The preliminary result shows that, in general, most built environment factors that smart growth theory was promoting are negatively associated with both the count and ratio of people who work at home. But there are several built environment patterns that feature fits the smart growth theory and show a statistically significant positive effect on telecommuting. This potentially means that although the rise of telecommuting could not contribute to smart growth practices in general. There is a hope that, when handled in the right pattern, both the preference of the teleworker and the urban planner's vision can be met at the same. This challenge proposes a more detailed requirements for future urban planners. Instead of focusing on improving separated built environment factors individually, planners should promote the right path of developments from a holistic perspective, such as the patterns we found in this study.

## **DIAGNOSING GENTRIFICATION: THE USE OF GOOGLE STREET VIEW IMAGERY ACROSS ALL CITY FORMS**

Abstract ID: 1102

Individual Paper Submission

HOLLSTEIN, Leah [University of Cincinnati] leah.hollstein@uc.edu, presenting author

RAVURI, Evelyn [Saginaw Valley State University] eravuri@svsu.edu, co-author

Gentrification is an ongoing process; it is not only apparent retrospectively — it can be observed “in real time.” Cities with the ability to diagnose it in time can take action to mitigate the negative effects they see happening. The object of this research is to establish a reliable method using widely-available data that cities can use to make early diagnosis and act accordingly.

In their 2014 article on gentrification, Hwang and Sampson established a method for studying gentrification in Chicago that included the use of Google Street View (GSV) images. The use of qualitative data, such as that captured by GSV imaging, has proven to be both a strong alternative to dependence on census data (Hwang & Sampson, 2014) as well as a complementary source of information.

Other studies using GSV have studied disorder (2017, Bader et al.) and physical urban change (2017, Naik et al.). The method has been applied to the urban forms of cities including New York, San Jose, Detroit, Philadelphia, Baltimore, Boston, and Washington DC. In each application, researchers have used different methods for selecting GSV images to study; parameters for using GSV to study urban form, including changes associated with gentrification, have not been established. As a result, use of GSV varies in terms of sample sizes and frequency, structured v. random sampling, etc.

In this research, we seek to establish a process whereby the Hwang & Sampson GSV visual survey method can be applied to cities across a range of population and housing densities, area of census tracts, block sizes, etc. Our goal is to create a customizable sampling method, taking into account pertinent urban variables, that can be easily applied by planning practitioners and academics.

## **GEOGRAPHIC TECHNOLOGY ADOPTION IN MID-SIZED MUNICIPALITIES**

Abstract ID: 1111

Individual Paper Submission

BORIA, Eric [City of Gary] eric.boria@protonmail.com, presenting author

Social dynamics among municipal workers affect how mapping technologies are implemented within municipalities, how data is verified and how new data is updated. These dynamics have implications for the accuracy of map-based data and its trustworthiness for alternative uses. In the last 20 years, an increasing number of municipalities have been adopting technology to migrate and store maps of their water and sewer infrastructures in electronic formats such as Geographic Information Systems (GIS). While centralized, online maps portray the confidence that data from those GIS-based maps are available to make better, data-informed decisions, a look into the social and organizational dynamics behind how those numbers are created and updated give a more complicated picture.

The driving force behind the investment in GIS was often described as the desire to have a better sense of the state of their underground infrastructure and to have a central repository that could be used for data-informed decision making. However, there is a cultural lag in how workers perform their tasks and how decisions are made within the municipality that affect how GIS is adopted.

The data are based on interviews with municipal employees across the US exploring the process of GIS adoption and the influence of social and organizational dynamics in the implementation of this technology in maintaining the water and sewer infrastructures. This paper seeks to contribute to the literatures on computers, urban systems and built environments in providing an interdisciplinary approach that highlights the importance of these social factors in how mapping technology is implemented within municipalities.

This is a qualitative study consisting of three stages. First, a pilot was conducted using the University of Illinois at Chicago campus as a test case. At this stage, a questionnaire was developed and tested through 11 interviews with individuals who create and update maps of underground infrastructure along with those who use maps of underground infrastructure in their work. Second, was a study of municipalities in the Chicago metropolitan area. Interviews in the Chicago metropolitan area consisted of 17 interviews across 5 municipalities with individuals working with and implementing spatially-based technology. The third stage was a nation-wide survey of employees in 14 randomly-selected municipalities with a population over 10,000.

Among the findings are that social dynamics among municipal workers affect how mapping technologies such as GIS are implemented, how data is verified and how new data is updated. The introduction of mapping technology was seen to raise issues of underlying dynamics of how data are created and updated, thus social dynamics affect the quality of data generated. Further, municipalities differ widely along the scale of adoption of GIS-based tools and their use of data for decision making on water and sewer infrastructures. The interviews have revealed differences in how data is updated from the field into the map and conversely, how Public Works employees use the maps to make decisions. There is a cultural learning that is happening within the municipalities that changes how the technology is used. The findings from this research suggest that more attention needs to be focused on the organizational learning and social practices that enable municipalities to make the best use of the technology.

NOH, Soowoong [University of Florida] [nswscott@ufl.edu](mailto:nswscott@ufl.edu), co-author

#### Background to Problem:

Practice and literature indicate that public transit services are essential to facilitate access to jobs, goods, and services. Ensuring accessibility to essential services, such as hospitals, parks, and grocery stores, via public transit is a critical job of transportation planners. Although there have been several studies and tools developed to measure public transit accessibility, the process still requires execution of many semi-automated GIS tasks. To this end, measuring accessibility to public transit is important to evaluate the effectiveness and the equity of such services.

#### Description of Application:

To provide more user-friendly tools for transportation planners, we developed the Transit Accessibility Analyst (TAA), which can be used to evaluate public transit accessibility and improve transit services. This toolkit works in ArcGIS environment and it provides a one-stop solution to accessibility modeling, which saves stakeholders from the repetitive tasks of the analysis and allows them to focus more attention on making adjustments to improve their services. TAA is written in Python and distributed as a Python toolbox in ArcGIS Pro. It contains four tools: (1) Create Network Dataset, (2) Calculate Impedance and Opportunity, (3) Measure Accessibility, and (4) Update GTFS using Proposed Routes.

The toolkit uses General Transit Feed Specification (GTFS) dataset, GIS street centerlines, destination opportunity points, and census geographic boundaries. TAA enables stakeholders to answer the following questions more efficiently: (a) how well public transit can fulfill the travel needs of users to various destinations, (b) how service changes may impact the accessibility, and (c) how expanded service can improve public transit accessibility compared to the current situation.

Unlike other existing toolsets, TAA is based on a widely adopted GIS platform, ArcGIS Pro, which means it requires no transitioning efforts for many in academia or professional practice. And, as an extension to ArcGIS Pro, the toolset can be easily integrated into other sections of the software such as ModelBuilder. Although the toolkit offers dedicated tools to analyze transit data such as the Transit Feed toolset, measuring transit accessibility using native geoprocessing functions in ArcGIS Pro is still a somewhat clumsy process. With TAA, we made efforts to streamline such process by organizing and modularizing it into separate but interconnected tools. In the meantime, TAA still maintains high configurability in terms of variable analysis zones, multiple choices of accessibility metrics, and different measuring scales, i.e., relative scale and definite scale. Also, to improve computational efficiency, we employed the NumPy package in the Measure Accessibility tool for its vectorization and broadcasting features, and the pandas package in the Update GTFS using Proposed Routes tool for its versatility in manipulating tabular data.

We have tested the toolkit with data from Gainesville, Florida, which maintains a very active public transit service. Three different scenarios are examined: (a) current accessibility to amenities and essential services, (b) how did COVID-19 impact transit accessibility, and (c) how can a new proposed route improve the current accessibility.

#### Statement on Why Application is Noteworthy:

The testing results show that TAA provides great flexibility and a variety of metrics to measure accessibility. The toolkit generates standardized accessibility scores by analysis unit. In addition, users can measure and visualize accessibility results in different spatial units such as, Transportation Analysis Zones, census block group, census

block, or their own custom geographic unit.

The findings demonstrate that the toolkit was successful in identifying areas with low public transit accessibility. TAA can be used as an effective planning tool to explore various scenarios to assist transit planners and policymakers in improving transit services in underserved areas.

#### **DOES ACCESS TO DIVERSE URBAN FACILITIES REDUCE STRESS AMONGST URBANITES? AN ASSESSMENT MINING SOCIAL MEDIA MICROBLOGS AND POINTS OF INTEREST.**

Abstract ID: 965

Poster

DUTT, Florina [Georgia Tech] [florina.design@gatech.edu](mailto:florina.design@gatech.edu), presenting author

GUHATHAKURTA, Subhrajit [Georgia Tech] [subhro.guha@design.gatech.edu](mailto:subhro.guha@design.gatech.edu), co-author

Psychiatric geography claims that higher levels of stress and anxiety are associated with mixed land-uses [1]. Higher accessibility and permeability of urban areas are identified as one of the risk factors for crime [2]. The assumption here is that diversity and accessibility invite potential offenders to urban areas. Another competing hypothesis that challenges Jane Jacobs's theory of street safety is that the perception of increased pedestrian traffic in residential neighborhoods leads to increased fear in residents who lack social integration [3]. Other findings suggest that large parklands or escape facilities in natural settings are key to good mental health for the urban population as they act as a buffer against high-density living [4, 5].

The findings of these studies contest the founding principles of urban theories that advocate land-use diversity, accessibility, and high-density living. In order to understand the gaps in the psychiatric geography and urban theory literature, we use social computing to understand how people's stress levels vary around the diverse facilities or points of interest (POI). We used Deep Learning techniques to assess the Tweets' stress levels (or microblogs) and compute the POI diversity and accessibility for each Tweet location. The points of interest are categorized as urban parks (including tails and open areas), community facilities, cultural or religious facilities, healthcare facilities, public transit stops, etc. The initial results of our findings show POI's with greater accessibility and higher surrounding diversity is heavily used by the urbanites for relaxing and de-stressing, contrary to the claims of the psychiatric geography literature. Our results show, while larger green spaces such as state parks and hiking trails are essential for people to decompress in nature, density does not act against people's mental wellbeing. Rather, access to diverse commercial recreation facilities such as cafés, restaurants, shopping facilities, and access to smaller urban parks and open areas are vital for social interactions, and the mental wellbeing of the urbanites. The poster offers a visual platform for explaining details of the POI classification where we link these classes with the stress levels of the

Tweets.

## Track 2 - Community Development

### PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

#### **2.28 PRE-ORGANIZED SESSION - WHY ARE WE COLLECTING THIS? UNDERSTANDING THE POWER OF DATA FOR COMMUNITIES**

Pre-Organized Session 28 - Summary

Session Includes 544, 545, 546, 547

HOWELL, Kathryn [Virginia Commonwealth University] klhowell@vcu.edu, organizer

We measure what we think is important. From evictions to tree coverage to life expectancy, data is produced at increasing granularity to understand patterns across jurisdictions. However, in most cases, data are rarely produced, disseminated and used by and for impacted communities. This can mean that the data have the potential to further pathologize communities and reproduce existing power relationships; erase community power and assets; or completely mischaracterize the relationships and institutions that make a community thrive. Increasingly data have been collected, managed and disseminated through processes that center community interests, including narrative creation, power building, visibility and decision-making. This panel examines several cases of community-centered data collection and usage at neighborhood, jurisdiction, state and regional scales to understand the opportunities, challenges and needs for this type of data in planning practice.

Objectives:

- Understand the broad range of contexts for community-centered data

#### **DATA FOR, NOT ABOUT, TENANTS: AN EVICTION TOOL TO INCREASE COMMUNITY ENGAGEMENT AND POWER**

Abstract ID: 544

Abstract within Pre-Organized Session 28

HOWELL, Kathryn [Virginia Commonwealth University] klhowell@vcu.edu, presenting author

HATCH, Megan [Cleveland State University] m.e.hatch@csuohio.edu, primary author

TERESA, Benjamin [Virginia Commonwealth University] bfteresa@vcu.edu, co-author

RAYMOND, Elora [Georgia Tech] elora.raymond@design.gatech.edu, co-author

Housing instability through eviction has critical implications for civic engagement and political power. Because households that have been displaced or expect to be displaced have to overcome the concurrent challenges of finding and keeping housing, accessing jobs, catching up in school and maintaining mental and physical health, they are often unable keep up with voter registration (Squire et al 1987) much less engage in community organizations, local advocacy, or political organizing (Fullilove and Wallace, 2011). Thus, housing-unstable households, regardless of tenure, are often unable to collectively advocate for changes in their buildings, neighborhoods, or cities. Having a stable sense of place is important for identity, claims-making, and for challenging the conditions that produce urban inequality (Good, 2017; Pierce, Martin, and Murphy, 2011). These conditions are exacerbated through inadequate or inaccessible data that matches the needs of tenants and tenant organizations. While landlords can learn intimate details about the tenants' rental histories, credit and other legal and financial issues, tenants have difficulty understanding who owns their buildings, much less the history of code violations, evictions and other relevant practices. Even where evictions data repositories exist for social scientists and policy makers to analyze social problems, they may not be structured to allow tenant organizers, legal aid providers, and tenants to prevent evictions. Tenants cannot access critical information that can help them shift the balance of power and advocate for policies that will get to the root of housing instability.

Acknowledging the role of data to reproduce existing power relationships, this paper takes a counter-mapping approach to eviction data that seeks to “render visible the landscapes, lives and sites of resistance and dispossession” that are often hidden through the eviction process (Maharawal and McElroy 2017 pg 381). We propose the development of an adaptable data tool rooted in community needs and data limitations that will facilitate meaningful organizing, community-based policy development and advocacy. Building on ongoing work in three cities, Richmond, VA; Cleveland, OH; and Atlanta, GA, we will collectively assess needs for a public data tool, the challenges of using existing tools and discuss the processes used to assess the local needs for housing data.

Scholars have considered autoconstruction, a practice that people use to build their own homes in informal settlements, as evidence of political insurgency (Holston, 1991), cultural agency (Jacques Berenstein, 2009), and material expression (Poiani, 2019). Less attention has been directed to how autoconstruction is changed by intensive State-led redevelopment projects. A particular missing perspective is that of residents who create their own ‘situated data’ about how redevelopment transforms autoconstructed dwellings (Stiphany, 2021). Our research seeks to fill this gap by asking: how does urban redevelopment shape the praxis and spaces of autoconstruction, and in what ways is this relationship represented by residents who incrementally build and evaluate autoconstructed housing? Drawing on a situated data-action study undertaken by one of the authors in São Paulo, Brazil, our research aims to identify common aesthetic patterns that span autoconstructed dwellings across settlements that have been intensively redeveloped. Using several data sources from a combined household survey and post-occupancy analysis of autoconstructed dwellings in two communities, we construct a typology of post-redevelopment aesthetic patterns. These patterns include dwelling densification, enclosure, interior and exterior surfaces, furnishings, and symbols of permanence and change (Kowaltowski, 1998). The study of autoconstruction’s post-redevelopment aesthetics provides insights into why people preserve their homes while others adapt and expand them. It also shows how residents negotiate space in a redevelopment environment that is simultaneously mutable and obdurate. The aesthetics of redevelopment is an important dimension of documenting urbanization through the smallest scales of change, and from the perspective of people who have used homebuilding to expand political inclusion. Understanding how autoconstruction has changed and is changing the study and representation of informality can inform how planners engage situated scales of urban transformation.

## **PROTOTYPING A REGIONAL EQUITY ATLAS**

Abstract ID: 546

Abstract within Pre-Organized Session 28

WILSON, Barbara Brown [University of Virginia] bbw5w@virginia.edu, presenting author  
 RUSSELL, Siri [Albemarle County] srussell@albemarle.org, co-author  
 CLAIBOURN, Michele [University of Virginia] mpc8t@virginia.edu, co-author  
 DIAMOND, Alissa Ujie [University of Virginia] au2c@virginia.edu, co-author  
 POWERS, Sam D. [University of Virginia] sdp7xc@virginia.edu, co-author  
 COLEMAN, Rebecca Cooper [University of Virginia] rac8f@virginia.edu, co-author

Many U.S. localities use digital mapping to visualize inequities to inform the activities of policy makers and advocates alike. This paper explores the ongoing process of coalition building and prototyping such a tool for the context of the region around Charlottesville Virginia. Drawing from participation in an effort to produce an Equity Atlas that focuses on redress of historical and present-day racial and economic inequity through community-engaged scholarship, this paper considers how such efforts might draw from methods of co-production and address some of the limits of current approaches to equity mapping.

This team represents a portion of an emerging coalition of community-engaged academic scholars, local government actors, local advocates and community leaders, and others who are using a multi-pronged methodological approach to develop an atlas tool to support progress toward racial and economic equity in the region. This paper will cover the methods used so far in this effort over the past two years. It will represent and synthesize the team's work across formalized qualitative research, cross-sector collaboration with local governments to develop tools for accountability and equitable decision-making, and rapid prototyping of data visualizations and mapping platform in collaboration with local advocates and journalists. The work is highly relevant to the planning scholarship, practice and education, as it aims to put principles of equity and justice planning into practice through ethical data collection and representation.

## **LEVERAGING TECHNOLOGY FOR IMPACT: UNIVERSITY-LED ENGAGED RESEARCH WITH AFRICAN AMERICAN COMMUNITIES DURING THE COVID-19 PANDEMIC**

Abstract ID: 547

CARTER, Schuyler [Texas A & M University] schuyler.carter@tamu.edu, presenting author  
ROBERTS, Andrea [Texas A&M University] aroberts318@tamu.edu, co-author

From 1865-1930, formerly enslaved African Americans in Texas founded 557 historic black settlements known as freedmen's towns or freedom colonies. Since then, their population has dispersed, physical traces have disappeared, and memories of their locations and founding vanish as descendants pass away. This panel will explore the engaged research strategies The Texas Freedom Colonies Project, an educational, social justice initiative based at TAMU's College of Architecture, employs to preserve and protect freedom colonies' heritage and remaining historical sites. Since 2014, Project team members have traveled the State to gather data that fills freedom colony knowledge gaps. As a transdisciplinary research initiative, the Project deploys various methods requiring various degrees of interpersonal engagement, including GIS analysis, archival research, and engaged ethnography, including oral histories. The Project's online Atlas collects and spatializes data about settlements' remaining schools, churches, and cemeteries. Then, it invites freedom colony descendants to reconnect to places and each other by sharing archival materials and memories through crowdsourcing surveys. Data collection and visualization are meant to amplify emerging threats, needs, and promising grassroots preservation practices.

The panel will describe how--because of the infectiousness of COVID-19--the team's research methods changed in the spring of 2020. Panelists present their adaptive strategy— Information and Communication Technology (ICT) for participatory preservation praxis. Through selected social-media-based ICTs, the team adapted to human subject research restrictions while sustaining connections to collaborators, collecting data, and educating the public. The panelists will share multimedia data associated with each ICT through which The Project engaged the public: an online Atlas which crowdsources place data; a monthly Facebook live "talk show" featuring advocates, preservationists, and descendants of freedom colonies; and Instagram freedom colony stories from crowdsourced entries. Black counterpublic theory, engaged community-based research, and participatory preservation literature inform the team's approach to coding themes and identifying patterns in the data collected. Finally, the team will assess each method's efficacy by describing their experiences, observed shortcomings, and identified social-media-based, collaborative heritage conservation potentialities. Researchers found that using social media-based ICT's for online counterpublic development amplifies oppressed groups' voices across multiple spaces. Attendees will learn how to leverage ICT's to help marginalized groups create counternarratives that strengthen the cultural fabric, even during a natural disaster or emergency. Participatory preservation praxis demonstrated through ongoing community-based counternarrative creation demonstrates the possibility that local effort can have a global impact on behalf of emerging counterpublics in the public sphere.

## **2.40 PRE-ORGANIZED SESSION - PLANNING AND PUBLIC SCHOOLS: FACILITIES, FUNDING, AND EQUITY CONCERNS**

Pre-Organized Session 40 - Summary

Session Includes 211, 212, 213, 214

REECE, Jason [The Ohio State University] reece.35@osu.edu, organizer

Schools are a critical part of community infrastructure that are often neglected in planning practice. As a form of public infrastructure schools are vital to child development, economic development/work force, community development, and community well being. Despite the importance of schools as a form of public infrastructure, inequities in school resources and facilities are found throughout the U.S., between metropolitan and rural areas and within cities and metropolitan regions. The infrastructure and resource base for schools are highly dependent on planning, zoning/development policy, and local fiscal policy. Neoliberal policies in redevelopment/economic development and exclusionary land use policies can undermine resources for schools while widening inequities. The session will focus on presenting the landscape of school funding models across the nation and their relationship to planning and equity. The session will explore points of potential conflict and models of innovation in respect to planning policy and school infrastructure/resources.

Objectives:

- Present a comprehensive overview of the intersection of land use policy, planning policy, and school funding. Introduce the work of the Public Schools Interest Group in the APA. Preview the forthcoming APA Planners Advisory Service report on Planning for Schools.
- Introduce equity concerns related to tensions between economic development tax incentives and school funding. Introduce recent data and analysis by Good Jobs First on the equity implications of tax abatements.
- Present model cases or innovations in addressing equity concerns in school funding and facilities.

## **SACRIFICING URBAN EDUCATION FOR THE GROWTH MACHINE: A CASE ANALYSIS OF COLUMBUS OH**

Abstract ID: 211

Abstract within Pre-Organized Session 40

REECE, Jason [Ohio State University] reece.35@osu.edu, presenting author

Urban growth machine regimes emphasize the interests of land owning elites and entrepreneurs in driving development, often at the expense of other opportunities for marginalized communities (Farahani 2017). Property tax abatements have been identified as a mechanism of growth machine regimes which harms local educational resources for youth and significantly diminish resources for urban education (Weber, 2003). Research from Good Jobs First revealed that in the 2017 fiscal year, public schools across the United States had more than \$1.8 billion USD divested from them through the use of TIFs alone (Good Jobs First, 2018).

The proposed case study explores the durability of the growth machine and its impact on urban youth in Columbus, OH. Through annexation policies and aggressive embrace of neoliberal redevelopment tools, the elastic city has nearly doubled in population since 1960 while its urban school district has lost more than half of its student population (Jacobs, 1998). Due to the historical disconnection of the Columbus school attendance boundaries with the city's annexation policies, the district is more economically and racially segregated than the overall demographics of the City of Columbus. After the Brown v. Board decision in 1954, the Ohio legislature approved municipal annexation without school district expansion. The goal of this policy was to support the city's aggressive annexation policy of nearby suburbs, while assuring White suburban households that they would not be integrated into the City's public school district (Jacobs, 1998).

The district is an exemplar for case analysis because of its aggressive embrace of neoliberal urban development and urban education policies, such as charter schools, school vouchers and punitive state policies for districts not presenting progress in testing outcomes. Conditions in the district also mirror many of the typical conditions experienced in urban public schools. The city of Columbus is recognized as a leader in aggressively embracing public private partnerships, this approach, known as 'The Columbus Way' has been featured in case studies by the Brookings Institution and the Harvard Business School. Similar to Chicago, Columbus is one of the few urban school systems, where the teacher's union (Columbus Education Association) has centered tax abatements as a critical policy conflict in union district negotiations.

I explore the geography and impact of tax abatements and public education in Columbus, Ohio. The paper quantitatively analyzes the impact of residential tax abatements on public schools funding and educational equity. Additional semi structured interviews from stakeholders provide additional insights on the motivations and consequences of the abatement policy on educational conditions. I find the effects of the urban growth machine has compounded the city's inequality furthered and creates unsustainable conditions for urban youth.

#### **BEYOND POLICY GUIDANCE: PROMOTING EQUITABLE COMMUNITY DEVELOPMENT THROUGH THE INTEGRATION OF PUBLIC SCHOOL PLANNING IN URBAN PLANNING PRACTICE AND EDUCATION**

Abstract ID: 212

Abstract within Pre-Organized Session 40

MAKAREWICZ, Carrie [University of Colorado Denver] [carrie.makarewicz@ucdenver.edu](mailto:carrie.makarewicz@ucdenver.edu), presenting author

The provision of public education in the United States is uneven and inequitable. This is due to structural inequalities in school funding and other education policies, but also from methods of urban planning and development that contribute to these inequitable structures, as well as a lack of professional knowledge on the interactions among schools, planning, and development. Despite the central role that schools play in communities, regions, and social mobility, most planners know very little about school district planning or operations. Further, research on schools is rarely conducted or published by urban planning academics and their major journals (Sanchez 2019; Fang and Ewing 2020). In 2015, a group of planners and academics started the Public Schools Interest Group (PSIG) within the American Planning Association (APA) to rectify this disconnect. Since its founding, PSIG members have had four of seven session proposals accepted to the National Planning Conference, and a few members contributed to APA's first Equity Planning Guide, ensuring schools were included in this landmark document. As of 2021, the PSIG has grown to 313 members, enough to apply for formal Division status within the APA, which while give the group more funding and other supports. But obtaining Division status will not alone attract the interest of planning researchers as a legitimate and important planning research topic or improve planning professionals' knowledge and understanding of school planning and operations—separately, and in relation to community planning.

Among other strategic initiatives to promote schools within professional and academic planning practice and research, the PSIG received approval and funding from APA to write a Planning Advisory Service (PAS) report on “Public Schools and Planning”. The report is the collective effort of 25 contributors from planning practice and academia. The process to develop its proposed content took two years among this group and with the APA editorial team. This paper is on the development and analysis of the report’s content as a critical pedagogical tool in light of the group’s effort to achieve awareness and legitimacy in the planning field, and more importantly, to actualize the school planning recommendations that were adopted in the Equity Planning Guide. The author uses participant observation, content and discourse analysis, and the theoretical lens of critical pedagogy to study how professionals and academics made sense of the bricolage of reality to contribute knowledge to the planning profession. Specifically, the paper asks: 1) In what ways did the PSIG PAS report authors from academia and practice break the presumed division between knowledge production and practice to produce critical praxis that includes both theory and action; and 2) As an educational tool, how can a PAS report help to develop more critical planners in both cities and school districts to better understand the forces shaping public education that fall outside the control of schools and teachers?

The study finds that the process of developing practical and theoretical knowledge for the planning field requires an iterative and collaborative process that is open to ideas, seeks similarities and differences in perspectives and processes, makes connections between the past and present, and utilizes multiple cases. Through this process, the author team pinpointed the disconnects between school districts and cities that have led to current siloed planning practices and inequitable education, as well as unique innovations. This study and the PAS report provide new detailed cases of processes, policies, and planning methods in relation to schools and their broader role in the community that planners can draw from in their own cities and regions. The study also suggests new avenues for research and provides guidance on using the PAS report in planning programs.

#### JOINT USE BETWEEN COMMUNITIES AND SCHOOLS

Abstract ID: 213

Abstract within Pre-Organized Session 40

WARNER, Mildred [Cornell University] mew15@cornell.edu, presenting author

Schools are critical community institutions. In addition to their critical educational role, schools can be used as centers for access to recreation, nutrition, adult education and health care. The community schools movement has been growing in some urban areas, but little is known about the level of school-community collaboration across suburban and rural communities. This study helps fill that gap.

Schools often exist as silos onto themselves. But that is changing. Planners are beginning to engage with schools

and recognize the critical role schools, as an institution, play in communities. In 2015 the American Planning Association approved a Public Schools Interest Group “ to enable planners to better collaborate and promote the role of planning in public schools and districts and with local governments.” The American Planning Association is currently developing a Planning Advisory Service memo on planners’ role with schools.

This study focuses specifically on the level of joint use service delivery between communities and schools. Using a national survey we conducted of 1312 cities and counties across the US in 2019, we assess the community level factors that lead to more joint use services with schools. Joint use services include services for children (After-school programs, preschool, child care, walk to school program, child nutrition for evenings and weekends or summer), services for adults (adult education, nutrition programs for seniors, using school buses to transport seniors) and services for the entire community (recreation and health care services for all ages, community partnerships with schools to deliver information). We differentiate the key factors that differentiate higher level of joint use services with schools. We find the importance of trust, formal joint use agreements, planning for schools and budget control. Engagement of families and seniors in the planning process also is associated with more joint use with schools. Interestingly, demographics do not differentiate levels of joint use.

This study shows the importance of planners engaging with schools. While 31 percent of communities report planning for schools or school siting, only 17% report that their community has budgetary control over schools. By contrast 57 % report partnering with schools for services to children and seniors and 66 % report using schools for information and service delivery. Cross agency collaboration has been shown to be key in helping communities provide more services for children and seniors.

To build communities better for children, their families and seniors, schools can become a community resource, if planning reaches out to build partnerships.

#### **MAKING THE STUDENTS PAY? THE IMPACT OF TAX INCENTIVES ON EDUCATIONAL FUNDING ADEQUACY AND EQUITY**

Abstract ID: 214

Abstract within Pre-Organized Session 40

WEN, Christine [Good Jobs First] rahalucni@gmail.com, presenting author

This paper investigates the impact of tax incentive spending on educational funding adequacy and equity in the U.S. Tax abatements are meant to stimulate economic development, but they could reduce the revenues of school

districts and, if growth occurs as a result, lead to increased enrollment and hence higher funding requirement. To assess the effect, this study conducts cross-sectional statistical analyses using district-level tax abatement, school finance, and other fiscal data from 2019; these are supplemented by qualitative inquiries in New York and Ohio—two of the seven states in the sample. The main explanatory variable is the revenue strain caused by tax abatements, and it is measured with foregone revenue (as reported by school districts in their financial audits pursuant to Governmental Accounting Standards Board’s Statement No. 77 on Tax Abatement Disclosures), district size, total revenue, and share of local property tax revenue. The main outcome variables are measures of spending adequacy and fairness from the School Finance Indicators Database by the Albert Shanker Institute at Rutgers University. State-level fixed effects include the use of funding equalization formulas, stringency of tax and expenditure limits (using measures developed by the author for a previous publication), share of students enrolled in public schools, and other relevant factors that could affect school funding. Preliminary analyses have revealed that higher tax expenditures are related with lower socioeconomic status of a district’s students. In states where districts cannot offset the foregone revenue (through increases in local levy or state aid), tax abatements undermine funding adequacy, and the effect is more pronounced for poorer districts. Based on these findings, this paper recommends that states cap or exclude schools’ portion of the taxes from abatements or give school boards the option to veto or opt out of incentive agreements.

## 2.65 PRE-ORGANIZED SESSION - ENVIRONMENTAL JUSTICE OF/FOR/WITH WATER I

Pre-Organized Session 65 - Summary

Session Includes 553, 554, 555, 556

SIMPSON, Sheryl-Ann [Carleton University] sheryl-ann.simpson@carleton.ca, organizer

From drought to flood, household water access, conservation and contamination, energy production, alongside ceremony and recreation, the work of fishers and water protectors these are just some of the ways in which humans and water interact. Beyond human interactions, water also has its own work to do, and its own relationships with more-than-human beings to maintain, even though humans often interfere and disrupt that work and relationships. We aim to bring together a wide range of perspectives on relationship between water and environmental justice. Re-proving the fact of harm and inequitable experiences with water related to race, class, gender, caste, disability, sexuality and ongoing colonialism is not the goal of the session. Instead the goal is to bring together work that aims to untangle the processes, institutions and structures that maintain these inequities. Alongside work that explores ideas around, and examples of care- and liberation-focused approaches to addressing harm and inequity related to water, and for moving towards thriving relationship with water.

#### Objectives:

- understanding of environmental relationships around water in planning

## FROM GROUNDWATER RIGHTS TO CONTAMINATION: CONTEMPORARY WATER DISPOSSESSION IN THE COACHELLA VALLEY

Abstract ID: 553

Abstract within Pre-Organized Session 65

BREMNER, Jessica [University of California Los Angeles] [jessica.bremner@gmail.com](mailto:jessica.bremner@gmail.com), presenting author

Access to water is often considered an in-existent problem in the United States. However, in 2019, the American Community Survey found that approximately 2.9 million people in the United States live without running water. In places like Southern California's Coachella Valley issues of water access are dire and unequal. Here, residents living in unincorporated and tribal areas, mobile homes, and in the Eastern Coachella Valley (ECV) lack access to running water or public water infrastructure. Issues of water access in the Coachella Valley go beyond whether households have running water – they are also about whether accessible water is safe for use. For example, in the ECV, over 30% of the population rely on private wells to fulfill their water needs; wells contaminated with chemicals like arsenic and boron significantly above healthy benchmarks (Wadsworth n.d.). This paper examines the systematic deprivation of water in the Coachella Valley through water governance. To understand how access to water is governed I conduct interviews of government and non-government actors and I use document analysis to examine policy and archival documents. I use dispossession as a framework for analyzing the scales of governance that limit potable water access. The concept of dispossession is commonly mobilized to describe extractive and exploitative relationships to land, housing, and property. More recently, scholars have used the analytical lens of dispossession for water to reframe the human right to water (Morinville & Rodina, 2013), examine the effects of water laws (Koppen et al., 2014), and study the collision of water financialization and colonial dispossession (Hartwig et al., 2020). Understanding water access by using the lens of dispossession makes visible the regulatory and accepted processes used to enclose water. In this paper, I argue that the dispossession of water in the Coachella Valley is enacted through multiple modes including accumulation, groundwater rights, contamination, neglect, zoning and permitting, debt, overuse, and diversion. Enacted through overlapping jurisdictional governance, the different methods for dispossessing water are hierarchical; groundwater rights, bolstered by zoning and permitting, enable dispossession through diversion, accumulation, contamination, and overuse, which in turn incentivizes dispossession through neglect and debt. What is created by water dispossession in the Coachella Valley is a spatial inequality of water access that is often overlooked. The conditions of water access in the Coachella Valley are not just spatially unequal, but spatially unjust. The framework of dispossession helps to illuminate when spatial inequality is, in fact, an issue of spatial injustice, offering important implications for policymaking and urban planning. Spatial injustice must be addressed through spatial justice, requiring a set of tools different than those that might address spatial inequality. The orientation towards spatial justice contends that space and social relations be taken into account together in order for governments and communities to address socio-structural and physical issues at the local level. Spatial justice processes are constructed from the ground up and sustained through daily practice. This is exemplified in the Coachella Valley through the work of grassroots, tribal, and state-wide organizations challenging long-standing political and planning processes that enable dispossession by encouraging gentrification, industrial production, chemical violation, and water overcharge.

## **VIETNAMESE AMERICANS IN CLIMATE AND ENVIRONMENTAL JUSTICE: UNDERSTANDING TRANSNATIONAL MIGRATION AND RESILIENCE**

Abstract ID: 554

Abstract within Pre-Organized Session 65

NGUYEN, Peter [UC Davis] pvtnguyen@ucdavis.edu, presenting author

More than 1.6 million Vietnamese refugees were displaced and resettled since the end of the Vietnam War in 1975, which is one of the largest groups of refugees that arrived in the U.S. Although Vietnamese Americans have a large population across the U.S., there is a gap between how Vietnamese refugees have been part of environmental and climate justice discussions. However, since Hurricane Katrina there has been a large community of Vietnamese Americans in the Gulf Coast who have been directly impacted by natural disasters advocating for environmental and climate justice.

Vietnamese Americans in the Gulf Coast have long since endured strenuous hardships through natural disasters such as Hurricane Katrina, oil spills, illegal toxic landfills, and other environmental injustice issues. However, Vietnamese Americans have exhibited strong resilience bouncing back and eventually returning back to their homes along the Gulf Coast. In the face of increasing natural disasters, shifting seasons, and rising sea levels this research aims to explore how Vietnamese Americans are currently adapting to climate change, particularly in the city of New Orleans and community of New Orleans East. How do different contributing factors and relationships impact Vietnamese Americans' adaptation and what role does each relationship play?

There are three parts that this research aims to answer, which are outlined in the following questions: 1) For Vietnamese Americans in New Orleans East, how do their experiences as refugees resettling in the U.S., post-Katrina and post-Deepwater Horizon oil spill resilience, and current endurance through the Covid-19 pandemic, impact their approach to climate adaptation? 2) What aspects of community capital are key in influencing their methods of resilience and adaptation? 3) What is the specific role that community organizations play with regards to climate adaptation within the Vietnamese American community?

Through partnerships with local community leaders and organizations, the methodology used will consist of key informant interviews, surveys, participant observations of community and project meetings, and document analyses of community organization reports. Qualitative data are then analyzed through qualitative coding that underscores major themes from the discussions. These methods are employed through a specific case study analysis of two community-led organizations in New Orleans East that have been vital to the Vietnamese American community and the role that they play in working with the community on both climate adaptation and community empowerment.

Preliminary findings illustrate that there is a strong link between the Vietnamese American community's refugee experiences in having endured past trauma and migration journeys that have contributed to their resilience and unity around their shared experiences. In analyzing community capital, social networks and cultural capital through shared religious beliefs have established a tight-knit community in New Orleans East. Secondly, community-led initiatives are taking place around adaptation in addressing alternative livelihood practices that have been impacted by past natural disasters, oil spills, and the current Covid-19 pandemic. These initiatives are centered around urban farming and gardening to support residents who practiced fishing as their main source of income.

This research contributes to the environmental and climate justice literature that benefit from learning about refugees and resettlement locations, which tend to be places that are most impacted by poverty and government

divestment that directly leave fewer safeguards from environmental catastrophes. Moreover, both Vietnamese American and Asian American communities are understudied around these literature, particularly in areas outside of California, thus it is important in expanding upon these communities in the Gulf Coast. By understanding the connection between refugee experiences, post-disaster resilience, and climate adaptation we can develop ways to best support locally led resilience and adaptation actions not only for these communities in the Gulf Coast, but also transferring this globally.

#### **MEXICO-USA BINATIONAL WATERS: INSTITUTIONAL AGREEMENTS AND ENVIRONMENTAL JUSTICE AT THE LAS VIRGENES DAM**

Abstract ID: 555

Abstract within Pre-Organized Session 65

VAZQUEZ CASTILLO, Maria Teresa [Universidad Autonoma de Ciudad Juarez] ma.tere.vazquez@gmail.com, presenting author

Water has always been a topic of contention in the Mexico-USA binational agenda. Even more so, in 2020 when farmers of the Las Vírgenes Dam in the northern state of Chihuahua refused to provide the amount of water that was obliged to deliver to Texas in order to meet the 1944 binational treaty that regulates shared border waters. Supposedly, the agreement was set in place to plan and guarantee an equitable distribution of water on both sides of the border. Different planning institutions were involved in a context that made evident processes and structures that maintain uneven distribution and use of water. Bilaterally, the planning institutions that participated in this negotiation were the Comisión Internacional de Límites y Aguas (CILA) in Mexico, and the International Boundary and Water Commission (IBWC) in the United States. Other Mexican institutions were involved as well such as the Comisión Nacional del Agua (CONAGUA or National Water Commission) and the Secretaría del Medio Ambiente y Recursos Naturales (SEMARNAT or Environment and Natural Resources Ministry). Using media sources, official documents, and interviews with planners at these institutions, this paper focuses on the case of the Las Vírgenes dam, the planning process in place, the social unrest that provoked the fulfillment of the bilateral agreement, and the unveiling of unexpected environmental injustices at different scales. It explores the actors and the institutions intervening in either protesting and/or negotiating this international water related issue. It elucidates uneven regional conditions as well as power relations that challenged access to water for different kinds of populations and for different economic activities. It proposes that access to water and international agreements need to be reviewed and renegotiated in order to make sure that water will be available locally, regionally, and bilaterally. It proposes the assessment of economic activities and the entities that regulate them in order to set priorities in times when water resources in this desertic area are getting to critical levels. In an area as the Mexico-US border, planning and

distribution of shared natural resources requires an innovative regional approach, a bilateral knowledge of current conditions, and an awareness of environmental justice across border.

### **DROUGHT, THE RESILIENCE FETISH AND THE DEEPENING OF WATER INJUSTICE IN CAPE TOWN**

Abstract ID: 556

Abstract within Pre-Organized Session 65

KARUNANANTHAN, Meera [University of Ottawa] mkaru021@uottawa.ca, presenting author

In January 2018, the City of Cape Town made international headlines when it announced that it was three months away from running out of water. Three consecutive years of drought in the Western Cape region had led to critical water shortages in municipal water dams that supplied the city's 4 million residents.

This paper investigates how discourses of scarcity and urban climate resilience were instrumentalized in the aftermath of the drought to deepen unequal hydro-social relations in South Africa's second largest city. Combining feminist ethnographic research with critical discourse analysis of policy documents, I examine the multi-scalar politics of water conservation underscoring the ways in which the urban water system is fetishized through narratives that obscure power asymmetries and legitimize the ongoing socio-ecological deprivation of historically marginalized groups. I argue that these discursive strategies construct a fantasy in which capitalism can "save water" using innovative green technologies and market-based solutions. Within the context of post-apartheid Cape Town, I argue, these narratives that fetishize water serve a racial capitalist agenda that seeks to control and criminalize the life sustaining activities of working class racialized populations, which stand in the way of capital accumulation.

My research foregrounds the resistance led by racialized working class women living in precarious housing conditions to municipal water conservation strategies that devalue their lives and intensify their burden of social reproduction. Guided by feminist standpoint theory, my research highlights acts of individual resistance and collective protest as important sites of knowledge production regarding the racialized violence of neoliberal urban environmental programs. It offers bottom-up critiques of global processes co-constructed through dialogical methods foregrounding everyday embodied experiences of racialized, working class women confronting water management and climate resilience policies in their homes and neighbourhoods.

## **2.104 PRE-ORGANIZED SESSION - ENVIRONMENTAL JUSTICE OF/FOR/WITH WATER II**

Pre-Organized Session 104 - Summary

Session Includes 549, 550, 551, 552, 567

SIMPSON, Sheryl-Ann [Carleton University] sheryl-ann.simpson@carleton.ca, organizer

From drought to flood, household water access, conservation and contamination, energy production, alongside ceremony and recreation, the work of fishers and water protectors these are just some of the ways in which humans and water interact. Beyond human interactions, water also has its own work to do, and its own relationships with more-than-human beings to maintain, even though humans often interfere and disrupt that work and relationships. We aim to bring together a wide range of perspectives on relationship between water and environmental justice. Re-proving the fact of harm and inequitable experiences with water related to race, class, gender, caste, disability, sexuality and ongoing colonialism is not the goal of the session. Instead the goal is to bring together work that aims to untangle the processes, institutions and structures that maintain these inequities. Alongside work that explores ideas around, and examples of care- and liberation-focused approaches to addressing harm and inequity related to water, and for moving towards thriving relationship with water.

Objectives:

- understanding of environmental relationships around water in planning

## **EMPOWERING CITIZENS TO CHANGE THE STATUS QUO: THE 2021 JACKSON (MS) WATER CRISIS**

Abstract ID: 549

Abstract within Pre-Organized Session 104

THOMAS, Talya [Jackson State University] talya.d.thomas@jsums.edu, presenting author

MARSHALL, Isiah [Jackson State University] isiah.marshall@jsums.edu, co-author

In February of 2021, what was thought to be a late, pithy, winter snow and ice storm, turned into a series of cascading events that included power outages, transportation stoppages, burst water pipes, causing the malfunctioning of Jackson, Mississippi's fragile water system that lasted nearly 30 days. These particular events led to citywide water shortages resulting in major health, economic, political, human, and social disruptions impacting over 100,000 residents. Jackson, a predominantly African-American capitol city, is also home to a majority white state legislature, with a history of ignoring the needs of its citizens based on race. For a number of years, black political officials have brought the issue of the fragile water system and outdated infrastructure to the attention of the conservatively ran state legislature; however, their requests for assistance have gone unanswered; in turn, causing irreparable damage to the city and adding to the misery of its citizens for years.

Similar Occurrence

In 2014, the Flint Water Crises in Flint, MI erupted as one of the most impactful public health emergencies in modern times. In changing water sources from the Detroit River to the

Flint River, water officials failed to properly treat drinking water that flowed through corrosive lead pipes. Subsequently, this incident increased the amount of lead in the drinking water, which caused a number of fatalities and impacted the health of hundreds of thousands of people, including children. Community groups in Flint and from across the state of Michigan responded to the needs of the people by laying the foundation for advocacy campaigns and harnessing resources needed to empower vulnerable communities during this difficult time.

#### Theoretical Framework

The theoretical framework identified for this study is empowerment theory. Empowerment theory is defined as the process of increasing personal, interpersonal, or political power so that individuals can take action to improve their life situations (Gutierrez, 2001, p. 216). Empowerment theory assesses the current situation; concerns such as the impact of environmental factors and personal characteristics are examined through a critical lens; and lastly, attention is focused on needed resources that have the power to change a particular situation. The theory argues that if given the required resources, the problem or issue of concern can be mitigated or eliminated, resulting in an improved quality of life. Furthermore, the theory asserts that as people possess the power need to exact change, the individual, organization, group, or community are better off. According to Poulin and Matis (2021), empowering systems give them the tools and skills necessary to do something...helping enhance self-efficacy or boost self-confidence in clients (p. 89). Thus, understanding the tenants of empowerment theory moves the subject from deficiency to becoming resourced.

Using Empowerment as a framework, this qualitative research captures the narratives of African-Americans living in Jackson, Mississippi, who were impacted by the water crisis. Their narratives will be used as mechanism to dismantle functionalist ideology held by the status quo government. Through their voices, the research will provide strategies to address the issues of racial bias and inequity of state government and provide steps to collectively untangle injustice, thereby remedying the water crisis. In addition, implications for policy and planning will be discussed as a foundation to build trust regarding the water system with the citizens of Jackson.

#### **LIVING WITH WATER: COMMUNITY PLANNING AND CONCENTRATED DISADVANTAGE IN LOÍZA, PUERTO RICO**

Abstract ID: 550

Abstract within Pre-Organized Session 104

TORRES-CORDERO, Ariam [University of Illinois at Urbana-Champaign] ariamt2@illinois.edu, presenting author

The risk of flooding in cities is often compounded by political and economic decisions made on watershed management, land development, and water infrastructure and provisioning. It has also become a point of conflict between a region's objectives for development and the struggles of marginalized residents living in low-lying coastal and riverine areas to remain in place (Goh 2019). In the case of disasters, the issue of urban flooding directly shapes recovery policies and funding, often leading to forced displacements in informal, low-income communities. These

issues are all present in Loíza, a historically marginalized municipality in Puerto Rico.

Conceptually and methodologically, this paper builds on the work of Pendall, Theodos, and Franks (2012) and uses the concept of concentrated disadvantage as an analytical device to (a) better grasp the multiple layers of environmental injustices related to urban water systems in Loíza, and (b) to develop a framework that allows us to build alternative water realities. The notion of concentrated disadvantage takes into consideration the kinds of vulnerability “associated with the personal characteristics of individuals”, the precariousness derived from people’s living situations, and the larger environment, which involves “the natural, built, social, and economic systems in which people operate and their situations are located.” In other words, this approach requires exploring intersections between multiple forms of individual or personal vulnerability (e.g., race, gender, age, income, etc.), housing precariousness (e.g., aging housing, tenure insecurity, etc.), and regional resiliency – or lack of – (e.g., disinvestment, informality, marginalization).

Based on mixed-methods research, this paper explores the interrelationships between biophysical and sociopolitical factors behind urban flooding in Loíza. The paper considers multiple scales of analysis, including the ecological scales of the watershed, the infrastructural scales associated with flood protection, and the urban scales of planning, governance, and social activism. The paper concludes with a proposition for a multidimensional approach to thinking and acting on problems of urban flooding in more socially just and humane ways.

#### **INFRASTRUCTURE INTERDEPENDENCIES CONTRIBUTE TO WATER AND SANITATION CHALLENGES IN DISADVANTAGED UNINCORPORATED URBAN COMMUNITIES**

Abstract ID: 551

Abstract within Pre-Organized Session 104

VIDMAR, Abby [University of South Florida] abbyvidmar@usf.edu, presenting author  
WELLS, Christian [University of South Florida] ecwells@usf.edu, co-author

This presentation discusses the results of ethnographic research that examines perceptions and experiences of water and sanitation insecurity in disadvantaged unincorporated urban communities in Tampa Bay, Florida. Safe and secure water and sewer infrastructures are not universal, even in high-income economies such as the U.S. (Meehan et al. 2020) where local and regional governments grapple with aging and underfunded infrastructures that produce water and sanitation vulnerability (Wells et al. 2020). When these issues are compounded with systemic racial, gender, and socioeconomic inequalities, health and wellbeing are compromised (Wells and Whiteford 2021). Moreover, recent research in disadvantaged unincorporated urban communities (DUUCS) demonstrates that water and sanitation infrastructures are often interdependent, such that failures in one sector can have cascading effects across other sectors (Mohebbi et al. 2020). In order to address water and sanitation insecurity in DUUCS, we therefore must understand the ways and extent to which water and sanitation challenges are interrelated and how infrastructure interdependencies compound or exacerbate these challenges.

Our team of applied anthropologists and environmental engineers from the University of South Florida are studying these issues in the University Area Community (UAC), a DUUC on the northern edge of the City of Tampa where

research reveals persistent water and sanitation challenges over the past decade. Part of the UAC is serviced by City of Tampa utilities, yet over 1,000 residents are located on properties with well water and onsite wastewater treatment. Potable water quality is an ongoing issue for many residents and inconsistent knowledge of safe water and quality sanitation complicates these challenges. Our research examines the problem from both the bottom up (working directly with community residents) and the top down (working on a city-county team of engineers who recently started examining water problems in the community). This dual perspective allows us to analyze how local knowledge and authoritative knowledge overlap with or diverge from one another, and how the gaps might inform positive interventions. This research thus contributes to better understanding environmental justice and urban planning in disadvantaged unincorporated urban communities.

Overall, we find that UAC residents identify both water and sanitation problems but do not see their interconnections (e.g., contaminated drinking water from wells located adjacent to septic leach fields). City/county officials, on the other hand, are generally unaware of water and sanitation problems in the community but understand the interdependencies between the infrastructures. Recent research by our team also found that water and sanitation infrastructures are managed independently and differently between the city and county (Wakhungu and Wells 2019). Thus, there are managerial and policy disconnects in being able to address joint water-sanitation challenges. The greater goal of this work is to inform context-sensitive planning interventions in the UAC and to promote positive policy changes aimed at creating more equitable water and sanitation infrastructure for UAC residents and other DUUCS.

#### **HENKAN. SHIN-KICHI: MILITARY REALIGNMENT AND OKINAWAN UPRISING IN THE "POST"COLONY**

Abstract ID: 552

Abstract within Pre-Organized Session 104

IWAMA, Daniel [University of California, Los Angeles] diwama@ucla.edu, presenting author

This article concerns the protracted opposition of Okinawans and their allies to the construction of an oceanic military base expansion off the coast of Henoko Village in the Yanbaru region of Okinawa Island. The US-Japan Security Alliance has been unresponsive to Okinawan calls for actual demilitarization (Kashiwagi 2019). At the same time, the promise of institutionalized processes of military land redevelopment remain limited by the private

property regime and gender inequalities established in the settlement period. Therefore, I argue that multi-sited peaceful protest against the new base performs a dual function. On one hand, the Henoko sit-in deters oceanic catastrophe and the desecration of indigenous remains in service to further militarization. At the same time, it creates a physical space that animates new and old socio-spatial imaginaries not provided for in mainstream pathways to demilitarization.

Occurring within the constellation of the US's "empire of bases" (Vine 2015), the struggle at Henoko is one instance of local people grappling with the particularized effects of the US forces' "pacific pivot" and related base realignments. As the military pursues greater "flexibility" in the region, marginal selections of base land have been returned and redeveloped by national governments and dispossessed landowners pursuant to these plans. This has allowed militaries and settler governments to construct narratives of "burden reduction," while consolidating actual military functions upon remaining and newly militarized land and waters elsewhere. This cup-game of militarism unevenly effects indigenous islands, where the exceptional political status of peoples like native Hawaiians, Okinawans, and Chamorro have historically made it easier for military planners to expropriate lands from them (Davis 2011). Ecological destruction, sexual violence, noise pollution, and dislocation from sacred places thus remain endemic in Okinawa, where local people are pushed to direct action to materialize a good life (Yoshikazu 2006).

In constructing my argument, I utilize preliminary findings from extensive participatory methods, key informant interviews, and policy and discourse analysis. This work produces a deeply contextualized and historic understanding of Okinawan protest in the post-millennium, and contributes more broadly to our knowledge of the ways in which peoples' uprisings disrupt colonial power throughout the global US military empire.

#### **BUILDING RESILIENCE THROUGH WATER: THE CASE OF COMMUNITY AQUEDUCTS IN PUERTO RICO**

Abstract ID: 567

Abstract within Pre-Organized Session 104

PEREZ-FIGUEROA, Omar [University of California Irvine] operezfi@uci.edu, presenting author

Recent studies suggest that extreme weather events are made more frequent or more severe by human-caused climate change. These extreme events represent a threat to society but this does not imply that they will automatically turn into disasters. Therefore, looking for ways to cope with them is not only relevant but vital to human survival. I propose that under our current climate change context, effective disaster resilience must incorporate environmental equity and community empowerment goals. Furthermore, it must support decentralized/polycentric water governance systems. This study aims to provide insights on ways to reduce the vulnerability of communities most impacted by disasters in the global south in the wake of future disaster events and to aid in the creation of disaster policies that are more effectively attuned to the ways in which communities

prepare for and cope with disasters

My proposed research explores whether different water governance systems—defined as the rules and social relationships that establish who gets water, when water is distributed, and how this distribution is done (Lu, Ocampo-Raeder & Crow, 2014; Obertreis, Moss, Molinga & Bichsek, 2016)—affect disaster resilience. I focus on the case of Puerto Rico’s Non-PRASA communities, which are community aqueducts that are not served by the Puerto Rico Aqueduct and Sewer Agency (PRASA). While the United Nations continues to stress the need to increase disaster resilience to address disasters and hazards, it is less clear how to achieve that resilience or what resilience looks like for local communities. My research questions seek to address both needs, on one hand testing the idea that water governance can influence recovery practices and produce resilience, and on the other hand observing how communities define, discuss, and interact with water governance and disasters, including those networks created from those interactions.

Puerto Rico represents a critical case to study how disaster resilience and water governance look when an island lacks the political power to execute effective disaster policies. I will focus on Non-PRASA communities, as they can serve as examples of resilience when considering future extreme climate scenarios. During prolonged droughts and extreme rainfall, a few Non-PRASA communities were still able to provide drinking water. Furthermore, the Non-PRASA communities enhanced the region’s overall resilience to hurricanes’ effects, as they both provided water and transferred knowledge about water management to neighboring PRASA communities that did not have access to water.

This research employs a comparative case study to provide a deeper understanding of the institutional design of Non-PRASA communities, the policies that shape them, and their relationship with disaster resilience. This research uses a variety of data sources including (a) interviews, (b) social media, (c) policy documents to understand how everyday practices involving the connection between water governance and disaster resilience are understood by community members. The combination of different data sources would allow me to identify (1) what are the different water governance structures in these communities; (2) whether horizontal or vertical structures are available, used, preferred, maintained; (3) and whether these structures are connected to good quality water. Information from interviews will determine factors that make some of these communities more resilient to disasters.

Initial findings reveal that Non-PRASA’s water governance structure affect had implications for access to recovery funds and improving water services. Additionally, this research uncovered how, through their social ties, many of these community aqueducts provided other services beyond providing water, like caring for the elderly, disinfecting services, and entertainment activities these latter activities have helped their communities deal with disasters, including COVID 19. Narratives of thriving Non-PRASA communities and water infrastructure beckon us to understand how they work and why they persist alongside large-scale, highly technical solutions.

## **2.150 PRE-ORGANIZED SESSION - RESILIENCE IS A NET WE WEAVE: REGENERATIVE PRAXIS FOR ENVIRONMENTAL AND CLIMATE JUSTICE**

Pre-Organized Session 150 - Summary

Session Includes 895, 896, 897, 898, 899

WALSH, Elizabeth [University of Denver] elizabeth.walsh@gmail.com, organizer

How might planners break from neoliberal models of resilience planning in the face of climate catastrophe? What tools, mental models, and methods can be leveraged to these ends? Shifts away from extractive, exploitative, and oppressive systems do not come from disembodied rationality; as Audre Lorde reminds us, “the master’s tools will not dismantle the master’s house.” Hegemonic modes of planning research and engagement miss opportunities to build the community power and collective wisdom required to disrupt systems of oppression and co-create living systems of liberation and regeneration. Approaching planning praxis through lessons shared by social movements as well as Black, Indigenous, anti-racist, and feminist researchers and theorists, this panel presents tools, frameworks, and stories from the field that can root resilience efforts in reciprocal relationality, reparation, and regeneration. We come together with backgrounds that range from engineering to community organizing, the majority of whom share white-settler positionality. We hold an intention to embody anti-racist, decolonial, regenerative praxis in our lives and work.

Objectives:

- Hold space for critical, compassionate self-reflection regarding the tension of liberatory praxis in the face of virulent white-settler culture carried in our institutions, our bodies, and our work.
- Articulate a paradigm shift in our epistemological and methodological approaches for the co-production of knowledge and power to advance environmental justice and climate resilience.
- Explore methods to support co-creation of reparative and regenerative infrastructures needed to support geographies of radical resilience.

## **BEYOND THE "PLANNER'S TRIANGLE" AND "LADDER OF CITIZEN PARTICIPATION": NAVIGATING WITH A COMPASS OF COLLECTIVE POWER AND WISDOM FOR EQUITABLE, REGENERATIVE DEVELOPMENT**

Abstract ID: 895

Abstract within Pre-Organized Session 150

WALSH, Elizabeth [University of Denver] elizabeth.walsh@gmail.com, presenting author

BROWN WILSON, Barbara [University of Virginia] bbwilson@virginia.edu, co-author

In the 25 years since Scott Campbell (1996) introduced the “Planner’s Triangle” and over 50 years since the publication of Sherry Arnstein’s (1969) “A Ladder of Citizen Participation,” what have we learned about community engagement that can help us plan in an era of climate volatility for societal transformation and a just transition to equitable and regenerative economies?

A growing consensus recognizes that our communities’ most urgent and persistent challenges are far too complex to be solved alone; we must work together, thinking across systems and centering the voices of underrepresented populations (Innes & Booher, 2018). Increasingly climate justice leaders and planners recognize that the dominant development paradigm achieved economic growth for power-brokers at the expense of the majority of human beings and the ecological systems of which they were part (Walsh & Wilson, 2020).

At the same time, our field's over-reliance on the Planner's Triangle and the Ladder of Citizen Participation as heuristics for engagement constrains our capacity to address the complex challenges before us. First, there are significant limitations endemic to use of the models themselves (e.g., they neither support paradigm shifts for systems transformation, nor offer guidance on building the power of diverse citizens to address complex social and ecological problems). Second, our field - even from its foundation in the work of Patrick Geddes - has a much greater wealth of (a) methods/practices of engagement and (b) theories of knowledge and power we can draw upon to support climate transformations in the 21st century.

Recognizing that visual heuristics are helpful for framing understanding and taking action, we offer a flexible framework - a compass that can help us navigate the wealth of methods we've inherited in the past to cultivate the collective wisdom and power we need today to plan for equitable, regenerative development in the future. Instead of "directional arrows," this compass points us to three "directional questions," while also signaling that our powers are more diverse than even the nine listed here.

At the center, the "inner" compass is a triangle, with each side representing a principle of natural law: integrity, reciprocity, and liberty. Beyond being "good" social norms, integrity and reciprocity are how the biophysical world works; billions of years ago, a solar economy of plants created a living world from inanimate materials, constantly regenerating life through networks of reciprocity, and ecosystems of integrity (Walsh, 2021). Liberty - the exercise of sovereignty in our entangled webs of relations - is both a birthright and duty of human beings (Allen, 2014). As Campbell argued, the goal for planners is not to eliminate conflict, but to engage it productively. This heuristic embraces tension as a source of co-creative energy.

The "outer" compass is represented by a spectrum of collective powers radiating out of the prism - each representing a path through which we can direct our vital energies to advance social and ecological well-being. Arnstein believed in the untapped potential of citizen power, and the need to redistribute resources and decision-making power to address the gap between the "haves" and the "have-nots." Building on Arnstein's legacy, we identify the power to redistribute as one of nine forms of collective power, including the power to disrupt, heal, host, appreciate, integrate, envision, co-create, and govern.

Drawing from a wealth of practical wisdom from the canon of planning and beyond its traditional boundaries from those leading on the frontlines of climate injustice, we provide a summary of methods drawn from existing literature, available to us to cultivate these collective powers through our planning processes, from design to implementation and ongoing management. We also share illustrative examples from planning practice.

## **“WISE” RESILIENCE PLANNING: TOOLS FOR ADVANCING RECIPROCAL RELATIONSHIPS AND RAPID ACTION IN SAVANNAH, GA**

Abstract ID: 896

Abstract within Pre-Organized Session 150

MCSORLEY, Meaghan [Georgia Institute of Technology] meaghanmcs@gmail.com, presenting author  
BOTCHWEY, Nisha [Georgia Institute of Technology] nisha.botchwey@coa.gatech.edu, primary author  
HYDE, Allen [Georgia Institute of Technology] allen.hyde@hsoc.gatech.edu, co-author  
LOUKISSAS, Yanni [Georgia Institute of Technology] yanni.loukissas@lmc.gatech.edu, co-author

Grounding the interpretation of big data in authentic community experience is challenging for planners and residents because of time and trust limitations. To move from “smart” city planning to “wise” city planning requires deep, thoughtful engagement with local specificity in the form of environmental, historical, and relational assets and challenges, as well as with difficult questions about power and governance (Young and Lieberknecht, 2019).

Particularly in the context of resilience, a tension emerges in our pursuit of ethical, effective, and efficient action between a need for urgency, and a need to slow down in order to build sustained and sustaining relationships. We must “move at the speed of trust” (brown, 2017: 42), while also keeping an eye on the ever-encroaching horizon of climate change-induced disaster(s). This is what is meant by “bounce forward” resilience (Kresge, 2015) – the ability to take advantage of disastrous moments to advance systems change. And yet, it is our relational capacity that positions us to bounce forward in a just and regenerative way.

This paper presents a case study from Savannah, GA that includes three tools used to support resilience planning. The tools were woven together for a multidisciplinary research project to respond to concerns around community resilience in a small southern city. Harambee House, the community partner, has reviewed, supports and piloted these tools employed in the study.

These tools are discussed in the context of moving towards wise city planning, and what ground they offer for productively engaging the tension described above. The three tools include (1) the map room, an interactive and tactile counter-mapping pilot project (Corbett and Loukissas, 2019); (2) the community profile, a document that aggregates detailed vulnerability and asset data for one neighborhood to provide local actors with information to contest official stories; and (3) the promise inventory, which serves as both a process for engaging deeply with local history and context, as well as an evaluation tool for showing impact and calling upon partners to uphold their commitments. Participants will come away from this session with tools that help to address the “people” side of resilience by building relational capacity and ultimately regenerative power (Walsh, 2021).

## THE ROLES OF SOCIAL CAPITAL IN EARTHQUAKE RECOVERY IN ECUADOR

Abstract ID: 897

Abstract within Pre-Organized Session 150

MCMULLEN, Shelley [University of Colorado - Denver] shelly.mcmullen@ucdenver.edu, presenting author

Disaster recovery and resilience has often been addressed in terms of physical infrastructure and economic systems, excluding considerations for the recovery and resilience of social systems. The social fabric and networks within a community provide keys to building the capacity for adapting to changes, recovering and moving forward, and those connections and networks within a community are the primary elements of social capital (Campanella & Godschalk, 2012). It is social capital that allows individuals to cooperate for a common purpose (Aldrich, 2012; Putnam, 1995).

Because the social impacts of disasters have traditionally been less studied than economic or infrastructure impacts (Tierney, 2019), there is still much discussion and disagreement between researchers regarding the role resilience and social capital play in disaster recovery (Sadri, et al., 2018). Researchers have found that disasters impact poorer populations far more than the wealthy and the ability to cope and recover is far more difficult for those in poverty (Tierney, 2019). Destruction may cause the displacement of survivors or fracturing of neighborhoods, resulting in the severing of social supports that may have otherwise helped alleviate some of that stress (Tierney, 2019). Understanding the social fabric and networks within a community can help researchers better understand community resilience (Campanella & Godschalk, 2012). Little research has studied what has gone right during disaster recovery in resilient communities (Aldrich, 2012).

By comparing the recovery progress and social capital of several small communities in Bahía de Caráquez, Manabí Province, Ecuador after the 7.8 magnitude earthquake in 2016, this case study attempts to better understand the influence of social capital on resilience and recovery after a disaster event. The research question asks how influential social capital was on long-term disaster recovery after an event. This study surveyed eight different communities in coastal Ecuador to better understand the influences of the three types of social capital (bonding, bridging and linking) to the perception of recovery. Social capital characteristics that were measured included community roots, social interaction, community cohesion, community trust, social responsibility, social infrastructure, and assistance from the surrounding community. Assistance from government and personal earthquake damage from the earthquake were also measured against perceived recovery. The results from the analysis showed that regular social interactions between community members and assistance from local volunteers or NGOs had positive, significant relationships to the perception of recovery.

The findings from this research support both scholars and practitioners in understanding the importance of social capital to disaster recovery at a neighborhood scale and attempts to fill gaps in the existing literature regarding long-term recovery and the role of social capital in communities in a community located in the Global South.

## CONSUMPTION AS CARE: TOWARDS A MODEL FOR REGENERATIVE PLANNING

Abstract ID: 898

Abstract within Pre-Organized Session 150

POLLANS, Lily [Hunter College, City University of New York] lily.pollans@hunter.cuny.edu, presenting author

Since the revolts of the 1960s, planners have, at least rhetorically, centered participation. But as cities struggle with the weight of decarbonizing energy systems, adapting infrastructure to rising seas and a whole range of other climate catastrophes, they do so in a landscape that remains structured by racist housing and urban development policies, and through methods that reify technocratic expertise. This has meant that most top-down interventions in the name of resilience may simply reproduce racialized patterns of risk and benefit and do little to change the calculus of the climate catastrophe (Meerow et al, 2019). The framework of resilience itself, which was largely devised and promoted by foundations in partnership with the insurance industry, has been observed to consistently advance neoliberal governing strategies while obscuring environmental injustice (Fainstein 2018).

Planning within a green new deal framework may offer a path out of this conundrum, though planners have already cautioned that it is no panacea. While planners rhetorically prioritize participation, we already know that the scale of energy decarbonization will require massive technocratic and top-down coordination. Kian Goh (2020) has challenged planners to recognize the tension between an ethical mandate to redistribute power and the necessity of top-down leadership, and to find a generative path forward. Following Goh's call, and building on concepts of degrowth (Kallis, 2018) and regenerative cities (Thompson & Newman, 2018), in this paper, I examine two sets of grassroots efforts to reshape consumption in New York City.

Urban consumption of energy and materials is central to extractive capitalism, but while city policy remains steadfastly neoliberal, grassroots and community organizing offers pathways for New York City residents to build a regenerative economy from the ground up. The two Brooklyn-based initiatives studied here—one a cooperative renewable energy installation in Sunset Park, and the second a set of informal sharing and buy-nothing groups—are actively building new institutions for consumption, the first for energy, the second for materials. Each initiative builds capacity and community outside of formal, market-based exchange networks. They both facilitate the supply of basic necessities in less damaging, or even nurturing ways, while also building political knowledge and capacity among participants. This research asks two questions. First, how do these small initiatives support the stated priorities of city leaders and planners, as articulated in the city's most recent plans and policy statements? And second, how can planners learn from and support these potentially transformative initiatives that embody, more purely than any public resilience effort in the U.S. to date, goals of redistribution, justice, and balanced sociocultures?

## RELATIONAL INFRASTRUCTURE FOR JUST RESILIENCE: THE IMPACT OF COMMUNITY BASED PLANNING AND DESIGN ON SOCIAL CAPITAL, PLACE ATTACHMENT, AND LOCAL KNOWLEDGE IN NORTHEAST HOUSTON

Abstract ID: 899

Abstract within Pre-Organized Session 150

SLABAUGH, Danielle [CU Denver] dani.slabaugh@ucdenver.edu, presenting author

Climate change is a social justice issue; disasters tend to amplify racial, class, gender, age, ability, and other disparities (Wilson, 2018; Wisner et al., 1994). As planners, engineers, designers and policy makers grapple with climate adaptation and resilience, many such efforts focus on the built environment. This approach leaves out critical social and place-based networks of resilience while often creating conditions for green gentrification, which has a deleterious impact on relational dimensions of community resilience (Gould, 2016). As low-income Black, Indigenous, and Communities of Color (BIPOC) are pushed out, relational networks that play a greater role in the resilience of marginalized communities, who often lack access to other safety nets in the form of savings or adequate insurance, are weakened or destroyed.

How might planners expand the scope of their impacts and more fully address climate justice issues that arise from displacement? Social capital, place attachment, and local knowledge offer the framework of relational infrastructure, a relationship-based network that serves as adaptable scaffolding for community resilience. Through the lens of relational infrastructure, the planning process comes into focus as a tool for building both tangible physical and intangible, relational resilience infrastructure.

Using semi-structured interviews, the impacts of community-driven and community-controlled neighborhood flood recovery and resilience planning on these three resilience indicators was assessed among low-income Black and Latinx community participants in Northeast Houston. Interviews with participants exposed several themes that tie the community-based planning methods to improved resilience. This case study reveals a significant-increases in both bonding and bridging community social capital, as well as interconnected increases in place attachment and community self-efficacy that members attribute to their involvement in the planning and advocacy process. Improved post-disaster mental health outcomes also emerged as a theme from this case study, suggesting that further research is needed to assess the impact of community-based planning and design methods on post-disaster mental health outcomes that disproportionately impact low-income BIPOC groups (Ahern & Galea, 2006).

Between March 19, 2020 and February 28, 2021, Stop AAPI Hate received reports of 3,795 incidents (Jeung et al., 2021). The Atlanta shooting on March 16, 2021, which took the lives of eight people, including six women of Asian descent, further pinpointed persistent racial discrimination and xenophobia in North America and revealed the complex intersectionality of race, gender, class, and immigration status. Since the Atlanta shooting, communities call for further changes to stop prejudice, stigmatization, or racism.

Long before the Atlanta shooting and the recent surge of anti-Asian violence, researchers and scholars, including the panelists in the roundtable, have examined the hardships and discrimination faced by the Asian population across North America (Portes & Zhou, 1993). In their scholarly works, the panelists have shown (references of the panelists' works are not provided due to the limited number of references allowed) that although native-born and immigrant Asian people have strived for "American dreams", engaged in self-employment and entrepreneurship, and invested in their communities and cities, Asian people still face severe risks of violence, residential segregation, a lack of access to the economy outside of ethnic enclaves, and barriers to participating in decision making. These hardships are similar to those faced by other marginalized groups but have not been widely recognized or acknowledged outside of Asian communities (Brockell, 2021).

In their works, the panelists have also proposed strategies to engage with Asian and Asian American/Canadian communities in creating equitable and just cities for all. These strategies include innovative approaches of participatory planning such as story mapping, developing cultural competence in urban planning research and practices, facilitating the welcoming movement of local governments. Moreover, they underscore that, in urban planning education, it is important to build community-university partnerships and engage diverse students in effective ways when teaching equity and advocacy planning.

Against this backdrop, we convene this roundtable to reinvigorate and expand the conversation, which centers around combating racism towards Asian people while striving for eliminating discrimination against Black, Indigenous, Latinx, immigrant, and sexual/gender and religious minority communities. This panel will center on how the Asian experience of racism has unique characteristics that overlap with these movements, but with particular features that must be addressed.

This roundtable is the start of a conversation to engage our ACSP colleagues to address the following questions:

1. How to raise the awareness of implicit and systemic biases toward Asian and Asian American/Canadian faculty and students in the field of Urban Planning?
2. What are the tools and resources available to faculty and students to navigate the structural, institutional, and political dimensions of implicit and systemic racism in urban planning and to combat discrimination against Asian and other minoritized groups?
3. In planning education and practices, how to build infrastructure and support systems that are welcoming and equitable for all?

## **INDIVIDUAL PAPER SUBMISSIONS**

### **MEASURING IMMIGRANT-SERVING NONPROFIT STRATEGIES IN US CITIES**

Abstract ID: 30

Individual Paper Submission

SORRELLMEDINA, Zayda [University of California Irvine] [zaydasm@uci.edu](mailto:zaydasm@uci.edu), presenting author

Immigrant-serving nonprofits employ many strategies to promote the inclusion of immigrants in communities throughout the US. This includes, for example, enacting cross-sectoral and organizational partnerships, engaging in administrative policy advocacy with city officials, and strategically framing immigrant issues (de Graauw, 2016). The strategies that practitioners employ are also shaped by their political environments (Casteñada, 2020; de Graauw, 2015). There is also evidence to suggest that different strategies result in disparate inclusion outcomes (de Graauw, 2015). While the literature on the interrelations between nonprofit strategies, their environments, and immigrant outcomes is robust, many studies employ primarily case study methods focusing on organizations in one or a few cities which limits generalizability. Hence, to precisely understand the degree to which local context and organizational strategies matter when it comes to immigrant inclusion outcomes, needed in the literature is a study that evaluates organizations operating throughout the US using statistical methodological approaches.

This study addresses the aforementioned empirical limitation by investigating the two questions: (1) What are the strategies of the US immigrant-serving nonprofit sector? (2) Do strategies significantly differ in inclusive and exclusive cities? Drawing from the literature, it is hypothesized that organizations nested in more inclusive cities will display more advocacy while organizations in more exclusive cities will employ more services. To identify nonprofit strategies, qualitative interviews with nonprofit practitioners (n=27) across the US are conducted with practitioners. Results from the interviews are used to develop an original scale that allows for measuring immigrant-serving nonprofit strategies. The scale is implemented on a stratified random sample of organizations located in inclusionary and exclusionary US cities (n=122). To measure the degree to which cities are inclusive for stratification purposes, a scale is created. Confirmatory factor analysis is used to validate both scales and to confirm the dimensionality of the strategies. A one-way ANOVA is conducted to evaluate whether strategies significantly differ among organizations nested in environments with varying degrees of immigrant inclusion.

Preliminary findings from the interviews reveal that there are at least nine mesolevel strategies operating in the field. This includes enacting community participation; educating the community; providing social, legal and cultural services; faith organizing; launching collaborations; policy advocacy; and engaging in confrontational practices. These strategies can be further specified into several functional strategies. Analysis of the survey data will determine whether strategies significantly differ across political contexts.

Findings from this research will have empirical, theoretical, policy and practice implications. Empirically, it expands

on current works by revealing the dimensionality immigrant-serving nonprofit strategies. It also results in two validated scales that can be used for future empirical testing. Theoretically, this research advances a conceptual framework for the concept *immigrant inclusion*. The practical implication is that results reveals potential (in)effective practices for promoting immigrant inclusion outcomes, which can benefit practitioners and immigrants. The policy implication is that the study provides a measure on how local city governments in US cities are doing when it comes to promoting immigrant inclusion in their community, which can be useful for diversity and inclusion planning.

#### TELLING THE TALE OF CREATIVE PLACEMAKING ADOPTION THROUGH STAKEHOLDER VOICES, AN APPLICATION OF SPRADLEY'S UNIVERSAL SEMANTIC RELATIONSHIPS TO UNDERSTAND PLACE-BASED IDENTITY PERCEPTIONS

Abstract ID: 49

Individual Paper Submission

KEMPER, Rebecca F. [COSI CRE, Ohio State University] rkemper@cosi.org, presenting author

Creative placemaking has been defined as a process of identity co-production specific to a location and its stakeholders within the arts; therefore to understand creative placemaking there is a need to understand people's subjective perceptions of the place at hand (Gaumer et al, 2019; Markusen, 2013; Kelkar & Spinelli, 2016; Sweeney et al., 2018; Wortham-Galvin, 2008). Additionally, there is a need to understand how various stakeholders' perceptions of a place relate to each other within creative placemaking (Salzman & Yerace, 2018). However, it can be a challenge to capture often under-represented community perceptions as well as those of decision-makers who are under bureaucratic constraints to discuss their own take on planning efforts (Becker & Meyers, 1974; Lupia & McCubbins, 1994; Philips, 1987). Yet, understanding decision-makers' and community members' perspectives on creative placemaking efforts is necessary to understanding how is creative placemaking is being adopted within a local context. This research applied Spradley's Universal Semantic Relationships framework to analyze a representative sample of archived in-press quotations from a variety of stakeholders; this content analysis identifies themes and situates them within a case study arts district located within an Ohio university district. Content analyses have been used when researching the role of arts and culture within urbanism, branding, and destination placemaking (Hanser, 2018; Reason & Garcia, 2007; Thomas et al., 2015; Schwartz, 2003). Additionally, archive analysis can assist in identifying hard-to-reach stakeholders within a case study (Yang, 2014). A framework for situating socially constructed themes relating to stakeholders is Spradley's Universal Semantic Relationships (Denitch, 1971; Howe, 1990; Spradley, 1970; Spadley, 1979; Spradley, 1987; Thanem, 2012; Wester et al., 2004).

This research gathered perspectives on creative placemaking within an Ohio university district through an archival search of in-press articles concerning the current implementation of an arts district. Twenty-six stakeholders (University District Businesses / Community Organizations, n=4; University Trustees, n=3; University Planners & their Communications Staff, n=7; University Students, n=6; Area Developers, n=3; University Faculty Members, n=3), produced 128 quotes, treated as segments for this content analysis. 52 of these quotes were classified as *Opposed* or *Neutral* (here neutral was defined as having counter-balanced perspectives or functioning primarily as neutral,

informative pieces perspectives) to the arts district, while 76 of the quotes were classified as in *Support* of the arts district development. From this sample of quotes, open coding was initially used to identify themes within these data. 49 initial codes were identified within these quotes and were subsequently collapsed into 39 codes. Interim coding was undertaken at this point to create a hierarchical structure using Spradley's Universal Semantic Relationships around these initial codes to organize thematic relationships. The semantic codes were then organized under three emergent categories: (1) the identified decision-makers for the arts district, (2) the place-identity of the arts district, and (3) the intended users for the arts district. Seven possible categorical state relationships were identified as the following: (1) Place-Identity, (2) Decision-Making, (3) Users, (4) Place-Identity & Decision-Making, (5) Place-Identity & Decision-Making, (6) Decision-Making & Users, and (7) Decision-Making, Place-Identity, & Users. Analysis of code types (and their related segments) within these category states found an interesting void - no stakeholder group discussed who the intended User for the arts district was to be in isolation. However, the combination category states with Users -- such as Place-Identity & Users and Decision-Makers & Users -- had the highest number of coded segment representations. Findings here are suggestive that all stakeholder perceptions about creative placemaking at this location did not have a clear view of who the intended users of the arts district were or should be and presents the need for creative placemaking to better envision the user of proposed places.

#### THE PLAN AS A VISION: HINDSIGHT 2020

Abstract ID: 69

Individual Paper Submission

GIBSON, Huston [Kansas State University] hgibson@ksu.edu, presenting author

CLANAHAN, Christopher [Arizona State University] cclanahan@ksu.edu, co-author

Around the turn of the century (2000), it was trendy for communities updating their community plans to title them “Vision 2020” due to the catchy name, the approximate 20-year time horizon of these plans, and the recognition that 20/20 vision signifies “perfect” eyesight. A plan, in many regards, is a tool to achieve a community vision (Klein et al. 1993). This study retrospectively analyzes “Vision 2020” community plans from this period, with a critical analysis of their vision statements and subsequent implementation. Evaluation and appraisal review of plan implementation is a valuable component of the planning and community development process; reflection fosters improvement (Seasons, 2003). This study uses document data and personal interviews with local planning professionals from different communities throughout the United States of America to discover outcomes and identify barriers and gateways to successfully implementing community visions. A varied sample was extracted from a dozen plans implemented over 20 years which exemplified a focus on community visioning. Findings discuss what worked, what did not work, and lessons learned. Subsequent recommendations are intended to aid planning professionals with future community visioning processes and implementation (Pig et al., 2015). The practical lessons

observed by Hindsight 2020 offers conclusions relevant to the discourse on local planning and community development practice (Littrel & Littrel, 2006).

### **RESEARCH ON CHINESE COMMUNITY REGENERATION BASED ON DYNAMIC ANALYSIS OF TERNARY NETWORK— CASE STUDY OF DAXUE ROAD IN SHANGHAI**

Abstract ID: 75

Individual Paper Submission

ZHENG, Luqiao [Tongji univercity] Luqiao.zheng1012@gmail.com, presenting author

In recent years, with the urban stock development and downward shift of social governance focus, community regeneration has become an urgent need to deal with the uncertainties of local development in China. It includes not only the improvement of the community built environment, but also the optimization of the governance mechanism in the process of public participation and the reconstruction of social relationship between neighbors. Therefore, it is particularly important to study the space-society relationship in the process of community regeneration. How to quantify the overall effect of community regeneration? How to build a spatial-social interpretation model? How to reveal the dynamic regularity of public participation? This research attempts to use the method of social network analysis, taking Daxue Road in Shanghai as an example, to construct a ternary network analysis model to explore the answers to these questions.

Daxue Road is the only internet celebrity street in Shanghai with a legal outside position. Block with mixed functions has created three-dimensional commerce and prosperous streets, and had become the fuse for conflicts between residents and businesses. At the beginning of 2019, Daxue Road experienced a mandatory fire prevention rectification led by the government, which has led to mass retreat of the creative stores and the gradual disappearing of vitality. Then the local real estate operator tried to introduce external social organizations, through the micro-regeneration of "Happening Convenient Store" and community empowerment, to build an inclusive, neutral, and friendly non-profit Third Space, which remotivated the community's internal vitality and realized space-society interaction.

Firstly, this study collected community spatial resources, behavior trajectories and social relationship information through on-site exploration, issuing questionnaires and semi-structured interviews, and comprehensively used social network analysis methods and spatial analysis techniques to propose a community ternary network research framework including spatial network, habitus network (spatial behavior trajectories) and social network, which is a space-society interpretation model. Secondly, it develops an analysis index system covering individual, partial and overall network characteristics, tracks and measures the static characteristics and dynamic differences of the ternary network structure in the whole process of public participation in Daxue Road. Thirdly, through the dynamic comparison and correlation analysis of ternary network characteristics, it reveals the iterative mechanism of spatial

network following social actions, the mechanism of space-society interaction, and the growth mechanism of social network following spatial practice.

The findings of this research are as follows. Firstly, in the face of the prevalence of consumerism, the community should introduce cultural life and natural experience to public space, shape the local spirit, maintain a continuous quality public life, and bring social power to the heterogeneity of the street. Secondly, multiple co-governance and multi-party collaboration should be incorporated into the local government framework and the action plan of the community regeneration. The community should integrate local resources and carry out systematic institution innovation in order to realize the long-term and healthy development of the community. Thirdly, the local developer operation team introduces social organizations to provide a unified voice platform for the creative community. However, the involvement of social organizations is temporary, and community development needs to stimulate the consciousness of local subjects.

In terms of community planning theory, this research constructs an interdisciplinary space-society interpretation model. In terms of research methods, it designs a multi-dimensional community regeneration utility (spatial efficiency and social performance) measurement system. In terms of research perspectives, it achieves dynamic analysis of public participation in whole process. At the same time, it also provides a practical sample of community regeneration through the interaction of space revitalization and social empowerment.

## USING ART MURALS TO UPLIFT COMMUNITIES THROUGH ECONOMIC DEVELOPMENT AND PLACEMAKING

Abstract ID: 78

Individual Paper Submission

FURTADO, Lara [University of Fortaleza] [larasuky@gmail.com](mailto:larasuky@gmail.com), presenting author

Urban design and aesthetic improvements have been connected to increased feelings of safety and social capital by influencing resident's interactions with one another (Wood et al, 2008). Among these, public art is a beneficial urban design strategy that can create spaces for public expression, economic opportunity and wellbeing (Kleinert & Horton, 2016). However, these initiatives can also fail to promote comprehensive community development and benefit low-income minorities living in urban centers. Elitist representations of culture can be used as window-dressing to rebrand cities and hide more systemic issues (Zukin, 1996). Thus, this research presents how public art can have tangible positive impacts on underprivileged communities through the case study of mural festival in Springfield, MA. This paper presents an example for planning practitioners and scholars of how socially committed public art can involve marginalized communities in the placemaking process by giving them power in shaping the urban realm (Palermo, 2014).

During the summer of 2019, the Fresh Paint Mural Festival (FP) brought dozens of artists to paint 10 murals in large building walls throughout downtown Springfield. The festival had community engagement as one of its core

principles and hosted several events where community members could work alongside artists. This study employs multiple data sources collected over the span of two months. A total of 168 attendees were surveyed about their spending during FP events, which informed an economic impact study of how much the festival had contributed to the local economy. The survey also included questions related to placemaking and about the impact of public art on people's perceptions of downtown Springfield. Additionally, in-depth interviews with community members involved in the event assessed whether FP had an impact in other intangible aspects connected to urban vibrancy and placemaking. The interviews targeted residents of a public housing who were overwhelmingly latino and African American and had extensive participation in festival events and in a mural installation on their building wall.

Results indicate that administrative decisions to implement FP were responsible for its success in effectively benefiting minorities and the local community of Springfield in two fronts: economic and wellbeing. Economically, FP spent nearly 50% of its budget in women or minority-owned businesses, even though women or minorities own only 12% of businesses in Springfield. Considering the relation between community health and economic security, the decision to invest locally exemplifies how an economic agenda can have broader social implications for minorities. Additionally, by using art to uplift Springfield communities, the event fostered wellbeing by building on intangible assets. An overwhelming majority of respondents agreed that the murals improved sense of safety and walkability downtown and improved perceptions of Springfield as a desirable place. Interviewees mentioned that FP built community by creating experiences of inclusivity and belonging in Springfield's downtown. The interviews provided valuable insight into how art allowed citizens to see themselves as part of Springfield, to feel that their city was being loved and to feel hope for a brighter future.

The information collected on the impacts of Fresh Paint provides meaningful metrics and attests to the potential of public art as a tool to catalyze comprehensive community health, which depends on financial, social and psychological aspects. Although beautification alone is not enough to undo the years of neglect of black and latino communities, Springfield residents said the festival started a hopeful process of reparation.

#### **GENTRIFICATION BEFORE TRANSIT IN DIVERSE SUBURBS: THE STORY OF THE PURPLE LINE CORRIDOR**

Abstract ID: 98

Individual Paper Submission

FINIO, Nicholas [University of Maryland] nfinio@gmail.com, presenting author

KNAAP, Gerrit-Jan [University of Maryland] gknaap@umd.edu, co-author

The State of Maryland is currently building a new light rail system, known as the Purple Line, which spans two suburban counties outside Washington DC. It will connect multiple major activity centers and subway lines with new

high capacity transit along its 16 mile, 21 station circumferential route. The Purple Line will greatly increase transit accessibility to jobs and points of interest along its path, including in majority Latinx neighborhoods where low-income residents may be vulnerable to displacement (Lung-Amam and Dawkins, 2020). This paper assesses whether or not gentrification is occurring along the Purple Line in advance of the line's operation.

The prevalence of gentrification and one of its primary consequences, displacement, is subject to ongoing debate. One reviewer of gentrification noted the subject is viewed in qualitative and micro-level studies as a social issue that is "deeply problematic and consequential for longtime residents" (Brown-Saracino, 2018, p. 517). In the same review, Brown-Saracino notes that macro-level quantitative analyses offer a viewpoint that gentrification is not as widespread as commonly thought, and further that "displacement is far from endemic" (2018, p. 520). This paper offers novel evidence from a case study of a transit line, in advance of its operation, that will directly impact hundreds of thousands of residents in nearby neighborhoods.

The Purple Line as a case-study is relevant given recent advances made and questions posed in the literature. Large-scale public investment, like the over \$2 billion investment in the Purple Line, has been shown to influence processes of gentrification and potentially catalyze displacement (Zuk et al. 2017). However, macro-scale evidence has shown that new rail transit stations do not directly catalyze higher rates of displacement for low-income residents who live nearby (Nilsson and Delmelle, 2020). Further, a growing amount of scholarly work shows that evidence of the extent and location of gentrification is irrevocably tied to how the concept is defined (Preis et al. 2020).

Given these challenges, we advance our case study using both traditional and novel sources of data, coupled with our experience as activist-scholars embedded in the Purple Line's planning process. We test for the presence of gentrification using census socioeconomic and demographic data at differing spatial scales, using both the census tract and the census block group. We measure gentrification over multiple time periods from 1980 to 2018, using different lengths of time to account for economic cycles. To identify gentrification, we create a subset of eligible areas based on race, ethnicity and income. We then track certain supply and demand indicators along with race and ethnicity to identify gentrification.

We supplement our identification of gentrification at the local scale with two unique sources. The first is a panel dataset of multifamily apartment rents conducted by Montgomery County, Maryland, which allows for between-census comparison of multifamily rents. The second is another panel dataset, the Quarterly Census of Employment and Wages (QCEW), which is an administrative database of firm geolocations and wages. That dataset will allow for identification of increased economic activity, proxied by firm openings and wages, in census tracts or block groups which may or may not be gentrifying. Combined, these two data sources will "ground-truth" both the supply and demand sides of gentrification, by indicating if gentrifying areas are experiencing upward pressure on rents and increased levels of economic activity.

We find that gentrification is occurring in the corridor, but exactly where one finds it depends on how one looks for it. The ground-truth data offers clear evidence of gentrification in certain areas, providing evidence to practitioners that that gentrification does not wait for new transit to come before it takes hold.

## **WHITENESS IN BLACK SACRED SPACES: POWER, PROCESS AND PREDICAMENT IN PRESERVING HISTORIC BLACK CEMETERIES**

Abstract ID: 163

Individual Paper Submission

GOUGH, Meghan [Virginia Commonwealth University] [mzgough@vcu.edu](mailto:mzgough@vcu.edu), presenting author  
 HOWELL, Kathryn [Virginia Commonwealth University] [klhowell@vcu.edu](mailto:klhowell@vcu.edu), co-author  
 CAMERON, Hannah [University of Maryland, College Park] [hmcam@umd.edu](mailto:hmcam@umd.edu), co-author

During the progressive era, the development of public space was centered on elites who controlled the design and programming of public spaces (Belanger, 2009; Schmidt, 2008). However, particularly in the segregated South, this control meant that public spaces - including cemeteries, an early form of public space in cities - were unavailable to African Americans. To assert control over their environments and build strength, African Americans began to build their own institutions and spaces, including cemeteries (Silver & Moeser, 1995). These institutions facilitated the development of a Black counter-public, or community at least nominally outside of the white gaze and control (McKittrick, 2011; Roberts, 2020). Yet the racialization of space – or the identification of space within Black communities – reified the ongoing disinvestment by the state even as white communities received support for critical infrastructure to prevent neighborhood deterioration (Lipsitz, 2007; Goetz et al., 2020)

Yet, by the early 20th century, vast numbers of Black families left the South during the Great Migration to escape restrictive Jim Crow laws, leaving behind African American cemeteries founded without perpetual care funds to ensure future maintenance - and without state subsidies that by law have been allocated to maintain Confederate graves, markers and memorials. Without these resources, family plots were consumed by vegetation, vandalism and illegal dumping (Smith, 2020). Today, there is a "preservation crisis" in Black cemeteries, fraught with disagreement over how to preserve, and the roles in which the Black community - including descendant families - should play in the preservation of these sacred places that have been neglected for decades (Mortice, 2017).

This paper examines the role of white-led institutions engaging in Black spaces through a case study of the restoration process of Evergreen Cemetery, a historic Black cemetery located in Richmond, Virginia. Founded in 1891 by African American leaders, Evergreen Cemetery emerged as a resting place for affluent African American during the Reconstruction Era, and was designed as a counterpart to burial sites designated for Richmond's most influential white citizens, including Confederate president, Jefferson Davis. We examine the structures that create inequality of access and resources, and engage with the case study through analysis of the process, and the values and power structures that underlie engagement in Black spaces. We use a reparative planning framework to investigate ways that white-led institutions can break patterns of white supremacy and support Black power over Black spaces. We argue that white institutions engaging in Black spaces must adopt a reflective practice that acknowledges the legacy of white supremacy in our communities, recognizes our role in reproducing or changing these dynamics, and considers what has to change for a truly reparative approach to the future of engagement.

## HOW NEIGHBORHOOD CONTEXT, DENSITY, AND GENTRIFICATION SHAPE IMMIGRANT INTEGRATION

Abstract ID: 166

Individual Paper Submission

NEMETH, Jeremy [University of Colorado Denver] [jeremy.nemeth@ucdenver.edu](mailto:jeremy.nemeth@ucdenver.edu), presenting author

RIGOLON, Alessandro [University of Utah] [alessandro.rigolon@utah.edu](mailto:alessandro.rigolon@utah.edu), co-author

BURCIAGA, Edeline [University of Colorado Denver] [edeline.burciaga@ucdenver.edu](mailto:edeline.burciaga@ucdenver.edu), co-author

In this study, we investigate the role urban planners can play in building pathways for immigrant integration, or the dynamic, two-way process in which immigrants and their receiving society work together to create secure, vibrant, and cohesive communities. Current research in this area suffers from two major gaps. First, integration is often measured based on objective variables such as economic incorporation, language acquisition, or educational attainment (Portes and Rumbaut, 2014). Second, the field has rarely considered the role of neighborhood context (i.e., “place”) in creating a sense of belonging for immigrants.

We ask: How do neighborhood built environments affect whether and to what extent immigrants feel more or less integrated into their communities? Answering this question helps generate new insights into how planners, policymakers, and immigrant-serving organizations can build place-based pathways for immigrant integration. Using a sequential, mixed-methods research design, we examine how, in the context of a changing patterns of immigrant settlement in metropolitan areas, an immigrant’s neighborhood can shape their feelings of integration and belonging, measured based on the US feeling more like home than their birth country (Burciaga and Martinez, 2017).

For the quantitative portion of the study, we draw on 356 original surveys of immigrants administered in neighborhoods throughout the Denver Metro Area. We expected that immigrant integration rates will be higher in urban contexts than in urban edge and suburban contexts (hypothesis 1), in areas with higher population density (hypothesis 2), and in areas that are not at risk of gentrification (hypothesis 3). To assess the impact of neighborhood context, we sorted each respondent into one of three categories established in Denver’s form-based zoning code: urban, urban edge, or suburban neighborhood. We then use logistic regressions to assess associations between respondents’ experiences of integration (dependent variables) and independent variables included in our three hypotheses, while controlling for potential confounders such as education levels, immigration status, and duration of stay in the U.S.

Our findings refute the first hypothesis and provide support for the second two: Feelings of integration are higher in suburban and urban edge contexts (compared to urban), in areas with the highest population density, and in areas not at risk of gentrification. We then provide examples of neighborhood types that contain immigrants that feel “most integrated” into the receiving society. We use field observations to paint a picture of these neighborhood types and uncover other neighborhood characteristics that might be conducive to immigrant integration.

Planners should be encouraged by these findings as they provide clear direction for the practice. First, we should seek to understand what it is about suburban areas in particular that increase positive integration outcomes more than the traditional urban enclaves which first-generation immigrants have historically called home. Second, these findings lend support to planners taking action to retrofit lower-density suburbs into the denser, inner-ring suburban neighborhoods where immigrants report the highest sense of belonging and integration (Lung-Amam 2019). Third, these findings show that gentrification risk affects immigrants, suggesting that planners should target gentrification-vulnerable, immigrant-rich neighborhoods with anti-displacement initiatives.

This study contributes to an emerging body of literature and policy in a number of ways. First, it introduces a key spatial-analytical construct for immigration scholars that can help tease out the relationship between the built environment and immigrant integration (Németh, 2019). Second, it recognizes the important role that planners and designers can play in building more inclusive and integrative spaces for underserved populations, as our findings show that place matters in creating more positive contexts of reception for immigrant. Third, it helps nonprofits, policymakers, and other state actors advocate for built environment improvements in existing and potential arrival neighborhoods.

## **COPING THROUGH NEIGHBORHOOD CREATIVITY: DRIVEWAY, SIDEWALK AND STREET MESSAGING AND ART DURING COVID**

Abstract ID: 168

Individual Paper Submission

SAADAOU, Rababe [Arizona State University] rababesaadaoui@gmail.com, presenting author

PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, primary author

EHLLENZ, Meagan [Arizona State University] Meagan.Ehlenz@asu.edu, co-author

The COVID-19 pandemic has upended lives in deep and disparate ways: increasing mortality, hospitalization, unemployment and possibly future eviction and foreclosure rates; fragmenting family and friends; transforming computers into workplaces and schools; and overall tethering people more strongly to their homes and neighborhoods. Emerging research explores how these effects are dynamically shaping people's mobility and engagement in local economies (Conway et al. 2020). Relatively less is known, however, about how the pandemic is changing people's engagement with their neighborhoods, particularly during and after stay-at-home orders.

Our scholarship helps to fill this gap by using fieldwork and photographic and spatial analysis (Gaber 2020) to explore the evolution and nuances of one type of neighborhood engagement over the pandemic: the use of transportation infrastructure, such as driveways, sidewalks, and streets, for informal creative expression, like chalk

drawings and inspirational messages. We use data collected from on-the-ground observations, Google Street View, and Instagram to investigate trends in the geography, longevity, intensity, purposes, and participants of creative practices prior to and during the pandemic, with special attention to trends across three neighborhoods with diverse demographics and built environments in the Phoenix region.

Preliminary findings indicate that residents across the lifecycle are using neighborhood transportation infrastructure to originate unique forms of expression and adapt others promoted through social media to cope with pandemic-induced disruptions, losses, and uncertainty. A dominant practice is neighbors' use of transportation infrastructure for "art therapy" (Braus & Morton 2020), a space to express their concerns, values, and experiences. Other prevalent practices include neighbors' use of driveways, sidewalks, and streets to creatively adapt traditions like birthdays and graduations and connect, educate, and play with one another. We also have discovered distinct temporal and spatial trends in these practices, with dramatic upticks 1) during the pandemic's early stages in the spring 2020 and 2) related to messaging the public and neighbors, particularly on sidewalks and driveways. These trends, though present in all communities to some degree, were more prominent in more sprawling, white, affluent, and single-family home communities. Practices also exhibit spatial clustering within neighborhoods, suggesting an infectious or coordinated quality to them.

The broader impacts of our research for planning scholarship and practice are twofold. First, our findings contribute to existing and new theories of how residents engage with their communities to meet their needs and build a sense of place in creative and informal ways during a global pandemic (Mukhija & Loukaitou-Sideris 2014). Second, our findings suggest that planners and decision makers should exhibit caution in constructing jurisdictional definitions of graffiti and vandalism, given that the freedom to use neighborhood transportation infrastructure for informal, temporary expression may help communities cope with crises.

#### **REDEVELOPING A DISASTER RECOVERY MODEL FOR 21<sup>ST</sup> CENTURY NEEDS**

Abstract ID: 281

Individual Paper Submission

SOBHANINIA, Saeideh [Clemson University] ssobhan@clemson.edu, presenting author

Over 40 years ago the Kates Pijawka Model for Disaster Recovery was introduced in the book chapter *From Rubble to Monument: The Pace of Reconstruction* (Kates & Pijawka, 1977). Since its publication in the 1977 the model has been used and cited hundreds of times to explain the process reconstruction post-disaster, such as New Orleans post Katrina (Kates et al., 2006) and New York post Sandy (Jahan, 2015). While this model has been used many times, the question prevails whether in the face of rapid urbanization and climate change over the decades, does the model still hold true or has it reached its shelf life? Furthermore, what can be done to update it for the third decade of 21<sup>st</sup> century?

Through an in-depth view of the literature and an examination of how model has been used, this paper will look to answer the question of model's usefulness and it will suggest how changes can be made to it. Upon deciding on those changes, they will be put to the test using the case study of Hurricane Maria in Puerto Rico. The aim of the paper will be to create an updated version of the model which can be used by academics and policy makers to assess recovery success and for planners to be better design and implement more resilient urban forms that can adapt future shocks to the systems as well as alter their physical design to be more prepared in a more unstable climatic world.

#### **ADVANCING TRANSIT-ORIENTED COMMUNITIES & PLANNING FOR EQUITY IN LOS ANGELES**

Abstract ID: 297

Individual Paper Submission

SONG, Lily [Harvard University] [lsong@gsd.harvard.edu](mailto:lsong@gsd.harvard.edu), presenting author

Twice in the past decade, voters in Los Angeles County have approved ballot initiatives raising sales taxes to finance transport infrastructure investments throughout the region. In the face of uneven gains and displacement risks, the Alliance for Community Transit- Los Angeles (ACT-LA), a broad-based coalition of transportation advocates, community and neighborhood groups, and work centers, has led citywide and regional campaigns to ensure that the transit investments serve LA's largely Black, Indigenous, and People of Color (BIPOC) transit rider communities, and are coupled with affordable housing, tenant protections, and inclusive workforce and economic development policies.

This research explores two-interrelated questions: (1) How do infrastructure-based struggles and mobilizations led by frontline organizers reveal and challenge social supremacies baked into and reproduced through the built environment and prevailing spatial development? (2) How can planners and designers align our creative practices with frontline communities to combat spatialized supremacies and help repair, heal, and make whole urban environments and social relations? The multi-method study combined archival research and document analysis with interviews, direct participation, and deliberative discussions.

Findings highlight ACT-LA's strategic approach of combining social movement repertoires and agonistic politics with pragmatic policy and planning acumen to address mobility and spatial injustices in LA's stratified racial, ethnic, and class geography and highly speculative real estate market. They conduct grassroots organizing, popular education, and mobilization of working-class communities of color around mobility justice and equitable and sustainable urban development. This allows them to build collective knowledge and power as well as exert pressure on public officials and agency representatives while enlisting institutional allies. ACT-LA moreover continually builds trust and capacity among their organization membership by collaborating on research, strategy, policy and planning prototyping along with organizing and advocacy. They additionally partner with value-aligned planning, design, and legal experts to develop proposals and strategies that support transit riders while taking direction from directly impacted communities and organizers.

This case of Alliance for Community Transit-Los Angeles is particularly relevant and instructive to planners in academia focused on questions of equitable infrastructure and spatial development (without displacement) along with issues of justice and inclusion, power and politics, and planning ethics, and building careers around engaged community partnerships.

#### **BEYOND COMMUNITY POLICING: CENTERING COMMUNITY DEVELOPMENT IN EFFORTS TO IMPROVE SAFETY IN IMMIGRANT COMMUNITIES**

Abstract ID: 333

Individual Paper Submission

ALVAREZ, Nohely [University of Maryland] nohelyt1@umd.edu, presenting author  
LUNG-AMAM, Willow [University of Maryland] lungamam@umd.edu, co-author  
GREEN, Rodney [Howard University] rgreen@howard.edu, co-author

Black and Brown communities have been the hardest hit by current events – from COVID-19 and its economic fallout to newly revealed police violence levels. But recent uprisings have spurred critical conversations about addressing the underlying conditions that produce and exacerbate vulnerabilities in these communities. Calls to defund police have centered on investing in alternative modes of ensuring community safety that does not rely on traditional policing. Our case highlights community-based organizations' critical role in helping residents imagine and execute programs that improve community safety and perceptions of security.

This paper reports on a four-year community-led effort to reduce crime and improve safety in a predominately Latina/o/x immigrant suburb outside of Washington DC. The effort was a federally sponsored "community policing" program supported by the U.S. Department of Justice's Community-Based Crime Reduction Program (CBCR). The program sought to reduce crime by leveraging community knowledge and expertise, focusing on neighborhoods where crime is concentrated, and addressing crime's root causes. A community-based immigrant rights organization with longstanding community relationships received the grant and enlisted us as researchers from area universities to provide regular data on crime, conduct resident surveys and focus groups, learn about their safety and police perceptions, and evaluate program initiatives' effectiveness. Project activities focused primarily on community-building activities, including gang prevention programs, infrastructure improvements, alcohol awareness, public resource campaigns, youth soccer leagues, and community walks. They also provided regular meeting spaces for police officers and community residents to share data and provided language training to local officers to increase communication and trust with residents.

Our evaluations of the initiatives, interviews with participants, and data collection from the annual survey

demonstrated that community policing activities did little to increase residents' sense of safety and improve their police relationships. Alternatively, the community development efforts that focused on building community, engaging and educating residents, and improving community infrastructure greatly impacted residents' sense of security more significantly. We argue that such efforts re-center the focus of policing discourses from the criminalization of people to the criminalization of state-sanctioned neglect and underinvestment in Latinx communities. The case highlights the insecurity and precarity produced by the state's failure to provide adequate and equitable public services and over-police low-income immigrant neighborhoods. In doing so, it highlights the importance of investing in underfunded place-based community development efforts and CBOs as alternatives to traditional and community policing. Such measures not only ensure that Black and Brown communities feel safer but address the root causes of crime and neighborhoods' uneven risks and vulnerabilities to crime.

### **LEVERAGING COMMUNITY SCHOOLS FOR COMMUNITY DEVELOPMENT: LESSONS FROM BALTIMORE'S 21<sup>ST</sup> CENTURY SCHOOL BUILDINGS PROGRAM**

Abstract ID: 363

Individual Paper Submission

BIERBAUM, Ariel [University of Maryland] bierbaum@umd.edu, presenting author

BUTLER, Alisha [University of Maryland] abutler1@umd.edu, co-author

O'KEEFE, Erin [University of Maryland-Baltimore County] eoakeefe1@loyola.edu, co-author

The COVID-19 pandemic has affirmed the critical role that schools play in the delivery of the social safety net. Schools are not only sites of teaching and learning but also sites where resources – including meals, healthcare, and other social services – are delivered to families. The community schools model is one approach to school-community partnerships that aims to link schools to their surrounding communities. The model begins with the premise that students' success is dependent on their – and their families' – overall wellness and links schools with local partners to provide education, healthcare, expanded learning opportunities, and other resources for families and community members (Coalition for Community Schools, n.d.; Warren, 2005). Community schools are neighborhood assets – open both to the school-based community (e.g., students, families, educators) and the place-based community (e.g., neighborhood residents, community partners).

In practice, community schools policy design and implementation has traditionally centered on the school improvement goals of the community schools model (Holme et al., 2020), with a focus on bringing partners and resources into schools to benefit students and their families. What might it look like to extend the community schools' model and create a more porous boundary between the school and the neighborhood? Moreover, what might it look like when community schools are positioned as neighborhood assets that can catalyze community development, cementing the link between schools and their surrounding neighborhoods?

This article draws on data collected for a larger study of the implementation and early outcomes of Baltimore’s 21<sup>st</sup> Century School Buildings Program (21CSBP) to understand the potential of community schools for catalyzing community development. In this article, we define community development as a process of place- and people-based initiatives that infuse resources into economically disadvantaged and disinvested communities (Wolf-Powers, 2016).

The 21CSBP leverages an unprecedented \$1.1 billion investment to Baltimore City Public Schools System (BCPSS) buildings. The design of the new and renovated buildings would not only support schools’ academic programs but also recreational opportunities, school partnerships, and joint-use of school facilities. Stakeholders saw an additional opportunity to use these schools to catalyze community development and make improvements in neighborhood infrastructure like housing and transportation. We draw on interviews with philanthropic partners, city agency and school district personnel, as well as interviews with school- and community-level stakeholders in three communities – Southwest Baltimore, Southeast Baltimore, and Cherry Hill – to understand the role of 21CSBP community schools in neighborhoods and their potential to catalyze community development.

We ground our analysis in Valli, Stefanski, and Jacobson’s (2016) school-community partnerships typology, which we use to understand the relationships between 21CSBP community schools in each of the focal neighborhoods. We find that across the three neighborhoods, the 21CSBP schools demonstrated elements of the full-service community schools approach and offered a range of services to the schools’ students, their families, and the broader community. We also found elements of the community development approach to partnerships, which was possible when lead agencies and their staff had a clear vision for the link between schools and their surrounding communities and the structures to support development. We argue that the lead agencies’ mission and vision for community schools can support a more porous boundary between schools and their surrounding neighborhoods and promote broader community development.

#### FROM AN ART FESTIVAL TO A YOUTH MOVEMENT: CITIZEN PLANNING IN A BRAZILIAN FAVELA

Abstract ID: 387

Individual Paper Submission

MOYA-LATORRE, Antonio [Cornell University] am3332@cornell.edu, presenting author

Jardim Colombo, a highly dense favela in the outskirts of São Paulo lacking a solid civic infrastructure, has historically struggled to address its social challenges (Mesquita, 2016). That fate changed with the birth of a self-proclaimed youth movement during the first art festival in this neighborhood, on July 22, 2018. Planned and delivered in one month, the festival gathered dozens of volunteers and hundreds of neighbors to dream together about the transformation of a dumping site in the middle of the neighborhood into a park for the community. Thrilled by the

spark that had been ignited, a group of young leaders of Jardim Colombo acting like “citizen planners” (Beard, 2012) met shortly after to envision an ambitious social and cultural agenda for the months and years to come (Moya-Latorre, 2019). One of this movement’s greatest achievements took place only two years later, when the COVID-19 pandemic hit. Given the impossibility of physical distancing, young community leaders quickly organized to ensure access to healthcare and food supplies while the lockdown lasted. Months later, they would proudly communicate that no single resident in Jardim Colombo had died of COVID-19 during the first wave of the health emergency.

How did an art festival overcome existing barriers for community engagement and turn into a larger youth movement? What defining qualities in its conception were crucial for its later consolidation as a civic infrastructure with growing capacity to respond to multiple social challenges? How much of this youth movement was indeed result of a conscious process of community planning? In this paper, I address these questions to understand what makes this youth movement a unique account of community engagement and citizen planning in an urban periphery of a city in the Global South.

This article draws from three months of fieldwork in the Summer of 2018 during which I employed participatory action research and ethnographic methods. During my fieldwork I focused on (1) co-facilitating the first art festival in Jardim Colombo and engaging in participatory design with the local community; (2) taking detailed, regular fieldnotes on my observations and experiences; and (3) “reflecting in and on action” (Schön, 2011) with the team and individually about the experience of the festival and what followed – the latter taking place over the two years after my fieldwork.

On the analytical side, I conclude that this nascent movement was possible thanks to a powerful cocktail of qualities – including its spatial dimension (Tonkiss, 2005), its co-generative origin, and its celebratory character. Crystallized during what I call “cycles of creativity” – a concept inspired in Sidney Tarrow’s “cycles of contention” – this rich combination of attributes resulted in a powerful civic infrastructure capable of adapting to different goals and challenges in the years to come, including the urgency of an unprecedented pandemic. As for the implications for community planning practice, I ultimately argue that multifaceted, art-based civic infrastructures of this kind can be planned to build in adaptability and embrace the unforeseeable.

#### **PRESERVATION AND DEVELOPMENT OF TRADITIONAL VILLAGE BASED ON ACTION THEORY: A CASE OF DIMEN, GUIZHOU, CHINA**

Abstract ID: 427

Individual Paper Submission

HU, Miao [College of Architecture and Urban Planning, Tongji University] 2557569172@qq.com, presenting author

Historic preservation in some contexts (in Chinese cities, for example) focuses mainly on the “top-down” governance, resulting in many residents’ behaviors violating the preservation plan. Based on the action theory, with

the case of Dimen traditional village in China, this paper elaborates systematically how “structures” (namely resources and rules) can guide and restrict residents' actions and therefore influence spatial production, and how “actions” in turn reconstruct “structures”. It aims to offer an empirical experience for the more effective implementation of the preservation plan from the perspective of the “bottom-up” process.

This paper first summarizes Giddens' theory of action and relevant sociological discourses on the production of space. The key argument is: Spaces are transformed into “locales” by social structures through people's actions. It means how people use space and interact in space will shape the form of space. Because people's actions are enabled by rules and resources, the form of space is subject to social regulations and the resources (both material and authoritative) available to the actors. Since the motives for people's actions are closely related to social relations, power, and the symbolic properties of social goods, space embodies these social order. Space, in turn, also affects social structures and people's actions in it.

Subsequently, with the case of Dimen village, this paper first analyzes the consistency between the historic spatial order of the village and the villagers' traditional daily routines. Then by comparing the author's field research on the status quo of the village in 2017 with the preservation plan formulated in 2014, this paper finds that although the public spaces of the village are well protected, many new renovations carried out by villagers in their private residential buildings violated the preservation plan and damaged the historic landscapes. For example, some historic buildings were expanded arbitrarily, and some villagers adopted “fake wooden facades” on their concrete houses or even imitated the western classical column order on the facades.

This paper analyzes the motives for these renovations from the social relationship and symbolic properties of social goods: The local traditional collective public life is being transformed into a lifestyle that focuses more on the nuclear family and brings different demands of living space; Villagers generally regard western building components as a symbol of more affluent or modern culture. This paper analyzes how these renovations are enabled from the perspectives of resources and rules (structures): Public and private buildings receive different proportions of subsidies through different channels; New building materials and techniques introduced from eastern China weakened the advantages of traditional wooden houses; The decline of the public enterprise of the village decreased the authority of the local government, while the accumulation of the household assets increased the power of individuals; Some rules in the preservation plan are too strict, so residents adopted a compromise method between completely wooden and completely concrete houses to meet both their own needs and the regulatory requirements. Finally, the paper discusses how these changes prompted urban planners to modify certain rules in the preservation plan and offer new resources to make it easier for the residents to implement the plan and avoid these negative renovation actions.

To sum up, historic preservation plan can guide and restrict residents' actions through rules and resources, thereby affecting spatial changes. In turn, the actions of residents have also reshaped the rules in the plan. The changes in the spatial order manifest the transformation of social relationships and social order. Urban planners should theoretically analyze residents' actions so that they can actively guide, motivate, and utilize the initiative contributes of local actors, and make the preservation plan more practical.

## **EVALUATING PUBLIC ENGAGEMENT USING OPEN SURVEY FOR A LONG-TERM URBAN OPEN SPACE DEVELOPMENT IN SEOUL**

Abstract ID: 433

Individual Paper Submission

SHIN, Myungjin [Seoul National University Graduate School of Environmental Studies] Meinung8@snu.ac.kr, presenting author

WOO, Jung Hyun [Harvard University Graduate School of Design] jwoo@gsd.harvard.edu, co-author

CHOI, Hyeyoung [School of Civil, Architectural Engineering, and Landscape Architecture, Sungkyunkwan University] hyeyoung@skku.edu, co-author

Public engagement for urban open space development has been gaining attention since the mid-20th century when urban renewal projects began to receive criticism for top-down policy implementation without public communication. However, the long-term nature of the urban development makes it difficult for sustained participation by the public, as well as the assessment of such public engagement efforts. Furthermore, studies in community participation in general has been under constant criticism regarding its evaluation, as the effect of community participation is difficult to measure with precision. In addition, with the technological advances in planning and public engagement, as in the online platforms, information distribution channels, public participation GIS systems, etc., the diversity of public engagement methods continues to grow; hence, a comprehensive exploration into the effects of these methods is necessary for those who will be designing and executing public engagement programs as part of the urban open space planning schemes in the future. How does the public respond to the different public engagement methods? Furthermore, in the face of the pandemic, what methods should we adapt to maximize the effects of the public engagement for urban open space planning without endangering the public?

This study conducted an online survey of 2,000 people on the public engagement of urban park development policy, particularly of the Yongsan Park in Seoul, up until 2020. Yongsan Park Development Scheme is a long-term project in South Korea whose primary goal is to repurpose a U.S. Army Garrison in Seoul, or Yongsan Garrison, into a large park. Spanning over 300ha, Yongsan Garrison has a long history of foreign occupancy throughout the 20<sup>th</sup> Century. Plans to turn this space into a park has been an ongoing debate between the two nations since the late 80s; with the Yongsan Park Master Planning Project coming to a close in 2018, the Park Development Scheme is preparing for the eventual park construction. However, because of the site's unusual scale and contextual complexity, the Korean public has yet to come to a consensus regarding the outcome of the overall process.

In this study, the authors hypothesized that the survey should demonstrate the following: (1) the public engagement efforts for Yongsan Park development has been ineffective; (2) mass media is an efficient option for delivering information to the public, while the quality of the information deliverance cannot be guaranteed; and (3) mixed methodology in public engagement is necessary to cater to multiple needs of the public, particularly as remote engagement becomes a viable alternative.

While a survey has its limitations in terms of evaluating a long-term project, this study nonetheless found several noteworthy results pertaining to the following: determining a target for public engagement, the varying perspectives according to age or regional categories, the difference and possible incorporating of the in-person participation and the remote participation, the issue of mixed-messages in long-term urban developments, online mass media and the public impact, and policy effectiveness according to the public.

Several features of the Yongsan Park Development Scheme make this study a unique venture: its central location in Seoul; century-long occupation by foreign military bodies; and the discussions and design process under way despite the prolonged occupancy by the U.S. Army. The results not only evaluate the objective efficiency of the Yongsan Park Development Scheme, but also demonstrate the need for mixed methodology which can cater to the diverse

public that are concerned with the urban open space development from varying degrees of interests. Finally, this study shows that while public engagement is essential for urban open space planning, its methodology must adapt to different sociocultural needs and situations to garner maximum efficiency.

#### HEALTHY PLACES, HEALTHY PEOPLE: THE ROLE OF PLANNING, BUILT ENVIRONMENT AND SOCIAL ENGAGEMENT

Abstract ID: 437

Individual Paper Submission

ZHANG, Xue [Cornell University] xz435@cornell.edu, presenting author

WARNER, Mildred E. [Cornell University] mew15@cornell.edu, co-author

Neighborhood and the built environment are important social determinants of health. Walkability and mixed-used built environment are recommended planning actions in the public health field. However, there is limited evidence showing the connection between urban planning and population health for two reasons: 1) the historical separation of land-use in American zoning regulations inhibits mixed-use development, and 2) the lack of data on local indicators of built environment to examine the health effects of planning policy. This research fills the gap.

In 2019, we conducted a national survey on 1312 local governments' actions to build a livable community for all ages. The survey explores built environment features including walkability (sidewalk systems, bike lanes, and complete streets), and mixed-use (a mix of retail, services, and housing, parks and playgrounds, public gathering spaces, and fresh food markets). The survey also measures how these relate to planning and zoning regulation, and public participation. We link the survey data with socioeconomic data from the American Community Survey to model key domains of social determinants of health: built environment, social context, health insurance coverage, and economy. Health data are constructed from the most recent CDC 500 Cities & Place data portal at the census tract level, and include the crude prevalence of obesity, diabetes, and physical unhealthy for more than 14 days. This comprehensive dataset allows us to address the following questions: does the built environment matter for population health after controlling for other social determinants of health? What role does planning play? Does social engagement matter? We run Structural Equation Models to answer those research questions.

Results show a positive relation between walkability and mixed-use built environment and all the health outcomes. Although the marginal effects of built environment are lower than the effects of economy and health insurance coverage, we find that people living in communities with more walkable streets have a lower percent of obesity; people living in communities with more mixed-use neighborhoods have fewer physically unhealthy days; and people living in communities with neighborhood walkability and fresh food markets have a lower percent of diabetes. We also run a built environment model to explore the role of planning. Results show that zoning codes promoting

walkability and mixed-use have the largest effect on better built environment outcomes. Results also show an urban bias, as denser places have better built environment outcomes.

Social engagement matters for health outcomes. Results show that communities with more volunteer opportunities have a lower crude prevalence of obesity. Obesity is a preventable disease that is lower in communities with more social engagement. Models also show that having a comprehensive plan is not directly related to the built environment, but civic participation in the planning process is related to better built environment outcomes.

Building a healthy community requires planning efforts to encourage both walkability and mixed-use environments. Planners should also recognize importance of social engagement in increasing the sense of community and promoting public health.

## REFUGEE RESETTLEMENT IN THE US: ORGANIZATIONAL NETWORKS THAT SUPPORT INTEGRATION

Abstract ID: 442

Individual Paper Submission

JUDELSOHN, Alexandra [University of Michigan] alexjud@umich.edu, presenting author

Resettled refugees regularly conjure considerable debate about their potential to either drain a city's resources or contribute to a city's revitalization (Maxmen, 2018). Yet, how the city that refugees are resettled in affects their ability to thrive and contribute productively to the cultural, economic and social fabric of their host community is rarely considered by urban planning scholars or practitioners. Moreover, the U.S. refugee resettlement program does not consider a city's characteristics when deciding where to place refugees. Once refugees are slated to come to the U.S., national resettlement agencies determine where to place refugees based on family ties or which federally-funded local agencies have immediate capacity to administer resettlement services, with little input from local governments or consideration of other grassroots agencies that often emerge to offer refugee support (U.S. GAO, 2012). Refugee resettlement services center around economic self-sufficiency, viewing refugees as workers (Gonzalez Benson & Taccolini Panaggio, 2019; Okour, 2019). Furthermore, local resettlement agencies are funded to work with their clients for 30 to 90 days, a short amount of time for their clients to adjust to a new culture and gain economic independence.

In other major resettlement countries, integration - where both the immigrant and host community are open to change and diversity - is what resettlement processes center on. The conceptual framework of integration provides a comprehensive understanding of the refugee experience, proposing that successful integration falls into four thematic areas, including "achievement and access across the sectors of employment, housing, education and health; assumptions and practice regarding citizenship and rights; processes of social connection within and

between groups within the community; and structural barriers to such connection related to language, culture and the local environment” (Ager & Strang, 2008). Yet in the U.S., our fragmented resettlement system, which differs among states, does not make clear which agencies are responsible for these services.

This research examines the network of formal and informal agencies that assist refugees in resettlement, focusing on two rust belt cities that have served as major resettlement locations in recent years. In addition to a review of municipal policies and plans, data collection methods include semi-structured interviews with local resettlement agencies, government officials, representatives from refugee-run grassroots organizations, and other agencies that support refugee populations. Preliminary findings suggest that more formal institutions such as local governments, healthcare providers, and federally-funded local resettlement agencies work together, but there is a disconnect with grassroots organizations that are centered within the refugee community.

Findings from this research have various implications for refugee resettlement and planning practice, informing the needed networks to provide successful resettlement systems. As a global leader in refugee resettlement, having a more critical understanding of the effects of placement in the US refugee resettlement program, it is crucial for ensuring that refugees have the tools to integrate more effectively. Understanding impacts of city placement is imperative, particularly as the number of refugees resettled in the U.S. sharply increases in coming years.

Populations are increasingly exposed to natural hazards due to expanding development and climate change. This exposure is exacerbated by sociodemographic and socioeconomic factors limiting resources for disaster mitigation and recovery. Federal disaster assistance is a crucial lifeline for impacted communities in the wake of catastrophic events by supplementing local resources. However, recent research suggests that federal disaster assistance may exacerbate existing inequality across social groups within vulnerable communities. The most pervasive and costliest disaster in the United States is flooding. The federal government maintains a suite of programs supporting flood mitigation and recovery assistance, yet a comprehensive understanding of how these programs may foster

inequitable outcomes across social groups is lacking. This paper uses a systematic review of federal flood policy literature over the last decade to fill this gap and identify patterns in the social and situational contexts that may contribute to inequitable flood outcomes. Results suggest that the policies themselves do not explicitly lead to inequitable outcomes. There is evidence, though, that policies prioritize equality over equity, and in turn do not overcome historical and systematic oppressive and racist decision-making. These findings further the understanding that social vulnerability to natural hazards is a complex and contextual issue.

#### **VULNERABILITY OF THE BUILT CULTURAL HERITAGE IN THE URBAN CENTER OF THE MUNICIPALITY OF PONCE, PUERTO RICO: A LOOK AT PUBLIC POLICIES AND RISKS MANAGEMENT PLANS FOR EARTHQUAKE RESPONSE FROM THE PERSPECTIVE OF CULTURE AND HISTORICAL PRESERVATION**

Abstract ID: 466

Individual Paper Submission

MARRERO, Jose [University of Puerto Rico] jose.marrero28@upr.edu, presenting author

On January 7, 2020, a 6.4 magnitude earthquake shook the southern part of Puerto Rico. This event was followed by major sequels that further weakened the already compromised structures causing considerable damage to many Spanish colonial buildings in Ponce: one of the oldest and most important municipalities of the Island. Ponce have a rich history dated from 1692 and typical of its origins its urban center houses many colonial buildings with prominent architecture. Some of these structures are included in the National Register of Historic Places. Due to its geographical location, earthquakes have always been a threat to Ponce and particularly to its rich built cultural heritage. From a cultural framework, the importance of heritage preservation is evident when defining the term "culture" as the past and the future synthesized in its present identity. If culture implies a harmony of ideas in a shared meanings, values and representations that serves to structure beliefs and actions and dictate order in society, then culture can induce sense of belonging to a community that allows the preservation of its historical heritage.

This research examines the public policies and risk management plans applied to the municipality of Ponce from the perspective of the preservation of its built cultural heritage and in the light of earthquakes. The investigation explores if changes in governance models are necessary to reinforce Ponce's cultural identity as an important community asset for development. Fundamentally, the analysis seeks to find answers to the following questions: What were the lessons learned through the seismic history of Ponce? Before the recent earthquakes, were there risk management plans for the built heritage of Ponce? Is there governance aimed at maximizing the social, cultural, and economic potential of Ponce's-built heritage? Is there room for improvement?

The methodological approach is based on the analysis of existing public policies aimed at urban regeneration in the context of risk management for historic buildings. Also includes comparative analysis of the physical conditions of some historical properties owned by both, private and governmental sectors to study correlation between actors and preservation. Finally, the methodology performs analogous case study of a community conservation initiative with the purpose of identifying best practices that could be applied to the municipality of Ponce.

The research suggests that the lack of cultural identity does not encourage preservation, and that this mindset appears to be institutionalized in public policies and permeated communities. Additionally, higher-ranking legal instruments do not consider culture as an important element for development. In turns, these laws are aimed at boosting economic growth indicators rather than promoting structural changes. Furthermore, it is inferred that the fact that there are government agencies committed to the preservation using culture as means to conservationist ends, and at the same time there are higher-hierarchy legal instruments that disregards that cornerstone, points out careless governance practices that usually results in poor execution. Finally, existing private initiatives committed to enhance the historical context of the built heritage promotes community empowerment which results in spontaneous preservation. However, perhaps due to the perception of seen culture as a matter of the elites, these initiatives have not managed to insert themselves into popular governance to form part of institutional public policy. To achieve the preservation of the built historical heritage of Ponce it is necessary to implement risk management plans before, during and after earthquakes. Concurrently to this plan, it is necessary to strengthen culture as a fundamental element of identity to create a sense of belonging that allows the conservation of its heritage.

#### **PUSHING BACK ON DISPLACEMENT: COMMUNITY-BASED REDEVELOPMENT THROUGH HISTORICALLY BLACK CHURCHES**

Abstract ID: 539

Individual Paper Submission

BERNEY, Rachel [University of Washington] rberney@uw.edu, presenting author  
 BORN, Branden [University of Washington Seattle] brandenborn@gmail.com, co-author  
 BAKER, Olivia [University of Washington] obaker@uw.edu, co-author  
 JONES, Mark [Sunyata Agency, Inc.] mark.r.jones@sunyata.ws, co-author  
 KING, Donald [University of Washington] dik49@uw.edu, co-author  
 MARCUS, Dylan [University of Washington] dmarcus2@uw.edu, co-author

Gentrification and subsequent displacement are common problems in cities, and result in the removal of poor communities and communities of color from urban areas as they move to cheaper locations in the metropolitan region. Here we describe a community-based approach to redevelopment by historic Black churches that seeks to counter such displacement and cultural removal. We explain the history of a historically Black neighborhood in Seattle and the founding and rationale for a church-led project called the Nehemiah Initiative. Our perspective is that of participants in the work of the Nehemiah Initiative and as faculty and students from a local university partner supporting it. We conclude with policy strategies that can be used to support such redevelopment in Seattle, with understanding that some may be broadly applicable to other cities.

Seattle's Nehemiah Initiative is a faith-based community redevelopment organization that takes advantage of the fact that many historic Black churches are longtime landowners in a rapidly transforming city. The Initiative is the collaborative effort of a number of pastors and their churches. Seattle faces a lack of affordable housing, and as new, more expensive buildings and homes rise in the place of old, a conflict over affordability and provision of housing continues to unfold.

In the paper, we review the historic and current context for gentrification and related displacement in Seattle's Central District. We describe the Nehemiah Initiative, both how it came to be and what it is attempting to do. The Initiative is a potential model for other communities struggling with similar issues of growth, gentrification, affordability, and displacement. The model intends to demonstrate an innovative solution to the challenges based on the combination of church land ownership, community participation, professional skills and vision in a rapidly growing region, and the support of local government and university collaboration in the goal of providing and preserving housing opportunity for all residents of the city. Finally, we also describe a developing university-community partnership in which students and faculty from the University of Washington's College of Built Environments have worked to support the Initiative.

Members of the Nehemiah Initiative began working with faculty members from the College of Built Environments during the summer of 2019. To date, the Nehemiah Initiative and the UW have collaborated on five classes over academic years 2018–2019 and 2019–2020. The College has hosted studio-style courses focusing on various aspects of the church-based development proposed by the Nehemiah Initiative. Plans are in place for such studios/collaborations to continue. This paper focuses on the courses and projects that involved the Department of Urban Design and Planning.

#### FIGURING OUT SOCIAL ROLES IN NEIGHBORHOODS: MIDDLE-AGED SINGLES IN THE CITIES—A CASE FROM TOKYO, JAPAN

Abstract ID: 572

MATSUMOTO, Naka [Kobe University] nakam227@gmail.com, presenting author

For several decades, the number of single-person households in large metropolitan areas has significantly increased, and those singles' backgrounds are diverse (Klinenberg, 2012). Part of the single-person households vigorously discussed in the literature is highly educated young professionals returning to the inner cities, often proving to be gentrifiers or the creative class (Florida, 2002; Lees, Slater, & Wyly, 2008). Another part is elderly singles, which raises concerns over their well-being (Klinenberg, 2001). Both groups experience weaker ties to neighbors and social fragmentation in urban cities (Putnam, 1995). However, there is little attention paid to middle-aged singles born in the cities or who entered when they were young. Most of them live in the city for work and are still relatively healthy and active, while just started to think about their retirement without direct family members. Despite a large number of middle-aged singles, their social roles in the city and neighborhood and how they build relationships are relatively unknown. By interviewing 22 singles and examining the survey data (N=2,598) of those between age 35 and 64 in central Tokyo, Japan, this paper explores this demographic's social relationships with family members, friends, and neighbors and examines their "roles" in society.

In the interviews, the singles expressed the ease of living in a large city for convenience, entertainment, and anonymity. Without close family members requiring support, singles tend to move locations and jobs. Some described active social relationships with friends through work and activities, such as sports and listening to live music. However, because many moved to Tokyo from other regions, they often lost ties with childhood friends. Moreover, they resisted social relationships with those with families because of difficulty finding common ground. There are also cultural norms in Japan suggesting that singles are "losers" or "immature," and self-evaluation makes them refrain from playing active roles in the neighborhood. Without clear "roles," middle-aged singles struggle to find a place—physical space and social position—in the cities and neighborhood.

There are also gender differences in how they approach neighborhood activities. Women tend to join the activities if friends ask them or if the group's mission aligns with their interests. In addition, more women buy apartments believing it is financial independence they earned and a reliable asset for retirement life. In contrast, middle-aged single men seek marriage and feel it will help them become a part of the neighborhood community. They think marriage will solve issues of isolation and loneliness, although the reality may not reflect that.

In conclusion, this paper finds that despite large cities giving singles freedom to choose their lifestyles, singles struggle to find a meaningful way to engage in the neighborhood community and society at large, a problem more apparent for men. The paper advocates needs in changing social norms, which would predetermine the social roles according to gender, age, and marital status.

It is also crucial for neighborhood organizations and local institutions to include singles as proper members of the neighborhood by sharing roles with them. Middle-aged singles playing active roles can be a great asset for cities, and they can contribute to society if they find appropriate roles.

The worldwide coronavirus pandemic created new obstacles to community engagement with only online methods as means for reaching community members. As Afzalan and Muller reported, online methods potentially “intensify social injustice and an unequal distribution of power.” Testing whether online approaches instead can serve community needs is an important planning concern. Our paper attempts to answer the question: can we successfully adapt a proven community outreach approach (Sloane et al, 2019) to an online project to listen, learn, and develop priorities around traffic safety for an underserved, under-resourced ethnic and racial community?

Traffic safety is a critical community development issue given the high number of injuries and deaths. Motor vehicle collisions are the leading cause of death for Los Angeles children aged 5-14. Multiple researchers have written about the role of infrastructure and environmental changes intended to improve traffic safety, especially on large arterials (Dumbaugh & Rae, 2009; Yu, Zhu, and Lee, 2018). Fewer studies (Banerjee, Uhm, Bahl, 2014) have considered the role of traffic around schools, especially in ethnically and racially diverse neighborhoods.

In spring 2020, a collaborative group received a small grant to conduct a series of art-based interventions to combat the high number of pedestrian and cyclist injuries in a neighborhood in South Central Los Angeles. The residents and collaborators chose to focus on traffic and community safety issues around 5 schools – 4 elementary, 1 elementary to high school. The area where the project is being conducted is home to a dense, poor, renter population with over 14,000 school children. In 2019, 6 area streets had been designated part of the city’s High Injury Network.

In summer 2020, street-based interventions had become impossible, so the collaborative— university professor, creative studio for civic engagement, pedestrian safety advocacy group, and local school-based safety program – pivoted to begin an online engagement process with the neighborhood’s largely Latinx and Black residents.

This paper presents the initial findings of our effort to use online methods through which the residents could define and refine their safety concerns. The group was able to develop cohesion among the over 3 dozen residents, organize a “story map” to illuminate their issues, and begin the process of creating a list of necessary improvements for their neighborhood.

After the initial listening sessions led to the decision to focus on the schools, residents were asked to map their routes to schools, places where they had witnessed dangerous driving and collisions, and other infrastructure and social attributes. Building off of Banerjee, Uhm, and Bahl’s (2014) finding that social issues were as important as infrastructure issues regarding safe routes to schools, residents did not simply focus on infrastructure, they identified places they loved and feared.

These initial findings were collated into a “confetti” map that was presented back to the residents in further meetings, during which the group (residents and collaborators) learned about issues surrounding traffic safety and decided on next steps. The next step was to refine the information, systematize the visual representation of the problems, and begin development of a “story map” that could represent the neighborhood’s traffic safety issues to planners and policymakers.

Planners need to be more conscious of the consequences of cars and speeding in neighborhoods. This paper provides insight into outreach into communities that may be hard to reach physically, such as during the COVID pandemic, and methods for achieving a high rate of continuing participation. Over 40 residents joined a series of Zoom meetings where they voiced their initial concerns, went out and mapped, photographed, and wrote up their experiences, and established, with the collaborators, possible solutions to enhance their community's safety.

WANG, Xinhao [University of Cincinnati] wangxo@ucmail.uc.edu, co-author

COVID-19 has posted severe challenges to cities - more than 95% of cases were reported in urban areas, which spread 1,430 cities in 210 countries (Mishra, Gayen, & Haque, 2020). Urban resilience has been widely used, through the framework and pathways, to help mitigate and recover from shocks or stresses, such as disease outbreaks, climate change, etc. In response to COVID-19, many researches have focused on actively allocating resources, providing health services, obtaining external assistance, and supporting economic recovery to absorb and mitigate negative influences in the early stage of the epidemic (Fu & Wang, 2018; Peters, 2020). However, the contribution of adaptation ability of urban residents to urban resilience is still unclear. To fill in this gap, this study proposes a comprehensive framework to assess the interaction and adaptation of urban residents in the pandemic. Besides widely used economic, institutional, and social dimensions of adaptation, we investigate how urban settings, community services, learning ability of residents, and individual adaptive behaviors improve resilience through a bottom-up process. A questionnaire was designed and a survey was conducted in Yangling, Shaanxi, China, to collect thoughts, opinions, and suggestions from urban residents. Descriptive statistics and principal component analysis were used to analyze 336 valid responses. The preliminary results indicate that community resources, family income and savings, newly learned personal activities in the pandemic, and education level are primary influencing factors for residents' adapting to COVID-19. Urban resilience could be enhanced by leveraging the internal and external resources of individuals and communities through interconnected social networks.

The survey can be modified for similar studies in other cities. The study result can help form adaptation strategies according to residents' cognitions and conditions. It also provides scientific support for municipal officials and community leaders, as well as urban residents to adjust daily routines and learn to cope with public health

emergency, a critical part of urban resilience.

### MI SALA, TU SALA? PRACTICAL AND PEDAGOGICAL LESSONS FROM A COMMUNITY TACTICAL PLACEMAKING INTERVENTION

Abstract ID: 657

Individual Paper Submission

DOUGLAS, Gordon [San José State University] [gordon.douglas@sjsu.edu](mailto:gordon.douglas@sjsu.edu), presenting author

This paper presents findings from a multi-year teaching, community engagement, and research endeavor to design, build, and study a small-scale “creative placemaking” intervention in a quotidian urban neighborhood. Recognizing that creative placemaking and tactical urbanism are frequently employed in trendy neighborhoods or as part of economic redevelopment efforts, the project set out to explore what a more community-based placemaking effort could look like in a diverse neighborhood when explicitly reflective of local cultural identity and priorities for public space. In 2018, graduate and undergraduate students in an innovative two-semester urban design studio and practicum worked with community members in the Northside / Luna Park neighborhood of San José, California, to envision, design, and install a tactical urbanism-style placemaking improvement. The resulting space - a “community living room” outside of a laundromat - was then studied for two more years through on-site observation, interviews, and photo-documentation. The research shows that, despite some mistakes, a thoughtful and relatively durable public space was created through a process that a diverse array of stakeholders were engaged by and that left many interested community members pleased with the result; and that, over time, while not universally beloved or widely used, the space itself has attracted local caretakers and seems to have had a modestly positive effect on the surrounding streetscape. Pedagogically, the case represents a unique model for teaching community-driven design through ethnographic and participatory fieldwork, including the challenges of fostering equitable community participation in planning. The empirical findings, meanwhile, suggest opportunities and pitfalls for would-be placemakers to consider (from engagement strategies to technical mishaps). The study thus has implications for how planning scholars and practitioners alike might better understand culturally-relevant placemaking and urban design at the neighborhood level, including the potential limitations of so-called tactical approaches in adequately capturing local priorities and producing meaningful public spaces.

## **NISHNAWBE ASKI NATION (NAN) HOUSING STRATEGY - CENTERING THE LIVED EXPERIENCES OF FIRST NATIONS PEOPLES IN HOUSING EVALUATION.**

Abstract ID: 686

Individual Paper Submission

MCCARTNEY, Shelagh [Ryerson University] shelagh.mccartney@ryerson.ca, presenting author  
HERSKOVITS, Jeffrey [Ryerson University] jeffrey.herskovits@ryerson.ca, co-author  
KAUPP, Courtney [Ryerson University] ckaupp@ryerson.ca, co-author

On-reserve housing crises have been declared by governments and First Nations alike; however, definitions and proposed solutions vary widely. However, without a distinct evaluation framework quantifying the crisis relies on the standardized Canadian approach of Core Housing Need; which has been documented to be culturally inappropriate. Failing to measure specific impacts of climate, culture and geography on housing need makes evidence-based decision-making, for all parties, impossible. Creation, and measurement, of occupant-focused housing metrics presents opportunities for identifying alternative housing development strategies, policy options and funding mechanisms focused on equity.

Nishnawbe Aski Nation (NAN) Housing Strategy, an immersive and participatory project centering the lived experiences of First Nations peoples in housing evaluation. NAN represents 49 First Nations across northern Ontario, a territory experiencing inequitable housing outcomes because of generations of failed colonial interventions. Over a two-year period, members co-created unique housing metrics which considered the region's unique context. The result is an evaluation framework which can demonstrate longitudinal change in housing systems rooted in occupant priorities and a novel, place-based understanding of 'need'.

Findings demonstrate both theoretical and practical applications of Indigenous, community-based planning practice and show potentials and limitations for multi-disciplinary and cross-sectoral partnerships in creating policy change. While the specific metrics developed are uniquely connected the region, findings point towards a transferable approach to evaluation frameworks. Importantly, local conceptualization of housing need points towards the need for wholistic understanding of housing which incorporate well-being and social infrastructure indicators.

### **Methodology**

This project, and its foundational partnership, are rooted in anti-colonial and Indigenous planning theories. Counter to western, state-based planning principles, validity herein privileges the lived experiences and knowledge of Indigenous peoples; recognizing them as enablers of their own communities (Jojola, 2013). Utilizing Indigenous research methods (Drawson, Toombs, & Mushquash, 2017; Lavallee, 2009; Wilson, 2001) and participatory action research (PAR) (Kemmis, McTaggart & Nixon, 2014) as primary methodological tools in the development of a housing evaluation framework. Including interactive and immersive tools which engaged all community members—from Elders to youth—about their priorities and experiences of home. Importantly, the process was iterative, recognizing that research entails processes of translation and analysis findings remained rooted in local understandings.

Given the cross-cultural and multi-disciplinary nature of the research team all project stages required a focus on reflexivity. Partnership itself, and understandings of the specific practical challenges associated with the

implementation of anti-colonial theory given power imbalances present important methodological learnings.

## Findings

The primary finding of research is a locally-specific housing evaluation framework that has been tested in NAN First Nations. The framework presents an important turning point in data sovereignty for NAN First Nations and reframes the discussion of evidence-based decision-making in housing between First Nations and governments. In addition, through the participatory research process which developed the metrics which form the evaluation framework, a new and more wholistic understanding of housing 'need' was conceptualized. Using this wholistic definition of need creates a clear explanation for previous gaps in how to address how the housing emergency.

Specific metrics created may not be transferable, but the process and challenges faced in defining housing priorities and developing occupant-focused practices will have application with other populations experiencing inequitable outcomes. This practical application of documenting lived experiences and prioritizing cultural understandings of place to create policy change, contributes to a growing literature of bridging Indigenous and anti-colonial planning theory and practice.

## Relevance

This project identifies that each methodological approach has boundaries in the creation of community-developed, occupant-focused housing evaluation in First Nations. This work brings the concept of decolonizing planning processes to the scale of house/home to create equity in the lived environment.

## **INDIGENOUS CHURCHES AND SOCIAL SERVICES: THE ROLE OF TONGAN LATTER-DAY SAINT CONGREGATIONS DURING COVID**

Abstract ID: 743

Individual Paper Submission

SOAKAI, Sarah [UCLA] sarahsoakai@ucla.edu, presenting author

Third sector civil society that include faith-based organizations (FBOs) and institutions fill the gaps not provided by the state or the market. Churches, mosques, synagogues, and other faith-based religious organizations and institutions are uniquely positioned and often the most trusted local neighborhood frontline contact among indigenous, immigrant, low-income communities of color. Indigenous Pacific Islanders in the U.S. diaspora are no exception. Catholic churches, Evangelical churches, Jesuit churches, Latter-day Saint (LDS) Mormon churches,

Methodist churches, Protestant churches, and Seventh Day Adventist churches are prominent faith-based organizations and institutions among Pacific Islander populations. Churches are the central anchor institutions among Pacific Islander communities. I looked specifically at the role of local, neighborhood Tongan LDS ward and stake congregations in social services delivery during the COVID-19 pandemic. I applied Critical Race Theory (CRT), Indigenous Tongan Tā-Vā (Time-Space) Theory, and Brown Church Theory as conceptual, theoretical frames of understanding the social services delivery response of Tongan LDS Mormon ward and stake faith congregations among its communities throughout the COVID-19 pandemic. Such theories depict how Tongan LDS communities encompass an indigenous margin from the centered mainstream, but willingly participate within a space that has been indigenized in particular ways to provide symmetrical tauhi vā (economic, social, and spiritual well-being) during ongoing crises and shock disaster events like COVID. Using talanoa (informal conversation, ‘talk story’) semi-structured interviews with individual church leadership and legacy congregation members, survey focus groups with specific church entities, and church archives, data collection occurred in three different states, namely California, Hawai’i, and Utah, where a critical mass of Tongan LDS populations exist. Narrative stories collected empirically depict the central role indigenous Tongan congregations play throughout the COVID-19 pandemic in providing community and a safety net, and in delivering important social services. Faith communities are often limited in capacity and better serve its members by partnering and collaborating services with the state. Additional and needed delivery of social services from the other two sectors of society – the state and the market – among Pacific Islander populations impacted by COVID-19 requires coordination and collaboration with indigenous Pacific Islander churches in the United States to both enhance delivery and impact as well as minimize bureaucracy and duplication.

#### INEQUALITY AND INEQUITY IN HAZARD MITIGATION AND DISASTER RECOVERY POLICIES

Abstract ID: 753

Individual Paper Submission

JANG, Seonju [Texas A&M University] s.jang@tamu.edu, presenting author

MAKAREWICZ, Carrie [University of Colorado Denver] carrie.makarewicz@ucdenver.edu, primary author

RUMBACH, Andrew [Texas A&M University] rumbach@tamu.edu, co-author

SULLIVAN, Esther [University of Colorado Denver] esther.sullivan@ucdenver.edu, co-author

This paper uses spatial data on mobile home parks (MHPs), Hurricane Harvey FEMA Individual Assistance Claims, and geospatial flood zone data to compare the relative vulnerability to flood risk for single family housing and mobile homes in the Houston Metropolitan Area. MHPs serve as affordable and attainable housing, often for marginalized populations, and provide opportunities for their residents to engage in social activities as a part of a

community (Durst and Sullivan 2019). Studies show that, although affordable housing options positively affect long-term community resilience to disasters by reducing social vulnerability, the residents and housing structures tend to be disadvantaged in hazard mitigation and disaster recovery policies (Rumbach and Makarewicz 2016). This holds true for MHPs. A case study of MHP recovery after the 2013 Colorado Floods found that parks were more exposed to severe risks, and thus, greater damage (Rumbach, Makarewicz, and Németh 2016; Rumbach, Sullivan, and Makarewicz 2020). Moreover, “socio-spatial stigma” from prejudicial perceptions toward mobile home residents, further affected disaster recovery decisions (Rumbach, Sullivan, and Makarewicz 2020).

This study further investigates the inequities in disaster management policies related to mobile homes and MHPs by answering the following research questions: 1) to what extent are mobile homes and MHPs more likely to be located in flood prone areas relative to other housing types; 2) did mobile homes and MHPs experience greater rates of damage from Hurricane Harvey flooding due to their locations relative to flood zones; and 3) whether and how the share of verified damage covered by FEMA’s post disaster assistance varies by housing types and income? To answer these questions, we created a unique geo-spatial inventory of MHP-parcels from multiple data sources including parcel data, county assessors records, satellite images, and MHP industry data. We used the MHP-parcels to calculate the shares of Census blocks with and without MHPs in the high risk flood zone, and compared this to other housing types in these flood zones and all blocks throughout the region. We then compared these results to the FEMA Individual Assistance claims for Hurricane Harvey, which reports each claim by block and includes housing type, income, amount of FEMA-verified damages, and actual amount awarded for short-term rent, personal property, and real property.

The findings show that MHPs were more likely to suffer damages during flood events compared to other housing types because of the unequal geographic location of mobile homes in flood prone areas, rather than from mobile homes’ structural characteristics. This accords with our earlier findings from field observations, which showed the three foot elevation requirement for mobile homes protected them during the Harvey storm and flooding. We also found inequality and inequity in the post-disaster assistance that mobile home residents received relative to residents of single family housing, as well as by income. An additional finding is the inaccuracy of the American Community Survey (ACS) estimates of the location and number of mobile homes. In many cases, ACS does not report mobile homes in block groups where we identified MHPs and where there were FEMA claims. Using the ACS to study mobile homes may lead to inaccurate results.

This study reveals how planning regulations for housing development in flood prone areas increases risk for vulnerable populations and an important source of affordable housing. It further shows how FEMA housing recovery assistance policies exacerbate and perpetuate inequities in social mobility by failing to restore housing stability for populations with lower incomes. It also contributes a new methodology for accurately locating MHPs, which fills a gap due to inaccurate and incomplete records from other sources, including county assessor records, the ACS, and industry associations.

## **SUBURBAN AGING: AN EXAMINATION OF BUILT ENVIRONMENT AND SOCIAL INFRASTRUCTURE SUPPORT IN GREAT MELBOURNE**

Abstract ID: 762

Individual Paper Submission

HARTT, Maxwell [Queen's University] m.hartt@queensu.ca, presenting author

DEVERTEUIL, Geoff [Cardiff University] deverteuilg@cardiff.ac.uk, co-author

POTTS, Ruth [Cardiff University] pottsr1@cardiff.ac.uk, co-author

Growing old in a suburban environment can be difficult. As we age, we are increasingly likely to experience some kind of physical or cognitive impairment. Simultaneously, the likelihood that we do not, or cannot, drive an automobile grows. As a result, our life spaces shrink. Without reliable transit, easy access to services, family and friends, older adults in suburban neighbourhoods may face loneliness, depression, and other health risks. The importance of supportive built and social infrastructure in all communities is critical to aging well. It is especially critical in the Australian context – one of the world's most suburban and rapidly aging countries. Over two thirds of Australians live in suburban environments and the Australian "baby boom" generation is, proportionally, one of the largest in the world. This paper examines the magnitude and spatial distribution of demographic aging in relation to the built environment and social infrastructure in the city and surrounding suburbs of the Greater Melbourne metropolitan area. Specifically, we ask: what is the relationship between built and social environments at the neighbourhood scale to individual older vulnerability? And how are(n't) planners and policymakers addressing challenges of aging in unsupportive environments?

Our study follows a two-part research design. First, we undertook a quantitative neighbourhood-by-neighbourhood analysis of Greater Melbourne's 257 neighbourhoods and found that (1) neighbourhoods with lower levels of built infrastructure support also have lower levels of social infrastructure, (2) 70% of older adults aged 65 years and over live in areas with low levels of built environment support and one third live in areas with both low social infrastructure and built environment support, and (3) there are distinct intragenerational geographies of older adults living alone with residents aged 85 years and above being more widely dispersed in the region and less concentrated near the central business district.

Secondly, the opportunities and challenges of suburban aging-in-place were assessed through the analysis of semi-structured interviews with fifteen local, state, and federal policymakers and stakeholders. The results demonstrate that practitioners are aware of the challenges faced by older adults – especially in suburban areas. There has been considerable effort by local and state government to cultivate age-friendly communities and engage older Melburnians. However, the vast majority of the effort has been focused in a relatively narrow band of solutions and programs and often relies on the downloading of responsibility to community groups. Furthermore, there has been a consistent reluctance to tackle the most critical and costly challenges facing the older adult community: housing, transportation, and outdoor spaces and buildings.

## THE NETWORK THAT (RE)BUILT COMMUNITY? FROM INSURGENT INTERNET TO CO-OPTED TECHNOLOGY

Abstract ID: 801

Individual Paper Submission

MEHTA, Aditi [University of Toronto] aditi.mehta@utoronto.ca, presenting author

As information communication technologies (ICTs) continue to evolve, scholars have continuously debated their effects on the concept of community. Do ICTs disintegrate social bonds or foster new collectives? However, past and current scholarship on this question in the digital era are either general population studies or only investigate upper to middle-class homogenous neighborhoods. Additionally, these studies do not extend themselves into the field of Community Development, which increasingly relies on providing access to ICTs for underserved residents in marginalized neighborhoods, bridging the digital divide.

Therefore, to fill this gap in the research, I ask: 1) How does the introduction of a new information communication technology into a disenfranchised neighborhood affect the concept of community? and 2) When a community is disenfranchised in physical space, how do its members then re-assert their identity in digital space? Using the case of Red Hook WIFI, a local Internet network that youth from Red Hook public housing in Brooklyn, NYC built and managed from 2011-2016 to connect neighborhood residents to information, create spaces for self-expression, and generate local economic activity. Through ethnographic data and participatory action research, I show how this information communication technology began as an insurgent organizing tool and then transformed into a disaster recovery infrastructure after Superstorm Sandy, facilitating a strong sense of community in Red Hook. However, eventually, Red Hook WIFI became a technology co-opted by city agencies and funders for the purposes of job training. Neighborhood youth then began seeing the Internet network as a ticket out of their neighborhood, leading to a loss of community solidarity.

These findings have implications for the practice of Community Development. In Red Hook, economic development over-shadowed amplifying voice. In disenfranchised communities, having voice and having an income are equally important. Both of these factors are necessary for individuals to aspire and for an effective democracy. Ultimately, I argue planning practitioners and scholars must include access to information communication technology and media production as an issue area in the field to effectively address inequality.

## **PUBLIC SPACES AND LONG COMMUTES: THE (DIS)USE OF NEIGHBORHOOD PARKS AS SITES FOR CIVIC ENGAGEMENT**

Abstract ID: 852

Individual Paper Submission

YERENA, Anaid [University of Washington Tacoma] yerena@uw.edu, presenting author  
CASAS, Ruben [University of Washington Tacoma] rcasas@uw.edu, co-author

This project seeks to understand the impact of dislocation, a term we use to describe the experience of increases in distance between where people live and work, by posing the following question: how does dislocation impact whether, when, and how people use neighborhood parks to engage with others in the community? Given the import of public spaces to democratic societies, if, when, and how people use public spaces matters to both communities and civic leaders and decision-makers who decide whether to fund and maintain them.

Our study site, Tacoma, Washington (population of 210,000), has almost three acres of public land, including 69 parks and recreation properties and four community centers; in this setting, park usage is expected. Along with this expectation comes the assumption that residents benefit from their parks and experience improved mental and physical health. However, research has yet to explore whether these benefits are reaped by residents that experience above-average commute times. According to a 2018 U.S. Census Bureau report, average commute times went up for all major regions in the U.S. in 2019. Tacoma happens to be in one of the top ten areas in the U.S. where people face the longest commutes to and from work. Tacoma commuters have the longest average travel time in the region of 32.5 minutes.

Within the city, we selected Tacoma's Central Neighborhood Council (TCNC), a centrally located area with 20,650 inhabitants within 9,317 households. We see TCNC as a cross-section of the city. Importantly, TCNC's tenure breakdown and owner/renter percentage of cost-burdened households (paying more than 30% of their income on housing) closely match the city's. Finally, most households in TCNC (97%) have moderate or higher access to open space.

We are conducting this mixed-methods study in three stages. We conducted a series of structured observations in all of TCNC's parks. Next, we will mail 1,000 households a survey to gather data about their average commutes and use of nearby parks. Finally, we will convene focus groups in English and Spanish to gain more detailed information about park awareness and usage from among survey respondents.

Integral to planning practice, understanding park use among those who experience long commutes is an initial step in understanding how revisions to public life have happened and will continue to occur in a neoliberal society that shapes local communities' social fabric. Given the well-documented correlation between public space and public life (Whyte, 1980; Mattson 1999; Gehl 2007), the impact of dislocation merits further study. Moreover, the effect of dislocation on park usage deserves greater critical attention because not everyone is experiencing dislocation equally. According to a 2020 Urban Institute report, "the average person using some form of government housing aid is likely to face tougher odds of getting a job near their neighborhood than the average job-seeker who is not using assistance." Tacoma-area residents are experiencing high dislocation rates in general, especially those in low-income households; thus, the question we pose in this study takes on greater social justice exigence. Tacoma may well enjoy abundant and high-quality parks and community facilities. Still, not everyone benefits from this social infrastructure (Klinenberg, 2018), resulting in a public commons where people of color and lower-income residents

are mainly absent.

### **ORGANIZATIONAL DISPLACEMENT AND MISSION DRIFT: HOW SOCIAL SERVICE PROVIDERS ADAPT TO GENTRIFICATION**

Abstract ID: 886

Individual Paper Submission

DELGADO, Laura [Trinity College] [laura.delgado@trincoll.edu](mailto:laura.delgado@trincoll.edu), presenting author

Nonprofit social service organizations provide critical resources for low-income individuals and families. They also tend to be located in the low-income, central urban neighborhoods that are prime candidates for gentrification. How do nonprofit organizations in gentrifying neighborhoods adapt as the populations they serve move further away and they find themselves in an area that is outgrowing its need for social services? To what extent do nonprofit organizations continue to serve low-income and marginalized populations as the neighborhood around them becomes more affluent? Do financial pressures lead to organizational displacement? This mixed-method research addresses these questions through a study of nonprofit organizations located in gentrifying neighborhoods in Boston.

The findings reveal that gentrification provides both challenges and opportunities, especially for organizations that face difficult funding environments. In response to gentrification, traditional organizations adapt their missions, programs, service areas, and fundraising. Some face displacement pressures, regardless of whether they rent or own their buildings. At the same time, gentrification provides some new opportunities, especially in regard to fundraising. Overall, this research builds on scholarship about how gentrification affects low-income and marginalized populations, but it does so through an organizational lens.

## **NUESTRA TELENÓVELA: FOR THE LOVE OF PILSEN'S LANDMARK ORDINANCE DEFEAT IN A HISTORIC PLANNING DISTRICT**

Abstract ID: 888

Individual Paper Submission

VANIK, Leonor [Independent Researcher] leonor.vanik@me.com, presenting author  
BETANCUR, John [University of Illinois at Chicago] betancur@uic.edu, co-author

Community development organizations, planners, preservationists, and community residents have a tenuous relationship when it comes to neighborhood revitalization specifically in lower income communities. Add to this mix the corruption of elected officials and a distrust of city hall who advocate programs and policies toward pro-developers with minimal incentives to homeowners to keep them from being displaced in a gentrifying community. Juxtapose these dynamics with the introduction of a historical landmark ordinance's where opponents argued that the historical designation protects the building and not the residents. Proponents for the ordinance argue that by not passing it, the community is not protected from gentrification; yet the way that the ordinance was written, it provided more red tape than incentives towards the preservation of 900 buildings located within a quarter of a mile in Chicago's Pilsen community. Moreover, if there was no action on the part of the City Council, the designation would pass making it the largest historical landmark district in Chicago. This paper examines the process confronting the city of Chicago and the community of Pilsen around a landmark proposal and its different iterations for landmark preservation after a city council vote. The main argument is how disempowered communities can prevent the coalition of developers and City Hall from taking further advantage of uneven systems.

This research is part of a longitudinal study of Pilsen's immigrant Latino community's trajectory over the past 30 years through a historical genealogical approach using grounded critical visualization. Using published and unpublished materials from archives, secondary data, published research, interviews, and participant observation, we document Pilsen's struggle to stay put against the forces of gentrification. We also address the nature of using different planning tools for slowing down gentrification and its impact toward homeowners and renters. Lastly, as researchers and a community activist impacted by this Ordinance, we address how community engagement has been utilized by city government, elected officials, developers and residents within the two-years of its introduction and defeat during the COVID-19 pandemic. The findings provide not only insight into policy implications for the development of local preservation ordinances but also provide a roadmap for the various approaches that low-income communities can take to push back developers and the city.

## COMMUNITY ENGAGED SCHOLARSHIP: AMETHYST AT FIVE POINTS

Abstract ID: 890

Individual Paper Submission

WESLEY, Joan [Jackson State University] joan.m.wesley@jsums.edu, presenting author

KEAHEY, Wanda [Dalehaven Neighborhood Association] dr.keahey@yahoo.com, co-author

Community-engaged scholarship provides unparalleled opportunities for university-community collaborations that result in reciprocal benefits. The integration of teaching, applied academic and community participatory research elevates these benefits in ways that continue to influence scholarship through practice. Planning faculty working in concert with community stakeholders and students are well positioned to enjoy multipliers of this phenomenon. This paper illuminates a faculty-led university-community venture that engaged Revitalization Studio students in an evolving community initiative. Three questions were posed to guide the work:

1. How could members of the collaboration gauge residents' opinions about the reuse of 8.5 acres of newly acquired land?
2. What contributions could each collaborator make to the project?
3. What was the highest and best use of the 8.5 acres vacant land?

Informed by the engaged scholarship precepts originating with Ernest Boyer in the 1990s, the conjoint venture, Community Engaged Scholarship: Amethyst at Five Points, focused upon Studio course participants working closely with the local community. Consistent with the four types of scholarship explicated by Boyers, the project incorporated: The scholarship of discovery, integration, sharing knowledge, and the application of knowledge. The project required close and regular interactions between the faculty member, students and community residents. In addition to residents' participation in various aspects of neighborhood research and data collection (community-based participatory research), they shared lived experiences and historical accounts of the community. These contributions strengthened the work and underscored the inextricable link between scholarship and community concerns.

The initiative included sequential steps that responded to community needs while concomitantly ensuring the achievement of student learning outcomes specifically designed to expand scholarship through active participation in community participatory research. Within the work plan, project collaborators addressed a variety of planning issues that included: Evaluating 8.5 acres of land for reuse; conducting a community profile; identifying site conditions; researching the zoning and land use history; developing a survey, conducting focus groups; and proposing the highest and best use for the property through regeneration or recycling. The proposed land use had to be compatible with community character and respectful of residents' desire to maintain the historical integrity of the five neighborhoods contiguous to the 8.5 acres study site.

Outcomes: All of the actors experienced firsthand the benefits of community-based participatory research, emerging citizen scientists, and the acquisition and production of transferable knowledge. Students were able to utilize and share existing skills and talents while learning new ones. A value-added benefit to students was that the experience amplified the strong connection between theory, classroom activities, practice and applied research. The outcome was a solid connection of seemingly disparate parts into a cogent final product reflective of teaching, community service, and engaged scholarship.

## **DIVERGENCE AND CONVERGENCE OF PUBLIC AND ELECTED OFFICIALS' OPINIONS ON A DOWNTOWN ARENA PROJECT: A CASE FROM THE CITY OF CALGARY, CANADA**

Abstract ID: 891

Individual Paper Submission

GRAHAM, Rylan [University of Northern British Columbia] [rylan.graham@unbc.ca](mailto:rylan.graham@unbc.ca), presenting author

HAN, Albert T. [University of Texas at San Antonio] [albert.han@utsa.edu](mailto:albert.han@utsa.edu), primary author

EHLENZ, Meagan [Arizona State University] [meagan.ehlenz@asu.edu](mailto:meagan.ehlenz@asu.edu), co-author

In the summer of 2019, Calgary City Council approved the construction of a new 'Event Centre' to house the Calgary Flames of the NHL. The Event Centre was approved with the intent to strengthen Calgary as a tourist destination, attract and retain young talent, and fuel development of a new Cultural and Entertainment District on the edge of Calgary's downtown (City of Calgary).

Since the 1990s, sports arenas and stadiums have found acceptance as part of the downtown revitalization toolkit, making them important to the planning profession. Robertson outlines common strategies for North American downtown revitalization, including efforts to enhance pedestrian experiences, redevelop abandoned waterfronts, strengthen the office sector, and introduce special activity generators (SAG)—a broad term encompassing convention centers, sports arenas, and stadiums (1995). Chapin notes that for decades, construction of new sports facilities was rationalized on the basis of its economic impacts, however, a major shift regarding the impact of sports facilities emerged in the 1980s (2004). Contemporary venues have been rationalized on the basis that they are central anchors and catalysts for district redevelopment (Chapin, 2004; Spirou, 2010).

Herein lies the debate for the City of Calgary, as community residents, planners, developers, and elected officials debate the potential benefits or harms of an SAG-driven development project. The proposed development of a new Event Centre, which was more commonly known to the public as the new arena for the Calgary Flames, sparked discussions among the stakeholders regarding its financial implications and benefits. Those in favor of the project emphasized its catalytic effects on revitalizing the city centre, while those who objected claimed that the overall costs will burden the people of Calgary with increased tax.

The public discourse surrounding the proposed event center has taken a number of forms—from inside City Council chambers to social media. As part of the public engagement process, the City of Calgary collected approximately 6,100 emails between July 22<sup>nd</sup> and July 29<sup>th</sup> of 2019. Informally, several council members debated the merits of the proposed event center on their Twitter feeds. And, formally, the Event Centre featured prominently in City Council meetings between 2019 and 2020.

In this research, we examine the divergence and convergence of public and elected officials' opinions on a controversial downtown arena project. We analyze the text data extracted from the City Council minutes, public emails, and elected officials' Tweets. We performed Natural Language Processing (NLP) analysis techniques, including Topic Modeling, n-gram analysis, and Sentiment Analysis, to identify emergent patterns from within a

massive amount of project-relevant text data. The findings reveal similarities and differences across multiple stakeholder groups within the context of a major downtown redevelopment project and publicly-funded arena, ranging from public perceptions to elected representatives. This research demonstrates how planners can use NLP techniques to systematically engage with and analyze digitized text data at a massive scale. Further, our findings elucidate the degree to which the convergence and divergence of public opinions can affect elected decision-makers' positions on major development projects.

#### **AN ANALYSIS OF DIFFERENT PERCEPTIONS OF GENTRIFICATION AND DISPLACEMENT: A CASE STUDY OF KOREATOWN, LOS ANGELES**

Abstract ID: 900

Individual Paper Submission

SUNG, Seyoung [Toulon School of Urban Studies and Planning, Portland State University] [seyoung@pdx.edu](mailto:seyoung@pdx.edu), presenting author

Koreatown is one of the most well-established immigrant communities in Los Angeles, CA. The overwhelming development boom for upscaling the housing and retail in Koreatown exacerbates the displacement pressures to the most vulnerable and disadvantaged people in the community. Although the previous studies using quantitative data analysis confirmed that gentrification has been underway in the community, the macro-level analyses missed the distinctive features of the process or a clear understanding of the actual needs and concerns of the community (Loukaitou-Sideris et al., 2017).

Applying a qualitative research approach, this in-depth case study of Koreatown utilizes open-ended semi-structured interviews. The purpose of interviews with different stakeholders in the community is to uncover the differences in perceptions regarding neighborhood change, gentrification and displacement, from small business owners, ethnic-specific non-profit organizations for Koreatown, and public planning agencies. The research question to be answered is how different are the impacts of gentrification between the actualities and the perceptions from various stakeholders in Koreatown.

As an interesting result, the observations and experiences of gentrification from different informants are almost converged regardless of their positions in the community, although the perceptions of gentrification vary by their positionality and relations of the community. This gap in perceptions of gentrification from different positionalities may hinder equitable development in the community. The findings will suggest a better understanding of what the community actually needs and wants under the pressures of gentrification and displacement in Koreatown. Also, the research will conclude with how to tailor the planning policy or equitable development strategy by incorporating the actual needs and concerns of the communities. Further, this case study will contribute to understanding the

neighborhood change in Asian/Asian-American urban communities at risk of gentrification while many gentrification studies overlook the ‘model minority.’

### WHY CHANGES IN BUILT ENVIRONMENT CANNOT CHANGE PEOPLE’S HEALTH BEHAVIORS? AN EXPLORATORY STUDY

Abstract ID: 916

Individual Paper Submission

YANG, Yicong [University of Wisconsin-Madison] [yicong.yang@wisc.edu](mailto:yicong.yang@wisc.edu), presenting author

**Background:** In the past two decades, plenty of research have addressed built environment’s implications to health, such as active living, healthy diet, and access to healthcare. It is well established that safe, walkable neighborhoods promote physical activity, reduce driving, and prevent health conditions such as obesity and chronic disease. However, studies have also identified limitations and provided critiques to current evidence base on the association between “D-variables” of urban form—density, diversity, design, destination accessibility, distance to transit, etc.—and health behaviors. Some studies also found counter-intuitive results. For example, a meta-analysis found that compact development features, measured by “D-variables”, has very little influence on people’s driving behavior, and in particular, people even drive more when the land use mix increases (Stevens, 2017). Given this background, this research seeks new approaches to planning and policy design to promote healthy behaviors.

**Analysis:** This paper analyzes three groups of health-related behaviors: physical activity, food access, and social interaction. Based on the evaluation and critique of the determinants of health behaviors found in current approaches to built environment interventions, this paper provides four distinct perspectives of criticism: (1) activity budget perspective. Activity budget is similar to a time budget, implying that built environment may make limited contribution to a person’s totally physical activity (Forsyth et al., 2008). (2) Built environment design efficiency perspective. This perspective argues that current built environment interventions explain only a small part of health behavior change. (3) Activity maintenance perspective. Changes in built environment has limited ability to change people’s attitudes and behaviors due to the difficulty in the maintenance of behaviors beyond six months of behavior adoption (Marcus et al., 2000). (4) Health benefits and risks perspective. Many health concerns are contradictory, and it is important to identify the combined health impacts of different behaviors. For instance, walking and bicycling are physical activities that are good for health, but people may be exposed to higher risks of injury and air pollution (Useche et al., 2019). Planners should expect that these health benefits and risks vary by built environment contexts.

**Recommendations for future practice:** The future of health-oriented planning requires not only built environment change, but also behavior change. This paper argues that behavioral-oriented policies for health promotion is a cost-effective approach to built environment interventions. The goals and objective should be primarily focused on behavior and behavior change, recognizing heterogeneity in health-related behavior formation. In addition, built environment interventions should be driven by the awareness of behavioral factors, including people’s attitudes,

values, and behavioral orientations.

#### ***DIVERSE GRASSROOTS STRATEGIES AND ACTIVIST NETWORKS IN THE GENTRIFICATION DEBATE IN THE BOYLE HEIGHTS NEIGHBORHOOD OF LOS ANGELES AND BEYOND***

Abstract ID: 926

Individual Paper Submission

HERNANDEZ, Ashley [University of California Irvine] ashleych@uci.edu, presenting author

Boyle Heights is a historically working-class Latinx neighborhood in Los Angeles, where strong grassroots resistance to gentrification and a severe lack of affordable housing have effectively developed into a compounding political and public health crisis. Collectively, community-based organizations have struggled to mobilize to influence development in the neighborhood and protect residents from displacement. One popular strategy among grassroots groups has involved insurgent activism. This has consisted of multiple coalitions of resource-poor activists and grassroots organizations engaging the debate with contentious tactics pushing their anti-gentrification politics, working directly with those most vulnerable to displacement, and targeting gentrifiers both online and offline. Their targets have included gentrifying businesses, political elites, and local investors. Across the neighborhood's grassroots landscape, their overarching goals lie beyond traditional channels of local politics and market driven urban development as they demand direct democracy in urban planning and community development. However, through closer observation, the specific tactics and demands held across groups are more nuanced and complex. In this political landscape, there is a wide range of tactics on display. Some groups build rapid-response networks and mobilize residents to directly confront landlords, local politicians, and professionalized non-profit community-based organizations with the claim that such actors are implicated in gentrification. Others opt to reclaim public resources, create cooperative community spaces, and develop networks that advocate for the collective ownership of land, housing, and labor. The political activities and networks of radical grassroots organizations requires a closer analysis to understand the perspectives of this political landscape that challenges traditional channels of urban politics, conceptions of community, and visions of an urban future.

This paper examines the type of insurgent tactics and political frameworks utilized by local grassroots activists in Boyle Heights and their networks throughout Los Angeles to advance their views concerning urban development and urban futures. Though activists making up radical grassroots mobilizations appear to be similar, they express their rights claims to the city in very different ways. While one sector of grassroots organizations fights to directly confront urban antagonisms and unequal power relations on the ground to call attention to irreconcilable class-based structural issues, others invoke indigeneity as a cultural identity to build and integrate new cooperative organizations to reclaim and protect public resources. Using a robust database of newspaper articles, participant observations between 2019 and 2021 and interviews gathered from sixty-five local activists within and outside of Boyle Heights, this paper aims to identify the different expressions of the right to the city, the activist networks

responsible for producing different discourses, and how activists work to reconcile (or not) discursive differences within the movement. Examining the differences among and within the grassroots political landscape can provide important lessons on how political discourses and networks work in relationship to political demands and representation in the built environment. These lessons have larger implications on the integration of marginalized voices in planning processes and civil society at large.

#### FAITH-BASED COMMUNITY DEVELOPMENT THROUGH ETHNOSPIRITUAL FIGURATION

Abstract ID: 937

Individual Paper Submission

PAP, Gitta Margit [Texas A&M University] gittapap@tamu.edu, presenting author

JOURDAN, Dawn [Texas A&M University] dawnjordan@arch.tamu.edu, co-author

U.S. faith-based community development (CD) organizations “have grown significantly because of the 1996 U.S. Welfare Reform bills and President George W. Bush’s faith-based initiatives” (Tarpeh and Hustedde 2020, 4). According to the White House Briefing Room, President Biden, not long after of his inauguration in 2021, reestablished “The Office of Faith-Based and Neighborhood Partnership,” a program had been started twenty years ago by President Bush. Despite CD’s wide application, Wilson (2015) argues, the relationship between identity, culture and community development is “immeasurable” and planners and practitioners of community development “often ignore these connections in their homogenizing development initiatives” (p.1). Identities can be national, ethnicity, location based, or professional in character and play important roles in development project outcomes. In these contexts, culture and identity are not separated (Ibid.,1).

Planning practitioners working in community development need to be well equipped to understand the sensitive nature of ethnic and cultural meanings, and interests. The importance of culture is emphasized not just in community development, but in planning. The conceptual boundary of planning and its practice has been widening, and challenged in the past decade and a half, to incorporate new meanings. Among these Porter (2010) argues for as cultural practice and “seeing planning as a cultural practice makes it become specific to particular peoples, life views, times and spaces (2). Porter (2010) argues that planning needs to pay attention to its own historic context where planning as a discipline and professional practice evolved to its present form.

Ammerman (2020) points out that sociological approaches failed to understand “much of the religion we see” (7). The issue is not just religion ‘messiness’ but religion’s conceptualization as “fixed, unitary”, or “coherent” (McGuire 2008, 12). Little attention was given to the historic, and cultural contexts where religious meanings and their definitions came to be (Ibid). Religion is produced by culture and the historic power struggles are rooted in its definition (Ibid). In the late 1990s scholars started paying more attention to religion-as-practiced, or simply as lived (Ammerman, 2020). Now more than two decades later, under the umbrella term of “lived religion” (Ammerman, 2020) much work resulted to understand religion, including spirituality in the every-day walks of life. McGuire (2008) explains religion as the result of historical and sociocultural struggles in the past and present, while the meaning of

religion is continuously changing by people. In light of these scholarly discussions and pressing societal changes for ethnic, religious, and cultural rights and just space we need to expand theorization on inclusions of religion and faith in community development.

This presentation expands on the findings of a social constructivist qualitative analysis that investigated three Historic Hungarian Churches role in community development in Romania. As a result of a study a substantive theory of religious institution driven defragmentation was developed (RIDD Theory). The RIDD theory captures a form of community development (ethnospiritual figuration) that is practiced through cultural (ethnic) and religious (spiritual) means. These practices, in the context of the RIDD theory, were captured as defragmenting activities in terms of ethnic community, space, among others.

In essence, ethnospiritual figuration is a form of community development that is performed through cultural-religious practices in ethnic Hungarian minorities. The RIDD theory's applicability in USA and international context will be discussed with sensitivity to culture, religion, and territoriality. Community development professionals and planners will learn about the dimensionality of faith and religion as it is lived and practiced, and bring the "practitioners of religion" closer to "practitioners of planning and community development." Practical take-aways for practice will be provided and discussed through examples from the USA, and Europe.

#### **APPLYING HERITAGE TRILSCAPES AS AN ACTION RESEARCH STRATEGY FOR REGIONAL COLLABORATION—A CASE STUDY OF THOMSON-MAXWELL HERITAGE TRAIL IN TAIWAN**

Abstract ID: 1048

Individual Paper Submission

CHANG, HSIUTZU BETTY [National Cheng Kung University] hschangbetty@gmail.com, presenting author

In an increasingly fragmented society, how to promote collaboration among communities to create synergy and consolidate resources has become an important planning issue. Heritage trails have been gradually gaining more attention as a strategy for tourism development and community economic development at the local and regional scales. Especially in rural areas, heritage trails serve as a network linking human settlements and natural environments by connecting local cultural, agricultural and ecological features. They are not only unique local landscapes that keep records of history and culture but also a common ground where communities share experiences and identities. This research is based on the author's participation in rural revitalization projects in southwestern Taiwan during the past five years. The motivation of this action research is to promote community economic development, strengthen local identity and promote regional collaboration via community-based tourism.

In this paper, we demonstrate the potential of heritage "trailscape" as a strategic medium to promote collaborative

planning among stakeholders in the rural region. We will discuss a particular trail, documented by Scottish photographer John Thomson in the 19th century, that connects aboriginal communities in southwestern Taiwan. By using document analyses of historical photos, literature and maps, important people, events, locations, architecture, artifacts and landscape of the trails are systematically analyzed, geocoded and reorganized into tourism themes and planning principles. In-depth interviews and workshops with stakeholders are conducted to understand the potential effects of the reconstructed “trailscape” as a medium to enhance the dialogue, consensus and actions. More specifically, we take institutional capacity in collaborative governance as the framework of evaluation. This research uses knowledge resources, social-relational resources and mobilization capacity as the indicators of evaluation. By inviting the stakeholders to the collaborative planning and participatory evaluation, this research determines how heritage trails might work as a potential public realm for rural community participation to develop regional identity and as a platform for promoting cross-scaled and cross-organizational collaboration.

#### **SPATIAL VARIATION OF NEIGHBORHOOD SOCIAL CAPITAL, CIVIC PARTICIPATION, AND SAFETY**

Abstract ID: 1057

Individual Paper Submission

NAM, Yunwoo [University of Nebraska Lincoln] ynam2@unl.edu, presenting author

Urban neighborhood characteristics and transition is important for formulating effective programs for revitalization and community development. This article is motivated from an intellectual tradition that seeks to explain variations of neighborhood outcomes such as crime and civic participation. While there are various factors that matter with spatial variations of neighborhood outcomes (inequalities) in an urban area, this study is particularly interested in place based social capital and their impact on neighborhood outcome such as safety. In urban planning fields, social capital has been applied in a variety of contexts to explain the ability of a community to solve the problem of collective action. The spatial dimension of social capital arises from the fact that their value and the way they are valuable to an individual depends on the physical distance. Social ties/networks may be restricted by the geographic location. Thus social capital is location specific.

The paper examines the interconnectedness and spatial dynamics among social capital, civic participation and neighborhood safety (crime), using GIS and statistical models. The main research question is “Do social capital contribute to neighborhood outcome (i.e, lower crime rate)?” In doing so, a novel approach is introduced to create the social effect composite index to contain spatial dimensions of place based social activities. Thus the spatial dynamics of social indicators are analyzed at a finer level of analysis such as parcel and street level. The traditional and common method of social capital research uses survey methods, with the unit of observation being either metro areas or cities or counties or zipcodes. This method is not necessarily well suited to capture the spatial dynamic nature of neighborhood characteristics at a finer level, e.g. street or parcel level. The paper proposes

methodological improvement to fill this research gap. The fast growth of GIS and spatial data removes former barriers to increasing spatial resolution, and the improvement of statistical modeling supports spatial data analysis of the research to be better worked. For empirical testing, SEM (Simultaneous Equation Modeling) and Path models are utilized. The study area is the City of Lincoln, Nebraska. Lincoln has a strong history of community organizations, voluntary activities, and neighborhood social capital supports.

The findings show that place-based neighborhood social capital and civic participation strongly influences the spatial variation of neighborhood outcome - crime. Government authorities see social capital as a heuristic tool that sheds new light on public intervention and the way in which public services can use this potentially valuable ingredient to attain their objectives. Along this line, the research reinforces the importance of developing formal organizational dimensions of social capital to support collective civic engagement in urban neighborhoods. To identify implication for planning practices, the paper discusses environmental strategies to promote positive social effects.

#### CRITICAL MAPPING: A TOOL OF ACTION FOR SOCIAL JUSTICE

Abstract ID: 1064

Individual Paper Submission

TOPALOV, Steluta ["Ion Mincu" University of Architecture and Urbanism, Bucharest, Romania]  
stela.topalov.drd20@uauim.ro, presenting author

In today's digital age, critical mapping is gaining more and more relevance in the architectural design and future urban planning decisions, since it plays a powerful instrumental role, observing and describing the urban social phenomena as much as creating and building it in a particular way.

In the last two decades, architects have started to think beyond their disciplinary boundaries, understanding spatiality not only as a "physical object and form", but as a "political and psychological social processes that flow through space" ( Corner, 1999). In this context, architects and urbanists expand their practices in the area of activism, advocacy and strategic decisions, redefining their role in community-based social strategies. By engaging in participatory civic actions, architects and urbanists are becoming more conscious of their ability to promote justice within their social climate but before this, the urban vulnerabilities of a place it is mapped. In this sense, we talk about mapping as a form of activism: maps not only inform and represents but they inspire and propose, being tools with an enormous power to re-shape the city for the emergence of new spatial decisions.

Critical mapping, at its most effective, is recognized as an innovative democratization of cartography that does not only describes the social injustice, hidden or neglected aspects of the reality, but has the power to reveal opportunities for activism and public engagement.

In the context of the contemporary digital technologies, where the process of collecting spatial information and mapping it is out from the control of the experts, we question the conventions of the map as an objective and rational survey of existing information and the use of maps as an instrument of power in order to control.

For a better understanding of the relation between design and planning practice and sociological frameworks of social justice, a series of significant examples of activist critical mapping techniques will be reviewed in order to answer to a series of questions : How can architecture and urbanism practices promote social justice? ”? How can be linked social justice to space?

One of the most recent examples of critical mapping used as a tool for and inclusive urban recovery is the “The Observatory of the Reconstruction” digital platform which provide a shared base of spatial information for/about the August 2020 post disaster reconstruction of Beirut from various perspective including historical development, geography and social urban trends. The standard reconstruction approach which is generally based on a collection of quantitative and physical data of damages, doesn’t take into consideration the multilayered dimensions for an inclusive recovery process. Treating the map as an applied research, the aim of the platform is to provide ongoing geographic documentation of the city by first disclosing and then staging and sharing the information as a strategy to generate collaborations and future people-centered decisions making.

With an increasingly focus on what it is called critical mapping, the article is embracing the idea that maps have great force to transform and act, not as means of projective power-knowledge but as an formative, creative and democratic instrument of any design and planning process. The critical map must remain a technique for both the acquisition of critical knowledge but also as a form of activism for an inclusive and people-centered design and planning decisions.

SITES, William [University of Chicago] [w-sites@uchicago.edu](mailto:w-sites@uchicago.edu), co-author

WEINER-DAVIS, Tadeo [University of Chicago] [tadeo@uchicago.edu](mailto:tadeo@uchicago.edu), co-author

Nonprofit actors, including foundations and universities, increasingly play a key role in urban development and urban governance more broadly. Recent scholarship focuses on the growing influence of nonprofit actors on governance in the context of fiscal austerity and limited government capacity, raising questions about accountability in public decision-making processes. This trend mirrors the rise of private consultants and exceptionality measures in the urban development process, yet further complicates the tension between private interests and public process. Nonprofits can effectively straddle the divide between public and private, articulating public intent while

mobilizing elite interests free of public accountability. Drawing upon a case examining the politics surrounding the proposed Jackson Park site for the Obama Presidential Center on Chicago's Southside, we highlight the singular political capacities nonprofit actors such as the Obama Foundation deploy in the politics of urban development. In particular, we highlight the Obama Foundation's strategy to script, manage, and control community engagement and participation in order to gain support for its project and quell opposition. We argue this effort served to substitute, not merely displace, a democratic process of community engagement and debate tied to a formal political decision-making process located within local government. Community actors found creative ways to respond and influence the process, albeit circumscribed and delimited in content and scope. We identify tensions between theoretical approaches that assume a neutral role of local state and planning actors, the continuing relevance and contemporary limits of urban growth machine frameworks, and the tensions inherent within planning discourses that conflate race and class in the context of sharp racial and class disparities and their intersections.

#### DISPLACEMENT IN THE CITY AND THE RISE OF SUBURBAN POVERTY

Abstract ID: 1082

Individual Paper Submission

CALISKAN, Bilal [Ohio State University] [aliskan.3@buckeyemail.osu.edu](mailto:aliskan.3@buckeyemail.osu.edu), presenting author  
 KHALEEL, Sahar [Ohio State University] [khaleel.3@buckeyemail.osu.edu](mailto:khaleel.3@buckeyemail.osu.edu), co-author  
 HANLON, Bernadette [Ohio State University] [hanlon.42@osu.edu](mailto:hanlon.42@osu.edu), co-author

This paper considers the prevalence and intersection of two increasingly powerful processes in the transformation of the U.S. metropolis —rising poverty in the suburbs and gentrification in the city. Some claim that a contributing factor to the rise in suburban poverty is gentrification-induced displacement from city neighborhoods (Ehrenhalt, 2012; Meyer and Graybill, 2016). The suburban poor are, in a sense, 'economic refugees' forced out of gentrified neighborhoods in the city (Filion, 2015).

From a theoretical perspective, the literature suggests a combination of factors contribute to the suburbanization of poverty in the U.S., many related to city dynamics. One influence are private market policy solutions aimed at dismantling social housing in city neighborhoods and decentralizing low-income inhabitants (Goetz, 2013). Furthering the process is fundamental labor market restructuring that contributes to low-wage sprawl in the periphery and, significant to the process of gentrification, the rise of professional, white-collar occupations in central locations. Overall, a major shift is occurring such that marked spatial polarization between gentrified neighborhoods in the city and low-wage neighborhoods in the suburbs is becoming the new reality (Randolph and Tice, 2017). As we focus on in this study, changes resulting from the emphasis on revitalizing the city through gentrification

(Newman and Ashton, 2004) create a situation where low-income households can no longer afford to live in certain city neighborhoods. This process of a 'great inversion' where white, high-income groups increasingly live in the city and low-income people of color are forced to the periphery (Ehrenhalt, 2012) has enormous implications for the socio-spatial arrangement of the U.S. metropolis.

In this paper, we examine, using linear regression fixed effects modeling, the relationship between displacement from urban neighborhoods and the rise in suburban poverty between 2000 and 2016 in the top 100 most populated metropolitan regions in the United States. We highlight several key findings. First, poverty is still largely an urban rather than suburban phenomenon. Second, in almost every metropolitan region in our study, suburban poverty rose at a faster rate than black urban poverty between 2000 and 2016. Third, there is a relationship between city neighborhood displacement and a subsequent rise in suburban poverty, but largely in those metropolitan regions that experienced high levels of gentrification over a given time period. Our results suggest that as gentrification-induced displacement intensifies in the future, suburban poverty is likely to continue to increase.

#### COMMUNITY DEVELOPMENT CORPORATIONS (CDCS) AND RESIDENT ENGAGEMENT SERVICES

Abstract ID: 1103

Individual Paper Submission

KIM, Youjin B. [University of California Irvine] youjinkb@uci.edu, presenting author

One of the main critiques about community development corporations (CDCs) is that they have grown so big – in numbers, funding, and influence – that they are no longer of, or for, the community (Swanstrom, 2020). CDCs are beholden to multiple sources of funding – government, foundations, and banks – and rely on elites or professionals to obtain funding. Raising funds is essential to CDCs, for not only operating and sustaining the organization, but also building affordable housing, which has become the primary program of CDCs. Critics argue that this perpetuates the spatial inequalities that CDCs initially sought to address, because poor neighborhoods often lack such sophisticated, strong CDCs and as a result, affordable housing and other resources are distributed unevenly within and among cities.

On the other hand, CDCs are able to navigate the complex housing policies and funding mechanisms, such as the low-income housing tax credit (LIHTC), to build quality, affordable housing in otherwise disinvested and gentrifying communities. (LIHTC has been the largest funding source of affordable housing for the past several decades.) Affordable housing directly benefits low-wage workers and their families because it provides housing stability and security, which allows tenants to pursue educational and other skills development opportunities (Reid, 2018). One study also noted that the higher quality of LIHTC housing gave tenants motivations to succeed (Reid, 2018). In addition, affordable housing in central locations provide greater access to public transit and employment centers. Finally, as mission-driven landlords, CDCs often offer various services to tenants, including case management and

other social services, and make efforts to build community within buildings (Burnstein, Gallagher, Oliver, 2019; Plassmeyer, Brisson, Lechuga-Peña, 2018).

While most studies on affordable housing focus on its impacts on housing retention or economic mobility, few, if any, have considered the process or implementation of services offered to its residents, i.e., whether they reach the intended target population. This study thus seeks to fill the gap in the CDC and affordable housing literature by highlighting the provision of services by one CDC in seven of their affordable housing developments. Using several years of sign-in sheet and administrative data, I identified individual, household, event, and building characteristics associated with program participation. I then interviewed the CDC staff and seven tenants – one from each building – for more context on why or how some tenants utilize services more than others.

Initial analyses of the data show that adult and elderly women are more likely to participate, and most tenant-participants are Spanish-speakers, which reflects the demographics of the tenants and community. Family-friendly, community-building events have much higher levels of participation, compared to financial empowerment or health and wellness workshops. On the other hand, youth participation is low, even in after-school programs. Tenants' council members are much more likely to participate, but also many non-tenants attend various types of workshops, as most events were open to members of the community.

Interviews with staff, tenants' council members, and tenants suggested that tenant services and organizing staff were central to engaging residents. According to staff, the organizing department worked with tenants to develop leadership skills and engage them in larger political campaigns, including the legalization of street vending and developing a community land trust. It remains a question, however, whether their resident engagement and tenants' council model is sustainable, as the organizing department has since left the organization. This development reflects Sites et al (2007)'s concern that not defining and identifying the different traditions and practices of community organizations can lead to uncertain goals and conflicting strategies.

## MANAGEMENT IMPACT OF ELDERLY SHARED HOUSING ON THE COMMUNITY IN JAPAN

Abstract ID: 621

Poster

DOIHARA, Natsue [Keio Research Institute at SFC] natsue@sfc.keio.ac.jp, presenting author

### Background:

Elderly shared housing called Elderly Group Living (hitherto referred to as EGL) is a living style of about 10 residents that have their own rooms and have dinner together in a house. It emphasizes by free and secure living for the elderly by purchasing neighborhood community based livelihood support services from the neighborhood community. The EGL concept started from “COCO Shonandai” in 1999, and there are about 20 similar types of EGL in Japan. Many are managed as community businesses by NPOs, and people in the community participate as staffs. There have been and continue to have ample studies on EGL residents. This study focuses on the management impact of EGL on the community and clarifies what new ties have been created in the community, and what values EGL community brought in the nearby area.

### Methods:

The study was conducted at EGL-B, which is located in the suburbs of Tokyo. EGL-B was launched in 2003 by NPO-B and Company M (hitherto referred to as Co. M). Co. M is a building provider, that rents out rooms, and operates a café in the same building. NPO-B provides EGL-B residents with meal, cleaning, and livelihood services. It also organizes hobby classes, and other events for the local people. Both Co. M and NPO-B aim to contribute to regional development. The study sample are comprised of 34 members who work at EGL-B, as operator, meal staff, cleaning staff, livelihood support staff, hobby activities staff, cafe staff, etc. We analyzed the formation of communities, changes in personal networks, the actual conditions of activities, and the operating system. In addition, the values EGL community brought in nearby area. The research methods employed in the study, were a survey using a self-administered questionnaire, semi-structured personal interviews using interview schedules, and participation observation. Data collection was conducted during February and March, 2019. Out of a total of 34 questionnaires that were distributed, 32 were collected and 30 valid responses were recorded.

### Result:

Through working at EGL, Networks of acquaintance and selective networks were formed in the members. And a feeling of trust was brought to the neighborhood. EGL doesn't only allow elderly people to live in peace, but also has a function to strengthen the community. While EGL doesn't pay much to members, they don't take great responsibility for their work. EGL work isn't time consuming, and members participate because it is fun. Members can work happily because a leader has prepared an equal relationship, a flexible work style, and respect for spontaneity in the workplace. The values that were created to nearby area by EGL management, such as consultation, watchfulness, intergenerational exchange, motivation for living, fun, and mutual help in times of disaster. It is said that there are two types of local community in Japan, “the community on local ties” and “the community on theme.” In “the community on local ties,” elderly men are the main players, and the participation of younger generations and women is limited. “The community on theme.” is on the decline with the decrease in the number of full-time housewives who were the main players. On the other hand, EGL, a community business, provided not only a choice of part-time employment for housewives, but also a choice of participation for people of different ages and occupations. New community ties created by EGL can be called a “new layer of local community” that is different from the local tie type and the theme type.

O'CONNELL, L. Katie [Georgia Institute of Technology] [l.katieoconnell@gatech.edu](mailto:l.katieoconnell@gatech.edu), presenting author  
BOTCHWEY, Nisha [Georgia Institute of Technology] [nisha.botchwey@design.gatech.edu](mailto:nisha.botchwey@design.gatech.edu), co-author

More than 50 years after Dr. Martin Luther King, Jr.'s assassination, what has become of his call for social, political, and economic equality for African Americans? A new generation of activists is giving new urgency to the call for racial justice and equality, even as polarization increases. How do we equip a new generation of advocates and activists with the knowledge, techniques, and strategies of past activists and assessments of the effectiveness of the policies that were implemented and/or defeated in the struggle for justice and equality? How do we measure our progress toward a more just and equal society? The Measuring the Dream (MTD) project anticipates where and how communities, decision-makers, and institutions can engage to build an equitable future. The goal of MTD is to inform, enable, and inspire a diverse audience to understand the history of the journey toward a more equal society. To quantify national changes in equity since the 1950s, the project created the MTD Index which identifies six arenas in which the struggle for equal justice has taken place and can be objectively traced, including: criminal justice, education, citizenship rights, health, residential segregation, and poverty. Data for high impact variables within each area are cataloged and then combined to calculate a MTD Index score from pre-1950 to today. No single index exists with this set of indicators that provides the scaling and longitudinal framework necessary to assess America's strive towards prosperity and equality for all. The MTD Index assigns objective measures and sets a baseline from which to measure progress toward equality for African Americans and other populations in the changing demographics of U.S. society. The project aims to educate leaders to fully understand the nexus between the legacy of racism and the continuation of gaps in wealth, education, criminal justice, and quality of life between White and Black Americans. This poster will describe the importance of a national equity measurement, the process to select indicators, the challenges of historical data, and construction of the MTD Index.

LEE, Ji Yoon [Pusan National University] wisepearl96@pusan.ac.kr, presenting author

HA, Ji Hye [Pusan National University] wlgp5346@pusan.ac.kr, co-author

KANG, Jung Eun [Pusan National University] jekang@pusan.ac.kr, co-author

There is a rapid increase of elderly population in South Korea. The country had already entered an aged society and is on the verge of entering a super-aged society. To prepare for this aged society, different policy measures at the city and national level are required. To do so, it is necessary to understand the region characteristics where the policy will be introduced, and consider the elderly population's changing activity levels due to various reasons such as longer life expectancy and their desire to participate in social activity. However, not many studies exist on the activity of the elderly population in terms of space, and the existing studies on spatial pattern analysis of the elderly population assumes that the activities of the elderly are centered around the residential area, especially on the neighborhood living area. Consequently, most studies focus on elements of neighborhood living amenities or use population statistics based on resident registration of residential areas.

In contrast, this study utilizes the current population (service population statistics) big data provided by mobile telecom service carriers to examine the activities of the elderly population and by visualizing the spatial patterns by age and time of the day. By doing so, this study aims to examine the regional characteristics that make up these patterns. The study was conducted in Seoul from November 2018 to April 2019, when the big data was secured for the average per-hour current population.

The analysis was carried out in two steps. First, the daytime and nighttime intervals were divided based on the distribution of the current population by time, then the spatial distribution pattern by age group during the day and night was examined through a cluster analysis based on ArcGIS. The aim of this study is to reveal that there is a significant difference in activity patterns between the elderly in their 70s and older, and people in their teens to people in their 60s in the above process, then to focus on the activities of the aged population by comparatively examining the spatial patterns of the aged and the non-aged populations. To explain the form of the aged and non-aged population clusters during the day and night times more effectively, the space was classified into four types (living area, external activity centered area, commuter town area, and underpopulated area).

Second, a multinomial logistic regression analysis was performed by selecting variables showing regional characteristics to examine these characteristics by cluster type. As variables, land use characteristics, social characteristics, economic characteristics, living infrastructure characteristics, and accessibility were considered and to determine how each variable affected the aged and non-aged populations. Therefore, there were differences in the characteristic variables that significantly affect each type, and it was found that the cluster type of the aged population was largely influenced by the living infrastructure. In addition, even though they are of the same type, it was found that the characteristics of the aged and non-aged populations were different.

The aim this study was to examine the spatial patterns of the elderly population and the factors that influence these patterns through comparison with those of the non-aged population. Unlike in the past, the patterns continue to change according to the specific age range of the aging population. This study classifies the patterns by age and time and explains them in terms of cluster type and characteristic variables. As part of preparing for the aged society, more studies on the elderly population by spatial unit and discussion on pattern changes are needed, and based on these basic data, gradual changes in spatial policies for the elderly population can be expected.

# Track 3 – Economic Development

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### **3.49 PRE-ORGANIZED SESSION - PROMOTING SOCIAL EQUITY WITH ECONOMIC DEVELOPMENT PRACTICE 1**

Pre-Organized Session 49 - Summary

Session Includes 225, 226, 227, 228

GREEN, Jamaal [University of Pennsylvania] jamaalg@upenn.edu, organizer

This session will focus upon a variety of issues in economic development with an explicit focus on how they address, or not, ongoing issues of social inequity. The past year has shown in stark relief how the racialized and gendered aspects of our labor market disproportionately expose groups to exploitation and danger. Combine this realization with the latest iteration of the Black Lives Matter protests and it is clear that the role of the labor market and local development in encouraging, or inhibiting, social inequality is of immediate and vital concern. This session will explore different ways that economic development, and regional labor market change, are implicated in reproducing inequity and also hold the potential to attack systemized inequality.

Objectives:

- Explore explicit links between social inequity and economic development theory and policy

### **GEARING UP: ADVANCING ECONOMIC INCLUSION THROUGH MANUFACTURING EXTENSION**

Abstract ID: 225

Abstract within Pre-Organized Session 49

LOWE, Nichola [University of North Carolina at Chapel Hill] nlowe@unc.edu, presenting author

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, co-author

WILSON, Matt [UNC Chapel Hill] mwilson2@live.unc.edu, co-author

RABBANI, Rumana [UNC Chapel Hill] rumana.rabbani@unc.edu, co-author

In Northeast Ohio a local manufacturing extension provider promotes racial equity through an early career pre-apprenticeship program, working with inner-city, public high schools to help youth of color gain access to promising manufacturing careers. Last year, this same extension provider joined a national learning initiative to build capacity to engage communities of color in support of equitable manufacturing employment growth. Roughly 300 miles away in Illinois, another manufacturing extension provider is 7 years in to an equally-transformative process called the Genesis Movement. Piloted in 2014 in the Chicagoland region, Genesis starts with the premise that workforce practices are central to business operations, productivity and competitiveness and therefore manufacturing extension services need to promote improvements to job quality in support of long-term business success.

We raise these illustrative examples to demonstrate what is possible when you layer goals of economic inclusion onto a robust and far-reaching industrial extension system. Both these Illinois and Ohio-based extension providers are part of this nation's federally-funded Manufacturing Extension Partnership—a national network of 51 centers (375 field offices) that employ over 1,400 specialists who provide business and technical assistance to small- and medium-sized (SME) manufacturers. In 2019, this national MEP network interacted with more than 28,000 SME manufacturers, generating billions of dollars in cost savings and new and retained product sales, also creating and retaining 114,000 U.S. manufacturing jobs.

U.S. manufacturing extension offers a proven institutional platform for boosting firm performance, with room to also strengthen support family-sustaining, opportunity-rich jobs, particularly for entry-level workers and workers of

color. But while manufacturing extension, as a revered business-facing institution, may offer a promising channel for improving worker livelihood, it is unclear the degree to which individual MEP centers use their on-going engagement with smaller-sized manufacturers to influence inclusive employment strategies and decisions. Are the examples from Illinois and Ohio exceptions to the norm or are they suggestive of a broader shift to institutionalizing similar actions across the MEP network? How, if at all, have the dual crises of the COVID-19 pandemic and systemic racism amplified (or stalled) this strategic direction? And what institutional barriers or resource constraints might stand in the way of continued progress?

This paper will answer these questions by examining the conditions under which manufacturing extension centers promote better quality, more inclusive employment opportunities as they serve and support SME manufacturing businesses. We will draw on a mix of quantitative (administrative data from the NIST-MEP office) and qualitative data sources to examine the extent to which economic inclusion gets institutionalized through manufacturing extension. We present cases studies that examine how MEPs extend workforce assistance to their manufacturing clients, also exploring the extent to which that support extends down the organizational hierarchy and outwards into the surrounding community, reaching historically excluded populations in the process.

We hope to illuminate examples where that support is potentially farther-reaching and transformational, in turn providing a resource for guiding MEP decision-making both now and throughout the post-pandemic economic recovery. Additionally, by capturing a variety of MEP strategies and institutional partnerships that may support economic inclusion, this research will provide baseline information for assessing the economic gains for individual workers and their manufacturing employers.

#### **DO INDUSTRIAL ZONES SUPPORT QUALITY JOBS AND A DIVERSE BUSINESS MIX COMPARED TO OTHER TARGETED EMPLOYMENT AREAS?**

Abstract ID: 226

Abstract within Pre-Organized Session 49

GRODACH, Carl [Monash University] carl.grodach@monash.edu, presenting author

Planners in strong market cities have rezoned a significant proportion of inner and middle suburban industrial land for higher value residential and mixed-use development. Alongside this, cities have designated new "innovation districts" and other areas intended to concentrate and grow knowledge economy jobs and advanced services. These trends combine to reinforce a long-standing shift towards a bifurcated and polarized economy consisting of highly skilled professional service jobs and often minority and immigrant labor funneled into lower wage services

industries. Further, under Covid-19, those working in consumer service jobs that are unable to be performed at home are increasingly vulnerable. This culmination of trends points toward the need for equity over growth-oriented economic development.

Researchers argue that manufacturing and industrial lands provide a route toward more sustainable and equitable economic development (Chapple, 2015; Leigh and Hoezel, 2012). However, while urban industrial policy in some cities recognizes the equity opportunities of manufacturing and industrial lands, this often does not translate into actual plan implementation. Additionally, many places continue to work from an outdated vision of industrial land that has not kept pace with changes in manufacturing (Grodach and Gibson, 2019).

Do industrial zones support quality jobs and a diverse business mix compared to other targeted employment areas? This paper seeks to provide an evidence base to support urban industrial planning and contribute empirical research on the equity roles of industrial lands. We examine if and how industrial zones in Greater Melbourne and Sydney, Australia support a mix of jobs and industry clusters and compare this to other designated employment areas in each city. We selected these cities because they contain the highest shares of industrial employment in the country as well as highly competitive property markets where the pressure for industrial rezonings is greatest. Analysis includes GIS mapping of job density and diversity based on employment/population ratio (EPR) and kernel density measures. We also analyze income, industry, and occupational mix across the employment areas. We find that industrial zones are more likely to provide a diverse employment and income base compared to other employment areas. This evidence base can equip planners to better consider a balanced employment mix in their land use planning efforts

#### **HAVE WE BEEN HERE BEFORE? MANUFACTURING RETENTION AND PROSPECTS FOR EQUITABLE DEVELOPMENT IN DETROIT**

Abstract ID: 227

Abstract within Pre-Organized Session 49

GUINN, Andrew [Wayne State University] arguinn@wayne.edu, presenting author

What possibilities are available for practitioners to reform or renew entrenched economic development institutions towards normative principles of social equity? From the 1950s through the 1990s, the City of Detroit pursued an economic development strategy of “industrial urban renewal” to retain and upgrade its automotive manufacturing base through a combination of land assembly and incentive policies. Against an expensive and decades-long record of failure to mitigate job loss and disinvestment, the sustained application of this approach led to claims that local politicians and practitioners had succumbed to institutional path dependency and “policy lock-in” (Thomas 1990, Jones and Bachelor 1993). To the extent that there has been a strategic reorientation away from heavy industry and towards the downtown real estate and professional services sectors in the 21<sup>st</sup> Century, this process has deepened racial and spatial inequalities, as it has generated more jobs for suburbanites than Detroiters and failed to direct significant income or investments to neighborhoods outside the urban core (Reese et al 2017). Since 2018, however, state and local agencies have touted a new round of large industrial projects in the city, justifying the extension of

public support on claims that they will bring growth with equity. In what ways, if any, do contemporary economic development projects replicate or deviate from the shortcomings of earlier deals? How, and to what extent, do they address development disparities in Detroit?

This paper addresses these questions through an extended, comparative case study of economic development projects related to two automotive complexes in Detroit, owned by GM and Chrysler (now part of the Stellantis joint venture), at two periods of time, the late 20<sup>th</sup> Century and the present day. In the 1980s and 1990s, both firms constructed facilities on or near the sites of obsolescent plants – retention projects which were heavily subsidized by fiscal incentives and aggressive land assembly actions. Again, in 2019, both firms received state and local support in exchange for new investments at these same locations. Drawing on archival documents, secondary literature and interviews, I examine three aspects of the retention deals during both periods: the public policies applied, incentive negotiations among various public agencies and the automakers, and the public and private actions and collaborations that implement the deals. My analytic approach builds on research by Lowe and Feldman (2018) and Pike et al (2007), among others, who draw attention to how practitioners develop and institutionalize collaborations across apparently unconnected policy realms to resolve strategic or normative tensions. Here, I consider possibilities for resolving material and political tensions related to the distribution of benefits and burdens from industrial development.

Variations in the projects across sites and over time indicate a meaningful break with late-20<sup>th</sup> Century practice. Fiscal incentives and, in the FCA case, land assembly remain the controversial fulcrums of public-private negotiations. Yet in different ways, the recent deals incorporate stronger performance requirements, and policy insiders have leveraged these to develop local hiring pathways and mechanisms that mitigate negative externalities in surrounding neighborhoods, among other institutional elements, which were absent from earlier efforts. In doing so, they draw in labor market intermediaries and community development organizations as collaborators in the implementation processes.

#### THE GEOGRAPHY OF WAGE THEFT ENFORCEMENT- INDUSTRIAL STRUCTURE AND WORKFORCE COMPOSITION

Abstract ID: 228

Abstract within Pre-Organized Session 49

GREEN, Jamaal [University of Pennsylvania] jamaalg@upenn.edu, presenting author

By some estimates, employers steal upwards of \$15 billion a year from workers (Cooper and Kroeger 2017). Of that \$15 billion that vast majority of stolen wages are taken from predominately low wage service industry workers, particularly retail and food service workers. Research on wage theft is highly varied, ranging from national studies using Current Population Survey data to specialized survey projects focusing on low wage immigrant workers in a

sample of large cities (Bernhardt, Spiller, and Theodore 2013; Cooper and Kroeger 2017). Additional recent research has examined the rise of community-labor coalitions' roles in passing stricter wage theft enforcement at the state level (Doussard and Gamal 2015).

These studies are principally concerned with estimating the incidence or prevalence of wage theft and the politics of labor standards enforcement. While these studies offer essential information on wage theft patterns and enforcement they are generally limited by their geographic and industrial scope. This study takes a different tact in tracking the geography of wage theft enforcement decisions at the federal level in order to gain a better understanding of the prevalence of wage theft and the role that local industrial structure and workforce composition plays in wage theft.

This descriptive analysis makes use of the Department of Labor's Fair Labor Standards Act enforcement data combined with the Quarterly Workforce Indicators from the Census to match wage theft enforcement decisions down to the county-industry level for the US, as a whole. I find that wage theft enforcement awards are concentrated in primarily low wage industries, but also in industries that make extensive use of subcontracting, such as construction work. In order to explore the role of local industrial structure and workforce composition, I present regression model results of the role that industry concentration, as represented by location quotient, plays in backwages awarded compared to the concentration of Black and Hispanic workers in particular county-industry pairs. Preliminary results show that both workforce composition and industrial structure matter with respect to wage theft enforcement.

The tens of billions of dollars a year stolen from primarily low wage, non-white workers represent a massive transfer of income that is generally invisible and matters for questions concerning income inequality as well as the health of local labor markets. Economic development planners concerned with helping high opportunity economies grow should be more aware of the risks that vulnerable workers face that limit not only their own work respects, but regional economies as a whole.

### 3.66 PRE-ORGANIZED SESSION - PROMOTING SOCIAL EQUITY WITH ECONOMIC DEVELOPMENT PRACTICE 2

Pre-Organized Session 66 - Summary

Session Includes 298, 299, 300, 301, 302

GREEN, Jamaal [University of Pennsylvania] [jamaalg@upenn.edu](mailto:jamaalg@upenn.edu), organizer

This session will focus upon a variety of issues in economic development with an explicit focus on how they address, or not, ongoing issues of social inequity. The past year has shown in stark relief how the racialized and gendered aspects of our labor market disproportionately expose groups to exploitation and danger. Combine this realization with the latest iteration of the Black Lives Matter protests and it is clear that the role of the labor market and local development in encouraging, or inhibiting, social inequality is of immediate and vital concern. This session will

explore different ways that economic development, and regional labor market change, are implicated in reproducing inequity and also hold the potential to attack systemized inequality.

Objectives:

- Explore explicit links between social inequity and economic development theory and policy

## **BIFURCATED ROADS: EQUITABLE ECONOMIC DEVELOPMENT STRATEGIES ACROSS GEOGRAPHY**

Abstract ID: 298

Abstract within Pre-Organized Session 66

FANG, Kerry [Florida State University] [lfang3@fsu.edu](mailto:lfang3@fsu.edu), presenting author

Different regions have adopted various types of economic development strategies. Economic development researchers have developed various typologies to describe these strategies. The most prominent typology classifies development strategies into three “waves” (Bradshaw & Blakely, 1999). The first wave begins in about the 1850s, focuses on Eisinger’s supply-side strategies, and offers tax abatements, subsidies, and low-cost land to attract footloose firms to locate in a jurisdiction (Hanley & Douglass, 2014). The second wave emerges in the 1980s, focusing on investment and entrepreneurial policies that foster innovation, nurture new businesses, breed high-technology industries, and promote local businesses (Hanley & Douglass, 2014). The third wave, starting in the 1990s, gears toward enhancing the local context for economic development instead of a particular firm’s needs, such as enhancing regional competitiveness and promoting industrial clusters (Bradshaw & Blakely, 1999).

However, recent studies have found that the “waves” typology does not truly represent how jurisdictions put their strategies together. Instead, jurisdictions bundle different strategies to form a managed portfolio (Lowe & Feldman, 2018). Moreover, some suggested that there might be a fourth wave of development strategies dealing with issues such as sustainability and social inequity (Stokan, Deslatte, & Hatch, 2020; Liao et al., 2020). A few questions emerge from these recent discussions. What is the most recent “wave” of economic development strategies really about? Is there even a fourth wave? If yes, which jurisdictions adopted it? Does the “waves” typology hold or are jurisdictions more likely to mix different waves of strategies? Which waves are mixed with the fourth wave of equitable and sustainable planning?

To answer these questions, I collected 376 most updated Comprehensive Economic Development Strategies (CEDS) from Economic Development Districts all over the nation and adopted a Latent Dirichlet Allocation topic modeling technique to identify clusters of keywords. This results in a data-driven typology of development strategies. Moreover, this approach allows a quantification of how many texts each development strategy and each wave of strategies accounts for. Thus, it can empirically answer the question of whether the fourth wave of strategies focusing on social equity and environmental sustainability is prevalent across local jurisdictions, and which jurisdictions adopted it. In addition, the mixing of strategy portfolios can also be quantified for each jurisdiction, and we, therefore, can identify which jurisdictions adopted equitable and sustainable strategies, and what other strategies they have mixed in their portfolio.

This study delivers a new data-driven typology of economic development strategies. For researchers, this empirically verifies the “waves” typology, whether the fourth wave exists, and how jurisdictions are mixing their strategies, and thus help settle the theoretical debates about strategy typologies. For practitioners, a quantification of local strategy portfolio can yield insights on the appropriate coupling of different strategies, especially what works well with equitable and sustainable strategies. As a result, it can help economic development planners design a more compatible and complementary package of strategies for their communities.

### **SPOTTING THE HUMAN DEVELOPMENT WAVE: WHICH CITIES ARE INVESTING IN PEOPLE?**

Abstract ID: 299

Abstract within Pre-Organized Session 66

YENIGUN, Ozge [University of Illinois at Urbana-Champaign] yenigun2@illinois.edu, presenting author

DOUSSARD, Marc [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, co-author

The idea of human development increasingly displaces the flawed metaphor of human capital in economic development. In doing so, it expands the scope of economic development in a way to value the creation and expansion of human capabilities. This leads to a concurrent practical shift to policies and strategies focused on public health, security, and amenities available to all, including individuals who rarely appear in human capital thinking. Our paper documents this shift in practice and evaluates the uneven adoption of human development approaches across U.S. urban regions.

We first document the shift towards human development in economic thought and as a response to expanding social and economic inequalities. We then analyze evidence on the roll-out of equity-focused policies across U.S. cities and states. This analysis shows that equity-oriented economic development practice has been emerging in local jurisdictions, and recent policy changes are evidence of the emergence of a human development wave of economic development. Free community college, college promise programs, universal pre-kindergarten pilot programs, basic income pilot programs, chief equity officers within city departments, fair scheduling ordinances, earned sick time legislation, free or reduced-cost child and elder care, and housing trust funds are diffusing across U.S. cities and states since the 2010s. For example, Stockton, California and Jackson, Mississippi have authorized Basic Income Pilot Programs; New York City, San Francisco, Seattle and many other cities have mandated fair work schedules and introduced earned sick time legislation; Vermont, Florida, and District of Columbia have initiated universal pre-K programs.

Our analysis replaces normative arguments in favor of human development theory with practical questions of how, where and how far human development programs operate. We find that most human development policies are implemented in large cities with more resources and large, diversified economies. These cities are taking the lead in introducing pilot programs and the promotion of social equity policies. However, fostering equity-oriented economic development efforts without institutional change risks the possibility of a more balanced distribution and diffusion of progressive and redistributive development policies. The turn is already uneven, and we argue that this has the potential to be the source of a new round of uneven development, where diversified and competitive economies have more leverage to make investments in people and households.

The paper concludes by highlighting the need for thinking of this wave as a potentially transformative moment, a project that focuses on the transformative power of cities to address economic and racial disparities rather than

narrow fixes to major challenges. Otherwise we will continue to see a trend similar to what Stokan, Deslatte, & Hatch (2020) have already found evidence of: Places that face less competitive pressure and have more resources and intergovernmental connections will be more likely to embrace and yield the benefits of equity-enhancing development strategies.

### **UNDERSTANDING LOCAL AND REGIONAL EFFORTS TO ADVANCE INCLUSIVE ECONOMIC RECOVERY**

Abstract ID: 300

Abstract within Pre-Organized Session 66

COWELL, Margaret [Virginia Tech] mmcowell@vt.edu, presenting author

COWELL, Margaret [Virginia Polytechnic Institute and State University] mmcowell@vt.edu, co-author

HASKINS, Conaway [Virginia Cooperative Extension] chaskins@vt.edu, co-author

The economic and social upheavals of 2020 have led many local and regional development organizations and governments to rapidly shape their strategies and plans to drive future economic recovery (Dzigbede, et al. 2020). In the majority of cases, inclusive or equitable recovery is one of their stated values or goals. However, there does not yet exist a common understanding or shared consensus around the meaning of inclusion, nor of the strategies and actions that might best advance inclusion in the context of local and regional economic development and recovery (Schmitt, et al, 2020). To fill this gap and extend our collective knowledge, our research seeks to answer two main questions: 1) How are concerns for inclusive economic recovery exhibited in local and regional recovery planning processes? 2) What are the strategies being deployed to promote inclusive recovery? Our research incorporates preliminary findings from a comprehensive survey of economic development and planning organizations in Virginia and Maryland as these entities initiate and work through their economic recovery planning processes, allowing us to identify common themes and differences as well as possible opportunities for knowledge generation and dissemination pertaining to inclusive economic recovery.

In 2016, the Rockefeller Foundation defined an inclusive economy as "one in which there is expanded opportunity for more broadly shared prosperity especially for those facing the greatest barriers to advancing their well-being" (Pacetti, 2016). The Foundation identified five inter-related characteristics of an inclusive economy and proposed associated indicators for each: participation, equity, growth, sustainability, and stability. Researchers with the Brookings Metropolitan Policy Program then worked with the Rockefeller Foundation to develop and employ this framework in their own work on measuring inclusive urban economies (Berube & Irons, 2016). Practitioners have simultaneously explored the idea of inclusive economies, though the concept has been deployed in fairly disparate contexts with little clarity or commonality in terms of meanings and implications. We observe that the fuzziness of this concept is particularly widespread and pronounced in the case of economic recovery plans, especially in the United States at the sub-national level.

For some entities, inclusive economic development means increasing the diversity of board members or diversifying

the types of industry present in a region. Both of these may indeed be worthy and relate to components of inclusive economic development, but in light of recent events they seem insufficient, especially when we consider the extent to which communities and neighborhoods with heavier concentrations of minority residents have been disproportionately impacted by the COVID-19 pandemic coupled with a long-standing racial wealth gap and institutionalized racism (Noel, et al 2019).

Data collected through our survey of Virginia and Maryland regional planning and economic development organizations shed light on the extent to which their planning processes incorporate concerns for – and define the term – inclusive economic recovery, as well as the strategies they plan to use to promote inclusive recovery. Though some common characteristics were identified, the results demonstrate widespread differences seen in both the extent to which inclusivity is prioritized as well as the ways in which it is conceived of in recovery plans across the two states and amongst the local and regional entities. The findings suggest the need for further dialogue about how inclusivity is defined and how it can best translate into actionable strategies. We conclude that while many economic development organizations are signaling a commitment to inclusivity, albeit in assorted ways, time will tell whether they are able to transcend mere signaling in order to enact lasting change.

### **BUILDING AN INCLUSIVE ECOSYSTEM FOR WOMEN AND MINORITY ENTREPRENEURS: A CASE OF COLUMBUS CITY GOVERNMENT, OHIO**

Abstract ID: 301

Abstract within Pre-Organized Session 66

MOTOYAMA, Yasuyuki [Ohio State University] motoyama.1@osu.edu, presenting author

O'BRIEN, Katherine [Ohio State University] obrien.758@osu.edu, co-author

GOLATT, Henry [City of Columbus] HAGolatt@columbus.gov, co-author

There has been an overwhelming empirical evidence that women and minority entrepreneurs underperform in entrepreneurship compared to men and Caucasian counterparts (Coleman and Robb 2012; Bradford 2014; Harper-Anderson 2019). It is one challenge to analyze structural causes for this disparity, which scholars are only beginning to understand (Sperber and Linder 2019; Motoyama et al. 2021). It is another and even larger challenge to build knowledge about how we can reduce such disparity. In this paper, we will analyze a case study of Columbus, Ohio, in which the City Government created the Small Business Assessment Committee with a specific aim to improve the ecosystem inclusive of women and minority entrepreneurs in January 2019. We will start with a descriptive analysis of the Committee's agenda, discussions, and recommendations for the city government. Those recommendations fruited as city's Small Business Agenda announced by Mayor Ginther in December 2019. The Agenda set four goals and established two positions of “ecosystem builders” in order to accelerate the local connectivity for women and minority entrepreneurs. The Committee's work continued in 2020 despite the pandemic and further advanced to

track the progress of city's works and regional ecosystem based on surveys, private data, and other publicly available data. We will extract key strategies, tactics, and lessons learned from this experiment and provide policy implications.

#### WHAT DRIVES EQUITABLE ECONOMIC DEVELOPMENT: AN ANALYSIS OF LOCAL GOVERNMENTS

Abstract ID: 302

Abstract within Pre-Organized Session 66

STOKAN, Eric [UMBC] [estokan@umbc.edu](mailto:estokan@umbc.edu), presenting author

Local governments must balance economic growth against the competing goals of social or racial equity, quality of life and ecological preservation. Yet, it is understood that they clearly prioritize economic growth (Peterson, 1981; 1995; Stone, 1989; Wolman and Spitzley, 1996) and utilize a broad range of policy instruments to that end (Reese, 1993; Rubin, 1988; Rubin and Rubin, 1987; Stokan, 2013; Zheng and Warner, 2010). Yet, what drives local governments toward greater commitments to social equity at the expense of economic growth is less certain and has garnered less research attention. Despite the field of public administration recognizing social equity as an equal pillar, on par with economic growth and efficiency, for more than 50 years (Frederickson, 2005) cities and administrators have struggled to properly balance these goals.

The fungibility of resource allocations and capabilities away from economic growth toward sustainability (Deslatte and Stokan, 2017, 2020) and social equity (Stokan, Deslatte, and Hatch, 2020) is possible; however, research demonstrates that doing so necessitates lowering resource dependencies on external environmental controls to overcome path dependence and "lock in" effects. Resource Dependence Theory has been shown, cross-sectionally and longitudinally, to explain greater commitments toward sustainability and equity over economic growth (Deslatte and Stokan, 2017; 2020; Stokan and Deslatte, 2020; Stokan, Deslatte, and Hatch, 2020); however, this theory has neither been causally tested nor have competing theories been fully dismissed. To address this gap, this paper uses changes in guaranteed federal resources, which trigger changes in RDT, as governments become "entitled" to CDBG funds. Thus, when municipal governments cross the 50,000 population threshold (increasing RDT), or conversely drop below 50,000 (decreasing RDT), they can reallocate resources in a way that prioritizes growth or equity.

With a newly created dataset of HUD CDBG expenditures aggregated to the municipal level matched to the International City/County Management Association (ICMA) economic development surveys, and Lincoln Institute's Fiscally Standardized City Database we ask whether an increase (decrease) in RDT leads governments to prioritize social equity (economic growth) using paired difference-in-differences and generalized synthetic control methods. To root out other competing causal explanations for such prioritization, we account for institutional form, policy

learning and diffusion, changes in citizen demand and ideology, and changes in the levels of community need. Supplementing the quantitative analyses with 10 case studies of cities that crossed the 50,000 population threshold, we explore the causal mechanisms leading governments to prioritize social equity.

### 3.79 PRE-ORGANIZED SESSION - PLANNING TO STRENGTHENING ECONOMIC DEVELOPMENT ASSETS

Pre-Organized Session 79 - Summary

Session Includes 378, 379, 380

HILL, Edward [The Ohio State University] hill.1973@osu.edu, organizer

Three papers are presented that examine efforts to build community-based economic development assets: philanthropic grant making in community development, regional sector-led workforce development, and Main Street programs in rural downtowns. Ned Hill's workforce paper posits that a region's workforce is a common pool resource hypothesizing that those that are successful share the governance characteristics of common pool resources developed by Elinor Ostrom. Observations are made on sector-led efforts both nationally and in Ohio. Andrew Van Leuven presents an overview of downtown revitalization as a place-making and economic development strategy in non-metropolitan communities. The third paper is an in-depth examination of shifts in community development grant making by philanthropic foundations. Jeelson Oh investigates efforts to promulgate a model of urban development by an influential national philanthropic network, Living Cities, offering insights into shifting approaches to urban (re)development by prominent foundations.

#### Objectives:

- Strengthening community development assets
- Governance of regional and community development
- Evaluation to inform practice

### GOVERNING SECTOR-LED REGIONAL WORKFORCE TRAINING USING ELINOR OSTROM'S RULES FOR GOVERNING THE COMMONS

Abstract ID: 378

Abstract within Pre-Organized Session 79

HILL, Edward [Ohio State University] Hill.1973@osu.edu, presenting author

## Research Question

Workforce training has changed in three ways over the past several years: the customer's identity transformed; control over the training curriculum shifted; the definition of the service territory expanded from political geography to economic geography.

First, the identification of the products of workforce training programs has changed fundamentally. Previously public policy, and possibly the public, thought of students as the customers of education and training providers. In this model, students disciplined the workforce system by voting with their feet and finances. The evolving model depicts the graduates of training programs as the product or output and employers as the customers.

Second, with the change in public policy's conceptualization of students as customers to products and depicting employers as the customers, power over content has shifted from education and training providers to sector-led intermediaries. This shift results in a move away from community college and vocational school degrees and certificates to industry-recognized credentials. One of the purported benefits of transparent standardization is lower search costs by employers.

Third, the geography of service provision is shifting away from political geographies of municipalities and counties toward economic geographies of labor markets.

What has not changed is the dominant source of funding of workforce training—it is a mixture of federal and state funds supplemented, at times, with student tuition payments and debt. Public financial support, the change in geography, and private demand for the product (trained workers) imply that new governance models are required. This research explores this question after offering a provocative hypothesis.

Hiring a worker is both excludable and rival, making labor a private good. At the same time, spillover benefits generated from general education and training makes labor a merit good. Declaring labor a merit good results in student-consumers forming the demand side of education markets. Unfortunately, this long-standing metaphor of labor markets breaks down when labor is a product, employers are customers, and positive externalities exist. I offer an alternative hypothesis: labor is a common pool resource, as conceptualized by Elinor Ostrom. The first part of the paper explores this hypothesis and builds out its implications.

If this hypothesis is credible, then Ostrom's guidance on governing the commons offers guidance on how sector-specific regional workforce training programs should be governed and affect program outcomes.

## Approach

### Literature review

A review of the professional and academic literature on sector specific workforce training will be undertaken with an emphasis on the manufacturing and the health care sectors. Guidance on demonstrated best practices and best bets will be recorded. These programs will be examined to identify their conceptualization of the customer and the product. We will also identify funding sources, geography, industry-specificity, and governance. The governance principles used in those programs will be examined to determine how they correspond to Ostrom's guidance.

### Examination of Ohio's Workforce Programs

The author has access to the manufacturing sector-led partnerships in the state of Ohio and the office that funds these programs, Innovate Ohio. An inventory of sector-led workforce training programs will be undertaken and data on program structure, funding, governance, purpose, and the issue of product will be collected. Effort will be made to collect data on manufacturing, health care, and software training programs.

# **FROM NEIGHBORHOOD PLANNING TO URBAN INNOVATION? UNDERSTANDING SHIFTS IN PHILANTHROPIC FOUNDATIONS' ENGAGEMENT IN URBAN DEVELOPMENT THROUGH A PROMINENT FOUNDATION NETWORK, LIVING CITIES**

Abstract ID: 379

Abstract within Pre-Organized Session 79

OH, Jeelson [Ohio State University] oh.483@buckeyemail.osu.edu, presenting author

This paper investigates efforts to promulgate a model of urban development by an influential national philanthropic network, Living Cities, offering insights into shifting approaches to urban (re)development by prominent foundations. A number of prominent foundations have inspired different models of urban development from neighborhood planning to Comprehensive Community Initiatives. Additionally, a subset of large foundations have been critical to the births and growth of Community Development Corporations and national community development initiatives such as the Local Initiatives Support Corporation (LISC) and the Enterprise Community Partners. Much of the support to these place-based community development organizations has been through funding and technical assistance and focused on neighborhood-scale projects such as affordable housing (Rohe 2009).

In the recent decade, however, a growing number of large foundations have shifted away from merely providing resources for community development organizations. These foundations seek to act as change agents themselves, advancing major planning initiatives or directly engaging in the development and implementation of urban agendas (e.g. Detroit Future City Strategic Framework, Bloomberg Philanthropies' American Cities, Rockefeller Foundation's 100 Resilient Cities). Using Living Cities' signature urban development model, The Integration Initiative (TII), as a case study and the concept of sociotechnical vanguards (Hilgartner 2015) as a theoretical framework, this paper analyzes discourse and practice of this prominent network of national foundations. The guiding research question is how can planners and policy-makers make sense of the shifts in large foundations' practice in urban development from a broader perspective on the work of Living Cities?

Drawing upon mixed methods that combine grant data analysis, discourse and document analysis, and semi-structured interviews with foundation officers and members from relevant organizations, this paper systematically compares Living Cities' discourse and funding activities with those of four longtime members of Living Cities—the Annie E. Casey, the Kresge, the Ford, and the Surdna Foundation. The objective is to examine why and how the network and the participating institutions co-produce discourse and actions. This study then investigates TII in Cleveland, Baltimore, and Detroit to assess the interconnectedness between foundation practice at the local level and Living Cities' model of urban development.

The findings are threefold. First, substantive interconnections exist among discourse and practice of Living Cities and the four member foundations, suggesting process within the network in which organizational interests are negotiated, amplified, or redefined, and manifested in discourse and practice. Secondly, this internal negotiation process has led to the development of two streams of discourse that Living Cities has used to expand its operational boundary and to project its prominence as a pioneer in creating visions for the future of American Cities: innovation and collective action. Lastly, Living Cities' collective action framework employed throughout TII model has galvanized a prevalent use of 'foundation collaborative' in the broader foundation practice. On the other hand, the very top-down nature of TII model created tension between the network and participating local institutions

including place-based foundations.

This paper seeks to contribute to the planning scholarship and practice. While social scientists have theorized, using policy entrepreneur or advocacy coalition theory, how foundations promulgate and advance policy reform agendas through networks (Reckhow and Tompkins-Stange 2018), much of the planning literature focuses on case studies that examine individual foundations within specific local contexts (Berglund 2020; Lowe and Grengs 2020). Applying a sociotechnical vanguards framework to the analysis of this national foundation network, this study contributes to conceptualizing the broader shifts taking place in philanthropic foundations. The paper also contributes to planning practice by shedding light on the directions prominent foundations are heading in as they assume increasingly direct roles in urban planning and development.

#### LESSONS FROM MAIN STREET: TRIANGULATING THE IMPACT OF DOWNTOWN REVITALIZATION EFFORTS IN THE RURAL MIDWEST

Abstract ID: 380

Abstract within Pre-Organized Session 79

VAN LEUVEN, Andrew [Ohio State University] vanleuven.3@osu.edu, presenting author

What does it take to revitalize a small-town central business district? How should we measure "success" when evaluating downtown revitalization efforts? Do revitalization programs lead to spillover benefits for the community? In this paper, I answer these questions by reviewing evidence from two recent econometric studies which focus on the long-term effects of the "Main Street Program" as a widely adopted downtown revitalization strategy in the rural Midwest. The first study used difference-in-differences analysis to identify the causal impact of Main Street Program adoption on job and business establishment growth in rural communities throughout Iowa, Michigan, Ohio, and Wisconsin. The second study used hedonic price analysis to estimate the relationship between downtown proximity and home sale prices in Ohio small towns with an active Main Street Program. I begin the paper by providing an overview of downtown revitalization as a place-making and economic development strategy in non-metropolitan communities. Next, using the data and findings from both econometric studies as a backdrop, I discuss the challenges associated with operationalizing "economic vitality" in evaluating the long-term impact of downtown revitalization efforts such as the Main Street Program. I conclude with a discussion of two overarching observations from my research. First, local context matters: regional differences in implementation may bring about pronounced disparities in estimated impact. Second, even when the impacts of downtown revitalization efforts are modest, such efforts can successfully elevate the *relative* position of small-town business districts within their larger regional housing and labor markets.

### 3.101 PRE-ORGANIZED SESSION - REPOSITIONING ARTS AND CULTURE IN PLANNING

Pre-Organized Session 101 - Summary

Session Includes 738, 739, 740, 741

ASHLEY, Amanda [Boise State University] amandaashley@boisestate.edu, organizer

Arts and culture is a growing subfield in planning scholarship and practice. Important instrumental research has sketched out the arts as industry (Currid 2008), the artist as a worker (Markusen and Schrock 2006), the arts as spectacle (Eisinger 2000), the arts as a placemaker (Zitcer 2020), the arts as community developer (Grodach 2010), and the arts as a force for protest (Ashley 2018). These valuable studies help us understand the role of arts and culture in our cities, but there is limited information in the U.S. about how arts and culture may influence planning policy and practice. This session connects to the art and science of planning (Birch 1980) through diverse collaborations that draw on distinct methodologies and approaches. The session includes several multi-city studies that deepen knowledge on how planners can support artist workforce development, how public universities perform as arts and cultural planners, how diversity, equity, and inclusion is addressed in arts and cultural plans, and how culture influences the way planning can be done. This session considers how arts and culture can shape planning through formal and informal channels.

Objectives:

- To learn about connections between arts and culture and planning that affect practice and scholarship

### OUR DIVERSITY IS OUR STRENGTH: EXPLAINING VARIATION IN DIVERSITY, EQUITY, AND INCLUSION EMPHASIS IN MUNICIPAL ARTS AND CULTURAL PLANS

Abstract ID: 738

Abstract within Pre-Organized Session 101

LOH, Carolyn [Wayne State University] cgloh@wayne.edu, presenting author

ASHLEY, Amanda [Boise State University] amandaashley@wayne.edu, co-author

BUBB, Karen [Boise State University] KarenBubb@boisestate.edu, co-author

DURHAM, Leslie [Boise State University] ldurham@boisestate.edu, co-author

Arts and cultural investment is an increasingly widespread economic development strategy, often guided by municipal arts and cultural plans, yet these plans often do not involve planners or contain the types of fact bases and commitments to equity that comprehensive plans do. In this study of 64 US municipal arts and cultural plans,

we investigated what kinds of places are producing arts and cultural plans that do a better job integrating concepts of diversity, equity, and inclusion, and what factors can explain these differences. We found that newer plans with more robust public processes more strongly emphasized most aspects of DEI, while more diverse and older cities' plans more strongly emphasized some aspects of DEI. Plans were much more willing to talk about diversity and inclusion than the specifics of equitable distribution of arts and cultural resources. Planners need to ensure that planning processes for arts and cultural plans meet the same standards we expect for comprehensive plans. They must be based on inclusive processes, able to understand the range of diversity of people in the city, and do the hard work of thinking about what a truly equitable distribution of arts and cultural resources would look like.

#### LOCATING ARTISTS IN THE CREATIVE ECONOMY: RESULTS FROM A 3-CITY SURVEY

Abstract ID: 739

Abstract within Pre-Organized Session 101

ZITCER, Andrew [Drexel University] [awz25@drexel.edu](mailto:awz25@drexel.edu), presenting author

TERESA, Benjamin [Virginia Commonwealth University] [bfteresa@vcu.edu](mailto:bfteresa@vcu.edu), primary author

Arts and culture has long been on the urban agenda, viewed as a tool for economic growth, a driver of tourism, and an intrinsic good for the local population (Strom 2010). Planners regularly highlight culture as an important driver of quality of life in municipal and neighborhood plans. At the same time, artists themselves often struggle to thrive in the urban political economy, due to low wages, insecure employment, and lack of systemic support for them as a class of workers (Markusen and King 2003). The COVID-19 pandemic was a catastrophe for the arts workforce. The pandemic massively impacted arts and culture, as live performances and public exhibitions were virtually eliminated due to health concerns. Amidst the ongoing severity of the crisis, some artists organized and were able to secure federal, state and local funds to bail out artists and venues (Limbong 2021). Philanthropy also stepped in, making emergency funds available to artists affected by the shuttering of the economy. These actions were nearly unprecedented, given the paltry culture funding available to artists in non-pandemic times compared to peer nations around the developed world (National Endowment for the Arts 2012).

This paper explores the conditions artists face in three cities on the U.S. East Coast (Philadelphia, PA, Baltimore, MD, and Richmond, VA), as well as the effects of the COVID-19 pandemic on their livelihoods. Data are derived from a three-city survey of artists conducted in Spring 2021. This research extends the findings of an earlier pilot project that utilized focus groups in Philadelphia to gain an understanding of artists' living and working conditions, as well as planning and policy interventions that might bolster their collective stability (Teresa and Zitcer 2020). The survey data explores the changing geography of living, working, and exhibition spaces for artists in these cities, as they are impacted by gentrification and neighborhood change. It also explores housing, income, debt and more. Finally, it

asks artists to voice their policy preferences for how planners and policymakers can best support their ongoing ability to thrive in the contemporary city.

#### **CULTURE AS PLANNER AND POLICYMAKER**

Abstract ID: 740

Abstract within Pre-Organized Session 101

TAYLOR, Johanna [Arizona State University] [Johanna.Taylor@asu.edu](mailto:Johanna.Taylor@asu.edu), presenting author

ZITCER, Andrew [Drexel University] [awz25@drexel.edu](mailto:awz25@drexel.edu), primary author

In the past year art and design have reshaped how we navigate the world and our shared priorities as a society. Consider the following examples of culture shaping planning and policy: Urban spaces previously designated for cars have become city-sanctioned as redesigned sidewalk cafes, gathering spaces, and playgrounds amid the COVID-19 pandemic. Calls for racial justice galvanized public spaces through protests, featuring visual artwork through signage and performance through civil disobedience actions as well as at temporary memorials and online recreations. Calls for a renewed WPA model advocate to not just create jobs for artists but make art-led solutions central for social and economic recovery as well as the reconceptualization of our cities, homes, and offices. Each of these examples is a turning point in which art and design influence decisions by demonstrating new ways of supporting resident daily lives and connecting city services with constituents. This is culture for planning and policy in action.

Culture does not rely on governments and planners to ensure its existence, rather culture itself shapes and advances planning agendas. This paper posits culture as a planning and policy tool and not just an industry that needs outside infrastructure to create the context in which it can function, enabling its existence. Building on current research advocating for the expanded impact of art and culture beyond economic metrics alone (Banks, 2018), this paper reviews existing research from urban design, public art, planning, policy, and geography in order to build a theoretical framework for understanding culture for planning and policy. This theoretical framework is grounded in examples of culture for planning and policy in action such as: participatory planning for urban development; artists embedded in government functions such as transportation and public health (Lithgow & Wall, 2017); cooperative social movement practices in shaping the built environment (Wilson, 2018); and advocacy for universal design, disability, and access (Hamraie, 2017).

## THE PUBLIC UNIVERSITY AS A CONTEMPORARY ARTS AND CULTURAL ANCHOR: ASSESSING A NEW IMPACT ASSESSMENT TOOL

Abstract ID: 741

Abstract within Pre-Organized Session 101

BUBB, Karen [Boise State University] KarenBubb@boisestate.edu, presenting author  
 ASHLEY, Amanda [Boise State University] amandaashley@boisestate.edu, co-author  
 DURHAM, Leslie [Boise State University] ldurham@boisestate.edu, co-author  
 KETTLER, Jaclyn [Boise State University] jaclynkettler@boisestate.edu, co-author  
 LOH, Carolyn [Wayne State University] cgloh@wayne.edu, co-author  
 WILEY, Brian [Boise State University] brianwiley@boisestate.edu, co-author

How do public universities serve as arts and cultural anchors, contributing to community planning and workforce development? A three-year interdisciplinary research project funded by NEA's ArtWorks program supported the development of an assessment tool to investigate this question. The tool is *The Innovative Arts University as Cultural Anchor: Impact Assessment*. The tool is a series of data-informed questions about key components of the innovative arts university. It assesses the role of the university as a cultural planning partner, workforce development engine, and arts innovator. Our research goal is to test and refine the impact assessment tool with four universities serving as case studies: Arizona State University, University of Colorado at Boulder, Boise State University, and Portland State University. We selected these four because each of these are public universities, in metropolitan locations, are not land-grant universities, are major population centers for the state, are located in the American Intermountain West and Pacific Northwest and are part of the WESTAF continuum. These cases are different in key ways so that we can test and control for whether the assessment works for a range of universities funding types and for different approaches to arts innovation. The selected universities are either Research 1 or Research 2 universities with substantially different levels and resources. Each institution has a spectrum of arts innovation in curriculum ranging from traditional to contemporary practices and each are involved with the community arts and planning ecosystems in varying degrees. Participating leaders include deans of schools and colleges of arts and science, art department chairpersons, arts innovation program leads, and university research vice presidents. To test the tool we invited participants to use the tool. After using the assessment tool each subject completed an individual survey and participated in one or two focus groups to gather their collective feedback on what worked and what did not work about the assessment tool. Findings were used to revise and update the impact assessment tool. Our findings revealed that university administrators are not fully aware of the role or potential of the university as an arts anchor in the community. The implications for the field are significant in that this tool can be used to help university leaders assess and tell the story of their artistic and pedagogical innovation, cultural relevance, centrality to community planning and economic impact to their various stakeholders. The tool demonstrated its potential to be an accelerator because it highlights areas where the university can invest resources, including filling gaps in developing or established campus and local arts ecosystems, forging deeper community connections aimed at advancing social good, partnering with municipal cultural planning efforts to improve the creative economy, and creating a vibrant creative workforce prepared to meet the challenges of twenty-first century employment.

## **ROUNDTABLES**

### **3.94 ROUNDTABLE - REIMAGINING THE POLITICS AND PLACE OF SKILL**

Abstract ID: 94

TILLY, Chris [UCLA] [tilly@luskin.ucla.edu](mailto:tilly@luskin.ucla.edu), Co-Author, moderator  
ISKANDER, Natasha [NYU] [natasha.iskander@nyu.edu](mailto:natasha.iskander@nyu.edu), participant  
AGARWALA, Rina [Johns Hopkins] [agarwala@jhu.edu](mailto:agarwala@jhu.edu), participant  
LOWE, Nichola [University of North Carolina at Chapel Hill] [nlowe@unc.edu](mailto:nlowe@unc.edu), participant

Skill is often presented as a technical problem: something to be addressed through better measurement of industry skill needs, through increased training program enrollment or through incentives to encourage individuals—or their employers—to invest in upskilling. This panel brings together authors of recent skill-focused books that challenge reductionist narratives around skill and outline instead the politics of skill that is too often used to exclude and marginalize large segments of the working population. While these books focus on vulnerable workers in very different national contexts—India, Qatar, the United States—they speak to the need to reinterpret skill and the power that is wielded by those who categorize, control and claim rights to skill. But with this critical assessment also comes the possibility for a reimagined future of work, with room for institutional and creative action to raise up and advocate for workers that are summarily dismissed as unskilled.

The three books featured on this panel include:

*Does Skill Make Us Human? Migrant Workers in 21st Century Qatar and Beyond* by Natasha Iskander. This book provides an in-depth look at Qatar's migrant workers and the place of skill in the language of control and power. Iskander takes readers into Qatar's booming construction industry in the lead-up to the 2022 World Cup. She reveals that skill functions as a marker of social difference powerful enough to structure all aspects of social and economic life. She demonstrates that skill categories adjudicate personhood, creating hierarchies that shape working conditions, labor recruitment, migration policy, the design of urban spaces, and the reach of global industries. Iskander also discusses how skill distinctions define industry responses to global warming, with employers recruiting migrants from climate-damaged places at lower wages and exposing these workers to Qatar's extreme heat. She considers how the dehumanizing politics of skill might be undone through tactical solidarity and

creative practices.

*Managing Migrants by Class: Indian Emigration as a Development Tool* by Rina Agarwala. This project employs a comparative-historical examination to examine how sending country governments manage the out-migration or emigration of their citizens and how migrants react to and reshape sending state actions? Agarwala compares the Indian state's relations with its poor emigrants to the Middle East (who are legally classified as "unskilled") and its wealthy emigrants to the U.S. (legally classified as "skilled") from the 1920s to the present. In India, emigration has been used to empower some classes, while disempowering others. This difference in policy treatment has been justified within the democratic context of India using the parlance of "skill."

*Putting Skill to Work: How to Create Good Jobs in Uncertain Times* by Nichola Lowe. Lowe starts with America's employment problem—not enough good paying jobs to go around or clear pathways leading to them. Skill-based solutions are critical for addressing this employment crisis, but the transformational power of skill is frequently misunderstood. For Lowe, the real power of skill lies in its uncertainty: reflected in the elemental yet enigmatic questions of who possesses skill, where it resides and whose responsibility it is to build over time. She tells the stories of pioneering workforce intermediaries that harness and at times heighten skills ambiguity to extend economic opportunity to workers at the bottom of the labor market. With renewed policy emphasis on skill development, these opportunity-rich solutions can be further expanded—ensuring workers across the entire educational spectrum contribute skills that drive innovation forward and share the gains they generate for the twenty-first century workplace.

### 3.202 ROUNDTABLE - WHAT'S NEXT IN ECONOMIC DEVELOPMENT?

Abstract ID: 202

LOWE, Nichola [University of North Carolina, Chapel Hill] nlowe@email.unc.edu, moderator

FANG, Kerry [Florida State University] lfang3@fsu.edu, participant

GREEN, Jamaal [University of Pennsylvania] jamaal.Green@gmail.com, participant

WOLF-POWERS, Laura [Hunter College] aw2416@hunter.cuny.edu, participant

DRUCKER, Joshua [University of Illinois, Chicago] jdruck@uic.edu, participant

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, participant

Economic development has always been a key topic of academic inquiry. The question of why some regions are rich while others are poor is among one of the most important puzzles in the social sciences and directly relates to the livelihoods of millions of people (Lucas, 1988). Over the past decades, economic development researchers extensively examined the development process, alongside attendant strategies, and outcomes (Leigh, & Blakely, 2016). Recent reviews of the field highlight the shifting priorities and emergent paradigms of economic development in the US. For example, Currid-Halkett & Stolarick (2011) unveiled top keywords in articles published in *Economic Development Quarterly*. The themes they highlighted cover what we would now consider traditional topics in economic development including, but not limited to: cluster analysis, labor market change, economic development incentives, high tech, education, industry, innovation, and redevelopment. In a more recent update, Fang (2021) conducted a bibliography analysis of economic development studies, and found sustainable development, climate change, local and regional development, developing countries, and development strategies as

the predominant research themes in the recent five years. Compared to previous trends, economic development appears to be moving towards a more sustainability-oriented path with a global perspective.

Beyond advancements in the literature, our current economy is undergoing a potentially new round of dramatic restructuring. The role of technological advances such as AI will likely be a major disruptor in labor markets. The COVID-19 pandemic accelerated the trend of “work from home” and the dis-association of workers to their employers’ locations. Moreover, the death of George Floyd and the latest iteration of the “Black Lives Matter” movement have elevated questions of racial and income inequality to the forefront of policy makers’ concerns. Overall, these changes raise major questions for economic development planners. These urgent issues represent a critical point for our cities and require us to evaluate the current state of economic development research and to critically examine where the field should go into the future. In this pre-organized roundtable session, we’ve invited leading scholars in the field to discuss the next big questions and future directions of our field. We’ll discuss the following questions:

What are the next big questions for economic development researchers and practitioners? What topics would you like to see the next generation of economic development planners and researchers devote their time?

To what extent has COVID changed the way we work and live? Are these changes here to stay? If so, which ones? What are some of the implications for the urban economy, form and community organization? What should economic development planners do in face of these new trends?

What are the most prominent racial, income and other social equity issues economic development planners face moving forward? How can economic development planners more effectively deal with them?

Will new technology such as AI completely change the way we work and live? What are the implications for economic development planners?

We hope these questions, and our panelists, can steer the field of economic development in new directions, offer some clarity in these overwhelming times and inspire colleagues and students to take on the ambitious task of answering these questions.

## **INDIVIDUAL PAPER SUBMISSIONS**

### **DO LOCAL GOVERNMENTS LISTEN TO THE EXPERTS? EVIDENCE FROM AMAZON’S HQ2 CONTEST**

Abstract ID: 4

Individual Paper Submission

PIPKIN, Seth [University of California Irvine] spipkin@uci.edu, presenting author

Amazon.com, Inc.'s recent "HQ2" headquarters competition made local economic development policy a top news headline. The spectacle spurred two contrasting assessments: one saw it as a heightened "race to the bottom" competition in which local and state governments outdid each other in giving away their tax bases. The other characterized it as signaling a decisive shift in regional economic competition towards "place-based" investments in local workforce skills and productivity, infrastructure, and quality of life. To date, only two scholarly studies have attempted to determine which of these two views more accurately captures what local governments proposed – a question with significant consequences for our understanding of the state of local economic development planning. Each study concluded in favor of one of the opposing stories.

This paper attempts to clarify what this competition – which attracted over 200 detailed applications – can tell us about what economic development policy models hold sway, in what places, and why. It does so through two primary advances: first, it gathers a larger set of local proposals (n=114) than has previously been analyzed. And second, it analyzes proposals based on the substance of policies that they describe (e.g. policy type, resources committed), as opposed to previous studies' emphasis on measuring the rhetorical and thematic emphases in proposal texts. Based on this approach, this paper establishes an overall view of what are the "modal" and "outlier" policies that cities practice in local economic development. "Outlier" in this context entails an uncommon or unique level of commitment to securing economic benefits for local workers and business owners, especially those from marginalized backgrounds. We leverage the sample size to examine and compare subsamples (e.g. large vs. medium-sized cities, cities from different US regions) to better understand which cities show the strongest commitment to reducing inequality and elevating local populations' chances of economic mobility, as well as how they mobilize these commitments.

We establish cities' varying adoption of "outlier" vs. "modal" policies by coding the proposals in terms of the breadth and depth of commitment to the policies described. Amazon required submissions to enumerate specific information across a wide range of criteria, including local resources and institutions for worker training and education, infrastructure investments (e.g. roads, air travel, renewable energy, public transit, active pedestrian/bicycle mobility), programs to support businesses (e.g. permitting processes and support), and local housing supply. Policy breadth is captured by the variety of policies, while depth is captured using an ordinal scale to measure the level of commitment to a policy.

By establishing what are the "modal" and "outlier" local economic development policies, and how their adoption varies by city size, region, demographics, and political partisanship, we contribute to the planning literature's knowledge of the range of local approaches to investment in long-term workforce productivity and social mobility. While there is a general academic consensus that "place-based" policies focusing on marginalized groups' skills and opportunities are needed, there is also strong agreement that political incentives often make these policies difficult to implement. By examining who is listening to the experts, we can better understand the conditions under which place-based economic development policies are implemented, and to what ends.

## **GREEN JOBS AND CLIMATE JUSTICE IN AMERICAN CITIES**

Abstract ID: 19

Individual Paper Submission

HADDAD, Monica [Iowa State University] haddad@iastate.edu, presenting author

WERNER, Edmundo [London South Bank University] edwerner@workingcities.net, co-author

Climate justice can be defined as “the mobilization of justice with respect to climate policy” (Bulkeley et. al, 2013). Efforts to mitigate climate change should strive for climate justice to combat the current global crisis in which extreme weather events are becoming frequent and vulnerable communities are being hit the hardest. Considering that these efforts can unfold on a variety of scales, this study focuses on American cities. Seeing as the built environment contributes to 59% of greenhouse gas emissions, it is imperative to promote changes in cities to move towards carbon pollution-free cities (Fitzgerald, 2020; Mi et al, 2019). In the context of climate justice, such changes can consist in making green jobs available to those who need them the most.

With the aim of providing useful findings on green jobs initiatives, this study investigates how programs adopted by cities, or programs partnered with cities, can improve the livelihood of low-skilled workers by including them in the green workforce through training for local “green” jobs. The following research questions are posed: How do city governments attempt to respond to climate mitigation in ways that promote justice by implementing workforce development and training programs to include low-skilled workers in the green economy? What is the role of cities in managing green job creation through local-led workforce development and training programs? How do city governments interact with local organizations in the process of implementing green workforce development and training programs?

To compare 8-10 different programs in green jobs across the U.S., in-depth interviews with program staff will be conducted and the contents of the program materials available online will be analyzed. An example of such program is the Oakland Green Jobs Corp Program, which is based on a city-college partnership, and is designed to help disadvantaged community residents’ transition to green careers. Our analysis will examine themes such as urban politics, fairness, local leadership, and technological change. The findings will assist urban planners and public officials interested in learning how to combat climate change in ways that improve the livelihood of vulnerable residents in cities. By identifying good practices, these initiatives can be scaled up.

## SMALL MANUFACTURING ENTERPRISES IN THE DEINDUSTRIALIZING CITY: SHIFTING GEOGRAPHIES AND SPACES OF OPPORTUNITY

Abstract ID: 36

Individual Paper Submission

COFFIN, Sarah [Saint Louis University] sarah.coffin@slu.edu, presenting author

JENNINGS, Joel [Saint Louis University] joel.jennings@slu.edu, co-author

Manufacturing has been the backbone of the US economy for more than a century. Whether the emphasis is on durable goods or biotech/life sciences, our ability to make things continues to drive local markets. Globalization has shifted these trends; with larger, multinational firms often moving operations and manufacturing to cheaper labor markets.

Compounding the global challenges, more recent urban economic development and land planning practices in core urban areas have been replacing lost industrial activity with service-based industries, threatening the integrity of legacy industrial corridors in crucial urban markets. Such development trends are evident in legacy urban neighborhoods where workers once lived within blocks of employment. These industrial neighborhoods are now home to eclectic live work/spaces, shabby chic retail, and hipster coffee houses. Aging infrastructure becomes art as 'new and improved' development erases a once thriving industrial past.

Yet urban manufacturing, small to mid-sized (SME) firms in particular, remain a core component of the US economy, providing diversification strength in local markets and overall fiscal health at a time when municipal budgets continue to strain as a fallout from the lingering effects of the Great Recession of 2008 and now the coronavirus pandemic. SMEs represent an important but often under- appreciated aspect of urban industrial economies. Small-scale manufacturing has generally experienced patterns of decline that follow the broader sector. Pressures from globalization, off-shoring, automation, and now supply-chain challenges continue to threaten manufacturing jobs in the US. Economic developers and urban planners have become increasingly concerned about pressures on urban manufacturing over the past decade. These concerns have mirrored and shaped municipal efforts to identify and protect active urban industrial land in cities around the United States. Together, these two efforts have led to the emergence of a small but important corpus of research seeking to understand and address the loss of viable urban industrial landscapes.

Contributing to previous urban manufacturing work, this study analyzes both the experiences of individual firms and patterns of real estate, land use, and infrastructure change to assess the opportunities and threats facing St. Louis City's manufacturing economy. The paper reports on the findings from a series of interviews (conducted prior to the coronavirus pandemic) of SMEs in the City of St Louis. The researchers interviewed firm owners/operators in a variety of manufacturing sub-sectors, exploring their industry concerns and how they view the role that city industrial development policies play in supporting the region's manufacturing and industrial base. While noting that the pandemic has had an unprecedented impact on the global economy, the interviews underscore the concerns about market instability and an uncertain future are not new. Lessons were learned as cities emerged from the 2008 recession that can be applied to the pandemic recovery. The findings suggest that renewed attention on the manufacturing sector needs to extend to SME firms if the pandemic recovery is to have a lasting hold.

## **BRITISH COLUMBIA'S COMMUNITY BENEFITS AGREEMENT: DISCERNING ECONOMIC JUSTICE FOR INDIGENOUS WORKERS FROM UNION POLITICS IN URBAN INFRASTRUCTURE PROJECTS**

Abstract ID: 58

Individual Paper Submission

BERGLUND, Lisa [Dalhousie University] lisa.berglund@dal.ca, presenting author

MILES, Jodi [Dalhousie University] jd544008@dal.ca, co-author

In 2018, the British Columbia (BC) government announced a province-wide agreement with a coalition of 19 prominent unions (the Allied Infrastructure and Related Construction Council of British Columbia (AIRCC)) that is referred to as the provincial Community Benefits Agreement (CBA). This agreement covers public infrastructure projects that mainly service urban areas and aims to address the province's looming labour shortage in the construction trades by increasing the hiring and retention of Indigenous workers and other underrepresented groups (Community Benefit Coalition of BC, 2019). While similar impact benefit agreements have been made with First Nation groups for specific projects, the CBA uniquely covers infrastructure projects across the province, and requires that the AIRCC increase the representation of Indigenous people in apprenticeships and as employees. Current projects under the CBA include the Pattullo Bridge Project (in metro Vancouver), the Highway 1 four-laning project (connecting Alberta border to the City of Kamloops, BC), and the Broadway Subway Project (in Vancouver) (BCIB, 2020).

Literature on community benefits agreements (CBAs) has grown in recent years, and has indicated that these agreements can be a successful way to distribute the benefits of development to underrepresented or politically marginalized communities (Leavitt, 2006). However, this literature has also revealed some challenges with CBAs, including concerns about these agreements being co-opted by local governments or other entities, such as developers, self-interested community organizations, and/or organized labour. Wolf-Powers (2010) and Gross (2008) also express concern about labour unions and government entities being involved as direct stakeholders in CBAs, as they may cause negotiations to be swayed by labour movement politics, rather than representing community interests. There has been a lack of research about the ways that CBAs may be leveraged to benefit Indigenous communities that are often greatly impacted by the proliferation of urban development, particularly in regards to large scale infrastructure and in its environmental impact. Existing literature on Indigenous workforce development focuses on job creation in resource extraction industries, rather than urban infrastructure and development. This research aims to address these gaps in the literature by asking whether British Columbia's Community Benefits Agreement is a means to promote economic justice for Indigenous workers, and what successes and barriers exist to distributing economic benefits of development in this way.

This research is a content analysis of stakeholder interviews, policy documents and informational materials about the agreement. The 17 stakeholders interviewed include: 1) Representatives from labour unions (5); 2) Members of other organizations involved with/impacted by the CBA (3); 3) Contractors who have business partnerships with First Nations in BC (3); 4) Representatives of First Nations that have been impacted by the CBA (4); and 5) Members of resource management consultancy firms who represent First Nations groups in negotiations for the CBA (2). We found that while there is optimism that the CBA may help advance public discourse on economic justice for Indigenous Peoples, that there are significant barriers that have gone unaddressed in this and other labor agreements due to a lack of community engagement. These challenges include lack of housing and transportation

needed to work in urban job sites. Additional challenges are the continued marginalization of Indigenous workers into unskilled labor in the construction sector, and the potential to reinforce economic dependence on non-Indigenous businesses and economies. Ultimately, the question of whether the CBA represents a means to economic justice is complicated by the co-optation of the process by political interests; as Indigenous groups are not formal stakeholders, the opportunities for employment, and whether engagement is done to recognize and address barriers to hiring for urban infrastructure projects remain in the balance.

#### **PATHWAYS TO EQUITABLE GREEN JOB GROWTH**

Abstract ID: 102

Individual Paper Submission

LIU, Haijing [University of Texas at Austin] [hjliu@utexas.edu](mailto:hjliu@utexas.edu), presenting author

To many, 'green jobs' suggest highly-skilled labor. Research and development is an important element in the greening of the economy, and one that has received much scholarly attention. But could it be that green jobs are not as skewed towards highly skilled labor as is often assumed? And if so, how does that change the way we understand the geography of the greening of the economy? On the assumption that green jobs require a highly-skilled, highly educated workforce, policies that focused on traditional R&D that stimulates green innovation have received a great deal of scholarly attention. But what does the greening of the economy look like when we see that the top green job growth happens in construction, installation, and maintenance sectors? My initial calculation according to data from the Bureau of Labor Statistics (BLS) from 2014 to 2018 suggests the top green job growth happens in construction, installation, and maintenance sectors, which mainly serves the local markets and require relatively low skill levels.

This misperception of green jobs has much to do with a rich scholarly work to investigate the relationship between environmental regulations and innovation (Popp, 2019). This strand of work argues that environmental regulations would incentivize firms to innovate in clean technology, greening their process, therefore creating jobs in these positions that would normally require high-skill labor. And such job growth would only be likely to occur in geographies within some innovation eco-system. However, green job growth is spatially far more dispersed than green innovation, indicating that strategies that focused more on the R&D side may not be the strongest drivers for green job growth for some places than the other (Chapple et al., 2011). Therefore, this paper would like to investigate the green job growth trajectories for the past 10 years in major US MSAs. How state and local policies differ in effect according to the preexisting local conditions, namely the preexisting knowledge base and industry

composition? Theoretically, this paper would like to provide empirical evidence to challenge the “job versus environment” argument and adds to the emerging regional innovation system literature around the green economy. Practically, it would provide insights on local pathways of green job growth according to local conditions.

### NEW ECONOMY IN CITIES: WHAT ATTRACTS ENTREPRENEURIALSHIP IN BIOMEDICAL INDUSTRIES

Abstract ID: 104

Individual Paper Submission

NIE, Xuanyi [Harvard Graduate School of Design] niexuanyi@gmail.com, presenting author  
LIU, Haijing [University of Texas at Austin] hjliu@utexas.edu, co-author

The concept of entrepreneurial ecosystem is a focus of research on the formation of startups which are important drivers of economic growth, employment, innovation, and productivity. Research on entrepreneurial ecosystem has particular implications for China because in recent years mass entrepreneurship and innovation has become a national agenda in China. Particularly concerning the spatial characteristics of entrepreneurial ecosystem, geography provides a platform to organize economic activity. Research in new economic geography has found that innovation is spatially concentrated and the proximity to related institutions and actors is important for creating an entrepreneurial ecosystem. However, despite the long list of relevant factors including human capital spillovers, proximity to local universities, financial development, and market sizes that can facilitate the formation of an entrepreneurial ecosystem, industry-specific co-location is rarely explored and needs more research attention, especially in biomedical industries. This research investigates two factors that associate with the cultivation of biomedical startups at the city level in China using datasets containing their geographical locations between 1999 and 2019. The first factor is related to knowledge base. New firms tend to locate in industry-specific localization economies so that new firms and existing firms can benefit each other through shared new technologies, competencies, and resources. Secondly, considering that pharmaceutical and medical products are consumed in hospitals, hospitals are closely related to the biomedical industry. Therefore, this research examines the co-location of existing firms in biomedical industries, hospitals, and startups. This research contributes to the existing literature on entrepreneurial ecosystem by describing the evolving characteristics of places through time and focusing on an emerging industry.

## **PROMOTING MITIGATION THROUGH POST-DISASTER SMALL BUSINESS RECOVERY PROGRAMS.**

Abstract ID: 111

Individual Paper Submission

KIM, SUA [University of Utah] sua.kim@utah.edu, presenting author

CHANDRASEKHAR, Divya [University of Utah] chandraskhar@arch.utah.edu, co-author

Small businesses are critical stakeholders in local economic recovery after disasters. And their resilience against disasters can affect that of the economic development as a whole. But rarely do they receive the same level of attention or aid as their neighboring households. Unlike large and medium-sized businesses, small businesses are particularly vulnerable to disaster recovery. Small businesses tend to have fewer financial resources, less access to political capital, take fewer mitigative actions against disasters and generally are less prepared for disasters. Small businesses not only have fewer programmatic options to aid them in their post-disaster recovery, but these programs often require significant and tedious paperwork that acts as a barrier to business participation. For instance, the U.S. Small Business Administration (SBA) requires small businesses to show Credit Requirements (e.g. credit history, repayment, and collateral) to receive a disaster recovery loan, which some small businesses cannot easily provide. Furthermore, existing small business recovery aid programs underutilize the recovery moment as an opportunity to promote long-range mitigation and resilience actions. Also, small businesses are less likely to adopt disaster mitigation and resilience-based strategies. It is unclear as to whether small business recovery programs, sparse as they are, provide an opportunity to take mitigative actions against the next disaster. This missed opportunity is rendered even more significant in light of the fact that businesses are more likely to do mitigation and resilience planning immediately after a disaster, rather than before it occurs.

While research on indicators of disaster resilience has grown significantly in the last few years, much less is known about programmatic dimensions of resilience-building. Insights from disaster planning and environmental management literature suggest that programs that focus on mitigation and resilience-thinking generally share a set of specific characteristics. They encourage long-range planning, including mitigation planning; encourage adaptive thinking in the face of uncertainty, such as through circumventing red tape; promote the use of creative funding mechanisms, to work around resource constraints; increase engagement with nonprofits to improve resource availability; and promote networking and collaboration between various stakeholders to better identify local needs and improve response.

This paper uses this resilience-focused framework to examine whether small business recovery programs are utilizing the opportunity presented by disaster recovery to promote mitigation and resilience-thinking. First, we review business recovery program (i.e., grant, loan, and other economic recovery schemes) in four disaster-affected states, namely New York and New Jersey (2012 Hurricane Sandy); North Carolina (2016 Hurricane Matthew), and Texas (2017 Hurricane Harvey) to identify program aspects such as implementing agencies (federal, state or local), scale of implementation (state or local), primary funding source, and programmatic innovations. These include creative financing mechanisms, incorporation of mitigation or resilience-focused actions (e.g. promoting use of insurance, business continuity plans, structural upgrades, etc), and other innovations such as involvement of nonprofits in program design or implementation, efforts to reduce red-tape. Secondly, to better understand decision factors in mitigation focused recovery planning, we will use snowball sampling methods to identify 10-15 key state and local officials from agencies involved in economic recovery planning for Salt Lake City after COVID-19 and 2020 Magna earthquake. Salt Lake County had suffered from two different disasters at the same time. We expected that some programs are more likely to mitigate the next disaster, others programs only focus on recovery right after disaster despite the fact that they name the mitigation.

This study fills many gaps in the literature. It sheds light on small business recovery after disasters, its relationship with disaster recovery policy, and the ways in which the post-disaster recovery moment can be used as an impetus to promote resilience-based thinking in the long-run.

### **WHICH START-UPS BENEFIT MOST? EXAMINING THE DIFFERENTIAL IMPACTS OF LOCAL ENTREPRENEURIAL SUPPORT ORGANIZATION PARTICIPATION**

Abstract ID: 207

Individual Paper Submission

CLAYTON, Paige [Georgia Institute of Technology] [paigeclayton@gatech.edu](mailto:paigeclayton@gatech.edu), presenting author

At the earliest stages of conception, before a start-up has accessed finance, its resources are limited to a combination of human and social capital from founders. Human capital, in the forms of advanced degrees and prior work experience, is associated with increased performance (Dencker et al. 2009; Gruber et al. 2012; Symeonidou & Nicolaou 2018). In the case of technology start-ups, entrepreneurs' prior experiences supply them with technological knowledge and organization-specific tacit knowledge useful to starting a firm. An entrepreneur's prior work and educational experiences also contribute to the formation of social capital through network affiliations, which provide access to resources for problem solving and acquiring information.

Entrepreneurs augment these resources by participating in local entrepreneurial support organizations (ESOs)—e.g., incubators, accelerators, co-working spaces, mentoring programs—where they benefit from external networks and knowledge about growth strategies and how to access finance (Clayton et al. 2018). These are often publicly run or nonprofit economic development tools. Part of the story of geographically defined entrepreneurial ecosystems is that ESOs are necessary for a robust entrepreneurial economy. Firms embedded in ecosystems benefit from location advantages such as access to specialized resources and lower information costs (Hsu & Ziedonis 2013; Stam 2015; Spigel et al. 2020), which in turn facilitate further innovation and growth (Dahl & Sorenson 2012; Huggins & Thompson 2014).

Missing from the literature on local ecosystems and ESOs is an understanding of which firms' benefit most from participating, and how the level of social and human capital that founders bring to their firms influence the relationship between ESO participation and firm outcomes. Several recent studies indicate women and minority groups as well as different types of start-ups experience local ecosystems differently (Cowell et al. 2018; Harper-Anderson 2017; Motoyama et al. 2021). While some studies examine the relative or combined influence of human and social capital on firms (Adner & Helfat 2003; Pennings et al. 1998), few investigate the relative role of human capital, social capital, and ESO use (with exceptions such as Davis et al. 2006). An important question is whether firms that already have high levels of social and human capital benefit more from ESO participation or whether ESOs better help the firms that are most in need of support.

This paper addresses this gap using an historically rich and detailed database of the universe of 865 life sciences firms founded in the Research Triangle region of North Carolina between 1991 and 2015 (Feldman & Lowe 2015). Using data on the firms, their founders, and participation in four local ESOs (three incubators and one venture mentoring organization), the paper asks whether certain firms benefit more from ESO participation than others in terms of their exits, funding acquisition, and commercialization. Specifically, using regression and event history analysis the paper examines whether start-ups with already high levels of social and human capital benefit more from participating in ESOs and whether participant firms with women founders experience different benefits than firms without women founders.

Preliminary findings indicate that there are different outcomes for firms. Specifically, firms that already have high levels of pre-founding social and human capital receive more funding on average after using an ESO, while firms with women founders also benefit more than firms with only male founders in terms of funding. Overall, the contribution of this paper is to more holistically consider the local entrepreneurial ecosystem and the heterogeneity of firms by bringing together literatures on social capital, human capital, and ESOs typically considered in isolation. The paper concludes with practical implications for technology and entrepreneurship-based economic development.

## HOW DOES THE COLLABORATIVE NETWORK STRUCTURE AFFECT INNOVATION? A STUDY OF FLORIDA'S HEALTHCARE INDUSTRY

Abstract ID: 229

Individual Paper Submission

WEN, Yijia [Florida State University] [yw20bn@my.fsu.edu](mailto:yw20bn@my.fsu.edu), presenting author  
FANG, Li (Kerry) [Florida State University] [lfang3@fsu.edu](mailto:lfang3@fsu.edu), primary author

Collaborative interaction helps generate innovation that fuels economic development. Prior studies have empirically established the positive relationship between innovation and collaboration within urban agglomerations and industrial clusters at the local level (Malmberg & Maskell, 1997), but few examined networks across cities over long distance. In practice, policymakers have recognized the importance of regional collaboration, but lack a strategic plan to form a meaningful collaborative network for their jurisdictions. This paper fills the academic and practical gaps by modeling the co-patenting networks in two healthcare industries among cities in the state of Florida. We study the following questions: (1) What network structure is more conducive to innovation? (2) What position in the network can encourage innovation in cities? And (3) what position in the network can help cities better sustain economic shocks? Healthcare industries are booming and highly innovative industries in Florida, and the state of

Florida itself is a rising state with expanding innovation economy; thus, they provide an ideal setting to study innovation.

The patent data come from the U.S. Patent and Trademark Office (USPTO) and cover all patents since 1976. We focus on two healthcare industries defined by the United States Patent Classification: surgery; and drug, bio-affecting, and body treating compositions. These two industries are patent-intensive with the largest number of patent grants among all healthcare industries in Florida, and thus perfect for studying patenting activities. The patent data document the inventors and their locations at the city level; two cities are perceived as having a collaborative relationship if they have co-patented. The more they co-patented, the stronger their connection.

We adopt social networks analysis (SNA) to quantify the collaborative network among cities. SNA provides a conceptual framework and a set of analytical tools to visualize and analyze interactions and social structures as networks of nodes and ties (Dempwolf & Lyles, 2012). We quantify the density and network centralization of the entire patent network, and various centrality measures for selected cities. By comparing these measures for the co-patenting networks over the past forty years, we distinguish hierarchical network structure from decentralized ones, and cities in different positions in the network, and evaluate which network structure and node position are more conducive to innovation. So far, we have collected and cleaned all co-patenting data of Florida from 1976 to 2020, and visualized the network dynamics. Next step we will calculate the network metrics over time and examine their relationship with innovation output.

This study sends three messages to policymakers. First, policymakers can target key innovation hubs in the network to facilitate regional knowledge spillovers. This study identifies cities in the network that play an important knowledge brokerage role, and policymakers can create positive externalities and spillovers to the whole region by targeting these cities for the dissemination of new information, knowledge and technology. Second, policymakers can connect isolated cities to the innovation network. This study also identifies marginalized cities in the network, and policymakers can facilitate their connection to the whole region and boost the synergies between cities for sustained regional development (Eraydin, Armatlı Köroğlu, Erkuş Öztürk, & Senem Yaşar, 2008). Third, policymakers can also strive to make the network structure more resilient to external shocks. A certain degree of redundancy of connections in the network is crucial in ensuring the network to remain intact when external shocks break some existing connections. Thus, this paper helps policymakers to identify where there is little redundancy and steers their efforts toward building resiliency there.

#### INCORPORATING CREATIVE CITY REPORTS IN MUNICIPAL CULTURAL PLANNING

Abstract ID: 327

Individual Paper Submission

GOLDBERG-MILLER, Shoshanah [Ohio State University] goldberg-miller.1@osu.edu, presenting author  
SKAGGS, Rachel [Ohio State University] skaggs.131@osu.edu, co-author

The creative economy is touted as an engine for economic prosperity and social good in urban areas. A combination of the cultural industries, city branding, cultural tourism, and the creative class, this field has gained attention worldwide as a tool for municipal policymakers to foster city building. Many cities and consulting entities have produced studies and reports on the promise of the creative economy. However, there exist few analyses of these reports and their inherent policy value.

This article explores five creative economy reports from cities on three continents –Adelaide, Austin, Chicago, London, New York – using the Narrative Policy Framework through an iterative coding framework. This emergent policy framework looks at the setting, the characters, the plot, and the outcomes or moral of the story to analyze the framing of policy in a new and different way. Exogenous and endogenous shocks are often the sparks that motivate the creation of analytical reports and studies. Financial challenges, changes in neighborhood composition, and the exodus of creatives from a city due to escalating urban cost of living, rising density, and dearth of affordable creative spaces are factors leading to the call for analysis. Some cities may produce these creative sector profiles to inspire the acceptance of this arena as an economic engine, encouraging policymakers to compete on the international stage as a creative force.

One often-cited aspect of the creative economy is its reliance on entrepreneurship and entrepreneurial action as a tool for innovation and economic development, and cities themselves are entrepreneurial in their collective effort to compete for development resources, attract jobs, and attract people. This creative economy rationale incorporates economic growth as a goal for cities, putting forward the tool of arts and culture as well as innovation as a solution to the challenges of attracting residents, tourists, and businesses, resulting in a stronger tax base.

The project of the city puts it in competition on local, national, and global scales and encourages entrepreneurial action (e.g., identifying and capitalizing on opportunity, capturing an audience, building a recognizable brand identity.). Reports on the “creative city” have been written and commissioned to operationalize local creative economies, measure creative economic outputs, create a picture of the labor force, and contextualize the value of artistic creativity within a municipality.

There have not been sufficient efforts to analyze the policy value of such creative city reports—we seek to fill this gap by analyzing the ways that creative economy reports use evidence to make claims and recommendations. In short, we ask: How do creative economy reports construct and image of the city as an entrepreneurial actor in its orientation toward measuring, contextualizing, and deploying the arts and creative industries as an engine for economic development?

Within the creative industries there is fundamental engagement in innovation: pursuing untapped markets, developing product innovations, recognizing and seizing opportunity, or the pursuit of change. This may lead to fostering creative mindsets in seeking to attract residents, workers, and corporations to specific cities.

Creative economy reports are used to market urban areas to the world. Urban advocates, called ‘policy boosters’, take up ideas that represent their city as solutions to urban challenges. They tout their municipality as the great hope for mastering these conundrums and, in so doing, compete with others for attention. Positioning one’s city as ‘creative’ can make a difference in fostering the image policy boosters are hoping to attain.

The key contributions of this article center the ways that creative economy reports use rhetorical devices and empirical data to support their claims and recommendations and forwards policy learning and adaptation as an important tool for municipal policymakers.

## EXPLORING INFLUENTIAL FACTORS OF WAREHOUSE LOCATION: A MULTILEVEL APPROACH

Abstract ID: 401

Individual Paper Submission

YOO, Chisun [Georgia Institute of Technology] cyoo34@gatech.edu, presenting author

ROSS, Catherine [Georgia Institute of Technology] catherine.ross@design.gatech.edu, co-author

Growth of e-commerce has influenced not only our daily lives but the logistics industry itself. According to Statista Digital Market Outlook (2020), in the U.S., the revenue of retail E-commerce sales was \$274 billion in 2017, and it is expected to grow by \$ 599 billion in 2024. The size of the contract logistics market also has been growing from \$13.6 billion to \$21.8 billion between 2010 and 2018 (Armstrong & Associates, 2019).

The change in the logistics industry is not confined to its size: it includes the transformation of freight distribution pattern, real estate footprint, and logistical facilities (Rodrigue, 2020). One prominent change is the location of warehouses. The location of warehouses has received a great deal of attention recently among academicians. Regarding warehouse locations in the U.S., the literature has three main focuses which are logistics sprawl, logistics agglomeration and clustering, and locational factors.

Nevertheless, the literature has largely ignored the warehouse location and its relationship with geographic and economic factors at multiple levels. The focus of the literature has been heavily concentrated on whether warehouse and logistics facilities are centralizing or decentralizing. Furthermore, although the industries involved in e-commerce have been diversified, the literature has examined only the transportation sector as the relevant industry of warehouse locations. Therefore, more diverse industries and their influence from different geographic levels needs to be explored.

Several research questions emerge from the shortcomings of the literature. The primary research question is, "Do the significant factors affecting warehouse location vary across different scales of geography?" Listed below are additional questions to be investigated.

What are the unexplored factors that influence the location of warehouses?

What are the interactions between factors operating at different geographic levels that affect warehouse locations?

Are there certain industries that are highly correlated relevant to the location of warehouses? If so, what kinds of industries? This study will use multilevel generalized quasi-Poisson model with three levels. We hypothesize that interactions between different levels of geography are related to warehouse location. We further hypothesize that the influential factors of warehouse location exist not only at a small geographic level but also at larger geographic levels. In the analysis, the number of warehouses in 17,694 Zip Code Tabulation Areas (ZCTA), which belong to 1,899 counties and 392 MSAs across the U.S., will be analyzed with explanatory variables at three different geographic levels.

This study contributes to the literature in several ways. We investigate the associated factors of warehouse locations focusing on not only conventional factors, e.g., infrastructure accessibility, but other factors that have been rarely studied. This includes the proximity of selected industries and the economic structure of the area. We identify the extent to which other factors influencing warehouse location vary across different geographies. These levels include ZCTA level, county level, and MSA level. Moreover, possible interactions between different levels of factors influencing warehouse location are examined.

## IMPACT OF SOCIAL DISTANCING ON OFFICE BUILDING OCCUPANCY AND FALLOUT EFFECT OF OCCUPANT SPENDING POWER

KIM, Youngchul [Korea Advanced Institute of Science and Technology] youngchulkim@kaist.ac.kr, co-author

While office markets have experienced various crises through time, the SARS-CoV-2 pandemic led for the first time to an unprecedented closure of buildings. In contrast to other crises, this is the first beyond the terrorist attacks of September 11<sup>th</sup>, 2001, to catalyze significant discussion on the reinvention of future office spaces, requiring security and cleaning protocols regarding social distancing and circulation with the objective to minimize potential exposure to airborne and surface hazards. Efforts to suppress exposure to the virus brought about a significant and likely sustained transformation in the office sector, with cascading effects for the businesses that depend on proximity to the workforce. As a result, the following questions have emerged: 1) How would office buildings become safer through workplace transformation? and 2) How will these transformations affect occupancy levels and therefore building occupant spending power in the surrounding area? An increasing number of surveys of C-suite executives suggest that a percentage of their employees will continue to work remotely even after the pandemic and therefore the floor layout and related safety measures will continue to be critical to the perception of risk in an office environment. The methods used to answer the first question will influence the second, and have an effect not only on the building itself but also the surrounding area through the spending power of the workforce in large-scale buildings or dense downtowns.

The study utilizes an interdisciplinary approach, beginning with a comparison of the implications of alternative methodologies for determining pandemic-related office safety through architectural design, followed by spatial

occupancy projections and analysis of economic effects, with implications for real estate and planning. The study consists of all class A office buildings within the city of Seattle, and the downstream effects of alternative approaches on the downtown area. The study utilizes both office building characteristics (e.g., number of floors, floorplans including workstation location, rentable square feet, etc.) and spending power. Architectural analysis compares generative design and software for floorplan alterations to determine the max occupancy levels based on a buffer distance of 6ft, 9ft and 10ft and space syntax analysis of circulation. The methodology proceeded by first formulating a typology of building types, floor plans, and available square feet, and collecting a sample of detailed floorplans for a subset of buildings, fitting low-rise, mid-rise, and high-rise categories. Using the typology of buildings and the results we obtained from comparing generative and typical architectural approaches, we extrapolated the effects on occupancy and workforce to all buildings in the area within each group. We then used these occupant estimates to determine the average spending power within a 1- and 3-mile radius around the buildings.

Results are two-fold, with implications for continued pandemic-related workforce safety, real estate, and economic prospects for downtown areas and associated planning activities. Results suggest that the office space per worker (sf/w) can range from 86 to 330 raising the question of market impact and the increased hoteling and remote working options for employers which could lead to smaller tenant footprint and larger vacancies in buildings. We also found that social distancing restrictions could lead to 40-70% decreases in building occupancy rates and \$25-\$40 millions lost in annual spending power per building. In the short-term, implications for planning and real estate suggest a focus on the economics of downtown business, especially in proximity to high-rise single-use commercial zones. Over the long-term, implications stretch into questions regarding mixed-use reconfigurations of downtown space.

#### THE LONG-TERM AND SUSTAINING EFFECTS OF PLACE-BASED POLICY

Abstract ID: 592

Individual Paper Submission

KIM, Geon [University of Illinois at Chicago] [gkim86@uic.edu](mailto:gkim86@uic.edu), presenting author

The adoption of place-based policy (PBP) begins with the rationale that spatially-targeted intervention can make a difference in local economic trajectories (Todes & Turok, 2018). Concentrated investments in the designated areas are expected to stimulate local economic activity and improve socio-economic conditions. With these rationales, the implementation of PBPs has been increasing in the U.S. and tax increment financing (TIF) is among the PBPs that have been widely adopted.

This research examines the effectiveness of TIF in Cook County, Illinois from 1990 to 2019. TIF districts are designated in the expectation of revitalizing blighted neighborhoods for 23 to 35 years in Illinois. Funds borrowed against future increases in assessed property values earmarked to a TIF district, are invested to provide direct

incentives to areas that hold potential to have a positive effect on the local economy.

Does this place-based policy effectively address spatial variation in terms of socio-economic growth? Numerous studies have attempted to assess the effects of TIF (Drucker et al., 2019; Kane & Weber, 2016). Despite such attempts, the results of the assessments are inconsistent, and scholars are far from a consensus on their effects.

This study fills the research gap and provides rigorous evidence by examining long and evolutionary temporal dynamics stretching beyond the policy expiration. Measuring long-term effects enables researchers to capture cumulative positive and negative feedback processes unlikely to be observed when looking at more immediate effects. As Neumark and Simpson (2015) note, however, studies on the long-term effects of PBPs (not just TIF) are scarce and this lack of long-term evidence is among the key causes of the skepticism regarding PBPs.

This research also illuminates the after-program expiration period of TIF to examine whether TIF districts have established long-lasting and sustaining effects on their local economies, which is one of the desirable goals of PBPs.

To measure the effects of TIF, this research uses two-way fixed effects (TWFE) regressions as a baseline regression model. In addition, this study also adopts recently developed a staggered difference-in-difference design to address possible heterogeneous policy treatment effects.

The findings contribute to the empirical urban studies and growing literature on policy evaluation that quantify the effects of PBPs and inform how PBPs can best meet the objectives of economic development and achieve sustainable growth.

#### **REGIONAL CHARACTERISTICS OF HIGH-GROWTH FIRMS AND THEIR JOB CREATION EFFECTS IN SOUTH KOREA: THE PRE-COVID-19 AND POST-COVID-19 COMPARISON**

Abstract ID: 637

Individual Paper Submission

JUNG, Namji [Seoul National University] namji.jung@gmail.com, presenting author

Many have discussed how the current economic turmoil driven by COVID-19 differs from other economic crises. The near-crisis economic downturn stems from stay-home-orders and lockdown which immediately affected regional, national, and global economies. Because the underlying reasons are not financial, there is no monetary policy that can fully address the solution (Rapisardi and Beiswenger, 2020). And there seems to be almost no geographical and industry sectoral exception that is untouched by the current problem.

However, the uneven distribution of economic consequences over a broad area is quite the same as former economic crises. For instance, against the backdrop of abrupt surges of the number of people who filed for an unemployment insurance claim, large gig corporations' stock value sharply went up. While businesses and workers in the seasonal and consumer service industry sectors, such as tourism, restaurants, and entertainment, were hit by COVID-19 the hardest, the manufacturing sector seems to do better (Cortes and Forsythe, 2020). Despite various constraints, many companies managed to find their ways to operate successfully without face-to-face interactions by exploiting cutting-edge technologies, and so on. It is evident that COVID-19 will deepen the already existing inequality in economic growth (Stewart, 2020). But how will it unfold? Will it only exacerbate the current patterns of inequality? Or will it shift the pattern of uneven distribution as it could offer new types of opportunities for some regions that were not available before?

This study attempts to answer the above questions by focusing on eight metropolitan areas in South Korea including Seoul, Busan, Daegu, Incheon, Kwangju, Daejeon, Ulsan, and Sejong. Although South Korea is known for its relative successful industrialization, post-industrialization, and the continued GDP growth, when looked closely, the growth was unevenly shared by region. Particularly, the Seoul Metropolitan Region, covering 12% of South Korea, not only takes up 48% of the entire population, generating half of the country's GDP, and but also enjoys the concentration of various resources and opportunities to access them from technology, culture, medical services, jobs, education, and more (Seoul Metropolitan Government, 2020).

This study examines how the already existing regional disparity shifts after COVID-19 among eight metropolitan cities. In doing so, this paper will perform longitudinal comparisons of various socioeconomic indices between before and after COVID-19. Most importantly, this paper will include the regional characteristics of high-growth firms and their job creation effects in measuring regional disparity shift. There are reasons to add high-growth firms. Even healthy firms that found new ways to operate their businesses in a contact-free way still are at risk of losing months of revenues. There is a possibility that the loss of revenues for an extended period will transform strong companies into weak ones. This, in turn, will slow down the growth of firms. This study expects to find a fewer number of high-growth firms in almost every region. However, one important aspect we need to note is that a very small subset of firms that still achieve high-growth under the recent turmoil could indicate where the regional growth strength lies. Thus exploration of regional characteristics of high-growth firms will not only tell us about how the growth momentum has shifted from the pre-COVID-19 era but also where to look for the future economic recovery.

For various socioeconomic indices, this paper will use government-published statistics. It will use an employer-employee matched panel data for the high-growth firm analysis and the foci of analyses will be given to the number of high-growth firms by type, and their new job creation effects, and whom they hire. These elements will be compared with the pre-COVID-19 patterns at each city level.

## THE RIGHT BALANCE BETWEEN TECHNOLOGY-ORIENTED AND PEOPLE-CENTRIC CITY: CAN A SMART CITY BE AN INCLUSIVE CITY?

Abstract ID: 670

Individual Paper Submission

SOHN, Jun Ik [University of Florida] juniksohn@ufl.edu, presenting author

The technology of smart cities is often perceived as a sought-after strategy for urban planning and development. As technological advancement has made our lives better, the technology of smart cities is believed to improve urban functions, such as sustainability and livability, for overall urban benefits, including people, economies, environments, and most urban-related concerns. Therefore, smart city projects are often excessively focused on technologies and driven by IT firms and land developers. Consequently, many smart cities have been developed into technology-oriented cities.

Technology-oriented smart cities are economically developed cities for the profit of stakeholders. They are not designed to serve citizens nor to provide equal public services for people. From the business perspective, smart city development represents new city-making industries for an array of interests and capabilities between a partnership of developers, investors, government, and IT firms. Thus, many smart city projects paid less attention to public benefits and provoked uneven development and spatial inequality. The uneven benefit of smart city development is raising important questions concerning the sustainability and livability of the city because it can affect social equity and cohesion and exacerbate existing inequalities within and across the cities.

Fundamentally, smart cities are spatial platforms where people are living. The true value of smart city development should be a thoughtful consideration of people, not implementing technologies. Therefore, finding the right balance between technology-oriented and people-centric cities should be significant for smart city development. For example, state-of-the-art technologies will make housing less affordable and unsustainable due to expensive development costs. However, intermediate technologies, which should be relatively cheaper, will make housing more affordable and sustainable for many people, and it can still satisfy the people's needs and governments' demands.

The objective of this study is comprehensively understanding the significance of the people-centric city against the technology-oriented city and analyze the feasibility of developing a smart city into an inclusive city. Thus, this study draws attention to the impact of smart city development on people. First, the study examines the development impacts of technology-oriented smart cities on housing affordability from the case of the smart city Songdo, Korea. Second, the study surveys people's perception and awareness of smart cities and compares their needs to the demands of governments. Third, the study systematically reviews the concept of the inclusive city and finds the feasibility of developing inclusive smart cities for underprivileged people. This study uses secondary data from the Korean housing census and primary data collected in Korea by surveys and interviews.

The result of this study demonstrates the feasibility of smart city development in developing countries or underdeveloped cities as a development tool that improves their resiliency and sustainability.

## **IMPACT OF COVID-19 PANDEMIC ON LOCAL GOVERNMENT FINANCES IN MEXICAN MUNICIPALITIES**

Abstract ID: 672

Individual Paper Submission

ECHAVARRIA, Aurora [University of California Los Angeles] [auroraechavarria@gmail.com](mailto:auroraechavarria@gmail.com), presenting author

Municipal governments throughout Mexico have struggled to maintain healthy local finances as a result of a number of factors including reduced funding from central government sources. Weak municipal finances have been profoundly exacerbated by the COVID-19 pandemic, which has rapidly increased the social and financial pressures on already struggling municipal governments throughout Mexico. Moreover, while the United States federal government has provided assistance to local, state, and tribal governments through the CARES Act, the Mexican federal government has decreased its financial transfers to municipal governments in the past year. This research addresses how the COVID-19 pandemic has affected the proposed income and revenue collection strategies of municipal governments in Mexico. To answer this question, I use data from approved budget and income laws of the fifty largest municipalities in Mexico from 2018 to 2021, as well as media notes and interviews. Findings provide an insight into the financial resilience of local governments in Mexico and into how they prioritize their budgets and revenue raising strategies (tax rates and fiscal incentives) in moments of financial uncertainty. These results also present important implications for urban planning in that they highlight urban programs whose funding has been affected as a result of the pandemic, bringing to light potential future challenges for Mexican cities.

## **UNEVEN REAL-ESTATE INVESTMENT IN OPPORTUNITY ZONES: EXPLORING INVESTMENT OUTCOMES BY DEVELOPMENT POTENTIAL ACROSS ZONES**

Abstract ID: 681

Individual Paper Submission

WILSON, Matthew [University of North Carolina at Chapel Hill] [mwilson2@live.unc.edu](mailto:mwilson2@live.unc.edu), presenting author

Between April and June 2018, the Federal government authorized States' Opportunity Zone (OZ) designations, officially making OZ designated tracts eligible for investor incentives. The goal of the program is to entice high net-worth investors through tax incentives to invest in real-estate projects in low-income communities (U.S. Congress. Joint Economic Committee 2018). Unlike Empowerment Zones in the 1990s, where zones were guaranteed investments from the federal government, a potential issue with OZs is that these areas may not receive uniform

investment because the program operates through incentivizing private investors to finance projects in OZs rather than a guarantee of appropriations into each zone. Since investors want to minimize risk in their investment, OZs that represent the safest investments or highest opportunity for return on investment (ROI) may be most likely to be impacted by the program while comparatively lower opportunity areas may be neglected by investors (Gelfond and Looney 2018). Private investors neglecting many OZs would render the program ineffective in certain areas that the program was created to target

In this paper, I propose assessing investment impacts of OZ designation in two ways. First, I assess whether or not OZs pass the “but-for” test by examining whether or not they create new economic activity in the form of aggregate real-estate transaction amounts and average prices, or subsidize economic activity that could have reasonably expected to have occurred without the subsidy. Second, I measure how changes in investments differ in designated OZ tracts according to a measure of their baseline development potential to shed light on how OZ designation may lead to differential impacts across zones. Real-estate data for this analysis will use Zillow’s ZTRAX dataset to estimate investment outcomes for residential and commercial real-estate transactions.

This analysis is a critical piece of the program’s evaluation because the OZ program relies on private market actors to make investment at their own discretion. In that sense, the program may not effectively target many areas designated as OZs meaning that the program’s prospects to deliver widespread economic investment in low-income communities are low. A key contribution of this paper is an extension of the evaluation of place-based economic development policy beyond the traditional question of if a program is impactful in aggregate to a question of which types of areas does the program have impact in. This paper adds to the early literature on the real-estate impacts of OZs (see Chen, Glaeser, and Wessel 2019; Sage, Langen, and Van de Minne 2019).

#### **PLACE-BASED COLLEGE SCHOLARSHIP PROGRAMS AND LOCAL ECONOMIC DEVELOPMENT: PROSPECTS AND PITFALLS OF THE BIRMINGHAM PROMISE**

Abstract ID: 702

Individual Paper Submission

YIN, Jordan [Alabama A&M University] [jordan.yin@aamu.edu](mailto:jordan.yin@aamu.edu), presenting author

This paper examines the potential prospects and pitfalls for the newly established Birmingham Promise (Alabama), a place-based college scholarship program that will provide universal last-dollar full-tuition college scholarships to in-state public post-secondary institutions for graduates of the Birmingham City Schools starting with the graduating class of 2020. The program is based on the Kalamazoo Promise program and other subsequently established place-based scholarship programs that have the dual objective of promoting academic success in secondary and post-

secondary education, as well as contributing to local economic development (Miller-Adams, 2015; Miller 2018). The Birmingham Promise represents a novel application of a place-based scholarship program for local economic development as the school district's students are roughly 90 percent African-American and more than half of the school district's college-bound graduates typically go on to attend Historically Black College and Universities (HBCUs).

The Birmingham Promise contrasts with existing place-based scholarship programs in locations such as Kalamazoo, Pittsburgh, and Buffalo in terms of the underlying demographic, institutional, and economic factors that may impact the potential success of the program (Bifulco et al., 2019; Page et al., 2019; Perna & Leigh, 2018). Five specific issues will be examined and contrasted to existing "promise" programs and their locations, including: (1) the demographic composition and academic performance of the Birmingham City School (BCS); (2) the preference of BCS graduates to attend HBCUs; (3) the public-private partnership funding and operational model of the program; (4) the inclusion of the scholarship program within a suite of related local economic development programs, and (5) the relevance of Birmingham's city and metropolitan economic structure.

Examination of these structural issues serves as the context for evaluating the strengths and weaknesses of the Birmingham Promise as it begins to pursue its stated objectives, including: (1) promoting economic development, (2) enhancing human capital, (3) stimulating urban revitalization, and (4) addressing racial disparities ([www.birminghampromise.com](http://www.birminghampromise.com)). The concrete findings of this work will be used to establish benchmarks for the success of the program, as well as to deliver operational recommendations for the on-going program that can be implemented by post-secondary institutions receiving Birmingham Promise students and stakeholders in the local public-private partnership for local economic development.

#### THE IMPACT OF THE COVID-19 ON DEMAND FOR TELEWORKING

Abstract ID: 797

Individual Paper Submission

CHOI, Yunkyung [Georgia Institute of Technology] [yunkyung.choi@gatech.edu](mailto:yunkyung.choi@gatech.edu), presenting author

DUTT, Florina [Georgia Institute of Technology] [florina.design@gatech.edu](mailto:florina.design@gatech.edu), co-author

GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] [subhro.guha@design.gatech.edu](mailto:subhro.guha@design.gatech.edu), co-author

In response to the COVID-19 pandemic, state and local governments have adopted a set of policies, such as stay-at-home order, social distancing, and mask mandates, and have strongly encouraged workers to work from home if possible. This sudden transition to telework raises questions about which occupations and how many jobs can be

done from home. While the shift in workplace from office to home is a temporary transition for many workers during the pandemic, the experience of teleworking during the pandemic may affect the demand for flexible working arrangements after the pandemic. Thus, this study examines the economy's telework capacity by estimating the share of jobs in the U.S. that can be performed remotely before the pandemic. Then it compares that estimates with the share of workers who actually worked from home during the pandemic. Based on historical trends, this study determines whether the demand for teleworking remains even after the pandemic.

Our study of the impact of COVID-19 on teleworking demand follows three analytical steps. First, we classify occupations based on their telework feasibility using the Occupational Information Network (O\*NET) survey data, which captures occupational characteristics and working conditions across the U.S. economy. We follow the methodology presented in Dingel and Neiman (2020) to identify which occupations can be done or cannot be done at home. Second, we merge this classification with occupational employment counts from the American Time Use Survey (ATUS) to examine the actual incidence of teleworking activities. We compute the share of jobs that have been performed at home by occupation and industry between 2003 and 2019. We assume that the observed shares of jobs from the ATUS represent teleworking behavior patterns under normal circumstances without the COVID-19. Similarly, we merge the classification of occupations with occupational employment counts from the monthly Current Population Survey (CPS) data during the pandemic. We assume that the observed shares of jobs from the CPS show teleworking behavior after the COVID-19 outbreak. Finally, we develop a series of trend analysis to estimate the share of jobs that can be done at home for the year 2021 based on the ATUS and CPS data. We believe that the discrepancy between the two estimates for the year 2021 indicates the impact of the pandemic on teleworking demand. In sum, this study will shed light on what policy responses and interventions are necessary to support the demand for teleworking beyond the pandemic.

#### **FROM STATE DEPARTMENTS TO PUBLIC-PRIVATE PARTNERSHIPS: A MULTI-CASE APPROACH TO EXAMINING CHANGES TO STATE ECONOMIC DEVELOPMENT DEPARTMENTS**

Abstract ID: 810

Individual Paper Submission

MARCELLO, Elizabeth [Columbia University] [elizabeth.marcello@columbia.edu](mailto:elizabeth.marcello@columbia.edu), presenting author  
GREEN, Timothy [Clemson University] [tgreen8@clemson.edu](mailto:tgreen8@clemson.edu), co-author

Beginning in the late 1970s, U.S. states began to engage in what Eisinger (1988) called more entrepreneurial approaches to economic development policy that involved more complex relationships between the state and the private sector. Over the same period, local and regional economic development policy became increasingly dominated by quasi-public and fully private economic development organizations. More recently, state governments have followed suit and vested responsibility for economic development with public-private partnerships (PPPs) of varying forms. Some have even gone so far as to effectively privatize entire state departments. The new agencies supposedly bring private-sector expertise to state efforts to attract new business investment and create new employment opportunities, but some advocates argue that these arrangements make

them less efficient and more prone to corrupt practices (Mattera et al., 2011).

Government structures matter. Davidoff (1965) contended that planning expertise should extend beyond technical knowledge and include elements of advocacy and political negotiation. On the other hand, Progressives asserted that organizations should protect experts so they can act in isolation from an ever-shifting political landscape (Doig, 1983). Concerning economic development planning specifically, Cable, Feiock, and Kim (1993) found that the probability of adopting certain economic development policies diminishes with greater institutional openness and public access, further highlighting the importance of organizational structure.

This paper is a first attempt to make sense of the processes behind and the rationale for privatizing state economic development agencies. Specifically, we ask: what are the predictors affecting whether states privatize economic development agencies? To answer this question, we take a multi-case approach and examine the privatized economic development agencies in 4 states. While the agencies in these states are not necessarily identical to one another (as there is no universal definition of what constitutes a privatized economic development agency), the agencies in these states are neither formal state departments nor are they housed within the governor's office. Through archival work, legislative research, media analysis, and interviews, we identify key trends among the states in question.

We identified agencies by carrying out a desk review of the economic development agencies in all 50 states. Of the 50 states, 12 had agencies that were not a formal state department or held within the office of the executive. Those 12 agencies show considerable variation in form and governance, specifically the type of control retained by the public sector. In order to generate more robust findings, we choose four states with varying degrees and types of public sector control including Iowa (where the role of the public sector is quite small) and Indiana (where the Governor and Secretary of Commerce act as Chairperson and CEO, respectively). Our case study design is aimed at literal replication across the cases, following Yin (2009).

The results of the research will provide a more detailed picture of a policy taken up by nearly a quarter of U.S. states. In addition, the findings will set up further research that will compare the policies and actions of privatized economic development agencies with their more conventional public sector counterparts.

#### **FOREGROUNDING TEMPORALITY IN HACKWORTH'S DEMOLITION AS URBAN POLICY: TRAJECTORIES OF DEMOLITION AND REDEVELOPMENT IN POST-CRISES CHICAGO**

Abstract ID: 826

Individual Paper Submission

ROHRET, Danielle [University of Louisville] danielle.rohret@louisville.edu, presenting author

Demolition has long been a common practice shaping the urban fabric in shrinking cities. The Great Recession and associated foreclosure crisis intensified vacancy and abandonment across the post-industrial landscapes of the Midwest (Harrison & Immergluck, 2020). Geographically targeted, publicly led housing demolition is a prevalent policy response to hypervacancy, population loss, economic decline, and the retreat of private capital (Mallach, 2018). Specifically, housing demolition in which the city has taken a direct property right is posed as a necessary step to kickstart private economic development in disinvested areas. Critics argue, however, that demolition practices center unjustly on marginalized communities and are reminiscent of Urban Renewal which displaced thousands of Black and brown households and destroyed communities for the sake of redevelopment (Akers & Seymour, 2018). Jason Hackworth (2016) points out, however, that ‘demolition as urban’ policy may be even more insidious than mass demolition under Urban Renewal. While neoliberal redevelopment schemes characterize demolitions as ad hoc, Hackworth argues demolitions accumulate over time to an even greater scale than Urban Renewal. Moreover, there are no specific plans for redevelopment.

While scholars often focus on mass demolition as a spatial phenomenon, the temporal dimensions have been less well studied. How then does housing demolition interact with racial and material contexts to reproduce or transform temporal trajectories of redevelopment in shrinking cities in the postcrises period? Foregrounding temporality in the conceptualization of demolition as urban policy - as Hackworth does – focuses attention on the discursive role of policy. To further this endeavor, I explicate the temporal aspects in Hackworth’s theory within a multilevel modeling framework. I use detailed administrative data, the United States Postal Service vacancy data, and the American Community Survey across 2011-2020 to empirically ground the analysis in Chicago. Findings indicate the importance of scale in understanding the role public intervention plays in shaping redevelopment within neighborhoods, but reaffirm the primary importance of the market mechanism for redevelopment at the urban scale. In general, modeling demolition as urban policy reveals the complex temporalities at work constituting the Chicago landscape.

Furthermore, understanding discourse in the strong materialist sense – that discourse is constituted through everyday sociospatial interactions and shared meanings through time - the model asserts the primacy of sequence to emphasize that time is not just another independent variable. To the contrary, temporality is integral to spatial relations, the constitution of shared meanings, and therefore to the study of place. Policy discourse, then, emerges through the carrying out of policy (administration) in spatial settings already imbued with meaning. Demolition as urban policy, in particular, draws out the material aspects of policy discourse, as demolition is an especially stark intervention into the sociomaterial fabric of the city.

#### UNDERSTANDING THE EXTENT AND NATURE OF SUBCENTERS ACROSS US METROPOLITAN REGIONS

Abstract ID: 869

Individual Paper Submission

OSMAN, Taner [UCLA] tanerosman@ucla.edu, presenting author

At the turn of the twentieth century, the economies of urbanized areas in the US were dominated by a central core, the geographic expansion of which was constrained by limitations in communication and transportation technologies. Largely facilitated by the prevalence of automobiles, as well as public investment in roads, today the majority of jobs and residents in U.S. cities are located outside of their historical cores. This transformation has induced change in urban theories, once grounded in models of the monocentric city, to account for the dispersed nature of employment and residents within cities. At the same time, empirical work has sought to understand the scope and nature of dispersed patterns of employment within cities (Giuliano and Small, 1991; Garreau, 1991). In particular, studies have sought to measure the emergence of subcenters of employment – hubs (or centers) of dense employment within cities – which is in contrast to studies that identify development that is more random and dispersed in nature (Gordon and Richardson, 1996).

The current study focuses on the location of employment within metropolitan regions in the US. Due to both data and computational limitations, measures of sub-centers have been mostly limited to the analysis of single regions. Few studies have attempted to measure the extent and nature of subcenters in regional economies as part of a comprehensive, multi-regional analysis. This study seeks to provide a more robust basis for understanding the landscape of decentralized employment patterns across U.S. regions by comparing the extent and scope of subcenters across 377 metropolitan regions. Additionally, there is little research into the nature of economic activity within subcenters. For example, are subcenters home to relatively higher paying jobs, on average, are they more likely to be home to services compared to manufacturing activities, and do jobs within subcenters require higher educated workers than in non-subcenter parts of regions?

To address these gaps, the current research is motivated by four primary research questions. First, what percentage of employment is found within sub-centers across cities, and does this vary by city size and geographic region (the Northeast compared to the South, for example)? Second, what is the average count of subcenters across regions and how does this vary by region size? Third, what is the nature of employment activity within sub-centers and which industries tend to locate in subcenters compared to non-subcenter areas? Fourth, has the concentration of employment within subcenters become more or less pronounced over time? Giuliano and Small's (1991) identification approach is used to measure subcenters and is adapted to different regional contexts, although the findings presented in this research are consistent across different approaches of subcenter identification. The Census Bureau's Longitudinal Employer-Household Dynamic (LEHD) program will be the primary dataset employed in this analysis. LEHD provides employment counts by 2-digit NAICS category for census block groups over the period 2002-2018.

#### **A WAY OUT OF NO WAY: STRUGGLES FOR ECONOMIC SURVIVAL IN BLACK MILWAUKEE**

Abstract ID: 876

Individual Paper Submission

WILSON, Hilary [The Graduate Center, CUNY] hwilson@gradcenter.cuny.edu, presenting author

Following the departure of many large employers in the 1980s, local public policy has focused on subsidizing so-called “value generating” activities, fully embracing the creative class thesis in the early 2000s (Zimmerman, 2008) and coalescing around a dual strategy of industrial development and revitalization of the city’s downtown. While these efforts have succeeded in gentrifying several Milwaukee neighborhoods (Maciag, 2015) data suggests that many communities remain in the midst of a decades-long economic downturn (Levine, 2020).

I argue that the local state’s economic development strategy has continually failed to address Milwaukee’s protracted crisis in social reproduction because of its adherence to racialized and gendered conceptions of value that invisibilize collective and non-capitalist solutions to social and economic challenges. In the context of the U.S., the obsessive hierarchical juxtaposition of “blighted” and disadvantaged inner cities against advantaged white suburbs elides the relational nature of poverty and denies actually existing practices of urban life-making. This ideological orientation ultimately leads to practices of public investment aimed at individual uplift and aesthetic remediation rather than direct support for livelihoods in marginalized communities.

Drawing on insights from feminist political economy and black geographies, this paper adopts an epistemological framework that seeks to recognize and make visible the ways in which poor and working-class Milwaukeeans in the city’s most disinvested neighborhoods are envisioning and enacting new economic relations based in the radical potential of the local community. I do this through a case study of the Sherman Phoenix, a self-described “hub for black entrepreneurs” created out of the literal ashes of a multinational bank, which was burned down during a night of protest over the police killing of a local black man. In its refusal to view black Milwaukee as only ever a space of lack, the Sherman Phoenix demonstrates the complex and sometimes contradictory ways in which struggles to survive and thrive after abandonment are negotiated. I suggest that this alternative approach to development constitutes what J.K. Gibson-Graham call an experiment in building a “community economy” (Gibson-Graham 2013).

#### DISASTER ASSISTANCE WINNERS AND LOSERS: DO SMALL BUSINESSES BENEFIT?

Abstract ID: 885

Individual Paper Submission

WATSON, Maria [Texas A&M University] [mw574@tamu.edu](mailto:mw574@tamu.edu), presenting author

Small businesses are important to our communities in normal times and after disaster events. However, this study identifies and tests conflicts for Federal disaster aid providers and impacted businesses that might affect how much small businesses actually benefit from recovery funds. For aid providers, loan-based assistance leads to a balance between allocating aid to businesses that were most damaged and those that will be able to repay the funds; for businesses, capital is crucial to their post disaster survival, but the threat of long-term debt can deter them from

participating, even if loans are below market rate. This study uses the case of Galveston, Texas after Hurricane Ike to understand which of these forces takes precedence in the amount of funds approved to businesses and which businesses chose to utilize the funds in recovery.

This research finds that these conflicts lead to a paradox where businesses that are both more likely to receive more funding and utilize loans are more likely to have the resources to recover in the first place. Specifically, the analysis finds that repayment ability was a key determinant of loan amount, with larger businesses, older businesses, and corporations being approved for more funds. Conversely, debt played a role in business decision-making when it came to using funds: loan term and damage were negative predictors of whether a business accepted and used the funds once approved, whereas business size was a positive predictor. These findings suggest that planners may need to create their own recovery programs specifically targeting subgroups of businesses that are important to their communities. Because, although important to many economic development initiatives, small businesses, entrepreneurs, and sole proprietors may not benefit from federal assistance, particularly if they were severely damaged.

Lastly, this research lends evidence to suggest there is a recovery dichotomy for businesses after a disaster, which highlights importance of training businesses in continuity, mitigation, and recovery planning. The existing literature suggests a vicious cycle where if a business is damaged, they not only face costs related to replacing the physical capital but also by the secondary losses due to the interruption of its operations. If recovery funds are delayed, repair can't begin and interruption is prolonged. This research shows that physical damage was only a marginally significant indicator of loan amount and was a negative predictor of disbursement; time to application and deliberation time were both positive predictors of loan amount, and deliberation time was a positive predictor of the business choosing disbursement. This lends some empirical evidence to the idea that if businesses can avoid initial damage and are able to continue their operations so that delay time isn't compounding their losses, they are more likely to benefit from Federal disaster assistance. By reducing initial damage, businesses may not just avoid the vicious cycle, but may actually put themselves into a virtuous cycle, which can be promoted through planning initiatives.

#### **STATE RESPONSES DURING COVID-19 PANDEMIC AND THEIR IMPACTS ON SMALL BUSINESSES**

Abstract ID: 887

Individual Paper Submission

LIU, Cathy [Georgia State University] [cylu@gsu.edu](mailto:cylu@gsu.edu), presenting author

NAZARENO, Luisa [Georgia State University] [luisa.nazareno@gmail.com](mailto:luisa.nazareno@gmail.com), co-author

The unexpected outburst of the Covid-19 pandemic in March 2020 has had immediate impacts on small businesses. Studies from the early stages have predicted severe consequences, including massive job losses and closures (Fairlie 2020; Bartik et al. 2020). While early stages studies were crucial for an initial assessment, none of them could have foreseen that a second and much larger wave would follow the first in late 2020.

Beyond the severity of the pandemic itself, the responses adopted by state and local governments produce yet another set of changes in small business operating environments. A closer examination of state executive orders reveals substantial variation in local responses based on how orders affect public liberties, alter or suspend existing rules and regulations, and degree of enforcement (Curley and Federman 2020).

This paper provides evidence of how small businesses experience these institutional environment changes during 2020 across the United States over a more extended period: April to December. The main question is how the diversity of policy responses affected small businesses in three indicators: perceptions of general effects of the pandemic on the business, recovery expectations, and overtime availability of cash on hand (aka financial resilience). We rely on data from the Small Business Pulse Survey – a monthly panel data beginning in April 2020 – combined with other sources such as the State Orders database, Google mobility data, Covid-19 cases and deaths, Current Population Survey, Business Dynamics Statistics, and others.

We carry a three-stage empirical strategy. First, we gather insights from descriptive analysis. Next, taking advantage of the panel structure of the Pulse data, we provide fixed effects estimations, which allows the study of the pandemic and the policy responses absent unobserved state-level heterogeneity. Such estimation, however, prevents us from studying time-invariant characteristics known to affect the levels of entrepreneurship and business activities such as the industry mix, taxes, average firm size, diversity, and others (Armington and Acs 2002). To examine the extent to which those factors affected businesses during pandemic times, our third strategy comprises a set of pooled OLS estimates.

Our discussion has implications for several other social dimensions. Not only do small businesses comprise a large share of all employers, but they are often run by minority and immigrant owners, usually with more challenging access to credit and financial resources (Huang and Liu 2020). Understanding how they experienced the pandemic and were affected by local policies is also informative of how these communities did.

#### **THE ROLE OF CITY GOVERNMENT IN SOCIAL INNOVATION: SEOUL, KOREA’S SOCIAL INNOVATION NETWORK**

Abstract ID: 930

Individual Paper Submission

KIM, Mina [Portland State University] kimmin@pdx.edu, presenting author

LEE, Yong Sook [Korea University] yongsooklee@korea.ac.kr, co-author

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, co-author

City-level governments throughout the world are increasingly seeking to reconcile strategies for urban innovation with goals of social inclusion. Seoul, South Korea is one example. Over the past 20 years, Seoul’s social economy has developed rapidly as a result of social innovation policies designed by the municipal government. For example, the number and the sales of social economy organizations (SEOs) nearly doubled between 2014 and 2019. This research aims to understand the characteristics of social innovation in Seoul by examining the institutional context of the

innovation and analyzing the social innovation ecosystem through Social Network Analysis of SEOs in Seoul Innovation Park.

Although the definition of social innovation varies, this study defines social innovation as a regional process of including subjects and issues that were previously excluded from in economic development process. In Europe, social innovation has been largely driven by grassroots movements and civil society actors (Unger, 2015), but in South Korea, government entities have played a more instrumental role in social innovation efforts. The Seoul government began to promote social innovation to include marginalized people in the background of serious unemployment and economic inequality structured after the 1997 financial crisis. The policymakers tried to promote citizen engagement through social innovation on one side (Kim et al., 2015), but also regarded social innovation as an alternative to the crisis of political and aggressive civic movement that once led the democratization movement in South Korea. Moulaert et al. (2005) argued that linking theories on social innovation to resistance against social exclusion and innovative emancipatory strategies is significant in the explanation of local development. We need to better understand how local government efforts to promote social innovation engage and support social economy actors on the ground.

Seoul Innovation Park was established by the City of Seoul in 2015 as a spatial platform for social innovation, where various actors discuss and experiment to address social issues. We conducted a Social Network Analysis of 132 SEOs located within the park to assess their connectivity to one another. We find that Seoul's social innovation network shows a diversity of relationships among SEOs, with a high centrality of government-affiliated intermediate support organizations within those networks but fragmentation among those organizations. We additionally conducted interviews to better understand the qualitative characteristics of the network. While the benefits gained from the network varied depending on the stages of growth of SEOs, they commonly mentioned that psychological stability, confidence and socialization were the most important resources gained through the network. However, we find that SEOs tend to rely primarily on government projects for their financial resources, and they often evaluate financial sustainability as not high as a result. Furthermore, respondents pointed out the excessive diversity of the organizations in the park as a hindrance of knowledge sharing through the network and showed skepticism about the efforts of intermediary support organizations to promote networking opportunities as an end in itself.

Our findings suggest both potential and limitations for local government-led efforts to promote social innovation. We find that the localization of resources within a district-based innovation park facilitates accessibility for SEOs as they startup and manage enterprises. And local government involvement can bring a mix of scale, resources and local context-specificity that may be harder for grassroots- or national-level policy actors to achieve (Schrock and Wolf-Powers 2019). But especially in an institutional context like South Korea's with a strong history of state developmentalism, active local government involvement can easily become bureaucratic in character. This can potentially hinder the formation of collaborative relationships among social economy organizations, which may limit their collective efficacy for innovation and social-economic change.

HARPER-ANDERSON, Elsie [Virginia Commonwealth University] elharperande@vcu.edu, presenting author  
TEKLEMARIAM, Nathan [Virginia Commonwealth University] teklemariam@vcu.edu, co-author

The impact of the COVID-19 pandemic on the entire US economy has been one of the most severe in the country's history. The health crisis and the lockdown it necessitated has triggered an economic crisis. However, the impact has been disproportionately severe on historically disadvantaged minority groups. Blacks and Hispanics have suffered the most both in terms of health and economics. To add to the trauma, during the height of the COVID pandemic, a racial crisis unfolded in the summer of 2020, exacerbating the challenges in an already difficult situation leading many to dub the situation the "triple pandemic."

From their arrival on the banks of Virginia as slaves, Blacks have always been in a precarious economic position in the US. A system enshrined with racist policies and conventions that has resulted in systematic and institutional racial inequality over time. Underlying structural inequality meant that blacks were already in a vulnerable economic position in early 2020. The pandemic exacerbated those vulnerabilities and highlighted the structural and institutional causes. Historically blacks have been the hardest hit and the slowest to recover from the economic crisis. Further, policies designed to assist, in some cases, have further marginalized vulnerable groups.

The \$2.2 trillion CARES Act provided direct payments to citizens, loans to businesses, and expanded unemployment coverage. Like its predecessor, the American Recovery and Reinvestment Act (ARRA) of 2009, the CARES Act was rolled out quickly, increasing people and communities' potential of falling through the cracks. History has proven that ARRA did not benefit Blacks in the same way that it did other groups due to oversights in implementation planning. A significant proportion of Black-owned businesses could not capitalize on the available resources due to complicated and often overwhelming requirements. Further, black workers were systematically excluded from the jobs created due to a focus on industries where they were underrepresented. Black communities received far fewer dollars per capita than white communities (Harper-Anderson, 2012). Preliminary evidence suggests that implementation of the CARES Act is having similar results.

The purpose of this research is to assess the economic impact of COVID-19 on Blacks compared to Whites in Virginia. I use Current Population Survey microdata to analyze the impact on employment and business closure by race, disaggregating results by occupation and industry. I next examine the implementation of policy responses focusing on the unemployment insurance claims and PPP loans by race using UI claims data and SBA PPP loan data. Finally, I compare results from the current pandemic to those of the Great Recession in terms of racial inequality and make recommendations for a more equitable recovery.

I find that between February and December of 2020, Blacks have been disproportionately impacted by the pandemic both in employment and business closure. Further, while unemployment is lower in Virginia than in the US, the Black-White gap is larger and grew during the pandemic. The policy response, including unemployment insurance payments and PPP loans, were not distributed equitably. Whites received larger loans earlier and in greater numbers than blacks. Preliminary analysis suggests that black received fewer benefits even after controlling for occupation and industry and were less likely to work from home and receive pay without working.

The triple pandemic will leave deep economic wounds, particularly for people of color, requiring policy interventions at all levels. The field of planning has a long history of promoting policies and programs that have an enduring negative effect on Blacks' economic fate. Recovery from the triple pandemic will require innovative strategies in workforce development, economic development, and housing to help communities recover. This research plays a

role in highlighting obvious places to start.

### THE ROLE OF SPATIAL PROXIMITY FOR URBAN INNOVATION PERFORMANCE IN CHINA'S ELECTRONIC INFORMATION INDUSTRY

Abstract ID: 1016

Individual Paper Submission

HOU, Yuting [Singapore University of Technology and Design] [hoyuting86@gmail.com](mailto:hoyuting86@gmail.com), presenting author

While theories of agglomeration economies have long predicted that spatial proximity between economic agents generates agglomeration benefits and promotes growth and innovation, only a few studies explored whether these positive externalities, especially knowledge externalities, are highly localized or spill over beyond the limits of a city or region (e.g. Andersson & Karlsson, 2004; Breschi & Lissoni, 2001). Moreover, empirical evidence on the expected role of agglomeration in innovation in China are relatively few (e.g. Sun, 2000). Focusing on China's Electronic Information (EI) industry, this study aims to explore the relationship between agglomeration economies, knowledge spillover and the geography of technological innovation performance across Chinese cities. Two key questions are explored here: 1) whether and to what extent spatial access to knowledge sources (e.g. research universities/institutions), skilled labors and markets in other cities matter in urban innovation performance of the Electronic Information (EI) industry; 2) how the role of spatial spillover effects vary among cities of different sizes and regions.

The 75 "innovation pilot cities" in China that are prefecture-level and above are chosen as the study areas. Following the standards by the Statistical Bureau of China, these cities are categorized into 5 classes (i.e. small, medium, large-I, large-II, extra-large) based on the 2016 urban permanent population and are assigned to 4 different regions of China (i.e. East, North-East, Central and West). The 2013 Economic Census is used as the primary data for constructing city-level variables. Technological innovation activities are represented by patent grants queried from China Intellectual Property Bureau for the years 2016 to 2018 and are further differentiated into major innovation (i.e. invention patents) and minor innovation (i.e. new utility models and exterior design patents), based on their relative importance to regional economic development (Sun, 2000).

Following the conceptual framework of innovation systems (Fischer, 2001), we include measures of manufacturing, scientific, producer service, and institutional sectors as key determinants of technological innovation at the city-level. To account for the potential spillover effects from other cities, spatial regression models are applied to include spatially lagged independent variables that embed measures of accessibility to resources (e.g. research institutions) and actors (e.g. R&D personnel, customers) at other cities (Paez, 2004). To test for the different effects of accessibility on cities of different sizes and regions, interaction terms are generated between each of the spatially lagged independent variable and city size or region categories, respectively.

The preliminary results indicate that the overall economic size, specialization in the EI industry, and the number of

research universities/institutions at the city-level are positively associated with urban innovation performance in the EI industry. Larger R&D investments and longer years of a city getting innovation policy supports are positively associated with major but not minor innovation activities in the EI industry. Moreover, positive and significant spatial spillover effects on both major and minor innovation are mostly found for small (i.e. 200,000-500,000 population) and medium sized (i.e. 500,000-1 million population) cities as well as cities located in the Central region of China.

This study adds to innovation studies by investigating urban innovation capacity among Chinese cities in recent years. Our findings imply that while the future growth and innovation pole of China's EI industry may still be concentrated in large cities in East and Central regions of China, small and medium sized cities in the Central region have the potential to further enhance their innovation capacity through "borrowing size" from larger and higher-order cities. Methods to improve accessibility and decrease the inter-city time distance between those cities and higher-order cities in the East and West regions may have the potential to improve their innovation performance in the EI industry.

#### **RACE, GENDER, AND THE URBAN WAGE PREMIUM: WHO BENEFITS FROM INCREASES IN A CITY'S POPULATION?**

Abstract ID: 1049

Individual Paper Submission

BUCHHOLZ, Maximilian [University of Toronto] max.buchholz@mail.utoronto.ca, presenting author

A large body of research has documented that workers' wages are systematically higher in more populated and denser cities, a phenomenon known as the "urban wage premium." Moreover, it is becoming increasingly accepted that the urban wage premium is mostly true for college-educated workers, who gain substantial benefits from locating in more populated cities, while for non-college-educated workers, there seems to be little wage advantage to locating in a larger city. A handful of recent papers however, have shown that the urban wage premium varies not only across education levels but also race and gender, leading to larger racial and gender wage gaps in more populated/denser cities. From these recent papers, we know that cross-sectionally, city-size and density are associated with stronger (and rising) racial and gender wage inequality across U.S. cities. Conversely, this paper seeks to understand whether increases in population and density over time within cities are positively related to increases in Black-White, Latinx-White, and female-male wage inequality. After controlling for a range of individual and urban-level characteristics, I find that rising population within U.S. city-regions is strongly correlated with increases in Black-White nominal wage inequality, though there are clear relationships with Latinx-White and female-male inequality as well. At the same time, increases in wage inequality depend not only on whether a city-

region's population grows, but also who drives that population growth.

### THE WHOLE FOODS EFFECT? THE RELATIONSHIP BETWEEN SUPERMARKET DEVELOPMENT AND PROPERTY VALUES IN HARLEM, NEW YORK

Abstract ID: 1053

Individual Paper Submission

SAKAMOTO, Kaz [Columbia University] k.sakamoto@columbia.edu, presenting author

SNIDAL, Michael [Columbia University] mjs2267@caa.columbia.edu, primary author

In 2016, the global real estate database company, Zillow, published a study that found the typical home near a Whole Foods or a Trader Joe's cost more and appreciated faster than homes lacking proximity to these supermarkets. Food gentrification and residential gentrification are correlated but do high end supermarkets like Whole Foods spur gentrification or do they follow it? We examine housing prices surrounding the Whole Foods on 125th Street in Harlem, New York City. We create a hedonic price index for residential sales. We apply a fixed effects difference and difference estimator model to examine changes in housing prices in  $\frac{1}{8}$  mile buffer increments. We find that the opening of the Whole Foods on 125th Street did not increase real estate prices within the immediate vicinity of the store but that it may have spurred price increases at greater distances. We also find that real estate appreciation may have been captured before the opening of the store.

### PATTERNS OF ECONOMIC DEVELOPMENT COLLABORATIONS: EVIDENCE FROM IOWA

Abstract ID: 1067

Individual Paper Submission

QIAN, Haifeng [University of Iowa] haifeng-qian@uiowa.edu, presenting author

SANCHEZ, Jose [University of Illinois at Chicago] jscnch2@uic.edu, co-author

KURTZ, Samuel [University of Illinois at Chicago] skurtz3@uic.edu, co-author

CARR, Jered [University of Illinois at Chicago] jbcarr@uic.edu, co-author

Collaborations lie at the core of the third-wave economic development planning and policy. Scholars have theoretically discussed the prevalence of public-private partnerships and the barriers to intergovernmental collaborations at the local level. However, we still have limited understanding on how state and local governments pursue economic development collaborations in practice. To address this gap, we analyze formalized economic development collaborations in Iowa. Our analysis aims to answer the following five questions: (1) Who are the partners of state and local governments in economic development collaborations? (2) In what institutional forms (e.g., service contract, joint operation, and transfer of authority) local governments collaborate with other governmental and non-governmental organizations in economic development? (3) In what economic development areas (e.g., business incentives, workforce development, and physical infrastructure) local governments collaborate with other governmental and non-governmental organizations? (4) Under what conditions state and local governments choose to enter economic development collaboration agreements with other governmental and non-governmental organizations? (5) What are the challenges that arise during these collaborations? And what practices are used or could have been used to address these challenges?

To answer the first three questions above, we conduct a content analysis on the Iowa 28E economic development collaboration agreements. Chapter 28E of the Iowa Code permits state and local governments to provide joint services and cooperate with governmental and nongovernmental agencies for accomplishing mutual interests through intergovernmental agreements. These collaboration agreements are filed with the Iowa Office of the Secretary of State. Chapter 28E defines public agencies as political subdivisions in Iowa or another state, federal and state government agencies, and federally recognized Indian tribes. The digital repository of agreements is publicly available (<https://sos.iowa.gov/>), which include more than 120 agreements signed for the economic development purpose since 2007. Our preliminary analysis has identified the active role of the state government in workforce development through service contracts. At the local level, we report that city governments collaborate with various governmental and non-governmental organizations in seven areas of economic development activities and through a variety of institutional forms.

To answer the last two questions, we will conduct semi-structured interviews with state and local government officials who are/were involved in some of the recent Iowa 28E economic development agreements. This qualitative analysis will shed light on the benefits, costs, and best practices in economic development collaborations.

This research contributes primarily to planning practice. It provides insights into how government pursues economic development collaborations in different areas of economic development activities.

## ECONOMIC DEVELOPMENT AND HOUSING STRATEGIES: AN ANALYSIS OF THE NEW ECONOMY OF NORTH AMERICAN CITIES

Abstract ID: 1106

Individual Paper Submission

VINODRAI, Tara [University of Toronto] tara.vinodrai@utoronto.ca, presenting author  
MOOS, Markus [University of Waterloo] markus.moos@uwaterloo.ca, co-author

Over the past two decades, North American cities have pursued the attraction of highly skilled and educated workers, alongside a series of entrepreneurial and innovation-oriented strategies to support tech-led development (Florida 2018). Such strategies have become deeply embedded in economic development practices despite critiques by urban planning scholars and activists alike. Yet, there are growing concerns that housing in major North American cities is becoming unaffordable, fuelled – in part – by these very same activities. There is growing concern that major cities that are ‘successful’ in the new economy have become less affordable for, and inclusive of, a broader spectrum of people (Lee 2018; Zukin 2019). As a result, high housing costs are increasingly viewed as a potential barrier to attracting young, skilled workers (Moos et al. 2018), especially in cities where these ‘new economy’ activities have taken hold.

In this paper, we advance our previous exploratory analysis of the relationship between housing policies and economic development strategies in major North American metropolitan areas by including a quantitative analysis of the relationship between local economic development plans, housing strategies and place-based characteristics. We draw upon a database capturing the policy details associated with 131 local economic development plans and 119 housing strategies across 59 metropolitan regions in Canada and the United States with populations greater than 1 million. We derive 13 variables capturing the local economic development and housing policy context drawing on methods and analytical techniques similar to those used elsewhere (cf. Kramer and Filion 2011). We assemble socio-economic data from the 2016 US American Community Survey (ACS) and the 2016 Canadian Census for these jurisdictions to describe key place-based socio-economic and demographic characteristics, including industrial structure, the prevalence of tech jobs, the proportion of young adults and educational attainment.

First, we examine whether these economic development plans identify talent attraction as a key element of their strategies, whether there was a specific youth or young adult focus related to talent attraction, and if housing and housing affordability issues were considered. We find that the majority of economic development strategies tout the presumed value of ‘talent attraction’, particularly young workers, as well as the importance of housing.

Second, we assess the housing strategies within these same jurisdictions to determine whether there was a bias toward young, skilled workers. We find that young adults entering the housing market for the first time receive little explicit attention in housing strategies. We also find that most housing strategies focus on low-income and marginalized populations, especially in the US due in part to federal requirements. Yet, in most cases, housing and economic development strategies are not explicitly linked, especially when it comes to the actions delineated in these strategies.

Finally, we conduct a principal components analysis using our place-based socio-economic, demographic and policy variables to establish a typology of metropolitan regions capturing the relationships that exist between concentrations of a young, skilled workforce, housing affordability and the local economic development and housing policy context. Overall, we conclude that – but for a small number of jurisdictions – these two domains of planning remain largely disconnected in practice and argue that economic development planners must actively consider housing market dynamics and affordability. Moreover, planning scholars have a role in drawing closer attention to the relationship between these domains.

MINNER, Jennifer [Cornell University] jm2359@cornell.edu, presenting author  
 HEISEL, Felix [Cornell University] felix.heisel@cornell.edu, co-author  
 WORTH, Gretchen [Cornell University] gmw82@cornell.edu, co-author  
 FERNANDES, Anthea [Cornell University] aff42@cornell.edu, co-author  
 REARICK, Jason [Cornell University] jr2249@cornell.edu, co-author  
 TALIB, Gyasi [Cornell University] gst44@cornell.edu, co-author

Visions for a circular economy seek to disrupt the enormous amount of waste generated by a linear system that extracts raw materials from the earth to construct the built environment, including its buildings and infrastructure, only for those materials to be dumped into landfills after a relatively short lifespan (Fusco Girard & Nocca, 2019). In a circular system, natural resources and embodied carbon are conserved through prolonging the lifespan of existing building stock through preservation, retrofitting, and repair (Huuhka & Vestergaard, 2019; McCarthy & Glekas, 2019); deconstructing buildings and salvaging usable fixtures and building materials; and transforming new construction through designing with repurposed building materials and for deconstruction (Hebel et al., 2014).

There have been growing calls for whole countries, regions and communities to achieve circularity, particularly within Europe and Asia (Kovacic et al., 2019). Within North America, there have been efforts to re-envision local government and private sector systems of demolition with deconstruction, particularly within Vancouver, CA; in the Bay Area Deconstruction Working Group; Portland, Oregon; and New York, NY. However, research into how concepts of circular economy fit within the highly variable and uneven regulatory context of urban planning and historic preservation in North America remain limited. Likewise, there has been limited planning scholarship into how deconstruction efforts might fit into the creation of green jobs and sustainable transformation of construction activity.

The Circularity Reuse, and Zero Waste Development (CROWD) Taskforce developed out of an alliance of community leaders and academics concerned with a vast system of building material waste within New York State. CROWD seeks to advance sustainability, resilience, and green jobs within the built environment. CROWD's efforts are aimed at helping communities realize the environmental, cultural and economic benefits of prolonging the lifespan of buildings and reusing building materials and architectural elements through research, education, policy initiatives and design that emphasizes deconstruction, salvage, and preservation.

The Task Force draws three programs at Cornell University - the Just Places Lab in the Department of City and

Regional Planning; the Circular Construction Lab in the Department of Architecture; and the Susan Christopherson Center for Community Planning. The research labs and community planning center have employed a wide variety of research methods in support of developing practical means of advancing a spectrum of building reuse to deconstruction and re-use of building materials. The efforts of the working group employ participatory action research; analysis of demolition and deconstruction ordinances; spatial analysis of demolition sites; social scientific methods to understand the perspectives of actors involved in demolition, deconstruction, salvage, and reuse; and architectural studies of deconstruction potential. The group is sustained through the community leadership within organizations such as Historic Ithaca, Preservation Association of Central New York, the Finger Lakes Reuse, Inc., among other nonprofit and governmental leaders.

This poster provides an overview of the research frameworks and efforts that underpin CROWD's work, the outcomes of research that combines the efforts of community organizations, faculty research, and students in research positions and classes. The aim is to share not only the results of this research, but provide insights that could be compared with efforts in other communities and replicated in other regions.

# Track 4 – Environmental Planning & Resource Management

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### 4.2 PRE-ORGANIZED SESSION - URBAN GREEN PLANNING AND CLIMATE JUSTICE: CONFLUENCE AND CONFLICTS

Pre-Organized Session 2 - Summary

Session Includes 22, 24, 25, 26, 1007

CONNOLLY, James [University of British Columbia] jconnoll@mail.ubc.ca, organizer

Can urban planning address climate change by greening cities without compromising social justice? Recent literature argues that conflicting pressures generate inevitable tradeoffs wherein even equity-driven urban adaptation or mitigation projects are left not going far enough to redress past urban injustices, including unequal development; inequitable enforcement of zoning regulations; and deeper histories of exclusion, segregation, settler-colonialism, and dispossession. Viewing these issues as fundamental in shaping the possibilities for urban climate justice within the globalizing green city orthodoxy, this panel highlights ways that planning can address the underlying conditions generating pressures to tradeoff between social and ecological goals. The studies presented unearth the foundations of a way of practice that shifts planners toward a deep engagement with issues of climate justice in the context of urban greening. Both climate mitigation and adaptation measures that seek to make cities more just require such a shift in practice as superficial adjustments to orthodox green planning have proven to be insufficient.

Objectives:

- Examine the role of green planning relative to a variety of urban socio-environmental tensions related to climate justice
- Highlight fundamental lessons, bases of knowledge, and examples of action pointing toward a mode of planning that is informed by climate justice challenges
- Foreground issues of greening and racial change in neighborhoods, green gentrification, equitable jobs through green infrastructure, and exclusive green design and urban renaturing programs, among others

### THREE HISTORIES OF GREENING AND WHITENESS IN AMERICAN CITIES

Abstract ID: 22

Abstract within Pre-Organized Session 2

CONNOLLY, James [University of British Columbia] jconnoll@mail.ubc.ca, presenting author

ANGUELOVSKI, Isabelle [Universitat Autònoma de Barcelona] isabelle.anguelovski@uab.cat, co-author

How has urban greening related to the degree of whiteness in neighborhoods? The answer to this question provides an essential “historical diagnostic” that can be used to develop an approach to urban ecology which integrates racial and ethnic change into the planning for proposed interventions. In this paper we employ state sequence analysis to analyze the historical trend of greening (including the implementation of new parks, greenways, community gardens, green recreation areas, and nature preserves) between 1975 and 2014 in a sample of nine cities in the United States relative to concentrations of white and non-white residents. We divide the nine cities into three common growth trajectories and separately examine the trends for each growth trajectory. We further illustrate these trends by mobilizing qualitative data from field work in selected neighborhoods to help explain the processes that generate certain key findings in the quantitative data. We find that the relationship between greening and

race/ethnicity differs according to city-level growth trajectory. Cities with continuous high and rapid levels of growth in the postwar period have the strongest link between increased greening and whiter populations. Meanwhile, in cities that contracted or had a punctuated growth pattern, non-white areas had a uniformly low level of greening that occurred mostly in recent years. In all, we show how urban growth, greening, and whiteness are inextricably associated qualities of American cities. We argue that understanding this association is essential for development of a race-conscious model for green planning.

#### **THE PARADOX OF THE CLIMATE-RESILIENT POST-INDUSTRIAL CITY: INFORMAL GREEN SPACE AND GENTRIFICATION IN PHILADELPHIA, PENNSYLVANIA**

Abstract ID: 24

Abstract within Pre-Organized Session 2

PEARSALL, Hamil [Temple University] hamil.pearsall@temple.edu, presenting author

CHRISTMAN, Zachary [Rowan University] christmanz@rowan.edu, co-author

Considerable research on green gentrification has been conducted in large cities with consistent population growth and limited land availability: Boston (Anguelovski et al. 2020), New York City (Checker 2011), Seattle (Dooling 2009), and Vancouver (Quastel 2009). Many of these cities have climate resilience planning efforts that enhance green gentrification or climate gentrification through infrastructure upgrades (Shokry, Angulovski and Connolly 2020). However, green gentrification is also occurring in other cities with modest population growth, fewer land pressures, and less private investment, yet also face climate vulnerabilities, such as increased rainfall and hotter temperatures. Post-industrial cities with a history of depopulation and disinvestment have vacant land available for development and growth, as well as extensive green space, though much of it is informal and overgrown. This type of leafy green vegetation has yet to be thoroughly explored in the green gentrification literature, and it presents an interesting context for promoting climate resilience. Large, leafy, overgrown lots contribute to urban vegetation cover, though many residents and planners view this type of vegetation as a nuisance that attracts undesired activities, such as crime or dumping. Post-industrial cities caught in economic decline seek to reinvent themselves as sustainable, attractive cities that balance sustainability with economic growth. The dual aims of economic growth and environmental sustainability present a paradox: the greener, officially, a city becomes, the more informal green space that could be applied towards climate resilience it loses. This study conducts a time-series analysis over two decades to examine the relationships among vegetation abundance and condition, surface temperature, and gentrification in Philadelphia, Pennsylvania. We draw on satellite imagery from the Moderate Resolution Imaging Spectroradiometer (MODIS) 16-day Vegetation Index Product and 8-day Land Surface Temperature Product from 2000–2020 to examine changes in vegetation cover and surface temperatures, land use data, building permit data, and demographic data from the 2000 US Census, 2010 Census, and American Community Survey in Philadelphia,

Pennsylvania to examine the following research questions: 1) How have development dynamics across urban neighborhoods in Philadelphia influenced patterns of vegetation and temperature from 2000-2020? 2) How does the relationship between vegetation cover and temperature vary across the changing socio-economic context? Building upon Pearsall and Christman (2012), we hypothesize that the relationship between temperature and vegetation responds to development dynamics and reveals uneven impacts of development on changing neighborhoods. This study points towards a dilemma for post-industrial cities simultaneously seeking to promote economic development and growth while becoming more climate resilient.

### DECOLONIZING THE GREEN CITY: FROM ENVIRONMENTAL PRIVILEGE TO EMANCIPATORY GREEN JUSTICE

Abstract ID: 25

Abstract within Pre-Organized Session 2

ANGUELOVSKI, Isabelle [Universitat Autònoma de Barcelona - Barcelona Lab for Urban Environmental Justice and Sustainability] isabelle.anguelovski@uab.cat, presenting author

BRAND, Anna Livia [University of California Berkeley] annalivia@berkeley.edu, co-author

RANGANATHAN, Malini [American University] maini@american.edu, co-author

The expanding reach of urban greening across the United States and beyond often materially and immaterially impacts communities of color, leading to displacement and decreased access to new urban amenities. While many scholars point to the persistence of racial inequality, we see the urban greening orthodoxy in urban planning and development as evidencing a deeper strain of environmental injustice bound up in white supremacy. In this paper, following the prompts of the Black Lives Matter Movement to enact life-affirming Black geographies, we call for decolonizing the green city and for an emancipatory spatial imaginary to enact green justice. Reflecting on the development of the 11th Street Bridge Park in the predominantly Anacostia neighborhood in Southeast, Washington DC, we ask how urban greening can enact a more emancipatory green justice. Building on 30 interviews with residents, activists, community organizations, and planners, we trace the contours and constraints of current greening and equity logics and practices and contend that decolonization and emancipation fundamentally require new spatial planning practices. While the green project is deployed as an “intentional” equity-centered infrastructure, it is limited in its ability to embrace multiple forms of land recognition, redistribution, control, and reparations and to develop green practices that engage with the history of a multi-layered geography of dispossession and include cultural and symbolic recognitions of networks of resilience and care. We thus argue for a more emancipatory spatial imaginary that confronts white supremacist forms of dispossession; centers resistance to anti-Blackness; and articulates a geography of reparations through decolonizing settlement patterns at multiple

geographical scales.

#### PLANNING AT THE END OF THE WORLD

Abstract ID: 26

Abstract within Pre-Organized Session 2

SAFRANSKY, Sara [Vanderbilt University] sara.e.safransky@vanderbilt.edu, presenting author

Keywords: futurity, Anthropocene, urban greening, otherwise planning

Cities have become key sites where people are confronting what it means to live together and collectively inhabit the so-called Anthropocene, if in radically uneven ways (Pulido, 2018). Projections of urban futures are not only important for how they shape possible futures but also for how they function biopolitically in the present (Smith and Vasudevan, 2017). At the turn of the twenty-first century, Detroit, Michigan—the city that put the world on wheels—was transformed into a laboratory for postindustrial futures. In 2013, a citywide plan called Detroit Future City proposed a major reordering of the city's land use and services. Widely touted as bringing together the brightest leaders and cutting-edge planning practices for sustainably managing cities, the framework sought to remedy the city's spatial mismatch between a declining population and historical urban footprint through urban greening. This talk uses the tensions and complex question of justice that arose as plans unfolded to decommission and ruralize parts of Detroit to think about the ethical and political imperatives to embrace "otherwise" planning—that is, to plan in ways that break from white supremacist, colonial, and capitalist spatial and ecological imaginaries (Bates et al., 2018). As Detroit became an exemplar of urban shrinkage, the newly inaugurated Detroit Metropolitan Truth and Reconciliation Commission on Racial Equity was engaged in a different kind of future-making project—one of racial healing. Drawing on ethnographic fieldwork in Detroit, this talk analyzes the confluence of these two projects, specially how they rubbed up against residents and activists' visions for their own futurity. I consider the aspirations and politics of recuperation and knowledge embedded in these competing imaginaries and the stakes thereof for collectively building more just, livable cities able to meet the urgency of our times.

## THE GREEN JOBS BEHIND GREEN INFRASTRUCTURE: A REVIEW OF THE LITERATURE AND IMPLICATIONS FOR ENVIRONMENTAL JUSTICE

Abstract ID: 1007

Abstract within Pre-Organized Session 2

SOLIS, Miriam [University of Texas at Austin] [solis@austin.utexas.edu](mailto:solis@austin.utexas.edu), presenting author

Environmental justice frameworks located in urban planning elucidate the potential consequences of green infrastructure in historically marginalized communities. This scholarship accounts of the grey, noxious infrastructure that has been sited in low-income communities of color (Melosi 2004). At the same time, needed greening initiatives can spur “climate gentrification” and increase local property values that lead to residential displacement (Gould and Lewis 2016). This greening effect creates a conundrum for local organizers and advocates who want to improve the conditions of their neighborhood without uprooting existing residents (Anguelovski, 2016).

Critical examinations of green infrastructure projects address neighborhood-level economic impacts, yet communities have also approached economic justice from the perspective of jobs. Community based organizations, unions, and educational institutions have promoted green jobs associated with skilled trades—for example, construction workers and technicians—as a workforce development strategy. They regard green jobs as well-paid, stable opportunities that can create career pathways for people of color (Scully-Russ, 2018).

To foreground these economic justice strategies in relation to green infrastructure initiatives, this review does multiple things. First, the paper contextualizes green jobs discussions in environmental justice scholarship. This body of work has long called for the redistribution of planning’s benefits, including resultant economic opportunities (Schweitzer and Valenzuela 2004). Second, it identifies the green jobs under discussion by applying federal classifications that track labor trends in the green infrastructure planning, operations, and maintenance sectors. It then provides a review of the scholarly and applied research on the equity implications of these jobs. Literature from the fields of community and economic development, sociology, and ethnic studies, as well as studies from policy institutes, document the inequities within these jobs categories. This research also highlight local social movements that have successfully advanced unionization efforts and secured living wages for workers. The review’s synthesis discusses if and how these moves toward economic justice effectively mediate the consequences of capitalism.

This paper proposes several directions for future research, including a call to strengthen inquiries on the intersection of climate action and economic justice. This would ideally involve building a stronger association to investigations of worker protections, including unionization efforts and health and safety protocols. Because the climate action path ahead is a long one, the paper also stresses a needed focus on training and education programs that create career pathways. By bringing together several domains of research and identifying implications for planning research, this review helps fill a critical gap in how we need to understand and rethink green infrastructure.

#### **4.8 PRE-ORGANIZED SESSION - SOCIAL AND ENVIRONMENTAL (IN)JUSTICE IN PLANNING RESPONSES TO NATURAL HAZARDS: A COMPARATIVE STUDY OF THE U.S. EXPERIENCE**

Pre-Organized Session 8 - Summary

Session Includes 215, 216, 217, 218, 268

HUR, Misun [East Carolina University] hurmi@ecu.edu, organizer

The industrial revolution has brought rapid environmental changes. Human integrations have augmented the negative effect on the environment further. As a result, extreme weather conditions and more substantial natural disasters have been observed globally, which caused severe damages to people in various ways locally. Although disrupting for all, the damages are not equally detrimental to everyone by raising an issue of social and environmental (in)justice. In this pre-organized session, we explore diverse subjects in various geographic locations through the lens of environmental (in)justice. Presenters will demonstrate the evidence of the social and environmental (in)justice by presenting and comparing different location-specific hazards and related planning actions cross-sectionally and longitudinally. As a result, we will explore the planning actions for marginalized communities' preparedness in future environmental events. By participating in the discussions, audiences will be able to construct the measures to better support such communities for a sustainable future through reducing the social and environmental imbalances.

Objectives:

- To demonstrate the evidence of the social and environmental (in)justice by presenting and comparing different location-specific hazards and related planning actions cross-sectionally and longitudinally.
- To explore the planning actions for marginalized communities' preparedness in future environmental events.

#### **IOWA'S WATERSHED MANAGEMENT AUTHORITIES: FLOOD RESILIENCY AND ENVIRONMENTAL JUSTICE**

Abstract ID: 215

Abstract within Pre-Organized Session 8

TERZANO, Kathryn [Iowa State University] kterzano@iastate.edu, presenting author

In states whose native landscapes have been heavily altered by row-crop agriculture, increasing precipitation rates and flood resiliency are pressing concerns (Weber et al., 2017, Villarini et al., 2015). Iowa is one such state, and after catastrophic flooding in 2008, the state created the Rebuild Iowa Office to provide recommendations on increasing resiliency through regional planning efforts. Part of these recommendations include managing floodplains through

watershed-wide regions. In 2010, Iowa followed-through on this recommendation by legislating the ability for communities to create Watershed Management Authorities (WMAs). WMAs are intergovernmental agreements between cities, counties, and Soil and Water Conservation Districts within subbasin-size watersheds, meaning they can contain several counties and dozens of communities. More important, perhaps, is that the creation of WMAs and their subsequent planning and implementation efforts are voluntary. Given the dominance of row-crop agriculture on Iowa's landscape, the onus for flood mitigation and resiliency is largely on farmers and landowners voluntarily implementing Best Management Practices (BMPs) to store water or slow its release into waterways. Watershed plans created by WMAs recommend practices for farmers and landowners to implement, while recognizing that flood impacts that can be felt downstream. Evidence suggests that vulnerable populations face inequalities when recovering from flood damage, however (Muñoz & Tate, 2016), which calls into question how a voluntary approach to flood mitigation can serve environmental justice.

The research here aims to answer if relying on recommendations and voluntary practices can serve a broader purpose of environmental justice for those living in flood-prone areas. To this end, a review of current WMAs' watershed plans was conducted, with a focus on how many WMAs have completed plans, how extensive they are in implementing flood mitigation, and how many areas of the state do not yet have such plans. Current plans were compared to assess how environmental justice may or may not be taken into account. Preliminary analysis indicates that extensive work has been done to demonstrate the hydrology of the watersheds and provide scenarios for how best to mitigate flooding. However, there is uneven attention paid to the most vulnerable populations. A social vulnerability index that can be overlaid with flood risk maps has been created for some WMAs, though easy access to this data appears reliant on funding source. Implications of the research include the need for practicing planners and local governments to better understand how their resiliency can be tied to communities upstream. To increase environmental justice considerations, practicing planners may need to take a financial interest in voluntary adoption of BMPs in other communities, as well as a financial interest in creating their own social vulnerability indices.

#### **SOCIAL INEQUALITY IN VULNERABILITY TO SEISMIC AND CLIMATE-CHANGED-INDUCED HAZARDS**

Abstract ID: 216

Abstract within Pre-Organized Session 8

CHEN, Na [University of Cincinnati] na.chen@uc.edu, presenting author

WANG, Chih-Hao [California State University, Fresno] cwang@csufresno.edu, primary author

It has been examined in many past studies that a comprehensive city plan with physical mitigation measures can significantly reduce the impact from a natural disaster to lives and properties in a city (Burby et al., 1999; Olshansky,

2001). However, these studies often neglect the need of different mitigation strategies for different socioeconomic groups. For instance, the city of New Orleans decided to build the city back to the original status after Katrina, even though this will make those socially disadvantaged neighborhoods remain vulnerable to the next catastrophic storm. One of the reasons is the citizens' refusal to accept any of the planners' more physical comprehensive approaches by the fact of race (Levy, 2016). The lesson learned here indicates the need to consider different strategies for different social groups since they are vulnerable to natural hazards in different ways. For instance, a retrofit or relocation project might not work for a neighborhood with more low-income families. A neighborhood with a higher crime rate is also difficult to develop a community sense to adapt to climate change. Therefore, it is extremely important to identify who is vulnerable to a specific natural hazard and thus design a mitigation strategy which is suitable for that neighborhood according to its socioeconomic status.

To fill up this gap, this study aims to (1) firstly identify seismic and climate-change-induced (sea-level rising and wildfire) hazardous locations, (2) and then examine whether all neighborhoods in the San Francisco Bay Area (Bay) from four dimensions (economic conditions, social status, land uses, capital investments) are equally exposed to each of the three natural hazards (earthquakes, sea-level rising, wildfire) at different spatial levels (county, region, the Bay) over two different time periods (2020-2060, 2060-2100) to the end of the 21<sup>st</sup> Century. The Bay area is selected as the study region because it is prone to the three natural hazards and likely exists inequality in the four dimensions listed above.

Methodologically, the peak ground acceleration (0.32, 0.48, 0.64 g) is used to represent seismic hazards to divide the Bay into hazard and non-hazard zones, based on the seismic hazard dataset provided by National Geospatial-Intelligence Agency (2012; updated in 2017). Similarly, in the case of sea-level rise (SLR), 1, 1.5, and 2.5 meters are used as thresholds for identifying low, median, and high SLR hazard zones. Finally, we will use 25% (low), 50% (median), and 75% (high) burned area for a cell in a gridded map as thresholds to identify wildfire hazardous locations for two time periods (2020-2060, 2060-2100), using the wildfire simulation data from Westerling (2018). After identifying the natural hazards, vulnerability characteristics for each census block group are collected from the four dimensions listed above. With the collected data, a two-sample t-test will be conducted to examine whether each of the vulnerability characteristics is different between hazard and non-hazard zones for each hazard at each spatial level.

The findings will reveal where, together with its socioeconomic characteristics and physical conditions, is more vulnerable to each natural hazard. This will help with local governments' finances by targeting at those who are the most needed for mitigation strategies. The results will be also summarized into three spatial scales and two time periods. The local governments will know better whether they should work on mitigation alone, or cooperate with other counties, or act as a metropolitan area during different time periods.

## NEIGHBORHOOD CHANGE AND CLIMATE GENTRIFICATION: MYTH OR FACT?

Abstract ID: 217

Abstract within Pre-Organized Session 8

LI, Yanmei [Florida Atlantic University] yli22@fau.edu, presenting author  
ZHANG, Sumei [University of Louisville] sumei.zhang@louisville.edu, co-author  
HOERMANN, Serena [Florida Atlantic University] shoermann@fau.edu, co-author

Traditional theories of neighborhood change focus on ecological factors, political economy, subcultural factors, and other factors (Galster, Cutsinger, & Lim, 2007; Harvey, 1973; Li & Morrow-Jones, 2010; Rothenberg et al., 1991). The natural succession of neighborhoods goes through a few stages, such as suburbanization, in-filling, downgrading, thinning out, renewal or rehabilitation, but is not always linear, and different neighborhoods change differently over time. Ecological factors, such as residential preferences and mobility, and the natural process of aging in housing and infrastructure, determines the fundamental change of neighborhoods. The push and pull factors explain the directions of mobility. Public agencies often use pull factors to attract intended residents. The push factors often stem from neighborhood decline and/or neighborhood revitalization, while such revitalization may be pull factors for other types of residents. When residents are pushed away involuntarily due to increased property value and rents, and/or cultural changes due to revitalization, displacement from gentrification may occur.

In recent years, climate change associated with increased intensity of human activity and increased carbon footprint has yielded an alarming trend of melting glaciers and rising sea levels. Although the projected magnitude of sea-level rise (SLR) is different based on different models, the overall unpredictability of weather patterns, increased tropical cyclone activities, and worsening king-tide inundation in low-lying urban areas along the coast have prompted many developers and home-buyers to consider elevation and flood exposure when making home development or purchase decisions. Speculations about developers eyeing higher-elevation areas for redevelopment have prompted researchers to investigate whether climate related gentrification is happening in higher-elevation low-income neighborhoods. In a study in Miami-Dade County, Keenan, Hill, & Gumber (2018) found that housing units in higher elevation areas tend to have higher appreciation rates than units in lower-elevation areas. While higher-income/higher-elevation areas may be resistant to displacement, lower-income areas may be more susceptible. Some of the higher elevation areas are the neighborhoods with predominantly Haitian (Little Haiti) and low-income minorities (Liberty City). In addition to the threat from climate gentrification, many also worry about the spillover effect of redevelopment and property value increases from adjacent neighborhoods, for example, Wynwood Business Improvement District in the City of Miami. Existing study about the impact of climate gentrification, particularly flooding, is scanty and mostly focuses on parcel-level research on price appreciation. This current study takes a different angle to explore whether neighborhood change relates to elevation and flood exposure.

We use the American Community Survey five-year data for all the block groups in the tri-county South Florida area, Palm Beach County, Broward County, and Miami-Dade County. The selected neighborhood-level and city-level socioeconomic and regulatory variables are combined with the average elevation at the block group level using the Digital Elevation Model (DEM) from the USGS (U.S. Geological Survey) and the flood exposure calculated from the floodplain data from FEMA to measure changes in selected neighborhood characteristics. For example, neighborhood and city-level variables in 2000, 2010, 2020, along with neighborhood elevation and flood exposure, are used to measure changes in certain neighborhood characteristics, such as median household income, housing value, and percentage racial and ethnic minorities from 2000 to 2010, and from 2010 to 2020 (or the latest year the data are available). A Hierarchical Structural Equation Modeling (SEM) system and panel models are used to measure all the change variables.

If our analysis indicates that higher elevation and less flood exposure are significantly related to neighborhood change variables, potential neighborhoods with the most impact will be identified and policy recommendations will

be made to ensure such change would not cause displacement of residents, particularly vulnerable populations such as lower-income minorities and immigrants.

#### **COMMUNITY RESILIENCY PLAN PRIORITIES FOR FOUR SAN FERNANDO VALLEY NEIGHBORHOODS: SIMILAR NATURAL HAZARDS AND DIFFERENT SOCIOECONOMIC STATUS AND ENVIRONMENTAL (IN)JUSTICE ISSUES.**

Abstract ID: 218

Abstract within Pre-Organized Session 8

OLWERT, Craig [California State University, Northridge] [craig.olwert@csun.edu](mailto:craig.olwert@csun.edu), presenting author

TOKER, Zeynep [California State University, Northridge] [zeynep.toker@csun.edu](mailto:zeynep.toker@csun.edu), co-author

Resilience plans have received increased attention and development to address the ability of neighborhoods to bounce back from shocks and stresses (Meerow and Pajouhesh, 2019). A funding program, launched by the Rockefeller Foundation in 2013, entitled “100 Resilient Cities,” has been instrumental in expanding the concept of community resilience planning to include social and economic concerns as well as environmental ones (Fainstein, 2018; Boswell, Greve and Seale, 2019).

Environmental (In)Justice recognizes that the poor and people of color have greater exposure to pollution and high-risk natural disaster areas (Fitzgibbons and Mitchell, 2019). To counterbalance these negative positions, policies to prevent new pollution sources and reduce current ones have been discussed and implemented (such as California Senate Bill 535 which has one-quarter of the Greenhouse Gas Reduction Funds focused on projects to reduce pollution in disadvantaged communities).

Neighborhood resilience plans have been developed as professional projects by the Masters of Urban Planning students for four San Fernando Valley (Los Angeles, California) neighborhoods. The methodology used to develop the plans was consistent between the plans and focused on communicative methods to maximize neighborhood feedback.

The four neighborhoods experience similar risks due to climate change and natural hazards: earthquakes, wildfires, flooding and heat. They differ in their exposure to air pollutants and other man-made pollution. The socioeconomic status also differs among these four neighborhoods, which will be discussed to highlight the issues of environmental (in)justice. The study will present the background of the neighborhoods and their risks. Then it will compare the types of recommendations preferred by the neighborhoods to be included in their resilience plans.

WON, Jaewoong [Kyung Hee University] jwon@khu.ac.kr, co-author

Floods are the most common natural disaster, which counts almost 75 percent of declared disasters in the United States (Montano & Savitt, 2018). The United States Geological Survey (USGS) reports 36 significant flood events in the US since 2011—four events per year on average. Major hurricanes caused the eight most recent flood events—Hurricane Dorian in 2019, Hurricanes Michael and Florence in 2018, and Hurricanes Nate, Maria, Jose, Irma, and Harvey in 2017. All resulted in devastating environmental, socio-demographic, and economic damages in southern coastal regions. The trajectory of damages compounds in the economically disadvantaged communities due to the limited resources.

Social and racial vulnerability (Fussell & Harris, 2014; Cutter, Boruff, & Shirley, 2003) and the resilience to disasters (Boon, 2014; Cox & Perry, 2011) are well researched. Researchers emphasize the social capital and a sense of place for community resilience in disaster-prone areas (Boon, 2014; Cox & Perry, 2011; Laurien et al., 2020). As a result, the social network has been mentioned as a critical response and recovery strategy (Karunaratne & Lee, 2020; Varda, 2017). Another focus is on government responses to a natural disaster (Howell & Elliott, 2018, 2019). Researchers heavily criticized the unequal distributions of disaster recovery funds for the socially vulnerable population (Howell & Elliott, 2018, 2019; Muñoz & Tate, 2016). As Howell and Elliott (2019) state, "the more funds areas receive from FEMA, the more this wealth inequality increases, (p. 450)" there seems a deeply rooted fracture in the system. However, the literature is discrete with mostly case-studies. A comprehensive analysis is needed.

The US Federal Emergency Management Agency (FEMA) assists individuals, households, and organizations after a natural disaster for recovery. Since properties are a major factor in the increasing costs of floods, FEMA provides housing assistance by the National Flood Insurance Program (NFIP) and the Individuals and Households Program (IHP). Although the size of NFIP assistance is massive (the total coverage of NFIP policies in 2020 was \$1.3 Trillion according to FEMA.gov), the program's beneficiary is limited to the household with flood insurance. Likely, the most needed population doesn't hold flood insurance unless required by a lender. On the other hand, IHP covers the housing needs of anyone whose damages—basic needs—are not covered by insurance or by other sources. In this research, we will focus on the homeowner and renter housing assistances under IHP.

This research has a hypothesis: *The FEMA flood housing assistance in the US southern coastal communities has distributed unequally in terms of race and economic means when environmental or disaster-induced factors are controlled*. The hypothesis will be tested by developing a model that consists of various socio-economic (race, education, and household income), housing (housing type and homeownership), ecological (elevation, vegetation, and floodplain), and disaster-induced damage factors in the area. We will conduct a series of spatial data analyses

(GIS analysis) by utilizing secondary data from the FEMA, US Census, and USGS.

The coastal communities in the US Southern States—e.g., Texas, Louisiana, Florida, South Carolina, and North Carolina—will be examined by the zip-code as the unit of analysis. FEMA IHP homeowner and renter assistance data with major flood events in recent years will be compiled. US Census and USGS data will be further added into the GIS system to run the spatial statistics for modeling. The findings will reveal the spatial patterns of injustice and key drivers in FEMA aids.

#### **4.30 PRE-ORGANIZED SESSION - RESPONDING TO CLIMATE INDUCED DISPLACEMENT AS A PATHWAY TO CLIMATE JUSTICE**

Pre-Organized Session 30 - Summary

Session Includes 139, 140, 141, 142, 143

BUTLER, William [Florida State University] [wbutler@fsu.edu](mailto:wbutler@fsu.edu), organizer

This panel brings together researchers to examine climate induced displacement and to construct pathways to climate justice. Climate change impacts have the potential to drive displacement and climate migration in multiple ways. Direct displacement is often linked to hazard exposure and vulnerability. Indirect displacement may come as hazard impacted communities and households seek new places to settle, some inevitably locating in areas that are already established communities. Climate gentrification literature hypothesizes that some lower income communities, especially communities of color in safer areas (often higher ground), will be under pressure from increased interest and investment, driving out low-income residents as property values increase and gentrification follows. The heaviest burden of displacement will fall on lower income residents who can least afford relocation. We propose to examine the extent to which these phenomena are occurring, how planning and policy strategies can slow direct and indirect displacement, and how to orient toward greater equity and justice as we face the climate change crisis.

#### Objectives:

- Examine drivers of displacement related to climate change and how different actors are responding to these drivers to minimize displacement outcomes.

#### **CLIMATE IMAGINED? DIFFERENTIATING GENTRIFICATION, GREEN GENTRIFICATION, AND CLIMATE GENTRIFICATION**

BUTLER, William [Florida State University] wbutler@fsu.edu, co-author  
HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, co-author  
MILORDIS, Anthony [Florida State University] acm11h@my.fsu.edu, co-author

“Climate gentrification” is the new turn of phrase used to highlight the disproportionate impacts of climate change on low-income populations of color. The global community turned its attention to climate justice identifying the ongoing and future disproportionate impacts of climate change on small and developing nation economies, livelihoods, and lands. The pivot to climate gentrification adds nuance by examining displacement of lower income populations of color as communities undergo neighborhood change and property values rise due to green or grey climate infrastructure investments and/or land speculation in higher elevation areas in flood prone cities. “Climate gentrification” gained traction in the late 2010s and can be traced to media and scholarly work in Miami, Florida with expanding applications in Louisiana, New York, Texas and others. Scholars have not settled on this term as some use “resilience gentrification” or “low carbon gentrification” with similar meaning.

Climate gentrification is an under-researched concept that is early in its development and does not yet make the connections between green gentrification and climate adaptation pathways to displacement. The key hypotheses associated with climate gentrification are multi-faceted, but the central idea is that land values will rise as risks associated with climate impacts fall. Climate adaptation investments that increase protections from flooding can make nearby lands more attractive. Investments in parks, tree planting, walkability, and mass transit as low-carbon transition strategies might also increase real estate values on nearby properties. Small and large redevelopment projects that upgrade housing stock and commercial districts in low income neighborhoods on higher ground to avoid future coastal flooding from sea level rise might also shift lower value properties to higher value properties. In all of these cases, the theorized dynamics are the same—as property values rise, existing residents are displaced either voluntarily (e.g. selling land if they own) or involuntarily (e.g. being evicted by new land owners as property developers convert low-income rentals to higher value uses).

We develop a literature review that first lays out how residential displacement is defined and measured as a frame for differentiating conventional gentrification, green gentrification and climate induced gentrification, arguing for a clearer analytical distinction. We explore related concepts of green and ecological gentrification which postulate that displacement can occur with investments by “greening” neighborhoods or restoring environmental amenities, such as parks, trails, greenways, and infrastructure for alternative modes of transportation, which can attract new residents, sometimes displacing longer term lower income residents. We connect these ideas to the concept of climate gentrification to examine dynamics that illustrate the linkages, interconnectedness and distinctions between gentrification, green gentrification and climate induced gentrification that may result in similar impacts of displacing low-income communities of color, further exacerbating existing inequalities. We explore the merits of these ideas and problematize analysis conducted in this domain thus far.

While there is merit to this theoretical conceptualization of the phenomenon, there is a need to evaluate the underlying dynamics and drivers of gentrification to determine how and whether displacement of lower income populations of color is driven by climate induced investments, or are other drivers responsible for residential displacement. We problematize the growing use of the term “climate gentrification” and seek to sort out what this adds to the discourse about climate change, displacement, and justice. We focus on housing policy and affordable housing as a lens through which to view this phenomenon in contrast to the usual orientation to real estate and land values. We explore how housing policy can be a useful intervention to reduce displacement pressures of low-income households (those least capable of moving) regardless of the drivers of displacement.

HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, presenting author

BUTLER, William [Florida State University] wbutler@fsu.edu, co-author

JACKSON, April [Florida State University] ajackson5@fsu.edu, co-author

Sea level rise threatens to reshape life on the Florida coast. Higher elevation neighborhoods may become gentrification hotspots through speculation and permissive development incentives for migrating coastal populations facing eventual retreat (Keenan et al. 2018). The process of inland retreat may also lead to secondary displacement of long-term residents as the pressures of gentrification, investment and development take hold, particularly in lower income communities of color (Angelouovski et al. 2019). While there is growing attention to the potentials for mass migration and retreat from the coast (de Koning et al. 2020; Hauer et al. 2020), there is limited empirical analysis of the spatial dynamics of displacement related to sea level rise and the planning mechanisms in place to manage impending neighborhood change in higher elevation communities (McAlpine et al. 2018).

We employ a multi-staged research design to explore how major urban centers in Florida are planning for and developing policies to address the disproportionate impacts that marginalized communities are likely to experience due to rising sea levels. The three stages of the research methodology include 1) mapping of displacement risk indicators, 2) a modified network of plans policy analysis, and 3) semi-structured interviews conducted with key actors in Miami-Dade County/Miami, Duval County/Jacksonville, Pinellas County/Tampa Bay regions. We identified (1) specific municipalities where the risks of inundation have the potential to lead to displacement of low income households directly as well as displacement of higher income households to lower income neighborhoods on higher ground triggering a secondary round of displacement of lower income households; (2) strategies, projects, and policies that aim to address displacement pressures, provide affordable housing, and account for marginalized populations in the process of managed retreat to higher elevation neighborhoods and (3) perspectives on planning responses and potential for displacement in the near horizon from housing specialists, resilience officers and community advocates in these counties.

Our spatial analysis reveals that in each region, census block groups with high displacement risk were characterized as having lower education attainment levels, high renter populations, high Hispanic and/or African American populations, high levels of poverty, high eviction rates, more single parent households, and lower school and job proficiency rates. Some areas of high displacement risk also correlated with planning designated boundaries such as opportunity zones and community redevelopment areas.

Through the plan analysis, we identify disconnects between policies concerned about the effects of sea level rise and housing protection policies used to manage neighborhood change and prevent displacement. However, this disconnect is not insurmountable, as actors acknowledged the need to break down silos and focus on integrated

and intersectoral approaches to address climate change risks with an explicit focus on the equity outcomes of policies and decisions.

Local variations across the three cases emerge as divergences in the salience of climate displacement perceptions and responses. In Miami-Dade, areas that are primed for potential displacement are explicitly identified as inland communities of color which are already undergoing neighborhood change. In Tampa Bay-Pinellas, planners are in the process of understanding the vulnerabilities related to sea level rise, sources of affordable housing stock and identifying potential areas where primary and secondary displacement may occur. In Jacksonville-Duval, community advocacy organizations are leading the charge in sounding the alarm, with limited engagement with public agencies.

This paper advocates for anticipatory adaptation planning and proactive examination of climate planning and housing policies focused on anti-displacement strategies to identify gaps in coverage and opportunities to promote greater equity and address the risks associated with first order and second order displacement before these coastal urban centers have no more tales to tell.

## THE GREAT CLIMATE MIGRATION OF THE 2030S AND ON: PREPARING RECEIVING AREAS FOR JUST AND SUSTAINABLE TRANSITIONS

Abstract ID: 141

Abstract within Pre-Organized Session 30

HAMIN INFELD, Elisabeth [University of Massachusetts, Amherst] emhamin@larp.umass.edu, presenting author  
RENSKI, Henry [University of Massachusetts, Amherst] hrenski@umass.edu, co-author

Climate disasters, including both fast-onset events like hurricanes and slow-onset events like sea level rise, are creating conditions for mass movement of people from hazardous to safer locations. As many as 13.1 million persons in the U.S. alone could, for example, be at risk of migrating due to a sea level rise of 1.8 m by 2100 (M. Hauer 2017). An increase in extreme heat days may also compel populations to relocate to cooler regions. We can therefore expect to have sending communities, where residents finally leave after experiencing one too many floods, wildfires and extreme heat days, and receiving communities with greater safety. Many inland and cooler urban and peri-urban areas in the U.S. can expect to experience large domestic in-migration in the next decades (Rigaud et al. 2018). As a result, scholars and policy-makers from physical and social sciences have recently identified attending to domestic migration receiving areas as a strong research need. In this paper we synthesize planning-related literature to explore the future of climate-migration receiving areas.

We begin by characterizing the types of in-migration that can be expected, from sending areas' perspectives. Forsyth and Peiser (2021) identify proactive retreat, which moves at-risk whole communities into new locations before an extreme event, and reactive retreat which moves settlements after a hazard; implicit in these is a strong government role in planning change. There is a third force for movement, which we call individual household retreat. In this scenario, government assistance and direction is limited and instead residents, faced with repetitive hazards and perhaps the loss of insurance, individually move. We explore the existing literature projecting how many people will move and where they will go, reviewing existing modeling efforts and identifying gaps. The next section of the paper will explore what is known to date about the role that city and town choices will play in outcomes (e.g., Rigaud et al. 2018). Aspiring post-industrial cities and towns may want to be Climate Refuges or Climate Havens, while other places will hope to pull up the ladder and prevent much influx. Some incomers can be accommodated in New Towns (Forsyth and Peiser 2021), but absent anticipatory policy, most are likely to disperse into suburbs near their old homes or go further into rural areas, creating significant pressure for sprawl, landscape fragmentation and attendant ills. And there are, as always, justice implications as those with less wealth move under more duress and experience harsher outcomes (Anguelovski et al. 2016). These changes suggest some anticipatory principles of what receiving areas ought to do to minimize stress for existing as well as new populations, such as assuring zoning and permitting supports new and affordable housing, scaling human services to meet increasing demand, and using participatory practices and scenario planning to identify paths forward. The article concludes by identifying research needed to ensure as best we can that climate migration creates just and sustainable towns, cities and regions.

Green climate resilient infrastructure is increasingly a key feature of climate adaptation planning, growth-driven neighborhood redevelopment and city branding programs (Anguelovski et al., 2019). Hailed as a win-win and no regrets solution, the health, safety and economic co-benefits of these green interventions are especially emphasized to boost their political salience and financial feasibility. While plans tend to focus on reducing climate risks and impacts through techno-managerial solutions that may exclude alternative politics and desires (Finewood et al., 2019). The drivers of social vulnerability to climate change – historic and ongoing environmental racism and inequitable and unsustainable urban development patterns – are also often ignored (Hardy et al., 2017; Ranganathan & Bratman, 2019). This suggests that green resilient infrastructure (GRI) may actually exacerbate social vulnerability, with lower-income residents and communities of color benefitting least from climate protection through their dispossession and displacement. Recent studies have begun to explore this hypothesis, identifying a challenging link between green resilient measures and gentrification processes that reconfigure, but do not necessarily eliminate, climate insecurities (Shokry et al., 2020). What remains underexplored, however, is the role of neighborhood contextual factors, such as neighborhood (re)development efforts and social support resources, in either advancing sensitivity to gentrification and displacement, or conversely, strengthening adaptive capacity in the face of it. In this presentation, we will discuss findings from a mixed spatial quantitative and qualitative study that examines the extent to which planned and recent GRI may be associated with possible future climate gentrification. To what extent are recent and proposed green climate resilient infrastructure being sited in neighborhoods vulnerable to future gentrification – those less likely to be inhabited by socially vulnerable residents in the future – and which neighborhood contextual factors are most associated with this vulnerability? Philadelphia is a forerunner among cities worldwide for its expansive green stormwater infrastructure program, which was integrated into a local climate adaptation planning framework in 2015. The city also created a heat relief plan in 2018 featuring GRI as a means for reducing heat vulnerability in highly exposed neighborhoods. Other cities are attempting similar programs to mitigate stormwater surges, flooding and heat island effects. Our paper therefore assesses multiple overlapping and intersectional factors in generating vulnerability and resilience to future climate gentrification by analyzing both spatial quantitative trends and qualitative interviews conducted in Philadelphia with relevant activists, non-profits, planners and policy makers. We develop a novel methodological approach by first identifying the statistically significant clusters of all variables (e.g., redevelopment certificates, historic districts, affordable housing and community based organizations) that we theorize to contribute to vulnerability to gentrification (i.e., a combination of exposure, sensitivity and adaptive capacity) and, in a second step, compare the current and planned GRI in each census tract to its spatial overlap with vulnerability to gentrification clusters. Lastly, we discuss our results in relation to respondents’ perceptions of green climate gentrification and how two socially vulnerable neighborhoods are confronting displacement pressures. Findings suggest that residents face a perpetual double insecurity and displacement risk – one by climate risks and impacts and the other by future climate gentrification via resilience interventions. The paper therefore contributes to debates on the equivocal role of greening and urban planning in climate justice and injustice dynamics by offering an example of how to mobilize and theorize vulnerability to future climate gentrification as cities adapt to and provide protection against climate risks and impacts.

## LEARNING FROM SUBNATIONAL BUYOUT PROGRAMS: PURSUING EQUITABLE RESPONSES TO INEQUITABLE FLOOD RISK

Abstract ID: 143

Abstract within Pre-Organized Session 30

SHI, Linda [Cornell University] ls886@cornell.edu, presenting author  
 FISHER, Anjali [Cornell University] arf98@cornell.edu, co-author  
 MORGENSTERN BRENNER, Rebecca [Cornell University] rjm478@cornell.edu, co-author  
 GREINER SAFI, Amelia [Cornell University] alg52@cornell.edu, co-author  
 VANUCCHI, Jamie [Cornell University] jlv29@cornell.edu, co-author  
 SHEPARD, Christine [The Nature Conservancy] cshepard@tnc.org, co-author

Climate-exacerbated flooding has renewed interest in home buyouts as a pillar of managed retreat from coastal zones and floodplains. However, federal programs funded by the Federal Emergency Management Agency (FEMA), Department of Housing and Urban Development (HUD), and the U.S. Department of Agriculture (USDA) have drawn criticism for being inequitable and insensitive (Howell & Elliott, 2018, 2019; Mach et al. 2019; Siders 2018). In response, we study the country's largest and most sustained state, county, and local buyout programs in New Jersey, Washington State, Charlotte-Mecklenburg County (North Carolina), and Harris County and the City of Austin (Texas) to understand the extent to which they offer alternative approaches that can inform federal reforms or subnational program expansion.

We contrast the literature's criticisms of buyout programs with programs' goals, objectives, operational strategies, funding, and evaluations metrics to consider how they frame issues of social well-being and fairness, which types of social concerns their strategies respond to, and what innovations they have developed as compared to federal programs. Interviews with program managers and field staff asked: How and why do these programs frame and operationalize goals for human well-being and fairness as they do? What challenges do they confront in expanding the social equity and justice of their programs? Focus groups with managers, case workers, and external stakeholders asked: What possible pathways point towards greater equity in floodplain risk management?

Findings to date suggest that these programs have developed strategies to address key limitations of the federal buyout funding programs. Programs with local sources of funding (such as utility or property taxes) are especially able to develop criteria and processes that center residents' experience. These include larger compensation packages to help afford a comparable replacement home locally, a longer period during which buyouts can occur, and investment in trained staff to work directly with residents. These innovations can be incorporated into federal programs. Despite this more sensitive approach, however, subnational programs similarly struggle with addressing the underlying drivers of inequitable floodplain risk and post-relocation inequity. Key barriers programs face in improving equity outcomes include: (a) the limited purview, capacity, and downstream role of stormwater and public works agencies charged with buyout work; and (b) the narrow metrics used to determine costs and benefits of buyouts, which focus on a snapshot of the buyout parcel rather than the social after-effects of relocation, remaining households who were not bought out, surrounding neighborhoods that rapidly gentrify with the addition of new recreation trails and green amenities, and historic inequities in flood infrastructure investment.

On the one hand, these findings suggest opportunities to learn from subnational buyout programs. Since only wealthier states and cities can afford such supplemental funding, federal reforms that incorporate local and state experiments are essential to assure more widespread improvement of experiences. On the other hand, they suggest

how efforts to improve the equity of buyout programs too narrowly construe the basis of the equity problem, which lies in the area of housing construction regulations and permitting, volume of affordable housing production on higher ground, housing assistance policies, and tax and development incentives. So long as buyout programs (local, state, or federal) are framed only as flood risk and infrastructure responsibilities, they will only be able to narrowly address the issue of fairness and reparative justice for disadvantaged households living in floodplains. This suggests the need to structure programs that integrally address floodplain health, regional affordable housing production, and socio-ecological relationships between human and environmental well-being.

#### **4.31 PRE-ORGANIZED SESSION - RESPONDING TO CLIMATE INDUCED DISPLACEMENT AS A PATHWAY TO CLIMATE JUSTICE**

Pre-Organized Session 31 - Summary

Session Includes 144, 145, 146, 147, 148

BUTLER, William [Florida State University] [wbutler@fsu.edu](mailto:wbutler@fsu.edu), organizer

This is the second of two panels on this topic. This panel brings together researchers to examine climate induced displacement and to construct pathways to climate justice. Climate change impacts have the potential to drive displacement and climate migration in multiple ways. Direct displacement is often linked to hazard exposure and vulnerability. Indirect displacement may come as hazard impacted communities and households seek new places to settle, some inevitably locating in areas that are already established communities. This can cause cascading cycles of displacement. In this panel, we propose to examine not only the extent to which these phenomena are occurring, but also how planning and policy strategies can be used to slow both direct and indirect displacement. We focus on housing responses related to evictions and recovery and the disproportionate impacts that lower income communities face in the context of climate change impacts.

#### Objectives:

- Examine drivers of displacement related to climate change and how different actors are responding to these drivers to minimize displacement outcomes.

#### **PUERTO RICO'S REPAIR, RECONSTRUCTION, OR RELOCATION PROGRAM (R3): CONCERNS AND RECOMMENDATIONS**

Abstract ID: 144

Abstract within Pre-Organized Session 31

GARCIA, Ivis [University of Utah] [ivis.garcia@utah.edu](mailto:ivis.garcia@utah.edu), presenting author

The 2017 Hurricane Maria damaged over 300,000 homes out of 1 million in Puerto Rico, and three years after, there still 30,000 people living under blue tarps. In 2019, with federal funds, Puerto Rico's Housing Department started its "Repair, Reconstruction, or Relocation Program" (R3 program) to help those whose FEMA assistance proof to be short or were disqualified. This study explores through the use of publicly available data from the R3 program, over two dozen documents, 20 interviews, and over 50 meeting conversations for over several years the regulations of the program. The article seeks to understand (1) what the concerns raised by advocates and grassroots organizations about the R3 program are? and, (2) how the R3 program compares to other relocation programs? Although there is a number of studies from different fields on buy-out programs, the planning field is still limited in its understanding of voluntary home buyouts due to extreme weather events, and this article seeks to fill that gap.

This article explores three specific policies that have raised some concerns. The first policy explored is that the program does not allow in-situ elevation. The study finds that advocates have criticized this policy because it promotes the relocation of program beneficiaries instead of on-site reconstruction. Although most buyout programs in the US are used for mitigation purposes (e.g., raising a home or employing other techniques that make people more resilient or relocating them) if they lived in a flood zone or landslide areas, this study finds that most people living in a risk area have been denied. This is because the program targets those who have suffered severe damages, and they belong to a prioritized vulnerable group (e.g., older adults, people with disabilities). Usually, the state would prioritize the communities at most risk (using FEMA flood map or landslides) and draw a boundary for those who can participate from the buyout, but in Puerto Rico is mainly based on need (policy two). Finally, in other buyout programs (third policy explored), communities would self-organize through a participatory process to say they would like to be part of the buyout. However, in Puerto Rico, individuals apply with little to no conversations at the community level about the program and what it entails.

#### PREVENTING EVICTIONS AFTER DISASTERS: THE ROLE OF LANDLORD-TENANT LAW

Abstract ID: 145

Abstract within Pre-Organized Session 31

RAYMOND, Elora [Georgia Institute of Technology] [elora.raymond@design.gatech.edu](mailto:elora.raymond@design.gatech.edu), presenting author  
 GREEN, Tim [Clemson University] [tgreen8@clemson.edu](mailto:tgreen8@clemson.edu), co-author  
 KAMINSKI, Molly [City of Charlotte] [mkamin@g.clemson.edu](mailto:mkamin@g.clemson.edu), co-author

Extreme weather events will become more common as climate change accelerates. Disaster researchers have asked for a more detailed understanding of how residents experience housing distress and/or relocate following disasters, arguing that these decisions and processes unfold over long timeframes, and are embedded in local institutions and

contexts (Elliott & Pais, 2006). The existing literature on the operations of housing systems following disasters establishes that many of the conditions associated with evictions: property damage, renovations, and disruption to wages, are commonly present in rental housing and rental households in the year following a disaster (Esnard & Sapat, 2014). In this research we ask (1) whether evictions rise during the disaster recovery period, and (2) whether increases in post-disaster evictions are affected by state legal frameworks.

Forced moves through an evictions process are associated with a series of negative outcomes for households and families. These include homelessness spells; worsening neighborhood quality followed by a series of relocations, long-term losses in household wealth, and increases in stress-related illnesses. If a household must relocate in the year following a natural disaster, an eviction process is arguably one of the worst ways by which relocation can happen. If evictions are an important process governing the post-disaster trajectory of socioeconomically vulnerable households, preventing eviction should be a key part of disaster recovery.

In this research, we examine whether evictions rise after extreme weather events, and if state-level statutory protections have any effect on rising evictions following a disaster. We measure the rise in eviction rates after extreme storms and flooding events in five states: South Carolina (Hurricane Joaquin, 2015), Southern Alabama, including the Mobile and Montgomery regions; the panhandle of Florida, including the Pensacola and Panama City regions (flooding events of April, 2014), and the New Haven, Connecticut region (Hurricane Sandy, 2012). Applying state-landlord tenant law typologies in the literature, we classify these four sites by landlord-tenant regime (Hatch, 2017). Florida is a pro-landlord state with little-to-no tenant protections; Alabama and South Carolina have tenant protections mixed with landlord protections, and Connecticut has strong tenant protections without landlord protections. We compare the rise in eviction rates between disaster-affected areas and neighborhoods in adjacent, unaffected counties.

We find that evictions rise sharply after a disaster, rising by 16% - 42% relative to neighboring areas that were not impacted by the storm. The increase in post-disaster evictions occurred all states with landlord-friendly laws, and the presence or absence of statutory tenant protections did not have a significant effect. In Alabama, South Carolina and Florida, evictions rose sharply in disaster affected areas compared to nearby, unaffected areas. Conversely, in Connecticut, a protectionist state, there was no increase in post-disaster evictions. This finding suggests that a pro-landlord policy environment leads to higher eviction rates, and that individual statutes offering tenant protections present in South Carolina and Alabama are not sufficient to outweigh other factors. Our findings are in line with other research into the importance of legal culture, or state-wide policy environments on eviction outcomes, which suggest that statutory tenant protections do not lead to better outcomes for tenants in places where the broader legal context favors landlord outcomes (Sudeall & Pasciuti, 2021).

#### HOUSING, DISASTER RECOVERY AND DISPLACEMENT IN PUERTO RICO AFTER HURRICANE MARIA

Abstract ID: 146

Abstract within Pre-Organized Session 31

LAMBA-NIEVES, Deepak [Center for a New Economy] deepak@grupocne.org, presenting author  
RAYMOND, Elora [Georgia Institute of Technology] elora.raymond@design.gatech.edu, co-author

CONVILLE, Megan [Georgia Institute of Technology] mconville3@gatech.edu, co-author

Climate change has exacerbated the pace and scale of disasters such as hurricanes. When devastating storms are met with a failed recovery process, many are displaced, especially the most vulnerable, and migration becomes a common strategy or an unchosen reality for households and communities responding to crises (Esnard, 2014). Understanding post disaster mobility, and when and how disasters spur migration, is of increasing importance.

Housing dynamics are a key component of the disaster recovery process. Past research has shown that recovery processes are often directed at restoring private property rather than rebuilding the social fabric and networks that ensure community recovery (Davis, 2005). Moreover, both the legal ability to remain, as well as the pace of reconstruction are affected by housing factors such as clarity of title, tenure (renting/homeownership), housing type, and quality of construction (Peacock et al., 2007).

The Puerto Rican context is characterized by informality in tenure, construction, and infrastructure (Fontáñez Torres, 2020; López et al., 2019), and a recovery process situated within the colonial relationship with the United States (Rivera, 2020). In this research, we investigate the intersections between housing, FEMA recovery programs, and migration. We merge neighborhood level data on Puerto Rico's housing context and from FEMA's individual assistance program with individual data on housing status, displacement and migration following Hurricane Maria.

While we confirm other research findings of increased out-migration from Puerto Rico, our most notable findings are a spike in regional migration in response to the disaster, suggesting reliance on local community support systems in the absence of effective disaster recovery policies. We link internal and external migration patterns to FEMA recovery programs and to housing systems on the island, finding that the dollar amounts of "pending need" — the difference between damage estimates and the amount of assistance disbursed per household — are highly predictive of internal moves, and that the presence of flood and homeowners insurance reduce this internal displacement. Finally, we examine the shift in the pace and composition of in-migration to Puerto Rico in the three-year period following the disaster, showing that migrants to the island were progressively older and more wealthy in the years following the disaster.

## JUSTICE ALONG THE JOURNEY: THE RECEPTION OF CLIMATE DISPLACEMENT HOUSEHOLDS IN THREE RECEIVING COMMUNITIES

Abstract ID: 147

Abstract within Pre-Organized Session 31

MARTIN, Carlos [Urban Institute] cmartin@urban.org, presenting author

Scholarly and policy attention has turned to the environmental vulnerability, demography, and public aid for households and whole communities facing or undergoing climate-related displacement. Yet, we know little about the communities where migrants resettle and how they are received. This paper presents findings from a current mixed-methods study of three "receiving communities:" Houston in relation displaced households from Louisiana following Hurricane Katrina in 2005; Orlando and Puerto Rican settlers after Hurricane Maria in 2017; and the ongoing resettlement north in southeastern Louisiana from repeat flooding, including Isle de Jean Charles residents. Findings cover migrants' perceptions of their welcome (including job discrimination, housing competition, and cultural integration), as well as the qualitative perceptions and quantitative capacity of public-, private-, and civil-sector service providers in the receiving communities to prepare for and integrate the newcomers. The findings also shed light on the generalizable policy and social questions about how communities that are likely receive climate migrants in the future should prepare.

## SEEKING CLIMATE JUSTICE: INTERESTS AND OUTCOMES IN LOUISIANA'S CLIMATE RELOCATION

Abstract ID: 148

Abstract within Pre-Organized Session 31

EHRENFEUCHT, Renia [University of New Mexico] rehrenfeucht@unm.edu, presenting author

NELSON, Marla [University of New Orleans] mnelson@uno.edu, co-author

We need effective climate adaptation policy to assist people who are making difficult decisions about how to adapt to climate change that simultaneously leads to environmentally and socially restorative action (Bronen and Chapin 2013; Maldonado 2014). Coastal planners and residents face imminent adaptation and relocation decisions and there is a dire need for immediate assistance. However, policy outcomes will diverge from stated intent if policy makers do not address contradictory assumptions within current frameworks.

Drawing on 87 interviews with residents and planners working in Terrebonne Parish, Louisiana, and an analysis of the Parish's planning documents, this paper examines how residents and planners are working towards alternative futures that account for coastal land loss, sea level rise, and community change. Although plans and policies increasingly recognize relocation as a coastal adaptation strategy, relocation goals and different programs can be contradictory in ways that reproduce inequitable structures of advantage and disadvantage (Nelson et al 2020; Rivera 2020).

In this paper, we examine two tensions in coastal climate change planning. A contradiction arises in stated planning goals between those that intend to enhance property values through recreational development and camps for fishing, and those that intend to return an area to ecological functions or reduce infrastructure and development to reduce the need to maintain the area for people's use. Our respondents discussed the contradictions that arose when formal planning documents promoted recreation along the coast as relocation programs were considered for their communities. Residents also recognized that oftentimes the recreational users were the only buyers for property, so that they and their neighbors contributed to this cultural shift even as they were adversely affected by it. A second tension arose because existing and proposed programs were based on limited views of property and land claims and they did not reflect the actually existing land tenure relationships. The initiatives assume that properties have a single family ownership structure, and that people are willing to sell their house if they can acquire another. Our respondents however spoke of a range of situations, including but not limited to shared family property ownership, one of multiple owners living on a property who would need assistance to find alternative housing (but would not receive most of the buyout funds), intergenerational property that families were unwilling to sell, and community members having emotional and social ties to neighborhood that was not tied to land ownership. In addition, some residents rent property or owned a house with a long term land lease. These situations created complexity for conventional relocation and adaption programs.

Our paper contributes to planning research and practice by examining how competing interests and divergent outcomes operate in Louisiana's coastal communities. Our interview respondents also spoke about transitions that went beyond buyouts, addressing the ways in which people live, and what would make better sense if they had to move. A second contribution is to consider climate relocation policy through the lens of racial and Indigenous justice movements to show paths to restorative policy frameworks (Biondi 2003; LANDBACK.org).

#### 4.46 PRE-ORGANIZED SESSION - EXTREME HEAT AND CLIMATE JUSTICE

Pre-Organized Session 46 - Summary

Session Includes 336, 506, 507, 508

TURNER, V. Kelly [University of California Los Angeles] vkturner@ucla.edu, organizer

Climate change, in combination with the urban heat island effect, is increasing risks of extreme heat worldwide (Stone & Rodgers, 2001). While other climate hazards garner more media attention in the US, extreme heat is the deadliest (Hondula et al., 2015). It also causes declines in quality of life, increases in mental health and behavioral disorders, declines in economic productivity, and strains water and energy infrastructure and ecosystems. Extreme heat is a climate justice issue with risk inequitably distributed across cities and populations, such as higher heat severity in historically redlined neighborhoods (Hoffman et al. 2020, Wilson 2020). Despite increasing recognition of

the threat extreme heat poses, heat policy and planning remains underdeveloped in comparison to other natural hazards (Keith et al. 2020). An assessment of over 3,500 climate adaptation resources in the U.S. found that only 4% focused on heat (Nordgren et al. 2016) and even fewer consider social justice (Lambrou and Loukaitou-Sideris in press). This session will explore diverse perspectives in the current state and innovations in planning research and practice for extreme heat.

Objectives:

- Attendees will learn the current state and new innovations in planning for extreme heat
- Attendees will learn about how extreme heat is a climate justice issue
- Future directions for extreme heat research will be identified and discussed.

## **ADVANCING EQUITY AND JUSTICE THROUGH PLANNING FOR EXTREME HEAT**

Abstract ID: 336

Abstract within Pre-Organized Session 46

FRENCH, Emma [University of California Los Angeles] emmafrench@ucla.edu, presenting author

Extreme heat presents a significant and growing challenge for communities around the world. In the last 30 years, heat has killed more Americans than any other category of climate-related disaster. Combined, the heat waves in Europe in 2003 and Russia in 2010 caused well over 100,000 excess deaths. Heat disproportionately impacts already vulnerable individuals and communities, making it a clear case of environmental and climate injustice. The COVID-19 pandemic and other public health and ongoing economic crises have worsened the impacts of extreme heat. Those most vulnerable to heat include individuals who are low-income, the elderly, those who work outdoors, those who are part of a racial or ethnic minority or immigrant community, those experiencing homelessness, as well as those with preexisting health conditions. Urban residents are also particularly vulnerable to rising average temperatures and heat waves due to the compounding effects of the urban heat island (UHI) effect. Heat has been broadly recognized as an environmental and climate justice issue by activists, policy makers and scholars like, however, how this understanding is research and practice remains unclear. This paper analyzes how equity is being framed, measured and actualized through a systematic review of empirical research connecting heat vulnerability and planning.

The findings from this study reveal three main trends. First, less than a fifth of the literature connecting heat vulnerability and planning explicitly mentions equity or justice. Second, only a third of the literature that does explicitly mention equity or justice actively centers these concerns in the research. A majority of this literature treats equity as a peripheral concern, emphasizing instead the measurement and mapping of vulnerability without grappling with the connections between social vulnerability and concerns around equity and justice. This approach aligns closely with traditional hazards research and mainstream techno-scientific approaches to climate mitigation and adaptation. Lastly, the literature that does grapple with questions of equity and justice takes a fairly narrow view of these ideas, focusing for the most part on distributive justice, both in terms of uneven exposure and sensitivity, as well as uneven access to resources to cope with heat. While several studies acknowledge the impacts of historically uneven development on current patterns of social and environmental vulnerability, none explicitly discuss the role of colonization in the production of climate change and uneven climate vulnerability, or connect heat equity with growing calls for racial and indigenous justice.

These findings reaffirm the need for greater attention to equity and justice in heat vulnerability research and planning practice. Research has focused on measuring vulnerability and while the concept of vulnerability has expanded in recent decades, surprisingly little attention has been given to how heat equity is defined and experienced locally. While research has found that heat vulnerability mapping has not been used to inform practice, scholarship plays an important role in the construction of analytical frameworks that can influence how planners and policymakers think about climate problems and solutions. Empirical research has affirmed the need for heat

adaptation to address the root causes of social vulnerabilities in order to address (rather than worsen) social inequities. Policy-oriented research is also needed to help us better understand the trade-offs associated with ecosystem services and different approaches to addressing heat. In order to advance equity and justice in heat planning, researchers need to ground our questions and recommendations in the experiences and needs of those most impacted by climate change and communicate and present our work and findings in ways that make it accessible and useful to those doing the work of planning and adapting on the ground.

#### FRAMING URBAN HEAT GOVERNANCE THROUGH FIVE CASE STUDIES

Abstract ID: 506

Abstract within Pre-Organized Session 46

KEITH, Ladd [University of Arizona] [ladd@arizona.edu](mailto:ladd@arizona.edu), presenting author

SCHMIDT, Erika [University of Arizona] [erikaschmidt@email.arizona.edu](mailto:erikaschmidt@email.arizona.edu), co-author

Extreme heat is an increasing climate risk for cities across the United States (U.S.) due to both the urban heat island (UHI) effect and climate change (Stone & Rodgers, 2001). Extreme heat is the deadliest climate risk in the U.S. and impacts the most vulnerable populations such as children, the elderly, and those with lower income. Historically redlined neighborhoods (Wilson, 2020) and Latinx neighborhoods (Dialesandro, 2021) have higher heat severity than their wealthier and whiter counterparts, making extreme heat a climate justice issue. Urban heat governance, as framed within this study, is the institutions, organizations, decisionmakers, stakeholders, plans, and initiatives that comprise a community’s heat management and heat mitigation efforts. Heat management strategies (e.g., heatwave warnings, cooling centers, utility assistance programs) and heat mitigation strategies (e.g., increased urban vegetation, site design, and land use changes) are both key to address extreme heat risk equitably. Planning and governing studies have identified a need for “more governance capacity” for both heat management and mitigation strategies for increasing extreme heat risks (Keith, Meerow, & Wagner, 2019). Studies also suggest that more collaboration is needed across city departments, levels of government, academic disciplines, and stakeholder groups (Mahlkow & Donner, 2017).

To better understand the current state of urban heat governance and equity implications, we utilized an exploratory multi-case study approach in five U.S. communities, including Baltimore, MD; Detroit, MI; Tucson, AZ; Houston, TX; and Seattle, WA. Case study communities were selected for their climatic and geographic diversity. We first conducted a scoping review that included relevant peer-reviewed papers, government and organizational websites,

media articles, mapping and climate information sources, plans, policies, and other heat-related initiatives. We then conducted semi-structured interviews with five decisionmakers in each community, including an urban planner, hazard mitigation planner, sustainability or resilience director/coordinator, emergency manager, and public health practitioner. Participants were asked about stakeholders and organizations currently working on urban heat initiatives, heat-related plans and policies, risk management and heat mitigation strategies, sources of information used and needed, barriers to action, and opportunities to advance urban heat governance. Interview transcripts were then coded and analyzed for similarities and differences both across and within the disciplines and communities.

Consistent with the literature, study findings confirm that urban heat governance is in its infancy in each case study community with a great deal of diversity and experimentation in how each address extreme heat risk. Participants in each community reported different responsibilities, resources, information sources, plans, and strategies. For example, cooling centers were the responsibility of some community's public health departments, but in others were run by the parks and recreation department. Similarly, information sources such as UHI and vulnerability maps were managed and used by different groups in each community. On a positive note, a majority of participants discussed the equity implications of extreme heat risk in their community. Despite the high awareness of equity implications, participants also reported that siloed approaches to addressing heat vulnerabilities were significant barriers to advancing efforts. Participants across disciplines and communities expressed the desire for more guidance to address extreme heat risk comprehensively. Findings from this study help frame emerging urban heat governance structures and future directions for research and practice.

#### **THE INFLUENCE OF BUILDING AND NEIGHBORHOOD CHARACTERISTICS ON INDOOR AIR TEMPERATURE DURING HEAT EXTREMES IN DETROIT, MICHIGAN; ATLANTA, GEORGIA; AND PHOENIX, ARIZONA**

Abstract ID: 507

Abstract within Pre-Organized Session 46

LARSEN, Larissa [University of Michigan] larissal@umich.edu, presenting author

STONE, Brian [Georgia Institute of Technology] stone@gatech.edu, co-author

The public health threat of exposure to extreme heat is increasing and indoor residential environments are commonly the source of heat exposure that lead to illness or death. Much of the existing research evaluating extreme heat events assumes that outdoor temperatures equal indoor temperatures. At 140 homes in Detroit, Michigan; Atlanta, Georgia; and Phoenix, Arizona, we measured indoor and outdoor air temperatures, collected unit

specific building and neighborhood characteristics, and surveyed residents to determine the presence and use of air conditioning. In our sample, 35% in Detroit, 57% in Atlanta, and 95% in Phoenix used central air conditioning. In Detroit, extreme heat at 5 am was defined as any temperature at or above 25.4 C or 77.7 F (95<sup>th</sup> percentile) and at 5 pm it increased to any temperature at or above 33.1 C or 91.6 F (95<sup>th</sup> percentile). In the Detroit sample, three independent variables significantly impacted indoor temperature at 5 am (masonry, access to air conditioning, and neighborhood tree canopy coverage) and 4 independent variables significantly impacted indoor temperature at 5 pm (masonry, access to air conditioning, distance to Detroit River, and nearby tree canopy coverage). Together, at 5 am, the R<sup>2</sup> of the Detroit regression model explained .75 while at 5 pm, the R<sup>2</sup> of the regression model explained .66. In Atlanta, extreme heat at 5 am was defined as any temperature at or above 25.7 C or 78.3 F (95<sup>th</sup> percentile) and at 5 pm, it increased to any temperature at or above 35.7 C or 96.3 F (95<sup>th</sup> percentile). In the Atlanta sample, two independent variables significantly impacted indoor temperature at 5 am (year of construction and access to air conditioning) and three independent variables significantly impacted indoor temperature at 5 pm (neighborhood tree canopy, nearby tree canopy, and access to air conditioning). At 5 am, homes built between 1940 and 1949 had indoor air temperatures that were 5.94 C warmer compared with homes built either before or after that period. At 5 am, homes accessing air conditioning were 8.53 C cooler and at 5 pm, homes accessing air conditioning were 2.95 C cooler. In the Atlanta sample, at 5 pm, homes with higher tree canopy both nearby (1.77 C) and in the neighborhood (4 C) resulted in significant cooling. Together, at 5 am, the R<sup>2</sup> of the regression model explained .91 while at 5 pm, the R<sup>2</sup> of the regression model explained .93. In Phoenix, extreme heat at 5 am was defined as any temperature at or above 31.1 C or 88 F (95<sup>th</sup> percentile) and at 5 pm, it increased to any temperature at or above 43 C or 109.4 F (95<sup>th</sup> percentile). In our model, at 5 am homes with air conditioning were 4.2 C warmer. No neighborhood or building characteristics significantly altered the indoor temperature at 5 am. At 5 pm, larger homes (at the 75% percentile of the size range) were 2.7 C cooler than smaller homes (at 25% percentile of the size range). Together, at 5 am, the R<sup>2</sup> of the regression model explained .85 while at 5 pm, the R<sup>2</sup> of the regression model explained .80. Unlike most other studies, this research compares the significance of common building and neighborhood characteristics across cities in different climate zones. During extreme heat conditions, residents in each city experienced indoor temperatures that exceeded the safe upper limit of 30.6 C (87 F) and this underscores the need to measure indoor temperatures and not assume that outdoor temperatures are an appropriate proxy for indoor heat exposure.

#### HOUSING AND HEAT VULNERABILITY: LESSONS FROM SAN JOSE, CALIFORNIA

Abstract ID: 508

Abstract within Pre-Organized Session 46

GABBE, Charles [Santa Clara University] cgabbe@scu.edu, presenting author

MALLEN, Evan [Centers for Disease Control and Prevention] mallenevan@gmail.com, co-author

VARNI, Alexander [Santa Clara University] avarni@scu.edu, co-author

A growing body of scholarship examines the causes and consequences of urban heat and can inform planning to reduce vulnerability. This is important because extreme heat is the largest weather-related cause of death in the United States, and it is expected to worsen with climate change. Past research has demonstrated that affordable housing is disproportionately at the intersection of heat and social disadvantage (Gabbe and Pierce, 2020). Relatedly, recent research has indicated that some housing structure types can elevate interior thermal exposure even beyond urban heat island-derived warming in an arid climate (Stone et al., 2021).

Our research analyzes intra-city disparities in heat exposure and adaptive capacity. We answer two questions for San Jose, California. First, how does outdoor temperature vary by housing type? Second, what associations exist between adaptive capacity measures and housing characteristics? We hypothesize that multifamily housing types, particularly those in which low-income residents reside, are in hotter parts of the city and/or have characteristics that hinder adaptation to heat.

Several datasets are created and compiled for answering these questions. We use air temperature measured as part of a NOAA Heat Watch Campaign in summer 2020. We compile a dataset of parcel characteristics based on county assessor data and city of San Jose affordable housing data. We model air conditioning (AC) provision at the parcel level using a method adapted from Gronlund and Berrocal (2020). We compile a tract-level dataset of factors that influence thermal exposure, including socio-economic characteristics, tree canopy, impervious surface, and residential energy efficiency.

Our approach includes a combination of descriptive statistics and spatial regression models. We first present a descriptive analysis of outdoor temperatures, tree canopy, and AC prevalence by housing type. We then specify spatial lag models at the parcel scale to associate heat risk with key housing and neighborhood characteristics. The dependent variable is a measure of heat risk based on Mitchell and Chakraborty (2015). The independent variables include parcel and neighborhood characteristics.

Preliminary descriptive results show that in terms of outdoor heat exposure, the average single-family unit is in a cooler location than the average multifamily one in San Jose. These results are partially explained by San Jose's geography, including the San Francisco Bay's cooling effects; heat trapped in the Coyote Valley at the city's south; and foothills with south-facing aspects resulting in peak afternoon sun exposure. Meanwhile, multifamily housing — and particularly affordable housing — is located in areas with less tree canopy and more impervious surfaces.

We speculate that there are bigger disparities when looking at AC provision, which more directly impacts residents' health due to higher frequency and duration of exposure indoors. Data from the Santa Clara County Housing Authority — which operates 21 public housing developments in San Jose — indicate that 32% of units have central AC; 44% have individual AC units, and 24% have no AC. By comparison, an estimated 42% of all larger multifamily developments in San Jose's climate zone have central AC based on a statewide study. As a next step, we will model AC availability across San Jose by parcel and housing type — and correlate prevalence with socio-demographic and housing characteristics.

Planners and policymakers can reduce residents' heat vulnerability through indoor and outdoor strategies. This paper contributes to planning scholarship and practice by analyzing factors related to heat at a fine spatial scale, and connecting these characteristics to housing by type, tenure, and affordability. While there have been several studies that have used social vulnerability indices, or individual components, to map neighborhood-level vulnerability, there has been limited study focused specifically on housing at the parcel scale.

#### **4.51 PRE-ORGANIZED SESSION - URBAN GOVERNANCE AND WATER ACCESS**

Pre-Organized Session 51 - Summary

Session Includes 231, 232, 233, 269

PIERCE, Gregory [University of California Los Angeles] [gpierce@luskin.ucla.edu](mailto:gpierce@luskin.ucla.edu), organizer

There remains quite a bit of debate around the US and the world regarding forms of urban water governance, their necessary planning supports, and their implications for essential access and livelihood outcomes, especially in light of climate change. Efficiency claims have been challenged and increasing evidence suggests concerns with social equity and environmental protection. This session explores the current state of urban water governance research around the globe. What theoretical perspectives can be used to understand the shift toward privatization, back toward public ownership or hybrid models? What does the empirical evidence suggest regarding efficiency, equity and conservation under different governance structures? Quantitative and case study papers will be presented.

Objectives:

- Interrogating forms of urban water governance and their implications

#### **CITY-LEVEL WATER SYSTEM ARRANGEMENTS IN CALIFORNIA: INFLUENCES AND IMPLICATIONS FOR GOVERNANCE AND PERFORMANCE**

Abstract ID: 231

Abstract within Pre-Organized Session 51

PIERCE, Gregory [University of California Los Angeles] [gpierce@luskin.ucla.edu](mailto:gpierce@luskin.ucla.edu), presenting author

Cities are expected to either directly or indirectly provide basic utility services to their residents, as the proportion of the population residing in cities grows across the globe. The type of provider serving a city has considerable albeit mixed implications for service and non-service outcomes, as shown in the literature on urban water service provision. Some cities directly provide drinking water and other utility services, whereas others contract out these responsibilities, with considerable implications for service and non-service outcomes. There is both a robust literature considering reasons for city versus private providers, as well as a growing number of studies assessing the rise in special district service provision within urban contexts. On the other hand, there are few if any studies assessing these three main provider types jointly, as well as fully accounting for the diversity of institutional arrangements in urban drinking water service.

In this study, we provide empirical evidence to introduce the idea of city-level water service provider arrangements

using a dataset we manually constructed and coded for all 482 cities in California. Our governance analysis shows that while 60% of cities have either city or private providers and 80% with the addition of special district providers, 20% had more than one service provider, and 68% of these cities were also served by more than one system type. Using multivariate regression techniques, we explain additional complexity in the typology of drinking water service providers serving individual cities beyond city and private providers. We find that city incorporation date most profoundly influences the mix of water systems in cities, especially arrangements involving special districts or multiple system types, with implications for performance and affordability. We also present suggestive evidence of differences in water conservation and affordability within cities depending on their water-system arrangements.

Our findings suggest that water system fragmentation is prevalent even within city boundaries, including those served by private systems, and that there is considerable potential for consolidation efforts by proactive city governments. Further research is needed, however, into how historical growth, development, and annexation decisions account for the existing water system arrangements seen in incorporated cities.

### INVESTOR-OWNED UTILITIES IN CALIFORNIA: LOCATION, PERFORMANCE, AND AFFORDABILITY

Abstract ID: 232

Abstract within Pre-Organized Session 51

ONDA, Kyle [University of North Carolina at Chapel Hill] [konda@unc.edu](mailto:konda@unc.edu), presenting author  
TEWARI, Meenu [University of North Carolina] [mtewari@unc.edu](mailto:mtewari@unc.edu), co-author

The privatization of water infrastructure has been controversial regarding performance and equity. This study compares geographic distribution, affordability, leakage, and water quality compliance between public and private utilities in California. Private utilities were found to charge more for water, although not to a degree that could be considered unaffordable on average, while providing more low-income assistance and shutting off fewer customers for nonpayment. Higher rates were also associated with lower leakage rates. This supports the notion that well-regulated private utilities can invest more in asset management by charging more for water than public utilities while protecting lower income customers.

## **SPLINTERED ACCESS AND PLANNING IMPLICATIONS IN HYBRID WATERSCAPES OF THE GLOBAL SOUTH**

Abstract ID: 233

Abstract within Pre-Organized Session 51

SUBRAMANYAM, Nidhi [University of Toronto] ns684@cornell.edu, presenting author

Rapid urbanization across the Global South is generating a growing demand for water. Water policies are emerging to fulfill this demand and to achieve the UN Sustainable Development Goals. In India, water needs are acute in small cities and peri-urban regions that house the urban majority (Subramanyam, 2020). Planning's historical neglect of these geographies has resulted in hybrid waterscapes on the ground, where people access water from multiple infrastructures and sources that are governed by a plethora of actors to cope with intermittent and unreliable municipal water supply (Acey, 2019; Spencer, 2019).

This paper investigates how emerging water policies and infrastructures are transforming the everyday governance of hybrid waterscapes and the experience of socio-environmental inequalities in small cities. In particular, I ask, how are everyday practices of water access and governance, and the exercise of political agency evolving with urbanization and concomitant changes in waterscapes? In what ways do differently situated residents contest the unequal costs of water access in this hybrid waterscape through everyday practices and politics? How do these everyday practices challenge elite-led water infrastructure plans and construct alternative visions for sustainable, water-secure futures in small cities? I examine these questions in the case of Tiruppur, an economically vibrant, growing small city-region in south India. The paper uses primary data gathered using mixed methods, including a participatory action research project involving a monthly water calendar maintained by ninety-four purposively sampled, working class households across Tiruppur. The data from the water calendars, along with a household survey, over fifty interviews with water providers and users, and observational data helped me trace and explain the relationships between the everyday practices and politics of connecting to different water sources and the exercise of political agency in water (and urban) governance in Tiruppur.

My findings reveal that the costs of access to quality water and the exercise of political agency in Tiruppur's hybrid waterscape are highly splintered by users' social and spatial identities. Individualized, quotidian acts of securing water from multiple sources construct different and unique relations between water users and the local state, even among users who are co-located and otherwise similarly marginalized based on their class or caste status. I find that these highly individualized relations of water governance devolve demands for accountability away from the body politic to the individual (cf. Jepson & Brown, 2014). In an urban context where there is little to no organizing outside political society to contest inequalities in service provision (Harriss, 2007; Benjamin, 2008), I argue that these individualized approaches prevent the sustained articulation of collective demands for improvements in city-level public infrastructures, and result in an overall acquiescence to exclusionary forms of water infrastructure planning. Overall, this work contributes to the planning literature on citizen participation and everyday governance in hybrid water markets by showing how political agency is influenced by both the materiality of infrastructure as well as multiple, intersecting social and spatial identities that include local citizenship and tenancy status. I also discuss

methods to measure and theorize the different non-monetary, unaccounted-for-costs of water access under conditions of intermittency and hybridity. The paper concludes with recommendations for just water infrastructure planning that seeks to reduce the costs of water access, advance equity, and foster collective action at various scales within the hybrid waterscapes of water-scarce, small cities like Tiruppur across India.

### **PITTSBURGH'S WATER MOBILIZATION: A CASE OF TRANSLOCAL ACTIVISM AND THE NEW PUBLIC**

Abstract ID: 269

Abstract within Pre-Organized Session 51

GONZALEZ RIVAS, Marcela [Pittsburgh University] [marcela@gspia.pitt.edu](mailto:marcela@gspia.pitt.edu), presenting author

This paper contributes to the water privatization and governance literatures by examining the case of Pittsburgh where renewed efforts of water privatization have emerged after a controversial private management arrangement between the local water authority and Veolia ended abruptly in 2015. We argue that, as the water authority aims to rebuild trust in the community, citizen mobilization has played a key role in hindering further privatizing arrangements and has exerted influence in defining what constitutes the "new public" water in Pittsburgh, by advocating for increased transparency and accountability in governance, infrastructure improvements and protections for low-income residents.

#### **4.61 PRE-ORGANIZED SESSION - ADAPTING TO CLIMATE CHANGE IN COASTAL CONTEXTS: LESSONS FROM FLORIDA RESEARCHERS**

Pre-Organized Session 61 - Summary

Session Includes 520, 521, 522, 523, 524

LINKOUS, Evangeline [University of Southern Florida] elinkous@usf.edu, organizer

Florida is often considered ground zero for climate change impacts in the US. With a highly developed coastline under threat from tropical storms and sea level rise, and the entire state facing increased incidence of excessive heat events, wildfire, and drought, Florida is facing an almost existential crisis if little is done to avert the worst impacts of climate change. However, the policy response in Florida has been limited and incremental, all while population growth and coastal real estate development continue with few signs of slowdown. This panel brings together a group of Florida-based scholars to highlight the breadth of climate change-related issues facing Florida. Papers in this session address changing approaches to local land use planning and hurricane evacuation policies, climate gentrification and neighborhood change, innovations in modeling and community engagement technologies, and emerging strategies for infrastructure planning and finance.

Objectives:

- Present and assess Florida local government policies that respond to climate change
- Highlight the impacts of climate change on Florida community and economic development and infrastructure
- Showcase emerging technologies and strategies for responding to climate change from Florida universities

#### **DENSITY INCREASES IN THE COASTAL HIGH HAZARD AREA: HOW FLORIDA LOCAL GOVERNMENTS REGULATE NEW RESIDENTIAL DEVELOPMENT IN FLOOD ZONES**

Abstract ID: 520

Abstract within Pre-Organized Session 61

LINKOUS, Evangeline [University of South Florida] elinkous@usf.edu, presenting author

This research examines Florida local government policies that address development in the places where people, property, and infrastructure are most at risk from storm surges. Under Florida Statutes, Coastal High Hazard Areas (CHHA) are defined as the area below the elevation of a Category 1 storm surge line and are those places most likely to be significantly damaged or submerged by sea water. Florida requires that local governments designate CHHA areas within the local comprehensive plan and limit CHHA development in accordance with the hurricane evacuation capacities supported by local transportation infrastructure. Although Florida's CHHA rules have changed over time since first adopted as part of the 1985 Growth Management Act, the overall intent has been to limit development in the CHHA for the purpose of maintaining evacuation capacity and minimizing loss related to public infrastructure and other public expenditures (Puszkin-Chevlin & Esnard, 2009).

Many Florida communities have long-established policies prohibiting additional residential density in the CHHA, resulting in zoning codes that are "frozen in time" (Puszkin-Chevlin and Esnard, 2009, 36). This led to concerns about the abilities of some communities to accommodate projected population growth, support economic development, and provide affordable housing. These concerns were amplified following a 2016 update to the Florida Sea, Lake, and Overland Surges from Hurricanes (SLOSH) model used to identify the CHHA. In many communities, the update resulted in a significant expansion of the CHHA, nearly doubling the footprint in some communities and forcing a rethink of areas targeted for growth and redevelopment.

This research provides a survey of Florida local government policies for accommodating residential density in the CHHA. Specifically, it addresses three research questions:

- What are the local government's baseline rules for addressing new density in the CHHA?
- How have requests for additional density in the CHHA been decided over the last decade?
- What changes to the CHHA density rules have been considered or adopted since the 2016 update?

The research includes three phases. In phase one, a survey of local government comprehensive plans that include Coastal Management Elements will be conducted to identify policies for addressing new density in the CHHA. Policies will be analyzed to identify major approaches, such as those that strictly limit new density, those that incorporate incentives such as transferable development rights that direct density to specific areas, and those that use criteria such as building code or hurricane evacuation standards to permit density increases.

In phase two, case studies of at least four Florida communities will be developed to examine how requests for additional density in the CHHA have been decided over the last decade and to identify CHHA density rule changes that have been proposed or adopted. The case study research will include interviews with key stakeholders, a review of relevant planning decision meeting minutes, and analysis of local media coverage.

I have currently prepared a database of density policies in the CHHA for Tampa Bay area communities and am actively working with a graduate research assistant to extend this work statewide. I have also developed a case study of the City of St. Petersburg, which faced a 41% increase in the CHHA following the 2016 model update which resulted in text amendments to their Comprehensive Plan in 2020 that shifted from a strict prohibition of new development in the CHHA to a criteria-based project evaluation approach.

The research will provide information about best practices in addressing density in flood prone areas. Florida's experiences provide instructive lessons on the balancing act involved between protecting human lives and public assets, preventing climate gentrification, and accommodating demand for housing and redevelopment near existing urban infrastructure.

#### **DEALING WITH CLIMATE GENTRIFICATION: HOLDING BACK THE WATER AND STABILIZING NEIGHBORHOODS TO ADDRESS THE DUAL CRISES OF SEA LEVEL RISE AND AFFORDABLE HOUSING SHORTAGE IN FLORIDA**

Abstract ID: 521

Abstract within Pre-Organized Session 61

BUTLER, William [Florida State University] wbutler@fsu.edu, presenting author

Florida is often considered ground zero for sea level rise (SLR) impacts in the United States. With extreme scenarios predicting sea levels at 2.5 meters above year 2000 levels by 2100, Florida's low-lying coastal cities and counties are facing an existential threat. And yet, development continues unabated as municipalities invest in infrastructure upgrades to keep the water out.

Despite this persistent focus on protecting the coastline, some inland and higher elevation areas of Florida are becoming targets for redevelopment. This trend is increasing property values and threatens displacement of some inland residents in a process called "climate gentrification." While scholars have been identifying the potential for inland migration for years, less attention has been paid to whether displacement from the coast will lead to cascading displacement.

This paper examines planning efforts to address the risks of first order displacement from the coast and mitigate second order displacement in low-income inland communities on higher ground. We selected the three most populous coastal areas in Florida for the study—Jacksonville, Duval County; Miami, Dade County; and Tampa Bay, Pinellas County. The project includes mapping, policy analysis, and interviews to address the research question: How are Florida communities responding to the risks of displacement from high cost coastal properties and the pressure of increasing displacement risks in higher elevation but often lower cost neighborhoods further inland?

First, we mapped the vulnerability of coastal areas to SLR inundation at 3 feet of SLR, a generally accepted level for planning purposes, and characterized the demographics of the population likely to be displaced. We also mapped a range of demographic and housing market factors to locate inland lower income neighborhoods that might be vulnerable to gentrification. The mapping exercise allowed us to select neighborhoods to focus on for deeper analysis. Second, we undertook a policy analysis that included a network of plans approach. We used a scoring mechanism to determine: 1) what level of protection is offered neighborhoods along the coast including strategies to reduce SLR impacts and slow coastal inundation, and 2) what level of protection of affordable housing and neighborhood stabilization is provided by plans that guide housing policies in inland neighborhoods at greatest risk of gentrification. Finally, we interviewed housing specialists, resilience officers, and community advocates in the three counties to determine the extent to which key policy actors are attempting to anticipate and respond to these threats and whether policies are being effectively implemented to curb displacement risks.

From the mapping exercise, we see a convergence of inland gentrification risk and targeted redevelopment investment through Community Redevelopment Agencies and Opportunity Zones. This suggests a commitment to target neighborhood investment, but not necessarily to minimize displacement. From our policy analysis, we find high variability across neighborhoods and counties in the application of SLR protections and affordable housing preservation strategies. County and regional plans play an outsize role in addressing SLR while municipal plans vary greatly in their commitment to SLR protection. Affordable housing protections are uneven across the cases as well, but county, municipal, and CRA plans all have language that lays a foundation for protection. Despite what is on the books, our interviews with planners and housing advocates suggest that they are struggling to stay ahead of the threats and unable to sufficiently protect affordable housing and reduce displacement pressures on low-income households who are least able to afford relocation.

This paper advocates for anticipatory planning and proactive examination of climate resilience and anti-gentrification housing policies to identify gaps and opportunities to equitably address the risks associated with displacement before coastal cities and neighborhoods have run out of time and land.

## **TOWARD RESILIENT COASTLINES AND TRANSPORTATION INFRASTRUCTURE**

Abstract ID: 522

Abstract within Pre-Organized Session 61

HOERMANN, Serena [Florida Atlantic University] shoermann@fau.edu, presenting author

MITSOVA, Diana [Florida Atlantic University] dmitsova@fau.edu, co-author

RENNE, John [Florida Atlantic University] jrenne@fau.edu, primary author

This presentation reports the results of two coastal resilience studies. The first explores the use of immersive technologies to visualize sea-level rise impacts on transportation infrastructure. The second examines the role of natural, green, and integrated infrastructure in shoreline stabilization.

Sea-level rise impacts threaten urban mobility, a vital component of community resilience (Sun et al, 2020). Local government officials, including transportation planners, usually rely on two-dimensional (2D) visualizations, including charts and GIS-generated maps, to convey future sea-level rise (SLR) scenarios to coastal communities. However, three-dimensional (3D), immersive visualization technologies such as virtual reality (VR) allow participants to “identify and locate themselves” in planning for flood-risk management (Wang et al., 2019, p. 8). For this study, the research team designed, built and tested immersive models as a public engagement tool in planning for projected SLR impacts on transportation infrastructure. Using a quasi-experimental design, the study compares 2D representations versus 3D VR models to educate stakeholders about potential SLR impacts in community meeting settings in Fort Lauderdale, Florida. VR technology proved effective in increasing participants’ self-reported understanding of SLR. The study also found evidence that the VR experience could (1) overcome bias typically associated with political identity and (2) overcome limited understanding of complex spatial concepts, as manifested in the many participants reporting that VR provided new information although the SLR data presented in 2D and 3D was the same.

Coastal ecosystems play a critical role in shoreline protection and flood risk reduction (Chang et al., 2018; Kurth et al., 2020). As the concern about the impacts of coastal armoring grows, coastal communities seek to invest in adaptive and alternative strategies to protect developed shorelines and coastal ecosystems against stressors caused by climate change and coastal development (Smith et al., 2018). The green infrastructure approach offers an array of alternative solutions to flooding risk and erosion hazards. This outline of a methodology at a landscape scale links a proposed framework of generic shoreline stabilization project types to a cumulative exposure index considering non-storm and storm conditions. The proposed approach integrates coastal engineering modeling, geospatial analysis, and expert opinion elicitation to identify potentially high-risk areas and areas suitable areas for alternative shoreline stabilization. Specifically, the multicriteria analysis combines a typology of generic shoreline stabilization options with a GIS-based shoreline exposure index and expert-derived parameter weights. Working in close collaboration with The Nature Conservancy and Monroe County, Florida, an application of the proposed framework to the Florida Keys' developed shorelines illustrates the approach. The study results are incorporated into a web application to support the coastal resilience efforts in the Florida Keys (<http://maps.coastalresilience.org/seflorida/#>).

Hurricane Maria, a category 4 tropical cyclone, hit the US non-incorporated territory of Puerto Rico on September 20, 2017. Widespread physical and natural infrastructure damage was observed, especially in already vulnerable coastal communities. As public sector funding availability for natural infrastructure (ex. coastal ecosystems) increases, mechanisms for its efficient and equitable allocation are lacking. An accessible and replicable coastal vulnerability indicator framework is presented to assist state and federal policy makers in the allocation of funding for coastal natural infrastructure recovery. To assess funding prioritization gaps and test the applicability of the proposed framework, spatial patterns in the estimated funding need identified in state-led post-Hurricane Maria assessments for natural infrastructure rehabilitation efforts were compared to physical and social coastal vulnerability estimations. Three main challenges that emerge during the implementation of a vulnerability indicator framework were considered for its design: 1) the compressed time frame in which decisions are made after an extreme weather event, 2) the availability of data to calculate indicators in a reduced time frame, and 3) the accessibility of results to a broad variety of stakeholders. We propose a vulnerability indicator framework that can become operational in a relatively short period of time, attempts to simplify data gathering efforts, and uses

methods that aim to be more transparent and understandable to a broad group of stakeholders.

#### **GETTING TO RESILIENT TRANSPORTATION INFRASTRUCTURE: HOW FLORIDA MPOS ARE ADDRESSING RESILIENCE**

Abstract ID: 524

Abstract within Pre-Organized Session 61

GOODISON, Crystal [University of Florida GeoPlan Center] [cgoody@ufl.edu](mailto:cgoody@ufl.edu), presenting author

Transportation resilience is a major area of concern both at the national and state level. The Transportation Research Board lists “Resilience and Security” as one of twelve major areas of concern for the nation’s infrastructure over the next 10 to 20 years (National Academies, 2018a). The FAST Act of 2015 includes requirements to consider resilience and stormwater issues in the planning process, but does include commensurate guidance (Weilant, Strong & Miller, 2019). The Florida Transportation Plan (FTP) set a goal for “agile, resilient, and quality infrastructure” (FDOT, 2015) in both the FTP Policy and Vision elements. Resilient transportation systems are those designed to endure and recover from the impacts of climate change and extreme weather events. Resiliency principles must be integrated into various components of the transportation system, including but not limited to long-range planning, project development and environment, design, construction, transportation systems management and operations, and asset management.

Some state DOTs and MPOs have begun integrating resiliency into the transportation planning process. A study of all state DOTs and 101 MPOs nationally found that about half had incorporated resiliency into their transportation plans (Dix, Zgoda, Vargo, Heitsch, & Gestwick, 2018). Of those addressing resiliency, most were still in the early phases of the planning process and had not widely integrated resiliency into practice or implementation (Dix et al., 2018, National Academies, 2018b). Obstacles to planning and implementation include the lack of information about climate impacts, vulnerability assessments, and models to assess impacts (Dix et al., 2018), and the need for resiliency champions and leadership (National Infrastructure Advisory Council, 2015). In Florida, several MPOs have begun to incorporate resiliency into the planning process, but there has not been a comprehensive assessment of their activities to date.

Current updates to the FTP call for increased focus on resiliency and the need for more state support and guidance for regional and local transportation partners. Recommendations from the FTP-SIS Resilience Subcommittee include (1) development and implementation of policies, tools, guidance, and design standards that reduce risk and (2)

integration of resilience data into transportation planning and design. Addressing these recommendations first requires an understanding of the status of regional resiliency planning efforts and specific needs. To support these efforts, we conducted a comprehensive assessment of how Florida MPOs are incorporating resiliency into the long-range planning process. We reviewed and categorized the latest long-range transportation plans from each MPO to evaluate the extent to which resiliency is defined and utilized in setting goals and objectives, project prioritization, and implementation. We will next conduct interviews with MPO staff to evaluate obstacles, challenges, and needs in regards to implementing resiliency into the long-range transportation planning process. Following that, we will produce a comprehensive assessment that details the current state of practice of Florida MPOs regional resiliency efforts and recommendations on specific data, tools, and guidance needed to advance climate planning for regional transportation agencies. This assessment will assist FDOT in strategically focusing resources to support implementation of resilient strategies into practice.

## 4.69 PRE-ORGANIZED SESSION - MANAGING FLOODPLAINS IN A CHANGING CLIMATE

Pre-Organized Session 69 - Summary

Session Includes 282, 347, 349, 350

HINO, Miyuki [University of North Carolina] [mhino@email.unc.edu](mailto:mhino@email.unc.edu), organizer

In the face of rising sea levels and more intense storms, there is growing urgency to manage floodplains in a way that promotes community wellbeing and resilience. Despite long-standing recognition of the importance of land use planning and policy for reducing natural hazard risk, many obstacles remain to realizing effective floodplain management. This session will explore how floodplains have developed and continue to evolve. It will also explore policy, planning, and legal tools for promoting climate-smart land use and for effective post-disaster recovery. We draw on diverse geographies and examples to highlight the social production of climate risk: the ways in which social, legal, economic, and political systems distribute risk among groups, often leading to inequitable outcomes.

#### Objectives:

- Demonstrate how land use choices create and distribute flood risk across different groups

## IS LAND USE PLANNING INCREASINGLY CONFRONTING EQUITY CHALLENGES IN HAZARDOUS AREAS? A CASE STUDY OF HOUSTON

Abstract ID: 282

Abstract within Pre-Organized Session 69

ROY, Malini [Texas A&M University] mr956@tamu.edu, presenting author  
BERKE, Philip [UNC Chapel Hill] pberke@email.unc.edu, co-author  
WOODRUFF, Sierra [Texas A&M University] swoodruff@tamu.edu, co-author  
CAMPBELL, Leah [UNC Chapel Hill] lc401@live.unc.edu, co-author

Every flood event reveals hidden disparities within cities - disparities in capacities to anticipate, respond to, and recover from disasters. Numerous studies examining drivers of disparity have found that highly socially vulnerable (e.g., poor, minority) neighborhoods sustain more damage, have access to fewer recovery resources, and experience slower recovery (Van Zandt et al., 2012). Scholars argue that these disparities in impact and recovery are partly due to inadequate planning. In socially vulnerable neighborhoods, planning has failed to (1) target infrastructure that reduces vulnerability to floods (e.g., ecosystem enhancements), and (2) account for the unintended consequences of flood risk reduction policies that further disadvantage socially vulnerable households (e.g., green infrastructure causing displacement) (Anguelovski et al., 2016). Moreover, effective flood mitigation and climate adaptation have suffered from inconsistencies and fragmentation across planning sectors and scales (Berke et al., 2015).

Past studies have examined the impact of climate adaptation policies on equity (Anguelovski et al., 2016) and diagnosed gaps in integrating hazard mitigation across cities' networks of plans (Berke et al., 2015; 2019). However, there is a lack of understanding on how the distribution of *all* land use policies driving development in hazardous areas impacts social equity, and whether cities' networks of plans are increasingly planning for equitable flood mitigation. To address these gaps, we ask:

1. To what degree is hazard mitigation integrated into networks of plans in low- and high- socially vulnerable neighborhoods before a disaster?
2. To what degree has the integration of hazard mitigation changed in networks of plans from before to after a disaster in low- and high- socially vulnerable neighborhoods?

We use natural experiment research design to evaluate network of plans before and after Hurricane Harvey in Houston. Although frequently criticized for lack of planning, growth in Houston is driven by planning at multiple scales and sectors. This has produced a large and diverse network of plans (e.g., plans for infrastructure, housing, mitigation) both before (n=26) and after Hurricane Harvey (n=31). The city also has a long history of systematic discrimination in the distribution of planned resources and services and is a poster child for the environmental justice movement (Bullard, 1996). Yet, the city's recent focus on resilience planning, makes Houston an ideal case study to evaluate whether plans are more focused on collectively mitigating floods and whether planning is mitigating floods equitably.

Preliminary analysis of the before-Harvey network of plans reveals a tendency to distribute resources equally rather than equitably or based on needs. In high socially vulnerable neighborhoods, fewer policies avoid dangerous development in flood prone areas or enhance land uses that foster natural flood management (like acquiring vacant land for parks). In the after-Harvey network of plans, degree of integrated effort to address flooding improves in both low and high socially vulnerable neighborhoods. But this improvement is much smaller in high socially vulnerable neighborhoods, reinforcing pre-disaster disparities.

This suggests that, despite the catastrophic effects of Hurricane Harvey, Houston's network of plans continues to overlook needs for more integrated hazard mitigation across plans in high socially vulnerable neighborhoods. From these findings, we draw recommendations to better target policies in socially vulnerable neighborhoods across different types of plans. We also discuss implications of our findings for tradeoffs between economic development,

flood mitigation, and equity in socially vulnerable urban neighborhoods in the US. As climate change exacerbates flood risk, it is imperative that planning confronts challenges of disparate impacts, loss, and adaptive capacities. This study takes a critical first step in this direction by evaluating how inequitable distribution of land-use decisions perpetuates the legacy of discrimination and by exploring opportunities to reverse this trajectory.

Managing development in hazardous locations has long been recognized as a critical component of broader efforts to limit damages from natural hazards. The benefits of managing exposure through avoidance and retreat have been well documented, especially in relation to floods. Over 60 years ago, Gilbert White, known as the father of floodplain management, recognized floodplain land use management as possibly “the single adjustment most likely to lead to a decline in national flood losses” (White et al., 1958). Larger amounts of open space, presence of wetlands, and tightly clustered developments have all been linked to fewer flood losses (Brody et al., 2011).

Despite this long-standing recognition that managing who and what is located in hazardous places is critical to limiting damages, data on floodplain development patterns remain scarce. A series of measurement efforts from the 1930s through the 1980s documented an increase in the number of floodplain structures in nine US cities, estimated through a combination of surveys and interviews of local officials, aerial photographs, and document review (Montz & Gruntfest, 1986). Another study sought to estimate floodplain development using building permits as a proxy (Burby & French, 1981). However, due to the difficulty of identifying the locations and timing of new development at large scales, standardized data on changes in floodplain exposure at large scales have remained elusive.

How do floodplain development patterns differ across communities with different geographic and socioeconomic

characteristics, and to what extent are other floodplain management activities associated with limited floodplain development? In this paper, we construct a novel parcel-level dataset to measure changes in floodplain development over time (2001-2016) in North Carolina, allowing us to identify which municipalities have undergone development while limiting flood risk. We also leverage a unique statewide, structure-level elevation dataset to assess the relationship between floodplain development and risk over time.

We find that higher rates of floodplain development are more likely to occur in wealthy coastal communities and less wealthy inland communities. In addition, construction of new housing in NC floodplains has far outstripped collective efforts to remove houses from flood-prone areas. Since 1996, 3,721 properties have been restored to open space through floodplain buyouts, while housing has been newly constructed on over 47,000 floodplain parcels. Finally, commonly-used measures of floodplain management “effort,” the Community Rating System score and use of property buyouts, are only weakly related to whether or not the community has experienced concentrated floodplain development.

As sea levels rise and storms become more intense, there is increasing urgency to understand how to effectively channel development away from flood-prone areas. Local governments, with their zoning and permitting authorities, play a critical role in reducing risk, yet our results illustrate substantially different floodplain development patterns across communities. Identifying best practices based on empirical results can strengthen flood risk management and reduce future losses across the United States.

Substantial evidence documents how public subsidies shape urban development patterns, with particular emphasis on their role stimulating the conversion of peripheral agricultural land into sprawling, low-density development. While most land use policies are crafted by state and local governments, subsidies provided by the federal government play a consequential role in shaping urban development. This is especially true for development in

coastal areas, which relies on a number of federal subsidies to be viable, including risk reduction measures (e.g., shoreline armoring), subsidized flood insurance (National Flood Insurance Program; NFIP), and post-disaster assistance.

In this paper, we explore how coastal development responds to the removal of federal subsidies. Specifically, we measure the long-term impact of subsidy removal on development rates in coastal areas through an examination of the U.S. Coastal Barrier Resources Act (“CBRA”; 16 U.S.C. 3501 et seq), which designated “undeveloped coastal barriers” (called “CBRA units”) to be: 1) ineligible for federal financial assistance for critical infrastructure (roads, bridges, water supply, etc.) and post-disaster assistance, and 2) unable to participate in the federally-subsidized NFIP.

We measure the effect of CBRA on development using a novel building structure dataset and a regression discontinuity design, comparing development rates along either side of CBRA boundaries. We focus our analysis on CBRA units in five states – Alabama, Delaware, Florida, North Carolina, and Texas – chosen for their wide variety of geographies, coastal hazard risk, development policies, and economic growth. Examining development at the borders of CBRA units (n=90), we compare the density of built structures inside and outside CBRA in 1980 (pre-CBRA) and 2016 using 500m grid cells (n = 1316), documenting the change in development densities across this 36-year time period. We use a paired t-test to measure the effect and significance of CBRA on development rates and a sensitivity analysis of CBRA boundaries to explore the importance of CBRA boundary location.

Our findings demonstrate that CBRA has a significant effect reducing development activity, and that this effect is caused by the delineation of CBRA boundaries. Specifically, grid cells in CBRA experience development growth at about one quarter of the rate of non-CBRA areas. The majority of grid cells in CBRA (87%) exhibit no new development from 1980-2016, compared to 52% of grid cells outside CBRA. These differences are highly sensitive to shifts in the location of CBRA unit boundaries, suggesting a strong causal role of CBRA’s subsidy removal that cannot be explained by underlying land characteristics.

Federal subsidies in coastal areas, such as NFIP and risk reduction measures, artificially depress the financial risks of building in hazardous areas, incentivizing development. This study demonstrates that in the absence of these subsidies, increased financial risk and infrastructure provision costs makes development prohibitively expensive, leading to substantially lower rates of development. This finding underscores the important role of federal subsidies in facilitating coastal development and illustrates how subsidy removal is an effective growth management strategy. More importantly, as the impacts of climate change increasingly afflict coastal areas, subsidy removal by federal, state, and local governments (particularly if coordinated) may hold promise as a climate-oriented policy that encourages the avoidance of hazardous areas.

## **HOW THE LAW CONSIDERS (OR DOESN'T) INCREASED FLOODING DRIVEN BY CLIMATE CHANGE AND SEA-LEVEL RISE**

Abstract ID: 350

Abstract within Pre-Organized Session 69

RUPPERT, Thomas [Florida Sea Grant] truppert@ufl.edu, presenting author

With the impacts of climate change and sea-level rise, we increasingly see that our past environmental and climatic records do not adequately reflect what we expect in the future. But our legal system, laws, jurisprudence, and rules have been developed under our earlier notions of climate and environmental "stability." [1] Thus, just as local governments see an increasing need to plan far more proactively and carefully for a changing future, these local governments confront a legal system that itself still needs to adapt to the facts of climate change and sea-level rise. This worsens an already serious issue: Local governments and floodplain managers often have serious concerns about potential legal liability for enacting regulations that would protect people and property from flooding impacts.[2] This fear of legal liability can lead to a lack of effective floodplain management and greater harm from flooding events. This session will provide an overview of the U.S. Constitution's property rights protections in the context of floodplain management as well as an introduction to potential civil (tort) liability of government for failure to adequately protect citizens and property from known flood risks. This will culminate in some general "legal lessons learned" and sharing of planning and legal resources with participants, including suggested actions, such as providing notice/disclosure of hazards,[3] permitting conditions, modifying comprehensive plans and ordinances related to infrastructure services, requiring additional building elevation, increasing tailwater elevations for stormwater design, liability for roads impacted by climate change and/or sea-level,[4] planning for cleanup of abandoned properties,[5] and other suggestions. Failure to understand where the law is, how it developed, and how to push the law to adapt will prevent planners from effectively assisting local governments in adapting to a changing future and nudging the law towards increased recognition of the challenges of climate change and sea-level rise.

## **ROUNDTABLES**

### **4.20 ROUNDTABLE - GREEN NEW DEALS AS CATALYSTS FOR URBAN CLIMATE JUSTICE?**

Abstract ID: 20

GOH, Kian [University of California Los Angeles] [kiangoh@ucla.edu](mailto:kiangoh@ucla.edu), moderator  
CONNOLLY, James [University of British Columbia] [jconnoll@mail.ubc.ca](mailto:jconnoll@mail.ubc.ca), participant  
POLLANS, Lily [City University of New York] [lily.pollans@hunter.cuny.edu](mailto:lily.pollans@hunter.cuny.edu), participant  
RODRIGUEZ, Akira [University of Pennsylvania] [akirad@design.upenn.edu](mailto:akirad@design.upenn.edu), participant  
FITZGERALD, Joan [Northeastern University] [jo.fitzgerald@northeastern.edu](mailto:jo.fitzgerald@northeastern.edu), participant

How can the recent proliferation of efforts in the US, Europe and elsewhere to create green new deals be translated into climate justice for cities? Programs are being developed around the notion of generating a transition toward a greener economy. However, the ultimate implementation of these programs as they will manifest in cities remains fairly non-specific. How can planning steer these initiatives toward climate justice by learning from recent experiences with environmental justice, green building, urban sustainability, and resilience initiatives? What types of infrastructure are the most important to target from a climate justice perspective? What types of intellectual, political and institutional shifts are needed within the planning profession in order to advance urban climate justice through the green new deal policy paradigm? Members of this roundtable will engage the audience in a discussion of what the green new deal means for planning's role in simultaneously addressing climate change and social justice.

HOLLAND, Susan [Historic Ithaca] [sholland@historicithaca.org](mailto:sholland@historicithaca.org), participant

Buildings in the United States – our homes and offices, schools and shops – contribute 40 percent of the country's total carbon emissions. We cannot achieve a carbon-neutral future without addressing our existing building stock, nearly two-thirds of which will also exist in 2050 (Architecture 2030, 2021). Such actions include implementing low-carbon retrofits as well as adopting deconstruction – rather than demolition – as a more sustainable way to address the waste of non-renewable resources such as old-growth wood and other building materials that currently go to landfills (Fraanje, 1997). In addition to positive environmental impacts, such actions can provide socio-economic

benefits such as green job creation and enhanced skills training, historic preservation opportunities, and wider availability of valuable building materials (Bertino, 2021). They can help the extractive construction sector move toward a more sustainable circular economy based on maintenance, repair, adaptation and reuse of our built environment (Huuhka, 2019).

However, municipalities cannot rely solely on market mechanisms (such as those found in the real estate sector) to create an environment suitable for thoughtful treatment of the existing built environment and the resulting creation of a circular economy (Hassler, 2009). Instead, legal and institutional interventions are often necessary, such as adoption of local ordinances bolstered by active community education and engagement efforts targeted at building owners and occupants.

With this in mind, university educators and community leaders in central New York have come together to encourage municipal adoption of practices and policies to create a more equitable and resilient built environment. Through the sharing of research, resources and networks, collaborators are working to promote the adoption of low-carbon retrofits, methods to address building material waste, the development of a circular economy, and the creation of equitable green jobs. The collaboration is focused on four areas: (1) education and community engagement, (2) research and resource development, (3) policy and practice recommendations, (4) equitable green jobs creation and skills training.

Roundtable participants, including two educators and two community leaders in the fields of planning, preservation and architecture, will discuss methods of university-community partnership to involve students and community groups in efforts to strengthen resilience of the built environment. Participants will discuss their experiences working together to promote municipal practices and policies to employ low-carbon retrofits appropriate for historic resources, encourage deconstruction and a circular construction economy, and create racially and socially just green jobs. They will draw on their efforts as members of CROWD (Circularity, Reuse, Zero Waste Development), a collaborative, multi-disciplinary task force that works with New York State communities to promote sustainability of the built environment.

SHANDAS, Vivek [Portland State University] vshandas@pdx.edu, participant

Climate change, in combination with the urban heat island effect, is increasing risks of extreme heat worldwide (Stone & Rodgers, 2001). While other climate hazards garner more media attention in the US, extreme heat is the deadliest (Hondula et al., 2015). It also causes declines in quality of life, increases in mental health and behavioral disorders, declines in economic productivity, and strains water and energy infrastructure and ecosystems. Extreme heat is a climate justice issue with risk inequitably distributed across cities and populations, such as higher heat severity in historically redlined neighborhoods (Hoffman et al. 2020, Wilson 2020). Despite increasing recognition of the threat extreme heat poses, heat policy and planning remains underdeveloped in comparison to other natural hazards (Keith et al. 2020). An assessment of over 3,500 climate adaptation resources in the U.S. found that only 4% focused on heat (Nordgren et al. 2016) and even fewer consider social justice (Lambrou and Loukaitou-Sideris in press). This session will explore diverse perspectives in the current state and innovations in planning research and practice for extreme heat.

Organizer: Larry Vale, Department of Urban Studies and Planning, MIT; Moderator: Zachary Lamb, Department of City and Regional Planning, UC Berkeley

Communities around the world are facing the conjoined crises of mounting inequality and increasing threats from climate change. From landslides in hillside favelas in South American megacities to wildfires in mobile home parks in the USA to floods in booming coastal cities of south and east Asia, the communities that are most vulnerable to climate change are often home to people without the economic and political resources necessary to prepare or recover from major disruptions (Shi et al. 2016). Many early efforts to adapt cities to climate change have actually exacerbated pre-existing inequalities, displacing or otherwise harming already disadvantaged residents while benefiting those with the political power and financial resources to shape adaptation plans and policies (Anguelovski

et al. 2016).

The concept of 'climate resilience' has been critiqued on several fronts, including that it is insufficiently precise (Meerow and Stults 2016), that it is used to justify returning to pre-disruption unjust status quo conditions, and that, by celebrating the self-sufficiency of the poor, it excuses neoliberal state retrenchment (Davoudi et al. 2012). Nonetheless, the concept has been widely embraced by grassroots and other advocates, leading some scholars to embrace the 'resilience' of urban areas, but only when the concept is framed as explicitly advancing 'progressive' or 'equitable' goals that address the underlying drivers of uneven vulnerability (Vale 2014).

Planners and designers seeking to advance equitable resilience face two important questions. First, what counts as equitable resilience? And second, where can we look for cases of realized projects, programs, and plans that exemplify this equity-centered vision of resilience?

This roundtable addresses these questions by inviting researchers to consider how selected international cases advance equitable resilience by addressing the underlying causes of uneven vulnerability. Participants will consider how their chosen cases go beyond reducing geophysical hazard vulnerability to improve conditions for urban poor residents by: 1) improving environmental safety and vitality; 2) enhancing access to livelihoods; 3) increasing self-governance; and 4) strengthening security, both from displacement and from violence (Vale et al. 2014). Undergirding this discussion is the foundational principle that cities cannot be resilient, and resilience cannot be truly 'urban,' unless equity is a central concern.

KENNEDY, Sean [University of Illinois, Chicago] seankenn@illinois.edu, participant

Climate change and planning responses to it often disproportionately harm individuals and communities that are already culturally, socially, economically, and/or environmentally vulnerable. Those most impacted by climate change are also often the least responsible for causing this global crisis, a fact commonly labeled "climate injustice."

This term initially referred to the uneven responsibilities and risks borne by different countries, but increasingly is used to describe differential vulnerability and uneven climate mitigation and adaptation manifesting at the regional, city, and even neighborhood scales. The field of planning is inherently implicated in the historical and ongoing processes of industrialization and development that are responsible for causing anthropogenic climate change and has also played a direct role in creating and maintaining social and ecological vulnerabilities that are exacerbated by climate change. Thus, this roundtable invites conversation to contribute to collective knowledge about how planners can better incorporate, measure, and actualize equity considerations in practice.

While planning seeks to create healthy, thriving communities, the field has intentionally and unintentionally produced and reinforced many social, environmental, and economic disparities. Planning has historically been embedded within the dominant capitalist economic model of growth, driving planners to consider economic growth as their primary goal, under the assumption that it will lead to greater equity and environmental health. In both overt and subtle ways, planning has perpetuated spatial inequities related to access to resources and quality of life. As an overwhelmingly white profession, planning has perpetuated racial segregation through explicitly racist practices, such as racial covenants and redlining, as well as more discretely through processes of suburbanization that Laura Pulido identifies as instances of white privilege (Pulido, 2000).

Climate change adds new urgency to long-standing efforts to advance equity in planning by reproducing existing disparities and creating new manifestations of inequities. Demands for greater attention to justice in climate action from multi-scalar and diverse social movements has led to an increase in equity-oriented climate scholarship and action. In 2019 Providence, Rhode Island adopted a Climate Justice Action Plan. Within planning this work brings together theories about the just city with research on social vulnerability and movement work and research on environmental justice to animate visions of the just climate city (Goh, 2020; Granberg & Glover, 2021; Ranganathan & Bratman, 2019; Steele et al., 2012). As planners attempt to address issues of inequity, fundamental questions arise around how phenomena like ‘vulnerability’ and ‘resilience’ are measured in practice, and how outcomes might be investigated and improved over time.

In this roundtable we will discuss the growing attention to equity and justice in climate planning practice with specific focus on on-the-ground implementation. Participants will share their thoughts on the opportunities and challenges associated with operationalizing and actualizing equity in climate planning. We will draw on examples of how cities and communities are integrating equity consideration into climate mitigation and adaptation plans and discuss the extent to which and potential best practices for evaluating the effectiveness of different approaches. Broadly, how do climate change and growing demands for justice require us to rethink planning goals, processes and outcomes?

Cities are increasingly focused on implementing green infrastructure as a strategy for managing stormwater and adapting to climate change more broadly (Shi 2020). Different forms of green infrastructure, such as rain gardens, green roofs, or even street trees, can provide many benefits to surrounding communities, but if not carefully planned and maintained, these developments will likely reinforce existing patterns of environmental injustice (Heck 2021; Hoover and Lim 2020). For example, green infrastructure may not be prioritized in areas that lack green space due to long-term disinvestment, and even if it is developed in those neighborhoods, it may cause green gentrification (Anguelovski et al. 2020; Meerow 2020). In this roundtable, we invite participants and attendees to engage in a rich discussion on whether, how, and where green infrastructure planning processes meaningfully engage justice. The participants include five scholars from different institutions who have recently published research on the topic of justice and green infrastructure planning. They will begin the session by reflecting on the current state of knowledge on this emerging topic. Questions we hope to discuss in this roundtable session include: What does a just green infrastructure planning process look like? Who do these processes engage? What are the biggest barriers to more just green infrastructure planning? How might we move green infrastructure planning towards a community collective model?

Key Words: green infrastructure, Environmental justice, Climate justice, social equity, urban resilience

#### 4.457 ROUNDTABLE - FROM CLIMATE JUSTICE TO CLIMATE FINANCE: HOW TO BRIDGE PLANNING'S NORMATIVE AND TECHNOCRATIC IDENTITIES?

SHI, Linda [Cornell University] ls886@cornell.edu, moderator  
FITZGERALD, Joan [Northeastern University] jo.fitzgerald@northeastern.edu, participant  
GREVE, Adrienne [CalPoly] agreve@calpoly.edu, participant  
KEENAN, Jesse [Tulane University] jkeenan@tulane.edu, participant  
TOVAR, Angela [City of Chicago] Angela.tovar@cityofchicago.org, participant  
WICKLAND, Teo [UCLA] teo@ucla.edu, participant

This year's conference theme – Planning for Climate Justice – encapsulates a fundamental tension between efforts to radically reconstruct planning on the one hand and rapidly scale-up existing technical planning tools and practices to effect change in policy and the built environment realm on the other. The catastrophic impacts of climate change necessitate deep introspection and reform to ensure that concerted efforts move in the right direction. However, there are clear dialogical divides among academics whose incisive structural critiques are often disconnected from implementation, action-oriented community activists who typically focus on local scales, and technical professionals whose fields have systemic impacts on the urban environment but whose communities of practice care naught for social equity, racial justice, much less decolonization and land back.

Increasingly, activists, academics, and practitioners, especially in the United States, are calling for a sea change in urban planning that centers racial, social, and environmental justice. In the area of climate change, green or climate gentrification, real estate speculation, insurance and lending reforms, and inequitable resource allocation, are recapitulating historic rounds of economic and spatial marginalization. The need for societal transformation has never been greater (Ajibade & Adams, 2019; Anguelovski et al., 2020; Fazey et al., 2018; Henrique & Tschakert, 2020). Meanwhile, the influencers of national land policy, among them the financial, insurance, and real estate community and the engineering-led disaster mitigation policies and projects are piloting, researching, and scaling up reforms that will dramatically change the envelope of urban fiscal, housing, and infrastructure options (Shi and Moser, 2021).

This roundtable session asks participants from the scholarly and professional circles to reflect on the tensions, gaps, and prospects for urban planning at this critical moment of national reckoning with racial justice and administrative realignment behind climate action. These debates reflect the tensions that have long existed within planning's normative and technocratic branches. What are the implications of decolonization and racial justice for policy levers like property rights, insurance, disaster relief, and infrastructure finance? What mechanisms and platforms exist for justice advocacy and concepts to enter these professional and policy realms? What are the implications for planning, as a diffuse and conflicted field, as it tries to mobilize a coherent response to planning for climate justice?

Despite the increasing engagement of cities around the world in planning for climate change, urban areas are not transitioning fast enough to meet the Paris Agreement (2015). The 2018 IPCC report emphasizes the peril of our current global pace of curbing emissions and preparing for unavoidable consequences, estimating a 1.5°C increase in global temperature by 2030 to 2052. In other words, we must move faster on both fronts, GHG emissions reduction and adaptation to unavoidable impacts. This places focus and pressure on urban areas. Cities consume nearly 3/4<sup>th</sup> of the world's energy, emit roughly 80% of greenhouse gases, and hold populations and assets at high risk from climate-exacerbated hazards (Newman, Beatley, & Boyer 2009). For planners, this calls for more effective implementation and mainstreaming of city climate strategies.

Mainstreaming has not been effective due to the slow pace of the integration of climate strategy considerations into all aspects of city finance and decision-making (Oulahen et al 2018, Reckien et al 2019). In addition, infrastructure and land use tend to change slowly, even when climate-oriented, which speaks to factors internal and external to cities, such as institutional and financial capacity. Land use has long been the focus of the field of planning, but climate change demands a wholesale shift in the world's portfolio of urban assets, and the scale and pace required would suggest that planners devote more attention to infrastructure planning, design, finance, and climate implications. The IPCC describes the need for a wholesale redirection of financial flows toward low-emission investments, and large scale increases in investment in buildings and infrastructure (IPCC 2018). Economists specializing in climate change urge cities to avoid the pitfalls of focusing only on the low-hanging fruit of projects with significant financial returns and instead prevent lock-in to carbon intensive sources of energy, even if that means investing in capital intensive infrastructure (Vogt-Schlib et al. 2018; Hallegatte et al. 2007). For cities, this generally means that barriers to climate action also are nested more broadly within barriers to infrastructure investment and development (Granoff et al. 2016). The challenge for cities is to unlock and dedicate global capital resources to decarbonized, climate-smart infrastructure.

This article reviews the recent history of city climate finance, as well as the literature from planning and the built environment to identify impediments, offer remedies, and highlight the transformative potential of city planning for climate change. City climate plans create opportunities by setting targets, suggesting the design, re-design, retrofit land use and infrastructure, often aiming for compact city forms with climate in mind. This article steps beyond research on the content of plans, to ascertain the institutional and organizational conditions for implementing strategies to make cities climate-smart. Incorporating climate measures, for example, into fiscal policy and capital investment plans could have the effect of mainstreaming climate action for city infrastructure with each budget cycle (Whittington and Lynch 2015; Whittington and Young 2013). The demands of climate change create a gap in

planning research and practice for the Global North and South that this article describes. The article combines existing literature with empirical evidence from implementing climate-smart capital investment plans for cities in Sub-Saharan Africa, India, Turkey, and the United States. The contours of this challenge encompass fundamental relationships between planning and physical infrastructure, the multidisciplinary nature of infrastructure development for governmental and non-governmental actors, and the underappreciated role of planning in the financial well-being of cities and the communities they serve.

#### FACTORS INFLUENCING CITIES TO IMPLEMENT CLIMATE ADAPTATION PLANNING

Abstract ID: 34

Individual Paper Submission

MATOS, Melina [Texas A&M University] [melina\\_matos@tamu.edu](mailto:melina_matos@tamu.edu), presenting author

This paper will examine the factors influencing cities to implement climate adaptation planning. Despite the imminent threat of climate change, few U.S. cities are implementing climate adaptation planning. A 2011 survey of 248 U.S. cities engaged in sustainable development found out that 55% were discussing climate adaptation activities. Yet, in 2020, only 41 cities from the 2011 sample had a plan addressing adaptation. What factors enabled these cities to implement adaptation planning? How can the success of these cities be replicated in other places? It is essential to identify the conditions that allowed those cities to complete a plan addressing climate adaptation.

The research uses the 2011 survey of cities developed by Dr. JoAnn Carmin in MIT (Massachusetts Institute of Technology) in partnership with ICLEI (Local Governments for Sustainability), augmented with new complementary secondary data from sources as Yale Climate Opinion, FEMA, Georgetown Climate Center, and the Census. Carmin's research group identified the general stage of adaptation efforts in cities worldwide and factors that contributed and hindered cities from engaging in climate adaptation. However, it focused on the first step of the policy process, agenda-setting, when an issue becomes a priority for action. Having a plan is the first step of implementing urban policies. Assessing the 2011 sample, I found out that only 16% of cities previously engaged in sustainable

development have a plan addressing climate adaptation despite a time frame of ten years. Why? The current state of knowledge concerning what factors influence cities to implement climate adaptation planning is unknown.

Climate adaptation is a prime example of urban innovation, defined as new ideas designed and implemented. Cities identified climate change as a problem and, spontaneously, are trying to address the issue. There is no requirement from the state or Federal government that cities must adapt; they did it independently. According to the diffusion of innovation, in a sample, innovators and early adopters represent 16%. In the sample of 248 US cities, 41 cities (16%) have a plan addressing adaptation. Therefore, using the theory of innovation to study climate adaptation will help identify what factors influence cities to implement adaptation planning. In this study, implement adaptation planning is measured by a city having a plan towards adaptation (which can be a stand-alone plan or a chapter addressing adaptation in other city plans).

Innovation is influenced by motivation, perception of need, resources, and engagement in learning networks. Using logistic analysis, we assess how these factors influenced a city to engage in adaptation and implementing it. Preliminary results suggest that the factors that influence a city to discuss climate adaptation are not the same that affect the city to develop the plan. While perception of need and learning networks are relevant for cities to engage in adaptation, having a plan is more dependent on resources and leadership.

As organizations successfully innovate, others are more inclined to adopt it since the risks are lower. But when a plan is the "innovative product," just follow a similar document structure will not ensure success. It is necessary to consider the process and underlying factors that led the early adopter to their innovation. Thus, there is a critical need to determine why some cities take action to adapt to a changing climate. Without this knowledge, nurturing climate adaptation in the broader community will be challenging.

#### **PATTERN AND PROCESS: EXPLORING SOCIO-SPATIAL (IN)EQUALITY OF ACCESS TO URBAN GREEN SPACE IN BEIJING**

Abstract ID: 35

Individual Paper Submission

WU, Longfeng [Harvard University] longfengwu@outlook.com, presenting author

ROWE, Peter [Harvard University] prowe@gsd.harvard.edu, co-author

Urban green spaces have multiple ecological and socioeconomic benefits and are often implemented as an effective approach fighting against environmental issues including air pollution, flooding, urban heat island, and more. However, green spaces are not always evenly available among different socioeconomic groups, which is often criticized as an environmental injustice by many scholars. Despite the emerging concerns on urban green space

inequality, most studies focus on examining the distributional pattern of such inequality. There are few studies that explore the driving factors causing such (un)equal patterns particularly in developing countries such as China. This paper investigates how different socio-economic groups access urban green space at a finer scale in Beijing. A further historical review elucidates how potential determinants including geographical characteristics, historical layout of the old city, urban planning and land use decisions, afforestation policies and projects, and public financial stresses influence the development of socio-spatial patterns of access to urban green spaces in Beijing. The results indicate a bi-fold outcome in that urban green spaces proxied by vegetation coverage tend to better serve marginalized groups, while advantaged socio-economic groups are well served by parks. The Geographically Weighted Regression output mappings pinpoint the abnormal cases of the inconsistent relationships between access to green spaces and the socio-economic status of residents. The result of this analysis identified locations allowing decision makers and planners to accurately invest in afforestation projects for the purpose of promoting social equality of urban green space, while highlighting potential factors in the distribution process that might harbor unequal outcomes.

#### STATE POLICIES FOR INTEGRATING CLIMATE CHANGE RESILIENCE IN LOCAL PLANNING: IMPLICATIONS FOR SMALL JURISDICTIONS

Abstract ID: 47

Individual Paper Submission

RAI, Pranjali [University of Washington] prai88@uw.edu, presenting author

High losses due to climate induced extreme natural events have increased the urgency for incorporating climate change impact in local planning. In the absence of federal regulations, some states have adopted, or are in the process of adopting, policies for integrating climate change resilience in local planning exercises. States, like California and Washington, are focusing on including climate change in local comprehensive planning (SB 379 and HB 1099- proposed), using their state legislations for developing general plans at the local level. On the other hand, Massachusetts has adopted a program (MVP- Municipal Vulnerability Preparedness program under EO 569) to incentivize resilience planning through a new and separate local planning exercise. It is unclear how these states consider a jurisdiction's character and its capacity to plan for climate change impact in their policies. In case of small jurisdictions (cities and towns with population of 25,000 or less) these considerations determine whether the jurisdiction will be able to follow through on the state's requirements. Moreover, the state mandates in California and Washington are unfunded, placing the complete financial and technical burden of climate resilience planning on

the local jurisdictions. In Washington, local jurisdictions have voiced their concerns regarding the lack of financial support for fulfilling the state's proposed climate change element requirements (AWC, 2021). Levying additional taxes or reallocating local budget for planning and implementation of climate adaptation actions may not be possible for some jurisdictions because of their political and socio-economic environment. Such jurisdictions may also be highly vulnerable to climate change impacts. The lack of provisions in these blanket rules has brought up an equity debate regarding which jurisdictions will be able to plan for climate resilience in these states.

This research focuses on determining how state policies can foster climate change resilience in small local jurisdictions. The author will discuss implications of existing climate resilience state policies for small jurisdictions in CA, WA, and MA. She will present her assessment on different perspectives regarding the impact of current policies on these jurisdictions, and the support they need to develop climate resilience. Perspectives will be gathered using interviews and case studies. Key outcomes from interviews with local planners, administrators, and consultants from small jurisdictions of these states regarding the (potential) impact of the state policies on their community will be shared. Also, examples of small jurisdictions who planned for climate resilience based on their state's policies will be discussed. Based on the results of this analysis, the author will present her recommendations for developing a support structure that facilitates integration of climate resilience in local planning of small jurisdictions. These recommendations can be used to repurpose legislation in states that have adopted climate resilience policies, to reduce the burdens imposed on small jurisdictions by their regulations. This may increase adoption of these policies by small communities. States who are currently deliberating on similar legislation can use these recommendations for developing climate resilience policies that also focus on equity across jurisdictions.

## **DO BUYOUTS MITIGATE HOUSEHOLD RISK? COMPARISONS BETWEEN BUYOUTS AND POST-DISASTER MIGRATION**

Abstract ID: 55

Individual Paper Submission

SCHWALLER, Nora [University of North Carolina at Chapel Hill] [nschwall@live.unc.edu](mailto:nschwall@live.unc.edu), presenting author  
BENDOR, Todd [University of North Carolina, Chapel Hill] [bendor@unc.edu](mailto:bendor@unc.edu), co-author

Government-funded property acquisitions and demolitions (frequently called “buyouts”) are one of the most common tools used to reduce vulnerability to flooding and storms in the United States. With few exceptions, these programs require voluntary participation on the part of homeowners and take place in the aftermath of storm events. Buyout programs typically work by paying homeowners the pre-flood value of their home, demolishing the damaged property, and permanently returning the property to open space. Theoretically, this facilitates disaster recovery and community resilience, lowering aggregate flood risks nationally. However, the success of buyout programs is a subject of academic debate.

This uncertainty of the value of buyouts as a recovery mechanism is caused by two features of the process. First, buyouts, as they are currently conceptualized, do not comprehensively incentivize the reduction of household risk. Rather, they provide households with funds indexed to the pre-disaster value of the homes and assume that individual choice and market forces will lead to more resilient resettlement. This is far from certain; one of the only studies analyzing post-buyout vulnerability found that 20% of participants of the 323 participants moved to areas at least as vulnerable to flooding as their pre-buyout properties. Second, the Federal government has only patch-work documentation on buyout processes and outcomes, affording limited opportunities for researchers to study these programs.

To better understand buyout outcomes, our work creates a comprehensive database of the 629 buyouts that have been completed in Harris County, Texas since Hurricane Harvey struck in August 2017, as well as the thousands of households that have moved from floodplains during this period. This is primarily created using two data sources: (1) publicly-available property data from Harris County, and (2) address history information acquired from the credit agency, TransUnion. This dataset includes household-level moves, allowing us to track migration patterns and post-program outcomes. These data allow us to circumvent the dearth of documentation at the Federal level.

We use this data to undertake a quasi-experimental analysis comparing buyout properties to similar households that also moved in the aftermath of Hurricane Harvey. We use a matching technique to create paired observations (buyout and non-buyout relocations) based on multiple criteria, including locations within the same contiguous floodplains and census tracts, house characteristics, and neighborhood traits. We then test whether buyouts are successful at mitigating household-level flood risk while supporting household recovery. Initial findings show that participating in buyouts only has a marginal effect on the outcomes of participating households. In other words, buyouts do not appear to dramatically reduce physical vulnerability compared to the control groups. This brings into question the utility of buyouts for household-level recovery.

Finally, we end this paper with a comparison of the post-disaster buyout program to other Federal housing relocation programs, such as HOPE VI and Moving to Opportunity. Compared to the buyout programs, Moving to Opportunity was designed as an experimental intervention, with the intention of helping families move from at-risk areas to “opportunity” neighborhoods. We argue that buyout programs are analogous to these programs, but with at-risk neighborhoods transformed from high-poverty to high flood-risk. This contextualizes the buyout program, which has shown little evidence of improvement in policy designs or outcomes over time, in the lessons of other past relocation programs, providing paths forward for improving buyout implementation. This background is used to provide suggestions for policy improvements rooted in housing research and prior programs.

## HOW DO LOCAL OFFICIALS CONCEPTUALIZE SUSTAINABILITY AS PRACTICED IN THEIR COMMUNITIES? AN EXAMINATION OF U.S. CITIES

Abstract ID: 56

Individual Paper Submission

HOFMEYER, Sarah [University of Kansas] sarahhofmeyer@ku.edu, presenting author

HAWKINS, Christopher [University of Central Florida] christopher.hawkins@ucf.edu, primary author

KRAUSE, Rachel [University of Kansas] rmkrause@ku.edu, co-author

PARK, Angela [Kansas State University] angelapark@ksu.edu, co-author

Sustainability has become an umbrella concept under which discourse over environmental quality, resource conservation, equity, climate mitigation, economic health and environmental justice all occur (Zeemering 2012; Purvis et al. 2017). Although sometimes criticized as overly broad and ambiguous, how planners think about and define sustainability is critical as it guides their operationalization of its objectives. Scholars have sought to develop a robust conceptualization of sustainability to determine measurements by which to assess success and gain deeper understanding of how local officials come together in a web of relationships at many levels of policy (Lorr 2012; Purvis et al. 2017). We add to this research aim by evaluating municipal government officials' definitions of sustainability, based on how it is practiced locally.

Cities have emerged as particularly important units of government in advancing sustainability-related policy, but they display considerable variation in their policies and the foci of their related programs and objectives (Krause and Hawkins 2021). Understanding patterns in their definitions thus have implications for scholarship and planning practice. This research provides a descriptive analysis of how US cities define and determine their sustainability practices, and how these unique operationalizations might be categorically understood among all cities. We ask, and empirically respond to the following questions: How do city officials conceptualize sustainability? What patterns emerge around how sustainability is characterized across different "types" of cities?

This research leverages original data collected in late 2020 and early 2021. A survey was administered to all cities in the US with populations over 20,000 (n=1,850) and included a range of questions about local sustainability planning, policy, and administration practices. It also included an open-ended question where respondents were invited to "define sustainability as it is practiced in their city or town". Three-hundred sixty-seven respondents completed this question. We use Atlas.Ti software to identify frequently used words, clusters frequently used together, and connections between definition and reported sustainability programming. Atlas.Ti also enables categorical coding to uncover distinct themes in how cities think of sustainability for themselves in comparison to other cities across the United States.

Preliminary results suggest a relatively comprehensive conceptualization of sustainability, which pairs with reports about the politicization of sustainability efforts. Results also point toward the role of formal collaborations and planning in local operationalizations of sustainability. The results ultimately add dimension to the existing understanding of how sustainability is practiced, and the similarities and differences across cities.

## LOCAL CLIMATE ACTION PLANNING AS A TOOL TO HARNESS THE GREENHOUSE GAS EMISSIONS MITIGATION AND EQUITY POTENTIAL OF AUTONOMOUS VEHICLES AND ON-DEMAND MOBILITY

Abstract ID: 65

Individual Paper Submission

ALEXANDER, Serena [San Jose State University] [serena.alexander@sjsu.edu](mailto:serena.alexander@sjsu.edu), presenting author  
WEINSTEIN AGRAWAL, Asha [San Jose State University] [asha.weinstein.agrawal@sjsu.edu](mailto:asha.weinstein.agrawal@sjsu.edu), co-author  
CLARK, Benjamin [University of Oregon] [bclark2@uoregon.edu](mailto:bclark2@uoregon.edu), co-author

This research focuses on how cities can use climate action plans (CAPs) to ensure that on-demand mobility and autonomous vehicles (AVs) help reduce, rather than increase, greenhouse gas (GHG) emissions and inequitable impacts from the transportation system. We employed a three-pronged research strategy involving: 1) an analysis of the current literature on on-demand mobility and AVs; 2) a systematic content analysis of 23 CAPs and general plans developed by municipalities in California; and 3) a comparison of findings from the literature and content analysis of plans to identify opportunities for GHG emissions reduction and mobility equity. Findings indicate that policy and planning discussions should consider the synergies between AVs and on-demand mobility as two closely related emerging mobility trends, as well as the key factors (e.g. vehicle electrification, fuel efficiency, use and ownership, access and distribution, etc.) that determine whether deployment of AVs would help reduce GHG emissions from transportation. Additionally, AVs and on-demand mobility can potentially contribute to a more equitable transportation system by improving independence and quality of life for individuals with disabilities and the elderly, enhancing access to transit, and helping alleviate the geographic gap in public transportation services. Although municipal CAPs and general plans in California have adopted several strategies and programs relevant to AVs and on-demand mobility, several untapped opportunities exist to harness the GHG emissions reduction and social benefits potential of AVs and on-demand mobility.

# ASSESSING THE EFFECTIVENESS OF NATURAL HERITAGE SYSTEMS IN PROTECTING ECOLOGICALLY IMPORTANT LANDCOVER TYPES TO RESPOND TO CLIMATE CHANGE: A CASE STUDY ANALYSIS IN HALTON REGION, ONTARIO CANADA

Abstract ID: 70

Individual Paper Submission

DELOYDE, Carolyn [Queen's University] carolyn.deloyde@queensu.ca, presenting author  
MABEE, Warren [Queen's University] warren.mabee@queensu.ca, primary author

The effectiveness of a Natural Heritage System is assessed through analyzing land cover classes in Halton Region Ontario, Canada. A review of the literature of concludes a lack of transparency exists in current approaches to NHS planning regarding various landcover classifications that are incorporated within these systems, as well as rationale as to why specific choices were made. An overview of ecosystem scales and nomenclature is presented to contextualize NHS planning in Ontario today. The identification and implementation of the Natural Heritage System in Halton Region is explored. Landcover classifications from 2002 (Southern Ontario Land Resource Information System 1.2) and 2011 (Southern Ontario Land Resource Information System 2.0) are assessed in order to evaluate landcover changes in Halton Region, both within and outside the NHS delineated within the Region as part of the 2009 Official Plan review which incorporated the first ever Natural Heritage System within the Regional Official Plan. This research suggests that NHS is an effective tool for protection of high conservation value features; more than 90% of forests and wetlands areas are captured in Halton's NHS, comprising 22,800 ha out of the total 49,990 ha designated within the system. This work provides novel insight into changes that have occurred within the NHS in the early years of its existence in Halton, which in turn can help inform broader strategies designed to maintain ecosystem function at the landscape level. This research quantifies ecosystem services associated with the Natural Heritage System in Halton Region, Ontario. Ecosystem services are directly linked to the achievement of increased human wellbeing across the planet, and can be divided into provisioning, regulating, cultural, and supporting services. Literature values for specific ecosystem services are identified for different landcover classifications across southern Ontario. Using this data and previous assessments of landcover classifications across Halton Region, the ability of Halton's NHS to capture and maintain ecosystem services is assessed. Slight changes in ecosystem values over time suggest that regulating services are declining. The assessment tool developed in this study can help identify where changes in ecosystem services are occurring, and provide guidance to stakeholder groups in informing updates to planning decisions related to Halton's NHS. Incorporating ecosystem services into Natural Heritage Planning for use as a tool for municipalities to respond to climate change is examined.

## TAKING MEASURES OF CHINESE NATIONAL NEW AREAS' LANDSCAPE

Abstract ID: 72

Individual Paper Submission

XU, boqian [University of Pennsylvania] boqianx@gmail.com, presenting author

In the 2010s, China's central government designated 17 National New Areas (NNAs) to redistribute resources spatially and cultivate regional centers. These projects extend the existing concerns of whether China needs more new towns as the population stops increasing and whether these projects could avoid the past new town movement's issues. Regardless of these large-scale new town projects' social and economic obstacles and achievements, scholars and practitioners criticized their ecological performance. However, most of the research claimed the new towns' environmental degradation through individual case studies, lacking quantitative analysis answering the question of these new towns' designation impacted the country's ecology.

Therefore, this research measures the altered ecology in all the NNAs in China, based on the Ecosystem Service Value (ESV) theory. It focuses on each NNA's ESV changes, using two global longitudinal land cover datasets in Google Earth Engine. This paper first argues that the coarse 20-year MODIS data is acceptable at the national scale, verified by the fine 5-year Copernicus data. It then traces each NNA's ESV from 2001 to 2019 and calculates the designation impact, the difference of ESV change before and after designation by the central government. The results show that, while some new towns' ESV decreased after being designated as NNAs, others' ESV did not reveal apparent declination. The research also shows that some NNAs' ESV even increased recently. Furthermore, this paper suggests that policy-makers formulate environmental policies case by case rather than adopt one national standard since ecological degradation is not prevalent in all the NNAs.

## STUDY THE INTERACTIONAL EFFECT OF VEGETATION IN MITIGATING EXTREME HEAT IN CITIES

Abstract ID: 84

Individual Paper Submission

KIANMEHR, Ayda [Virginia Polytechnic Institute and State University] akianmehr@vt.edu, presenting author  
LIM, Theodore [Virginia Polytechnic Institute and State University] tclim@vt.edu, primary author

Climate change is now one of the most well-known environmental phenomena of the 21<sup>st</sup> century. Sea level rise, floods, droughts, and wildfires are increasingly attributable to this phenomenon, which threatens the life and well-

being of humans, as well as other species worldwide. Within cities, urban heat islands, and extreme heat events such as heatwaves, are some of the most tangible outcomes of climate change that pose direct and indirect effects on citizen's quality of life. Unfavorable thermal conditions and excessive heat-related mortality, especially among racial minorities and vulnerable groups, are some inevitable outcomes of those situations. Albeit the severity and magnitude of the problem might not be the same in different places, extreme heat exposure is a major issue in the era of climate and environmental change in most crowded cities (Luber & McGeehin, 2008). However, the impacts of contributing factors of extreme heat can be alleviated through planning strategies. This notion makes the study of the contributing factors and strategies relevant to the urban planners who are responsible for providing healthy and safe environments for all residents.

One of the most familiar planning strategies for controlling extreme heat in cities is promoting trees and vegetation in urban environments. Although this heat mitigation strategy advocated by many studies, it appears the cooling effect of trees is largely controlled by background meteorological and morphological conditions. For example, it has been shown that trees and vegetation have a higher cooling impact in sites with taller buildings, higher temperature, and lower relative humidity (Perini & Magliocco, 2014). There is also evidence that trees with high trunk and low canopy density are most influential in improving daytime thermal comfort in deeper canyons, while trees with low trunk and high canopy density are more effective for shallow canyons and open areas (Morakinyo et al., 2017). The cooling performance of trees is also dependent on the orientations and surface materials of streets (Ali-Toudert & Mayer, 2007). If those interactions and background circumstances are not considered, it could result in performance that is much lower than expected. Moreover, due to cities' limited capacity for new greenings and other physical changes, we need tailored decisions on quantity, type, and spatial configuration of vegetation (Zhou et al., 2017). Therefore, a better understanding of true causal relationships and magnitudes of interactive effects of vegetation under a variety of contexts is necessary to ensure mitigation strategies result in observable improvements in thermal conditions in urban environments.

Microclimate models are useful tools to test the relative impacts of influential parameters such as vegetation in changing temperatures and the important interactions. For example, ENVI-met, a popular microclimate computational fluid dynamic (CFD) model, has the capacity to simulate surface-plant-air interactions. In this study, through implementing the ENVI-met model, we evaluated the effectiveness of vegetation-related heat mitigation strategies under different combinations of contexts. For this purpose, we simulated different types of trees with different densities and tested their cooling performance in street canyons with different surface materials, geometries, and orientations under an extreme heat situation. Our results confirmed that vegetation under various circumstances would exhibit different cooling performances, and no one-size-fits-all vegetation-related strategy exists for mitigating extreme heat in cities. In our study, the maximum cooling effect of vegetation achieved through dense evergreen trees in deep canyons covered with concrete pavement material and oriented perpendicularly to the prevalent wind. From the planning perspective, this study's findings highlight the necessity of prioritized interventions based on the physical characteristics and landscape features of the site and avoiding generic strategies for all types of urban environments.

## PLANNING FOR CLIMATE CHANGE: AN “ALL-OF-THE-ABOVE” APPROACH TO FUTURE WATER SCARCITY

Abstract ID: 106

Individual Paper Submission

SCRUGGS, Caroline [University of New Mexico] [cscruggs@unm.edu](mailto:cscruggs@unm.edu), presenting author

HEYNE, Catherine [University of New Mexico] [cheyne@unm.edu](mailto:cheyne@unm.edu), co-author

Urban centers around the world are grappling with the challenges associated with population increases, drought, and projected water shortages. With a substantial global shortfall between water supply and demand expected by 2030, water planning strategies must adapt to a new reality characterized by higher temperatures and less precipitation, requiring new ways of thinking about water management, use, and governance. Commonplace strategies such as water conservation and non-potable water reuse might not be sufficient to adequately stretch water supplies in water-scarce parts of the industrialized world. In the US, planned potable water reuse (i.e., purification of domestic wastewater for reuse as drinking water) is emerging as the way forward to mitigate water shortages without significant changes to lifestyle, behavior, or infrastructure. But potable reuse is not the only solution: paradigm shifting and disruptive options that more holistically address water scarcity, such as composting toilets, water recycling at the household or building scale, and market-based approaches to water use, are also gaining traction, and they could be pursued alongside or instead of potable water reuse. However, these options would require more significant changes to lifestyles, behavior, policy, and infrastructure. While all of the options considered offer advantages, they each come with new concerns and challenges related to cost, public perception, and social norms. The goal of this conceptual work is to consider a number of plausible solutions to water scarcity – partial and complete, traditional and disruptive – to stimulate forward-looking thinking about the increasingly common global problem of water scarcity. We base the recommendations on a combination of our original research results on potable water reuse and the broader literature on water scarcity and interventions to combat the effects of climate change. The latest projections for climate change and water shortage indicate that it’s time to rethink the status quo for water management and use. We need design and development to be more holistic, producing more adaptive and resilient solutions, and accounting for our new climate reality. Communities will need to transition to multiple options from the suite of those that are feasible – considering societal costs, benefits, and risks of potential solutions – to create a future that draws from all available options to better manage and conserve water.

Stormwater management has become an entry-point for enhancing green infrastructure in cities. Green stormwater infrastructure governance is highly influenced by federal policy, but ultimately enacted by local stormwater management professionals (Hopkins et al. 2018, Johns 2019). The paper compares green infrastructure priorities and environmental concerns, values, and norms among stormwater managers in two metro-regions that have recently implemented regional stormwater programs, but under different conditions. Cleveland, Ohio must reduce combined sewer overflows in response to an Environmental Protection Agency (EPA) consent decree and Denver, Colorado must improve water quality to comply with EPA MS4 permit requirements. Both specify a minimum amount of improvement that must be achieved via green infrastructure; any additional implementation of gray infrastructure alternatives is discretionary. Studies have shown that the extent to which individuals hold relatively eco- versus anthropocentric environmental concerns, values, and social norms, can influence the adoption of pro-environmental behaviors, especially when those behaviors are voluntary (Brown et al. 2016). Less is known about the relationship between the nature of environmental concern and behavior in the professional realm (Brown et al. 2005, Keeley et al. 2013). Through a survey of stormwater management professionals (n=185), this study asks: To what extent do stormwater professionals' environmental concern influence green infrastructure prioritization beyond regional context? The results of chi-squared difference tests and k-means cluster analysis revealed that stormwater management priorities differed based on respondent's region--Cleveland and Denver respondents prioritized quantity and quality goals, respectively--but individuals holding eco- and anthropocentric environmental concerns, values, and social norms were equally abundant in both regions. The nature of individual environmental concern did influence priorities: anthropocentric managers were significantly more likely to prioritize human-centered stormwater management goals with reservations about cost and private property rights and ecocentric managers were significantly more likely to prioritize environment-centered goals, regardless of cost. Overall, human and environment-centered stormwater management priorities were given equal weight in both regions, likely due to equal abundance of manager-types, suggesting that differences in regional priorities mostly align with legal context.

The UNIPCC (2018) states that in order for the planet to avoid the most catastrophic effects of climate change, a broad global transition to zero carbon energy sources must be well underway by 2030, and humanity must achieve no new anthropogenic carbon emissions by 2050. An increasing number of cities, states, and countries have therefore committed to this goal, known as deep decarbonization. Deep decarbonization will require sweeping and fundamental changes in energy systems that are deeply embedded throughout societies, economies, and communities.

While there is great enthusiasm for local climate action and initiatives by leading cities such as C40, there are profound knowledge gaps between current planning knowledge and immediate needs to begin deep decarbonization. This gap exists in both directions. All deep decarbonization plans call for national, economy-wide transformation in five major categories: the electric power sector, buildings, transportation, industrial processes, land-based carbon sinks, and consumption and waste. However, as presently constituted, planning for land use and the built environment in the U.S. operates across multiple scales with competing authorities and jurisdictions; and either must anticipate or react to dynamic changes in society, technology, markets, and federal policy.

This article reviews the existing planning literature, seeking to answer four interrelated questions about planning in relation to the goal of deep decarbonization. First, what are the existing opportunities for planning to enable beginning steps towards deep decarbonization in the United States? Second, how does planning – in practice and its powers – need to change in order to enable deep decarbonization? Third, what new planning knowledge is required to achieve deep decarbonization? Fourth, what do ‘minimum’ needs for deep decarbonization imply for other planning concerns such as justice, equity, resilience, conservation, and growth? Answering these four interrelated questions provide the initial outline of a practice and research agenda for planning towards deep decarbonization.

Multiple recent deep decarbonization plans are listed below in the references.

## **BEYOND AIR POLLUTION AT HOME: DYNAMIC ASSESSMENT OF PERSONAL EXPOSURE TO AIR POLLUTION USING INDIVIDUAL DAILY MOVEMENT PATTERN DATA AND LOW-COST AIR SENSOR NETWORK DATA**

Abstract ID: 171

Individual Paper Submission

LU, Yougeng [University of Southern California] [yougengl@usc.edu](mailto:yougengl@usc.edu), presenting author

Human exposure to air pollution occurs through dynamic spatiotemporal interactions between humans and air pollutants. However, assessing personal exposure to air pollution poses challenges due to the limited availability of human movement data and the complexity of modeling air pollution at high spatiotemporal resolution (Nyhan et al., 2019; Park, 2020). This study addresses this gap by integrating 100,784 individual movement patterns with hourly air pollutant (PM<sub>2.5</sub>) concentrations at a 500-meter resolution that are derived from a low-cost air sensor network. It examined the impact of individual's mobility on their estimated exposures (to PM<sub>2.5</sub>) through a case study of Los Angeles.

In this study, spatiotemporal PM<sub>2.5</sub> concentrations are predicted using a random forest model based on low-cost air sensor network data (Lu et al., 2021). Air pollution exposures of individual subjects are assigned considering modeled PM<sub>2.5</sub> levels at their homes, workplaces, and free time activity locations. These exposures are then compared to the residence-only exposure metric, which does not consider daily mobility. The results suggest that subjects' exposure levels were usually underestimated when their movement patterns were not considered. Bias for the residence-based exposures was 0.87, relative to the exposure metric considering the movement pattern, which means that the exposure being underestimated by 13%. Exposure classification error increased for subjects that exhibited higher mobility levels, especially for full-time workers with longer commute distant. Overall, the personal exposures of workers were underestimated by 22% relative to the residence-based exposures to air pollution. For workers who commute more than 20 miles, their exposure levels can be at most underestimated by 55%. Additionally, we find the exposure classification error caused by ignoring the subject's movement pattern is also related to the variance of activity locations. Omitting mobility could result in underestimating exposures to air pollution for people who reside in suburban areas and work in urban areas, and tend to overestimate exposures for people residing in urban areas and work in suburban areas.

In this study, we find that ignoring daily mobility potentially leads to misclassification in health effect estimates. This study contributes to the environmental health literature by demonstrating that considering both the spatiotemporal variability of air pollution and human daily movement patterns is vitally important for accurate exposure and health risk assessments. It helps planners and policymakers identify the disadvantaged populations in air pollution exposure and entails targeted policy and planning implications.

## IMPROVING SUSTAINABLE WATER MANAGEMENT IN MAFATE, LA RÉUNION: THE CHALLENGE OF INSTITUTIONAL INERTIA

Abstract ID: 198

Individual Paper Submission

DISSART, Jean-Christophe [Univ. Grenoble Alpes] jean-christophe.dissart@univ-grenoble-alpes.fr, presenting author  
NICAULT, Maëlle [Univ. Grenoble Alpes] maelle.nicault@cr-reunion.fr, primary author

Characterizing trajectories of Socio-Ecological Systems (SES) is increasingly necessary to evaluate development policies and their sustainability. Using a case study of water management we analyzed the resilience trajectory of Mafate (Reunion Island) to address the following research question: To what extent do institutional analysis and the capability approach explain territorial resilience trajectories?

Institutional analysis is largely used to evaluate the sustainability of practices in SESs. These works show that management practices and rules are determined by the ecosystems as much as by the social, political and cultural human systems, and that they are formalized by institutions.

Here an institution is defined as a « set of rules actually used (the rule-in-use) by a set of individuals to organize repetitive activities that produce outcomes affecting those individuals and potentially affecting others » (Ostrom, 2010, p.68).

Therefore, we argue that resilience trajectories are determined by the capacities of agents to induce change in the rule-in-use. To test this hypothesis, we link the capability approach (Sen, 2001) and the SES Institutional Analysis and Development Framework (McGinnis and Ostrom, 2014) to characterize the real opportunities of agents to improve resource management.

In terms of methods, we spent two years following the collective work of a group of agents (local administrative authorities, inhabitants and private companies) involved in a water management project. Based on qualitative data collected via in situ observations and interviews, we built an exploratory tool to explore quantitatively the link between the definition of rule-in-use and the expression of collective capabilities. This approach also gives us insight into power relations and inequality trends to exert fundamental rights in Mafate.

The results show that it is close to impossible for local agents to bring about sustainable practices due to current constitutional rules. Indeed, even if agents clearly identify that moving beyond the status quo is necessary to bring about sustainability, to address injustice and to foster decent living conditions, their action is bound and therefore limited by national laws. Moreover, administrative agents, via their rigid vs. flexible interpretation of the law, impact the sustainability of water management at the local level.

The panarchy model (Gunderson and Holling, 2002) indicates that smaller systems adapt and change more quickly than higher systems, which are slower and present higher inertia. In our study this plays a key role in explaining the impossibility to quickly advance resource sustainable management projects in an SES that is strongly characterized by cascading connections between legal texts that condition the ability of the whole system to act.

In addition, whereas administrative agents rely on the know-how of Mafate inhabitants, the latter cannot be recognized as resource-managers in the formal sphere. Indeed, we find that legal vagueness, due to the specific situation of this inhabited national park core, plagues Mafate's water management.

This historical non-recognition of Mafate's human settlements and its translation into planning documents is the major variable explaining the impossibility of a formal contract to recognize inhabitants as water-management workers.

Consequently, coping strategies are the only way to ensure access to water. Those coping strategies induce overexploitation of the resource and the impossibility to enforce the right to the environment since, according to local arguments, human beings come first. This happens as the SES of Mafate is in an extremely vulnerable state (UICN, 2017).

The case of Mafate shows that formalization of fundamental rights and their translation into legal codes (here, the code of the environment, of urban planning and of public health) not only does not guarantee the enforcement of these rights but also may limit the possibilities of concrete improvement of living conditions for individuals.

## STUDY ON THE EVOLUTION TREND AND SPATIAL CHARACTERISTICS OF URBAN FLOOD RESILIENCE IN CHINA

Abstract ID: 206

Individual Paper Submission

REN, Jie [College of Architecture and Urban Planning, Tongji University] renjie\_cathy@163.com, presenting author  
WANG, Qixuan [College of Architecture and Urban Planning, Tongji University] wqx3@qq.com, co-author

With the continuous aggravation of urbanization and climate change, many cities around the world are affected by flood disasters. As a potential measure to tackle this problem, flood resilience has gradually gained more and more attention in urban studies. In this study, based on Pressure-State-Response model, an urban flood resilience evaluation system was constructed by analyzing the process of urban response to flood disturbance. Then it was used to measure the flood resilience of 29 representative cities in China from 2009 to 2018. The results showed that: (1) although Chinese cities became more and more resilient to flood, their overall resilience levels were low and most cities were faced with increasing flood pressure; (2) in different regions in China, the overall flood resilience was highly different and showed a "high in the north and low in the south, high in the west and low in the east" pattern, which was similar to that of the pressure index, while the interregional divergence of state index was relatively low and regions with developed economy and active innovation had a higher response index. In addition, by identifying the influential indexes, three measures are proposed to improve urban flood resilience: (1) facing up

to "pressure": exploring urban planning and construction method to achieve symbiosis with flood; (2) enhancing the "state": improve the flood carrying capacity of gray and green stormwater infrastructure; (3) "responding" actively: improve the construction of flood disaster emergency management system and pay more attention to undeveloped cities with high flood pressure.

#### A COMPARATIVE ANALYSIS OF SOCIAL VULNERABILITY AND PROXIMITY TO COAL-FIRED POWER PLANTS AND WINDMILL FARMS

Abstract ID: 221

Individual Paper Submission

CROWLEY, Julia [Western Carolina University] jccrowley@wcu.edu, presenting author

The Environmental Protection Agency (EPA) defines environmental justice as, “the fair treatment and meaningful involvement of all people regardless of race, color, national origin, or income, with respect to the development, implementation, and enforcement of environmental laws, regulations, and policies” (EPA, 2020, para. 1). Cutter (1995) dates the beginning of the environmental justice movement back to 1982 when a predominately African-American, rural, and poor area in Warren County, North Carolina was selected as the site to host a hazardous waste landfill. Residents, national civil rights groups, environmental groups, clergy, and members of the Black Congressional Caucus demonstrated, and although they were unsuccessful in hampering the project, the demonstrations set the stage for the environmental justice movement (Cutter, 1995). Five years after the Warren County demonstrations, the United Church of Christ (UCC) published a report that concluded that active hazardous waste management facilities and uncontrolled toxic sites were disproportionately located in African American and socioeconomically disadvantaged communities across the United States (United Church of Christ, 1987). The environmental justice literature often incorporates the concept of social vulnerability as it relates to hazard exposure (Chakraborty et al., 2020). However, Fatemi et al. (2017) found that a large proportion of studies identify indicators of social vulnerability to natural hazards, but there is a lack of studies that examine if these indicators also measure social vulnerability to technological hazards. The siting of technological hazards raises concerns pertaining to environmental justice and social vulnerability. More specifically, coal-fired power plants continue to raise concerns in regards to the environmental justice of the neighboring residents.

This research examines if there are differences in the social vulnerability of U.S. residents living near a coal-fired power plant compared to residents living near a wind mill farm for facilities in operation as of April 2020. To address the research question, the buffer tool was used in ArcGIS to create a database of U.S. census tracts located either within a five-mile radius of a coal-fired power plant or a wind mill farm (N = 5,776). Two binary logistic regression models were then created with demographic data for 2020 and 2010 to account for the decline of the coal power industry and rise of the wind power industry. The dependent variable was binary, and a value of 1 was assigned to

all census tracts in the U.S. that are located within a five-mile radius of a coal power facility, and a value of 0 was assigned to all U.S. census tracts that are located within a five-mile radius of a wind power facility. The independent variables represented socially vulnerable populations that were commonly discussed in the literature as well as the control variables of population density and the percent of the population employed in the utilities sector. Results suggest that U.S. census tracts with higher percentages of populations aged 25 and over with a Bachelor's degree, living in poverty, minorities, and employed in the utilities sector were significantly more likely to live within a five-mile radius of a coal power facility than a wind power facility for both the 2020 and 2010 models. The only major discrepancy between the two models involved the percentage of owner-occupied housing as the variable was only a significant predictor for the 2010 model. Census tracts with higher percentages of owner-occupied housing were less likely to be located near a coal power facility than a windmill farm. The presentation will conclude with a discussion that links the above-described findings to planning practice and education. This includes a description of hazard mitigation planning recommendations for socially vulnerable populations living near toxic sites.

#### **REBUILDING FOR RESILIENCE – REEXAMINING A 10-YEAR PLANNING PROCESSES AFTER THE GREAT EAST JAPAN EARTHQUAKE AND TSUNAMI**

Abstract ID: 242

Individual Paper Submission

IUCHI, Kanako [Tohoku University] [kxiuchi@gmail.com](mailto:kxiuchi@gmail.com), presenting author

A classic model of disaster recovery suggests four phases: emergency, restoration, reconstruction I and II (Haas, Bowden, & Kates, 1977; Johnson & Olshansky, 2016). Various reconstruction activities develop during this time, a phenomenon theorized as the “processes compressed in time (Olshansky, Hopkins, & Johnson, 2012).” Recovery governance also develops in a sequence. At the initial stage, rebuilding plans and programs develop, and coordination bodies emerge to initiate the process. Recovery activities then roll out with stakeholders and funds allocated. When recovery approaches its ending, affected regions are anticipated to be reconstructed with a better economy (Haas et al., 1977). Recently, resilience is increasingly used to explain the outcomes (Sou, 2019).

This paper aims to critically review a decade of the recovery process in the Tohoku region, where the idea of resilience was included in rebuilding. This examination is important to revisit the existing recovery theory and provide new insights and understandings to better recover from the disasters. I moved to Tohoku after the earthquake in 2013, to closely observe the reconstruction effort, and have conducted various research projects, served on national and prefectural research committees, and engaged in the planning efforts in the affected regions. While this paper examines Tohoku's overall rebuilding with an ethnographic approach, two fishing communities in Kamaishi City (Iwate prefecture) and Kesenuma City (Miyagi prefecture) where information has been collected via interviews and locally available documents are also highlighted.

In many ways, recovering from the tsunami has been distinctive from other past recoveries in Japan – first, an unprecedented amount of funding (USD 320 billion) was secured, 40 percent of which was used for building infrastructure, for the region facing the fastest population decline. Second, the funding secured at the national level was allocated to local governments through a bottom-up recovery mechanism (Iuchi, Maly, & Johnson, 2015). This reflected the national vision that local governments to take leadership in the recovery. Third, all stakeholders, including governments, communities, and individuals, shared a notion to rebuild robust, so that the affected areas will be safe from future tsunamis. Lastly, at the 10th year after the tsunami, infrastructure projects are about to finish without major modifications from the original plan.

Almost all the affected local governments envisioned rebuilding robust by reorganizing spatial layouts of the affected regions. Available program options to do so, among several others, included elevating the land, relocation to higher grounds, and levee construction. Since various stakeholders owned these programs, local governments had to coordinate in the center without them knowing the best way to approach the “robust” rebuilding. This was also the case for Kamaishi City and Kesenuma City governments.

Interestingly, however, two communities in their jurisdictions had unique rebuilding processes to result in different physical forms and higher levels of satisfaction, distinctive from others in the affected region. The research found that rebuilding processes are the key factors making such differences, including: i) recurrent community initiatives towards their defined goals; ii) search on professional helps to reflect community ideas in the plans and implementation; and iii) preserving their ways of living to carry over to the reestablished livings. Two communities examined successfully redefined their ways of living in the process and owned the process to make vision materialized. Having the recovering communities own their processes to reflect their views of resilient living is essential, especially at this age when resilience is underscored while interpretations are varied beside strong infrastructure and developed economy.

#### **BETTER THE SECOND TIME AROUND? A LONGITUDINAL ANALYSIS OF THE QUALITY OF MANDATED PLANS**

Abstract ID: 254

Individual Paper Submission

LYLES, Ward [University of Kansas] wardlyles@ku.edu, presenting author  
 OVERSTREET, Kelly [University of Kansas] keheiman@ku.edu, co-author  
 SUTLEY, Elaina [University of Kansas] enjsutley@ku.edu, co-author

Since the 1990s, attention to the myriad ways plans can be evaluated has exploded, particularly in the realm of systematic analysis of the content of plan documents by scholars. Plan quality evaluation studies have covered a lot of conceptual, topical, and spatial territory. This range includes analyzing the fact base and policy content, the communicative characteristics, the process dimensions and more; analyzing plans dealing with natural hazards, environmental conservation, affordable housing, transportation, and more; and analyzing plans from Australia, Europe, the Americas, and more (Lyles and Stevens 2014). Analysis of plan documents has even moved beyond looking at lone plans in isolation to looking at networks of inter-related plans (Berke et al. 2015). Yet, temporal comparisons of plans remains severely under-developed as only two studies exist that assess changes in plan quality over time (Brody 2003 and Lukasiewicz et al. 2020). Longitudinal analyses are crucial for answering questions such as: Does the quality of plans change over time as they are updated? If plan quality does change, how do the changes vary across different components of plans? And, what factors, such as state or federal mandates for regular plan updating, explain variations in changes in quality?

We help answer these questions using a comparative, longitudinal research design. We apply systematic plan quality content analysis methods (Lyles and Stevens 2014) to a sample hazard mitigation plans from 84 counties and cities in Florida, Georgia and North Carolina. These three states share exposure to similar hazards and similar recent disaster experiences, while varying in terms of their state planning frameworks. Two plans were coded for each jurisdiction, one from the first wave of adoption between 2005 and 2010, coded as part of a Department of Homeland Security-funded study (c.f. Lyles, Berke, and Smith 2014) and from the second wave between 2010 and 2015, coded as part of an ongoing National Science Funded study (#1760183). Specific components of the plan that we assessed include 1) aspects of the planning process, 2) integration of the coded plan with other planning initiatives, 3) inclusion of a wide array of risk reduction policies, and 4) general characteristics of the plan document. All of the plans in our sample were adopted in compliance with the mandates of the federal Disaster Mitigation Act of 2000.

Our findings demonstrate a mix of statistically significant differences in plan quality over time and across the states, as well as notable patterns of no statistically detectable difference in quality. The pattern of variations in the differences point to the influence of state-level approaches to supporting local mitigation planning, including both patterns of difference that remained the same in the two waves as well as patterns of difference that changed over time. Also, the differences in quality are far from uniformly positive; that is, some aspects of plans improved in quality and others aspects declined. Given the low baseline of hazard mitigation plan quality found in prior studies, this result is discouraging.

We discuss practical implications for federal policy, state coordination of local planning, and local planning processes to reduce risks from natural hazards in a changing climate. An example of these implications is the tradeoffs that arise if states encourage multi-county regional planning instead of plans developed at the single-county level. We also discuss the implications for planning scholarship about if and how developing planning functions as a form of group learning and challenges to assumptions about plan monitoring and implementation.

 SALVESEN, David [University of North Carolina at Chapel Hill] dsalv@email.unc.edu, co-author

Average annual, hurricane-related damages in the U.S. have increased significantly over the past century. This trend, combined with population growth patterns and a variety of negative predicted effects of climate change, has contributed to a growing consensus that managed retreat will be a necessary component of flood mitigation strategies going forward. To date, floodplain buyouts have constituted the primary federally-funded approach to managed retreat in the US. In buyout programs, governments purchase flood-prone properties from willing sellers, usually restoring the land to some sort of open space. However, efforts to assess the effectiveness of floodplain buyouts, and to identify opportunities to improve the design of buyout programs, require an understanding of their full costs across the different levels of government involved. Further, delineating and quantifying transaction costs may enable better implementation and more robust evaluation of the effectiveness of buyouts.

Using a transaction cost framework, we analyze the costs of activities that comprise floodplain buyouts. Federal data do not distinguish transaction costs, but they do suggest that the cost of acquiring properties often accounts for 80% or less of total project costs. Through a systematic review (n = 1,103 publications) and an analysis of government budgets (across n = 859 jurisdiction-years), we find limited sources with relevant cost information, none of which report transaction costs. While we are able to use this literature to identify which activities incur transaction and production costs, the absence of transaction cost data inhibits more targeted policy reform and adoption of best practices. More detailed data collection and reporting can inform more impactful and equitable buyout policy.

## PLANNING IN THE PHASE FOG: INTEGRATING MITIGATION AND RECOVERY PLANNING IN THE MIDST OF REPETITIVE DISASTER EVENTS

Abstract ID: 258

Individual Paper Submission

WU, Yiwen [University of Kansas] yiwen@ku.edu, presenting author  
LYLES, Ward [University of Kansas] wardlyles@ku.edu, co-author  
OVERSTREET, Kelly [University of Kansas] keheiman@ku.edu, co-author  
SUTLEY, Elaina [University of Kansas] ejsutley@ku.edu, co-author

Communities around the globe now experience repeated major disaster events in quick succession as anthropogenic climate change exacerbates existing risks from natural hazards like hurricanes, floods, and fires (Collins et al. 2019). In the United States, coastal areas of the Southeastern states exemplify the new normal consisting of a perpetual process by states, counties, and municipalities of preparing for a major disaster, recovering from one, and preparing for another close on the heels of the first (National Climate Assessment 2018). For instance, Matthew and Florence flooded North and South Carolina in 2016 and 2018. Irma and Maria, which brought winds and water to Florida, were separated by just weeks in 2017 and were followed by the Category 5 Michael in 2018. In 2020, the Hurricane season exhausted the list of names pre-approved for the year, with 30 total named storms, of which Laura, Marco, Sally, Beta, and Delta all hit land in the east Texas to West Florida stretch of the Gulf. The conventional Disaster Mitigation-Preparedness-Response-Recovery cycle was never as linear as it sounded Randolph. But now that model is bordering on farcical. For planning scholars and practitioners, this 'phase fog' dynamic raises myriad questions about the role of discrete planning processes and documents intended to have long-range horizons but, in reality, needing to be updated before they are completed. It also raises questions important for the emerging scholarship on networks of plans (Berke et al. 2015, Bacău, Grădinaru, and Hersperger, 2020). Here, we tackle questions including: 1) to what extent are hazard mitigation and recovery plan documents integrated? 2) to what extent are hazard mitigation and recovery planning processes integrated? And 3) what state and local factors explain variation in the integrated of mitigation and recovery efforts?

We answer these questions using a comparative case study research design as part of an ongoing National Science Funded study (#1760183). We apply systematic plan quality content analysis methods (Lyles and Stevens 2014) to a sample hazard mitigation plans and recovery plans to a sample of nine counties in Florida, Georgia and North Carolina. We also conduct digital surveys and semi-structured interviews with key stakeholders in hazards planning in each jurisdiction. These three states share exposure to similar hazards and similar recent disaster experiences, while varying in terms of their state planning frameworks. The particular counties are an availability sample because very few counties in the region have disaster recovery plans, although virtually all have hazard mitigation plans in compliance with the mandates of the federal Disaster Mitigation Act of 2000. Specific themes we explored across each data set include 1) integration across the plan documents, with particular attention to the policies and actions in each plan; 2) the connections (or lack thereof) in the network of stakeholders in each planning process; and 3) connections to long-term land use planning and other planning processes (e.g. transportation, climate change, housing, etc.).

Our findings demonstrate variations across all themes at the state and local levels. The patterns of variation provide insight into different historical state-level approaches to coordinating planning, as well as ongoing changes occurring within states. Variations in local context also appear to explain differences in local planning. Two findings speak to broader challenges facing planning in the 'phase fog:' 1) federally mandated hazard mitigation plan quality remains low and 2) most jurisdictions do not have robust recovery planning process, much less integration of recovery planning with mitigation planning. We conclude with practical implications of this new normal of hazards planning for federal policy, state coordination of local planning, and local planning processes to reduce risks from natural hazards in a changing climate.

## WHAT DOES NEIGHBOURHOOD CLIMATE ACTION LOOK LIKE?

Abstract ID: 272

Individual Paper Submission

JOSHI, Neelakshi [University of Alberta] [joshi2@ualberta.ca](mailto:joshi2@ualberta.ca), presenting author

AGRAWAL, Sandeep [University of Alberta] [sagrawal@ualberta.ca](mailto:sagrawal@ualberta.ca), co-author

LIE, Shirley [University of Alberta] [lie@ualberta.ca](mailto:lie@ualberta.ca), co-author

Cities are recognized as an important scale for framing and implementing plans and policies for action on climate change (Bulkeley et al., 2011; Wolfram and Frantzeskaki, 2016). Within the structure of cities, it is in urban neighbourhoods that climate action gets 'contested, deconstructed and reconstructed' (Wittmayer et al., 2014). Further, the neighbourhood scale is easily recognized by urban residents as a place for participation and experimentation around climate action (Rohe, 2009). Concepts like low-carbon localism are beginning to define and create an imaginary for bottom-up climate action in urban neighbourhoods (Brownill and Bradley, 2017). Despite its importance, scholarly literature has played limited attention to the scale of the neighbourhood as a site for climate action. The objective of our paper is to provide an overview of the role of neighbourhoods in leading bottom-up climate action and its implications for urban planning.

We conducted a qualitative scoping review of 79 scholarly articles published between 2000 and 2020 identified through three academic databases (Scopus, Web of Science and Google Scholar) addressing neighbourhood climate action. Our objective was to establish the existing conceptualization and positions of neighbourhoods in leading climate action, focus of climate action efforts (adaptation or mitigation), actors involved (residents, local organizations, city governments and academics), theories and concepts guiding neighbourhood climate action, methods and tools of engagement, governance models in place, challenges and future avenues of research and action. Our scope was limited to English language literature emerging from cities of the Global North that involved neighbourhood residents as key-actors.

Our findings indicate that while neighbourhoods have historically engaged with issues of social and environmental sustainability and in turn contributed to address them, climate change adaptation is a nascent area of participation. A majority of papers on neighbourhood climate action involved local academic institutions, neighbourhood associations and non-governmental agencies. Authors engaged with a wide range of concepts like social mobilization to establish practice oriented models like LEED for Neighborhood Development (LEED-ND). We also found that the presence of existing governance structures like neighbourhood organizations or residents

associations help design, implement and anchor climate action at the neighbourhood scale.

As cities plan and prepare for transformative urban change to address the wicked problem of climate change, the scale of the neighbourhood emerges as an important site for research and practice. Our findings provide a vocabulary for rethinking neighbourhood level planning and stress the need to build upon the tools available for it in light of engaging neighbourhoods for urban climate action.

## FOOD SECURITY AND CLIMATE CHANGE: DISTINCT IMPACTS ON RURAL COMMUNITIES IN THE GLOBAL SOUTH AND NORTH COUNTRIES AND IMPLICATIONS FOR ADAPTATION EFFORTS

Abstract ID: 273

Individual Paper Submission

RAJ, Subhashni [University of California Davis] subhashn@buffalo.edu, presenting author

ROODBAR, Sam [UC Davis] sroodbar@ucdavis.edu, co-author

BRINKLEY, Catherine [UC Davis] ckbrinkley@ucdavis.edu, co-author

WOLFE, David [Cornell] dww5@cornell.edu, co-author

The determinants of food security in the Global South and North countries differ and hence we hypothesize that unique strategies for adaptation, beyond a focus on food production, are required. Globally, 805 million people are chronically hungry. Meeting future food needs must consider not only global population increase and changing diet preferences that will increase resource demand but also climate change impacts on food security. Research shows climate change will exacerbate food security through multiple pathways, including increasing the total number of food insecure people globally. Climatic factors that negatively affect food production vary by region and include: increasing heat stress, drought, flooding, and increased weed, disease, and insect pest pressure. Many low latitude regions are particularly vulnerable because high temperatures already constrain crop and livestock production, while some high latitude regions could potentially benefit from longer, warmer growing seasons. To understand climate impacts on the food systems, scholars need to look beyond food production, and consider the food access and capacity for utilization as well. The extent to which climate change will affect food security and human health will ultimately depend on the degree to which our food and production systems have been adapted.

In this paper, we review unique climate, agricultural, demographic, and socio-economic aspects of rural populations in developed and developing regions, to elucidate an array of climate change adaptation interventions necessary to bolster food security in different regions. We focus on two case studies on the determinants of food insecurity in rural communities in the United States and India. Our review indicates that while there are overlaps in effective strategies for improving food security for rural populations in a changing climate, the “one-size-fits-all” approach

suggested in much of the adaptation literature lacks the nuance needed for planning strategic and cost-effective interventions. Emphasis on agricultural production in developing regions where a majority of individuals living in rural areas are smallholder subsistence farmers will benefit the majority of the population. In the Global north, an emphasis on food access and availability is necessary to improve food security among the populous.

As US cities propose ambitious climate plans, many question if and how they can be implemented equitably. The Biden administration has proposed sweeping climate goals and funding mechanisms that will likely provoke renewed interest from state and local governments as they seize a window of opportunity to implement projects. While the impacts of climate change will disproportionately affect vulnerable populations, planning solutions like mega infrastructure projects, managed retreat, and other large-scale projects have potential to displace marginalized communities or protect others at their expense. Additionally, equity and vulnerability considerations are likely to differ in scope and scale for affected population(s) across adaptation and mitigation strategies.

This paper asks three central research questions: 1) How do US cities integrate equity considerations into their climate mitigation and adaptation plans; 2) how do plans prioritize and reconcile equity across adaptation and mitigation efforts, and 3) do these equity considerations include measurable metrics for evaluation? Answering these questions will update knowledge on equity in local climate and sustainability plans, as Schrock et al. (2015) found few city climate plans that incorporated social equity goals and Hurlimann et al. (2021) found limited integration of adaptation and mitigation efforts in urban planning documents. This paper will provide an updated review of city-level climate action plans and address a gap in the literature by investigating how equity goals might be measured and evaluated.

Social equity in the US urban planning context traces back to the “social progressive era” of the late 19<sup>th</sup> and early

20<sup>th</sup> century, gaining popularity during the 1970s. These themes have evolved and diversified in contemporary planning contexts with Fainstein’s conception of ‘just cities’ or in conflict with growth and environmental preservation objectives in Campbell’s ‘triangular model’ of sustainable development (Campbell, 1996; Fainstein, 2000). Today, persistent environmental injustices and systemic racism push planners to further scrutinize equity implications in all aspects of practice. American Planning Association (APA) guidelines assert that “planning for equity is intended to challenge those planning processes that result in policies, programs, and regulations that disproportionately impact and stymie the progress of certain segments of the population more than others”. With specific attention to climate planning, the APA calls on planners to move beyond concepts of resilience, where everyone endures, to climate equity, with awareness of impacts specific to marginalized and vulnerable populations.

We focus on climate action plans of cities in the United States with populations greater than 300,000. Among 66 cities that fit this criteria, 49 cities have a publicly available climate action plan. Our preliminary research revealed that about 75% of these plans were published or updated within the past five years. This project proposes to analyze these plans using APA’s guidelines, coding for the presence of equity considerations and equity outcomes that can be measured, quantified, or otherwise evaluated. Our findings will not only reveal the best practices among these plans, but also illuminate their shortcomings and yield recommendations for planners to prioritize equity in climate solutions.

To prioritize just urban climate action, we argue that in addition to including end goals to enhance equity in their plans, cities must provide measurable targets that can be monitored for evaluating equity goals. As climate plans can potentially result in socio-spatial inequities, planners should build in opportunities for equity checks as plans are crafted and leverage emerging policy tools to meet these goals (Hughes, 2020).

One of the key challenges for cities across Canada is coping with future threats from natural hazards and environmental risks. Recent disaster events in Canada – Quebec's 2019 spring floods, British Columbia's 2018 wildfires, and Fort McMurray's 2016 wildfires – have impacted residential communities and raise questions about how municipalities understand and manage risk.

In recent times, risk communication has emerged as an important risk-reduction and resilience-building strategy used by multiple actors to deal with future risks to communities (Kar & Cochran, 2019). Risk communication can play an essential role in increasing risk perception and mobilizing adaptation action among communities and individuals, ultimately helping all impacted stakeholders – homeowners, municipal and provincial governments, and developers – prepare for future disaster events (Henstra et al., 2019). Risk knowledge can be acquired, perceived, and used in different ways by different actors depending upon their developmental priorities (Nathan, 2008).

Municipalities in Alberta, Canada, are at risk from multiple hazards, such as wildfires and flooding, which have increased in frequency and intensity as a result of climate change (Sauchyn et al., 2020). According to the Insurance Bureau of Canada (2021), Alberta experienced the most frequent and costliest disasters in the last decade. As a result, municipalities in Alberta are beginning to develop adaptation plans using existing regulatory strategies and legislation to reduce the exposure of new developments to these hazards. Recent literature notes that, throughout all stages of Alberta's provincial disaster recovery process, impacted individuals and communities are not engaged or empowered to reduce their vulnerability to future risks (Bogdan et al., 2018).

In the above context, the linkages between municipalities' risk communication approaches and existing developmental priorities remain underexplored. The main research question we ask is: In what ways do risk communication and urban development processes interact in municipalities in Alberta?

Using a multi-method approach, we explored the above question taking five municipalities of varying sizes in Alberta as case studies – Calgary, Canmore, High River, Fort Vermilion, and Fort McMurray. We analyzed the existing regulatory framework, as well as relevant municipal plans, policies, and programs for risk communication in the study areas. We built on this by conducting semi-structured interviews with stakeholders (municipal officials, developers, insurance agencies, and homeowners).

We present two key findings from the study. First, risk communication in Alberta's municipalities is practiced through four main approaches — strategic actions (institutional changes); public engagement (creating risk awareness); localized planning (updating regulations and development permit processes); and social media marketing. Second, our interviews reveal that risk communication in Alberta's municipalities is shaped by technical risk knowledge as well as multiple, often conflicting, developmental priorities at the provincial, municipal and individual levels. Risk communication is a layered process involving a complex interdependence between actors within a multi-level governance framework.

We highlight that recent extreme weather events in Alberta have provided a 'window of opportunity' for reviewing existing risk information — and its communication — changing key perceptions around risk, building trust between communities and institutions, and creating opportunities for participatory forms of risk communication in the future. The outcomes of this study will inform short and long-term municipal risk management approaches and improve regulatory mechanisms for risk-sharing in future developments across Alberta. Further, research findings will facilitate the creation of guidelines for effective risk communication during the development approval process.

## INEQUITY IN STORMWATER INFRASTRUCTURE PERFORMANCE IN HOUSTON: A MULTILEVEL ANALYSIS

Abstract ID: 296

Individual Paper Submission

LEE, Jessica [Texas A&M University] [jjlee8605@tamu.edu](mailto:jjlee8605@tamu.edu), presenting author

VAN ZANDT, Shannon [Texas A&M University] [svanzandt@arch.tamu.edu](mailto:svanzandt@arch.tamu.edu), co-author

Stormwater infrastructure is an important physical element that can be used to deter extensive localized flooding in an area by controlling stormwater runoff during rainfall events. Stormwater infrastructure performance is normally decided by the local government's stormwater management project allocation within a limited budget. Based on the decisions on stormwater management, the design capacity and maintenance condition of infrastructure elements in an area are determined, which in turn influence the overall infrastructure performance and the extent of floods during and after rainfall events.

To understand the distribution of impacts from localized flooding, it is important to examine whether stormwater infrastructure management is equitably allocated for adequate stormwater infrastructure performance across a municipality. A growing number of recent studies have examined the uneven distribution of stormwater infrastructure capacity across neighborhoods within a municipality using an environmental justice framework (Hendricks, 2017; Mandarano, et al., 2017; Porse, 2018). However, such studies are limited by infrastructure types and measurement, while considering the macro-scale design capacities of one or two types of infrastructure only at the neighborhood level, such as census block group, tract, or watershed level. The neighborhood level analysis has a higher group heterogeneity than the smaller units, and the aggregated data cannot represent the overall infrastructure performance of the neighborhoods. To reduce the group heterogeneity, measurements at the micro-scale level should be considered.

Using a city-wide cross-sectional multilevel analysis, this study addresses the gaps by examining the distribution of micro-scale stormwater infrastructure performance across diverse neighborhoods in the city of Houston, Texas. Specifically, this study explains how the design capacity and maintenance condition of stormwater infrastructure at the road segment level are associated with the socio-economic compositions of the adjacent parcels and neighborhoods where the road segments are located. Road segment is the smallest unit in which infrastructure elements tend to have similar characteristics. Results presented here are from secondary data analyses of public stormwater infrastructure spatial data, which is merged with public road segment and adjacent parcel data, Census block group data, as well as impervious surface data of the city of Houston. This study uses multilevel analysis to relate stormwater infrastructure performance (i.e., total volume of conveyance systems normalized by imperviousness and age of sewers) to the socio-economic characteristics of people who will be influenced by the infrastructure performance (i.e., property values of parcels adjacent to road segments, as well as income and race/ethnicity of neighborhoods where the road segments are located).

The preliminary results support the hypotheses based on the findings from environmental justice and hazard vulnerability literature that people of color and low-income have insufficient access to public resources and capital investment because of persisting economic and racial segregation across the US. Specifically, socially vulnerable people, residing in neighborhoods with a higher percentage of Black or Hispanic people and lower median household income, as well as properties with lower values, live in areas with more roadside ditches and less storm sewers, as well as less total volume of conveyance systems for stormwater management when controlling for density and imperviousness. Socially vulnerable people reside in areas having more deteriorated storm sewers when controlling for density and imperviousness. The findings of this study have substantial implications when developing land use plans and Capital Improvement Plans (CIP) to reduce the impacts from localized flooding and make them more equitable.

#### **URBAN ENVIRONMENTAL FACTORS ASSOCIATED WITH SPATIAL DISTRIBUTION OF PARTICULATE MATTER CONCENTRATIONS : THE CASE STUDY OF SEOUL, KOREA**

Abstract ID: 316

Individual Paper Submission

AHN, Haesung [Chung-Ang University] [liki1229@naver.com](mailto:liki1229@naver.com), presenting author

LEE, Jeongwoo [Chung-Ang University] [jeongwoo@cau.ac.kr](mailto:jeongwoo@cau.ac.kr), co-author

#### Backgrounds

Particulate matter (PM) in the air is a serious threat to public health in many urban areas in Asia. Developing air quality management strategies is an important but a difficult task because the distribution of air pollutants in cities are complicated and sensitive to large number of factors related to urban environment. The relationship between air pollution and urban environmental factors has been studied in recent years. The results of these studies showed that the distribution of air pollutants is dependent on temporal and spatial variability such as traffic volume, human activity, land use, and the amount of vegetation. Although previous studies have discussed the characteristics of pollutant distribution in urban areas by using sensor-based data, detailed analysis was limited due to sparse monitoring sampling. This study investigates the influence of urban environmental factors on air quality with fine-grained air quality data acquisition to determine main contributors of air pollution both on regional and local scales in Seoul.

## Methodology

This study analyzes PM concentration from fine-grained monitoring sensors, which are installed at 850 locations in the city of Seoul. The concentration of PM was measured from April 2020 to January 2021. Whereas the conventional land use regression model has been used to simulate pollutants' concentration in previous studies, this study applies geographically weighted regression (GWR) to detect non-stationary relationships between the urban environment features and the distribution of PM. Potential urban environmental variables including both macro and microscopic factors are considered. At macro scale, traffic volume and network accessibility are assessed. Ordinary kriging is used for spatial interpolation of 135 values of annual average daily traffic volume, whereas Space Syntax was used to assess relative accessibility of a region. At micro scale, urban environment features around the monitoring sensors are measured by ArcGIS and extracted as three categories: transportation infrastructure, land use, and building densities. The buffer radius of local scale variables ranges from 100m to 1km.

## Results

First, the results of the study show that the spatial scope of environmental factors that affect PM concentration are different. On one hand, the variables of building densities such as floor area ratio, lot coverage, and building height show positive associations with higher concentration of PM at the range of 300m around monitoring sensor. Similarly, the variables of mixed land use show a positive association at the scope of 300m buffer. On the other hand, the variables of transportation infrastructure are significant with larger buffer sizes. The arterial segment length has a positive association with PM concentration at the scope of 500m, whereas the number of subway stations and length of highway segments show positive association at the scope of 1km around monitoring sensor. Second, the study demonstrates that GWR models show better performance than global multivariate regression models with lower AICc. The results show that there is a spatial heterogeneity. The determinants of PM concentration are different by areas. PM concentration is highly influenced by width of the road where the monitoring sensor is installed especially in the case of old downtown compared to the case of new business district of Seoul.

## Implications

Findings of the study helps to give us a better understanding of how PM concentrations are affected by different urban environment factors and how spatial scope of influence differs among these factors. The results indicate that implementation related to air quality management should be more targeted to reduce personal exposure to PM according to the geographical context. The study has potentially far-reaching implications for urban planning and design practices with air pollution management strategies.

## SOURCE WATER PROTECTION PLANNING IN OHIO: ASSESSING THE INTEGRATION OF LAND USE PLANNING AND WATER MANAGEMENT

Abstract ID: 324

Individual Paper Submission

WILSON, Jessica [Ohio State University] wilson.3499@osu.edu, presenting author

Amendments to the U.S. Safe Drinking Water Act in 1986 and 1996 highlight a shift in relying solely on treatment technology and responses to contaminants to a focus on incorporating the proactive protection of public drinking water resources at the source. Through direction from state-level source water protection (SWP) programs, public water systems create protection plans for drinking water sources. While these protection plans and related implementation programs rely on land use-based data, policies, and decision making, including regulatory and non-regulatory interventions, they have received limited attention in planning literature (Lindsey & Schoedel, 1997).

Recognizing a divide between land use planning and water resources management, there is increased momentum in planning practice and research to integrate the two (Dyckman & Paulsen, 2012; Cesanek et al, 2017). Yet such an integrated approach involves more than collaboration between planners and water managers. Coordinated land and water management occurs at scales beyond political jurisdictions, involves the incorporation of both scientific and place-based knowledge into planning and management processes, and focuses on increasing economic and social benefits while ensuring environmental protections (Grigg, 2016). However, barriers exist in collaboration and decision-making across jurisdictions for shared water resources and protection areas. Further, challenges may also include creating institutions that support the integration of historically separate planning and management sectors and activities. Literature suggests that effective governance is key to overcoming such challenges. I argue that SWP plans and programs provide an opportunity for examining an integrated approach to land and water governance and management. As such, my research addresses the following question: How do governance arrangements impact the management and integration of land and water resources for SWP?

Using a multiple case study approach, I examined five SWP plans/programs in Ohio (3 using groundwater and 2 using surface water sources). Data collection included document review of SWP plans, related water management plans, and land use plans and policies, as well as semi-structured interviews with public water system representatives, planners, zoning managers, and other relevant actors involved in SWP planning and management. For each case, I analyzed if and how the five plans/programs incorporated elements of integrated land and water management for SWP. I draw from collaborative planning, governance, and integrated water management literatures to assess the five cases. While source water protection in Ohio is administered by a single state agency (Ohio Environmental Protection Agency), the case analyses highlight variation among protection plan implementation efforts, collaborative structures for protection, and scope.

This paper focuses on two main themes that emerged in the comparison of the five cases: (1) the importance of boundary spanners for SWP efforts, and (2) the variation in the framing of the role and scale of SWP across cases and sectors. The results suggest that moving from a protection plan to implementing a SWP program involves continued inter-governmental and cross-sector collaboration, as well as sustained capacity for SWP. The planning process and subsequent protection efforts also provide a means of establishing collaborative governance arrangements to protect the quality of drinking water resources. Results from this paper are expected to inform planning practice and theory through identifying points of planning intervention into local and regional SWP efforts. Implications for practice from a pragmatic perspective also include the necessity of understanding what integration means for and in practice for planners and water suppliers alike.

## UNDERSTANDING PLACE THROUGH ENVIRONMENTAL HISTORY: ADAPTIVE CYCLES AND GOVERNANCE

Abstract ID: 328

Individual Paper Submission

KELLOGG, Wendy [Cleveland State University] w.kellogg@csuohio.edu, presenting author

This research extends prior work based in resilience theory to understand the evolution of governance of a watershed as a social-ecological system (SES) (Kellogg and Samanta 2017). The current work developed an environmental history of the Chagrin River watershed in NE Ohio, extending the period of change backward to the creation of the Connecticut Western Reserve in 1795. Research objectives were to 1) understand how changes in landscape over 200 years impacted water quality and quantity in the river and altered its broader biophysical status; and 2) to understand the resilience of the social – ecological system to disturbances, disruptions, and thresholds (Folke 2006) through different time periods of natural history, socio-economic change, and perceptual (political/ideological) shifts (Hughes 2008). How did management, planning and governance systems change through several major historic periods in the social-ecological system to reflect changing perceptions of actors (DuPlessis 2009)? Can incorporation of resilience theory with environmental history more effectively identify the evolutionary change (the adaptive cycle) of a watershed, including the attributes of nested and cross scale interactions and of multiple equilibria which relate directly to the variations in biophysical conditions in sub-watersheds?

Primary and secondary sources were used to identify historic change to landscape from settlement, resource extraction and political institutions (e.g., surveyor notes from 1796, land sales maps, tax records, Sanborn maps, and state and county aerial photos). Data for changes to the river (e.g., water quality, changes to stream morphology, and water quantity) were obtained from 19<sup>th</sup> and 20<sup>th</sup> century newspaper accounts, and local, state and federal agency testing databases. Timelines of disruptions and trends for these attributes knit data from disparate times, scales, and sources together and were compared to discover key social or biophysical thresholds and ecological regime changes indicating evolution of the system across scale and time.

The timelines indicate critical disruptions to the SES, some internal and periodic (such as flooding) and some external (e.g. opening of the Erie Canal in NY state), interspersed with longer term landscape change. Settlers and entrepreneurs shifted their subsistence and economic exchange behavior to substitute for declining ecosystem services, which in turn often initiated a secondary round of landscape change, causing further degradation of ecosystem services over two hundred years. A counter trend to restore ecosystem services began in the late 19<sup>th</sup> century and accelerated after passage of the CWA, resulting in a new governance structure, one explicitly focused on restoration. Sub-watersheds experienced different drivers and changes to landscape and ecosystem services across differing time scales, and adaptation in these watersheds reflected the perceptions of actors who dominate governance in these smaller geographies.

Relevance of this approach stems from planning as primarily a place-based enterprise. One of the outcomes of developing the environmental history was a deeper appreciation of the value of the Chagrin River to its residents

and leaders that was discovered in earlier studies. The history of the place frames decision making up to this day as actors seek to address changing climate conditions. A resilience framework combined with an understanding of historic disruptions and trends provides a deeper foundation for decision making.

### **PLANNING FOR SEAWATER INTRUSION INTO FRESHWATER SUPPLIES: RISK AND ADAPTATION IN THE SOUTHEASTERN UNITED STATES**

Abstract ID: 335

Individual Paper Submission

LASSITER, Allison [University of Pennsylvania] [alass@design.upenn.edu](mailto:alass@design.upenn.edu), presenting author

KING, Kellie [University of Pennsylvania] [kingkell@desing.upenn.edu](mailto:kingkell@desing.upenn.edu), co-author

The drinking water intakes of many coastal communities are located in freshwater sources just upstream or inland from the ocean. As sea levels rise, many of these surface water and groundwater sources will be contaminated by ocean salts (van den Brink, Huismans et al. 2019, Befus, Barnard et al. 2020). This study evaluates sea level rise-driven salinization of drinking water in the southeastern United States, from New Jersey through Texas. The study asks three questions: (1) To what extent does sea level rise pose a risk to public drinking water supply systems in the southeastern U.S.? (2) How are state and local governments in the southeastern U.S. planning for salinization? (3) Are there regions with high risk and little planning?

First, we map risk of drinking water salinization. We relate the location of public surface water and groundwater drinking water intakes to the U.S. National Oceanographic and Atmospheric Administration (NOAA) three-foot sea level rise scenario, NOAA's projected medium-high scenario for 2050. Across the study area, we find 260 drinking water intakes owned by 165 unique public water suppliers serving 13.2 million people are expected to be inundated at three feet of sea level rise, putting these water sources at very high risk of salinization. An additional 4,876 drinking water intakes owned by 1,579 unique public water suppliers serving 27.5 million people are within 1500 meters of the three-foot scenario, putting them at a lower, but still substantial risk of salinization. Regional risk evaluation is for planning purposes and certainty of salinization will require watershed-by-watershed modeling. To refine the risk mapping, however, we spatially locate desalination facilities and shoreline hardening as infrastructure that mitigates salinization risk.

Next, we evaluate salinity planning following methods of plan quality review demonstrated by Burke and Godschalk (2009) and Woodruff et al. (2018). We review sixteen adopted and draft state Coastal Zone Management Program Assessment & Strategy plans in the study area. We also review 148 state, regional, or local adaptation plans related to climate change, sea level rise, and hazard mitigation and preparedness topics that may affect drinking water infrastructure planning. To assess these 164 documents, we use a deductive coding approach. We search for keywords related to salinity (e.g. salt, saline, intrusion) in each plan and identify salinity control strategies, if any. We score plans both for quantity and quality of salinization planning. We find forty-one plans discuss salinity control

strategies to mitigate seawater intrusion into drinking water sources, taking a total of fifty-eight types of salinity management actions. We find the primary focus of these actions is on monitoring, not adaptation.

Finally, we overlay the maps of salinization risk and the salinity planning scores. We find that planning is likely inadequate for protection from NOAA's projected 2050 sea level rise scenario. Further, planning is inconsistent and not commensurate with risk. Many areas with the highest risk of salinization have thus far demonstrated the lowest degree of planning at state and municipality levels. We do not observe planning that is happening within many water agencies, since we do not examine planning documents from each of the 1,744 public water suppliers at risk in the service area. One thousand six hundred and fifty-eight of these water suppliers, however, serve small to medium populations (<100,000) and are likely to be less resourced and have lower planning capacity. Already, socioeconomically disadvantaged populations often have lower quality source water and poorer quality water infrastructure (Switzer, Teodoro 2018). Left to individual water suppliers, widespread salinization combined with differential capacity for salinization planning has the potential to exacerbate existing inequities in drinking water provision.

#### HOW HAS COVID-19 IMPACTED LOCAL GOVERNMENTS' CLIMATE PROTECTION AND SUSTAINABILITY EFFORTS? AN EXAMINATION OF INITIAL EFFECTS

Abstract ID: 342

Individual Paper Submission

KRAUSE, Rachel [University of Kansas] rmkrause@ku.edu, presenting author

HAWKINS, Christopher [University of Central Florida] christopher.hawkins@ucf.edu, co-author

PARK, Angela [Kansas State University] angelapark@ksu.edu, co-author

Although many local US governments have adopted climate protection and community sustainability as an explicit objective, it is not a core local government responsibility. As a result, compared to policies and programs focused around traditional functions, those related to sustainability may be at greater risk of retrenchment or change in times of crisis (Yi et al. 2017).

The global COVID-19 pandemic has disrupted society in a manner not experienced in generations and required communities to adapt to meet new sets of needs—often while simultaneously facing reductions in their overall financial and human capacities. Local governments have been particularly hard hit, with many facing considerable declines in sales tax-base revenue (Sheiner and Campbell 2020). In this context, it is unclear how policy objectives, like greenhouse gas mitigation and sustainability that are often considered “extra,” may be impacted (Krause and

Hawkins 2021). At the same time, certain organizational and community characteristics—including whether sustainability objectives have been formally incorporated into a municipality’s strategic or comprehensive plans—may strengthen its durability as an actively pursued policy aim.

This research examines how COVID-19 has impacted local governments’ climate and sustainability efforts approximately one year into the crisis. It empirically assesses factors associated with substantive planning and programmatic changes including in the relative prioritization of local social equity, environmental, and economic efforts. It also considers factors that influence logistics related to implementation, resource allocation and collaboration around these efforts.

We explore these dynamics using a series of logistic and ordinal logistic regressions applied to new data collected from 515 US cities. This data was collected via an online survey, an invitation to which was emailed directly to the person in each city government pre-identified as “most responsible” for sustainability-related efforts. Invitations were sent to all US cities with populations over 20,000 (n=1,850) and a 28% response rate was obtained. Data was collected between December 2020 and February 2021, approximately 1 year after COVID was first found in the US. Thus, although the situation remains dynamic, enough time had passed for its initial effects to be felt. Archival data indicating the financial and public health impacts of the crisis as well as political leanings round out the dataset. Preliminary results suggest that smaller cities and those without institutionalized sustainability or climate protection objectives in a formally adopted plan are most likely to have engaged in policy retrenchment. However, the presence of broad public backing for their sustainability initiatives may reduce this dynamic, indicating the importance of stakeholder support in sustaining policy initiatives.

Urban environmental stewardship is increasingly extending beyond traditional public sector actors, like Parks Departments, to include diverse networks of public and private groups that are critical to maintaining urban ecosystem services (Connolly et al 2014). These “civic ecology groups” can be small and self-organized, such as “friends of parks” groups, or well-established agencies or non-profits, but ultimately their impact comes from their

responsiveness to local needs and their ability to successfully partner (Krasny 2012). Ultimately, such partnerships and networks have been critical to the successful stewardship and maintenance of nature in cities (Pickett et al 2016).

Stewardship mapping has been utilized to understand who is doing this type of stewardship in urban areas and how and where they are doing it down to a granular level (Connolly et al 2014; Svendsen et al 2016). STEW-MAP is a specific type of stewardship mapping framework designed by the US Forest Service Field Station system for this purpose (Romolini et al 2016) that has been applied to over a dozen communities. One of the newest regions to implement the STEW-MAP framework is the greater Denver region, as part of the Forest Service's new Denver Urban Field Station, which the authors are affiliated with. Denver STEW-MAP is a survey of hundreds of regional stewardship organizations, from agencies to nonprofits, asking numerous questions about the type of work they do, who they work with, where they get their information, and where they work. The information on "where" is elicited through an interactive online mapping interface that allows respondents to draw service areas.

Through this interface, and our follow-up mapping efforts that sought to improve geographic coverage by manually mapping additional stewardship footprints, we have built an increasingly comprehensive geographic database of stewardship areas in the greater Denver metro area. This database shows us where groups are actively working, where there are overlaps in group activities and, most importantly, where there are gaps. To date little coverage exists on the topic of using stewardship mapping to detect and remedy such gaps. Another innovation of Denver STEW-MAP is that it includes a new category of stewardship organization not present in previous STEW-MAP implementations, but critical to open space management in the Western US: Homeowners' Associations (HOAs). Some of the nation's largest HOAs are found in the Colorado Front Range and many of these manage hundreds or thousands of acres of open space or park land, yet their role in urban environmental stewardship is still poorly studied.

In summarizing our key results, based on our extensive GIS and statistical analysis, this presentation will address the following questions:

Where do geographic gaps exist in regional stewardship coverage in greater Metro Denver?

Are there critical environmental assets that lack stewardship coverage, like riparian corridors, regional greenways, etc., and where are they?

Is there overlap between stewardship organizations that could be coordinated to provide capacity for nearby gap areas?

Are there systematic disparities in geographic stewardship coverage that correlate with socio-economic status, environmental liabilities or community vulnerability and what are the ramifications for environmental justice?

What proportion of open spaces and other urban environmental asset areas receive stewardship from HOAs, and do they partner with other stewardship organizations in managing these lands?

What proportion of these HOA lands are restricted vs. public in access?

Flooding is the most common natural hazard in the United States, and it poses the greatest threat to property and human safety. Vulnerability to flooding is growing as a result of continued development in flood-prone areas and a lack of coordinated land use and hazard mitigation planning. The resilience of the built and natural environments is strongly influenced by the development and growth management guidance provided by a community's network of plans, which often includes land use, hazard mitigation, and transportation plans, among others. These plans guide development, including in flood-prone areas. The ways these independent plans interact can significantly impact community vulnerability (Berke et al., 2018). A well-integrated network of plans can aid in building resilient communities and reducing losses from flood events. However, few methodological tools exist to examine the level of integration among plans.

To address this gap, Berke et al. (2015) proposed the Plan Integration for Resilience Scorecard (PIRS), a method to identify inconsistencies between plan policies that may exacerbate flood vulnerability by, for instance, encouraging development in risky locations. Since its inception, the PIRS had been applied in research and practice, and employed to evaluate hundreds of neighborhoods in over 15 cities around the world (Berke et al., 2018; Malecha et al., 2018; Yu et al., 2020). As the method is used more widely – especially in light of recent endorsement by the American Planning Association – it is important to consider the different methodological decisions made when applying PIRS in a given community. These decisions may affect replicability and the interpretation of results. The goal of this paper is to outline these various decisions and their permutations, and to provide guidance on when certain decisions are most appropriate, based on a review of the existing PIRS studies and guidance documents. The research questions are:

- (1) How can the replicability of the Plan Integration for Resilience Scorecard method be improved?
- (2) How can the integration of community networks of plans to address resilience be improved?
- (3) What are future directions for integrating resilience in planning?

This paper examines several important aspects of the Plan Integration for Resilience Scorecard method, focusing on issues arising during the policy selection (Berke et al., 2019), policy scoring (Berke et al., 2018), and spatial allocation (Malecha et al., 2018) stages, as well as questions of inter-coder reliability, replicability between studies, and

context-specific adjustments. Illustrating and comparing the application of the method across various case studies, we discuss best practices and lessons learned to facilitate the application of the PIRS and improve the integration of community networks of plans to address resilience in both planning practice and research. We explore future directions for the PIRS method and for integrating resilience in planning, including but not limited to: providing greater analytical nuance by weighting policies by impact; enlarging the scope of possible evaluations to include additional hazards (e.g. urban heat, wildfire) and other urban concerns (e.g. public health, transit-oriented development); and targeting the integration of resilience across multiple scales (Yu et al., 2020).

This research explores theoretical and practical problems at the nexus of climate change and justice, and seeks to contribute to their resolution by reevaluating and exploring the future of the novel Plan Integration for Resilience Scorecard method. Coordinating plans is particularly important to confront “wicked problems” (Rittel and Webber, 1973) like climate change, racial justice, and public health, which require collective and coordinated action across government departments. Deeper knowledge about the principles and future directions of plan integration for resilience can inform more effective approaches as practitioners evaluate their plans and work to foster a more coordinated strategy.

#### **A SYSTEM DYNAMICS APPROACH OF URBAN DECENTRALIZED ENERGY SYSTEMS INTEGRATION INTO THE CURRENT ENERGY MARKET**

Abstract ID: 366

Individual Paper Submission

ROZHKOV, Anton [University of Illinois at Chicago] arozhk2@uic.edu, presenting author

The energy market is changing. After many years of stagnation and being relatively static, the vertical top-down structure no longer exists as a single energy management option. Many changes like access to new renewable energy sources, improved quality of the data, including access to the real-time data from smart meters and other sensors, cheapening effective storage systems, and overall decentralization of the grid make systems much more complex from the one side, but much more flexible and adaptable from the other. The main benefit of these changes and opportunities is that they address the climate crisis's pressure and create a brand-new energy industry appearance that helps communities cut pollution and advance environmental justice.

Energy systems are critical systems that provide the energy that is needed for almost all everyday activities. Today's energy infrastructure is a vast and complicated system that primarily relies on fossil fuels and simultaneously

interrelates with various subsystems. It interacts in a technical way with cities, roads, and buildings, and the more action-based way in terms of interactions with private and public organizations, individuals, utilities, legislators, and regulators. It creates a linkage where social and legal values influence technical outcomes, and technical characteristics have social effects. While the engineering and design perspective for these changes is understandable and had been well-studied for more than a decade (Guerrero et al. 2010), little has been done from a policy and urban planning perspective.

The alternative to the traditional energy grid is decentralized energy systems (DES), including modular and more flexible technologies, distributed energy resources, which are located close to the consumer. A DES application may include renewable sources for power generation that are combined with power storage and conversion, including batteries and various local- and regional-scale distribution technologies. Several examples of these technologies include microgrids, energy hubs, smart grids, or district heating/cooling networks.

This paper explores the consequences of the transition from huge, centralized power systems to smaller distributed sources. Social science in general and urban planning, in particular, are just beginning to investigate the potential role of actors involved in the new paradigm of decentralized urban energy systems. Therefore, the main goal of this study is to analyze and evaluate the potential impact of different strategies related to the transitioning to DESs for all stakeholders: utilities, policymakers, and consumers enhanced by a data-driven modeling framework. Causal Loop Diagrams (CLD) were used to observe an electricity-development nexus and identify the dynamic complexities and further propose a simulation model based on the System Dynamics approach to understand, describe and simulate complexities identified in CLD over time (Ford 1999).

A stock and flow diagram is in the core of the model; it consists of the process of quantification of the components of CLD. The model investigates the relationships between the policy, environmental, and economic side of the DES in the urban environment expanding the existing knowledge that mainly focused on the traditional energy systems. System Dynamics is widely used as a decision support method in the energy sector, and Momodu et al. (2017) look at the market perspective, Aslani et al. (2014) look at the role of renewable energy in energy dependency and security, and Riva et al. (2018) review the interactions between electricity and development. Different aspects of the interrelations between energy and urban systems from a unique perspective by adding decentralized energy components to the existing systems were studied. The paper concludes with a discussion on how new energy components affect policies and planning strategies in urban areas and how small-scale (neighborhood level) factors are connected to the large-scale (regional and power grid level) factors.

## LANDSCAPE PATTERS AND THEIR EFFECT ON STORMWATER RUNOFF IN COASTAL ALABAMA AND MISSISSIPPI REGION

Abstract ID: 369

Individual Paper Submission

BYAHUT, Sweta [Auburn University] szb0054@auburn.edu, presenting author  
ROGERS, Stephanie [Auburn University] s.rogers@auburn.edu, co-author  
LAFROMBOIS, Megan [Auburn University] meh0085@auburn.edu, co-author  
LEBLEU, Charlene [Auburn University] LEBLECM@auburn.edu, co-author

Regional ecosystems in coastal areas are increasingly at risk of being damaged by rapid urbanization, which will likely lead to the conversion of undeveloped land into impervious surfaces, degrading ecosystems, and increasing flood risks. In order to minimize these negative impacts, local and regional governments will benefit from the knowledge about the type of macro-scale “green infrastructure” and landscape patterns that should be conserved, including natural resources, such as greenways, wetlands, and open spaces that should be protected at the regional scale. This will help towards the goal of creating more resilient communities that can respond effectively to flooding events. At the macro/regional scale, green infrastructure focuses on connecting greenways and protecting wetlands. In this research, we identify landscape patterns that should be protected to help reduce stormwater runoff and mitigate flooding. The expectation is to find that desirable landscape pattern consist of larger patches, more connected and unfragmented patches and corridors, wide corridors, and heterogeneous areas of nature throughout human-developed areas.

This research uses GIS and quantitative methods in order to examine current green infrastructure planning practices and their outcomes in the Mississippi-Alabama coastal region. Specifically, regional and local landscape patterns are analyzed for 1290 sub-basins in the Mobile, Foley, and Mississippi watersheds of the Gulf Coast region. GIS tools of ArcPro and Fragstats are used to undertake regional landscape pattern analysis for each of the sub-basins. Since there are ungauged basins in the watersheds, the Soil and Water Assessment Tool (ArcSWAT) is used for discharge modelling to estimate the amount of stormwater runoff using inputs of DEM, land use data, soil type data, weather data, and observed discharge data. Finally, the impacts of landscape patterns on the variations in the mean annual peak runoff depth is determined using ordinary least squares (OLS) regression, while controlling for the effects of precipitation, slope, soil permeability, floodplain area, natural drainage density, wetlands, and impervious rate.

Preliminary findings explain some of the impacts of green infrastructure land uses in terms of their size, shape, isolation or cluster, and connectivity on local flooding, while controlling for other environmental conditions. Specifically, we find that average precipitation and natural drainage density are very significant and the strongest predictors of runoff quantity. Percentage of wetlands and more connected wetlands are significantly associated with a reduction in runoff. An increased proportion and more connected vegetation are also significant and associated with reduced runoff. On the other hand, barren lands have negligible effect on runoff, but proximity of development has a significant positive association with runoff.

This research aims to identify open spaces/greenspaces/floodplains/landscape patterns that should be protected with the intent of transferring this knowledge to Mississippi-Alabama coastal communities, so that they become more resilient to flood damages, and also facilitate connected habitats. It offers a new approach to framing the role of open spaces/greenspaces/floodplains/landscape patterns within a multifunctional green infrastructure in a regional setting.

## **ROBUST ADAPTIVE PLANS: INTEGRATING SEA LEVEL RISE AND TSUNAMI INUNDATION SCENARIOS AT THE COMMUNITY LEVEL IN WASHINGTON STATE**

Abstract ID: 373

Individual Paper Submission

ABRAMSON, Daniel [University of Washington] [abramson@uw.edu](mailto:abramson@uw.edu), presenting author  
 NGUYEN, Lan [University of Washington] [lan8@uw.edu](mailto:lan8@uw.edu), co-author

Hazard mitigation planning is rarely incorporated into comprehensive planning (FEMA, 2013). Mitigation is typically hazard-specific and correlates poorly with the goals of community development that underpin most comprehensive plans. Formulating robust strategies to cope with multiple types of hazard scenarios may be a useful step towards reconciling conflicts between mitigation and development, especially if the different time horizons, frequencies/probabilities, and suddenness of onset associated with the hazards can be accounted for. This paper reports on community workshop-based action research in coastal Washington State to consider multi-hazard mitigation in updating local comprehensive plans, and to identify opportunities for more robust strategies than is typical in singular “worst-case” hazards planning. Community stakeholders and a University of Washington team used weTable participatory GIS originally developed for sea level rise (SLR) planning only (Yusuf et al, 2018), to consider localized probabilistic scenarios of both SLR and more sudden, existentially threatening change: near-source megaquake tsunamis and associated co-seismic land subsidence – a rare combination of hazard information in local planning (Dall'Oso et al, 2014). The participating community, Westport/South Beach, faces an estimated 10-17% chance of a major earthquake occurring along the Cascadia Subduction Zone (CSZ) within 50 years. Although rare -- with recurrence intervals of 250-500 years to approximately 2,500 years, depending on the magnitude – a CSZ megaquake could resemble the 2004 Sumatran and 2011 East Japan events, killing more than 10,000 people and injuring over 30,000 throughout the region (CREW, 2013). Given its low average household income and precarious housing conditions, Westport/South Beach had already demonstrated remarkable political will and community cohesion by self-funding and constructing North America's first tsunami vertical evacuation structure (VES) at its local school. Incorporating hazard resilience into its Comprehensive Plan Update is helping the City apply for funding to build additional VES's. To generate longer-term, more comprehensive resiliency and pre-disaster recovery plans including gradual relocation of critical facilities and preparation for possible resettlement on less vulnerable sites, the university-community partnership adopted a values-driven, asset-based participatory workshop protocol (Freitag et al, 2014). Stakeholder participants discussed two scenarios of earthquake-subsidence-tsunami as well as two SLR scenarios – all with different probabilities of occurrence and severities of impact. In this case, the long-term projections for land loss due to SLR happened to resemble the projected land loss due to sudden subsidence of the coastline in a CSZ earthquake, further prompting workshop participants to discuss strategies for relocation of critical facilities and, given time, housing and business assets. However, since an earthquake and tsunami may occur much sooner than the worst case of SLR, further development of the workshop protocol should include combined scenarios of both earthquake-subsidence-tsunami and SLR impacts, at different time horizons. Framing hazard information with local-historical geo-narratives of environmental and developmental change may further encourage generation of robust strategies. Processes that focus only on community vulnerability to severe (but low-probability) existential threats, by contrast, tend to generate primarily immediate life-safety strategies, and provide less useful information to long-term comprehensive planning.

CANNON, Clare [University of California, Davis] [cebcannon@ucdavis.edu](mailto:cebcannon@ucdavis.edu), co-author

Cities across the U.S. are planning for climate change impacts such as heat, drought, sea level rise, and other extreme hazards. Although researchers have long sought to understand the drivers of more aggressive local climate action – which range from rising public awareness to different regulatory incentives and stronger political leadership (Shi et al. 2015) – we have yet to develop consistent and coherent indicators to assess climate change planning outcomes (Woodruff and Stults 2016). The prevailing assumption is that evaluating planning outcomes, especially in the context of adaptation to climate impacts, is challenging because implementation depends on local resource incentives, capacity constraints, and different policy opportunities (Ford and Berrang-Ford 2016). Emerging work on social equity seeks to reorient climate adaptation action around more normative goals such as broader inclusion and consideration of interests from historically disadvantaged communities (Meerow et al. 2019), although again, there are no ways to benchmark the extent or degree to which equity-oriented adaptation actions are (or can be) implemented on the ground. As a result, we have no idea whether climate adaptation plans that are currently being implemented actually lead to more environmentally resilient or socially just outcomes.

This paper addresses the need to benchmark climate adaptation progress through evaluating emerging strategies taken by larger cities across the U.S. to monitor and evaluate their own efforts in designing and implementing more equitable climate actions. Our research seeks to inductively uncover ongoing experiments and innovations in adaptation action in cities, with the aim of articulating general categories of equity-focused interventions that can then be scaled-up to other cities. Our approach draws on a document analysis methodology, focusing on the 24 largest U.S. cities that have published standalone climate adaptation and resilience plans. The plans are coded according to the frequency and degree to which planning actions tackle widely-accepted dimensions of social equity, namely through procedure, (re)distribution, and recognition. This database of equity-focused actions is then sorted according to substantive themes to inform both the type of action and any potential evaluative criteria applied to ensure that planning intentions are met.

Our results indicate that – across the 24 cities included in the analysis – equity-focused climate adaptation actions

fall into three main categories: (1) actions to reduce exposure of and manage risks in vulnerable or historically disadvantaged neighborhoods; (2) actions to legitimize decision-making through inclusive, transparent, and accountable institutions; and (3) actions to tackle root causes of vulnerability, including addressing systematic racism, compounding and cascading risks, and intergenerational disadvantage. Within these three categories, we also identify emerging metrics to benchmark progress in meeting planning objectives, including those targeting specific demographic and age groups or those that qualitatively delineate between ‘surface-level’ and co-productive participatory approaches.

Our findings point to emerging strategies and, most surprisingly, a growing consensus on ‘what counts?’ as social equity-focused climate adaptation action in cities. Despite the diversity of urban contexts, such actions typically range from equitably managing heightened exposures to climate impacts to recognizing historic forms of exclusion in adaptation interventions. Although these efforts are nascent, we are also seeing parallel efforts to benchmark and evaluate these actions against effectiveness, inclusiveness, accountability, and feasibility criteria. Our results therefore help to make sense of ongoing equity-focused adaptation actions in U.S. cities and can inform the types and potential approaches to catalyze more equity-focused actions in other cities. Conceptually, our results chart a new domain of potential metrics and indicators to evaluate planning outcomes in view of the increasing urgency to address climate change impacts nationwide.

The risks and costs of flood damages for coastal cities are increasing. Resilience planning is an increasingly popular framework for coordinating hazard mitigation and planning more generally. Research suggests that the concept’s malleable meaning allows resilience to function usefully as a “boundary object.” As such, resilience planning is theorized to help increase collaboration and avoid counterproductive outcomes that arise from treating interrelated problems in isolation (Woodruff et al., 2018). Many cities are now ostensibly engaged in resilience planning, however the extent to which resilience is actually transforming planning processes, stakeholder collaboration, or

mitigation of long-term flood risks is unclear. There is a significant body of literature on governance networks and collaborative planning (Dempwolf & Lyles, 2012; Sayles & Baggio, 2017) and a growing literature on the qualities of networks of plans (e.g. comprehensive plans, hazard mitigation plans, and infrastructure plans) that shape vulnerability to hazards (Yu et al., 2020). These literatures often imply that there is a relationship – with collaboration thought to improve planning and better planning to enhance resilience – but empirical studies of the relationship between governance networks and networks of plans are lacking. This study contributes to the urban resilience, collaborative governance, and planning literature by examining the relationship between collaboration structures and the integration of flood mitigation information, goals, and policies across plans in four coastal U.S. cities (Fort Lauderdale, FL, Baltimore, MD, Boston, MA, and Seattle, WA).

To understand collaboration in each city, we surveyed organizations involved in flood resilience planning about how they work together. We used social network analysis to assess collaboration across this governance network. We also analyzed the content of all current plans shaping development and physical vulnerability to flooding in each city using four different approaches: 1) plan quality evaluation; 2) analysis of the network of organizations listed as participants in plan development; 3) analysis of which plans cross reference each other; and 4) the spatial distribution and impact of the policies outlined in the plans using the Plan Integration for Resilience Scorecard methodology (Berke et al., 2015). We looked at the relationship between these different plan analysis approaches. These plan-level results suggest that higher quality plans and those that include flood information are more likely to have policies that reduce vulnerability to flooding and less likely to have policies that could exacerbate vulnerability. Plans that are more connected to other plans in the network also tend to have higher plan quality scores and are better at integrating flood information. At the city level, the relationship between indicators of collaboration across the governance network and aggregate plan quality and policy scorecard results for the network of plans are not as clear. We compare the four cities' planning network profiles and discuss key differences that likely complicate the relationship between governance network structures and planning outcomes. As one of the first studies to assess the coordination of organizations engaged in resilience planning and to explore the influence of that coordination on plan network quality and integration, these results highlight important avenues for future research.

#### PLANNING IN THE PLANTATIONOCENE: CLIMATE JUSTICE MEANS DECOLONIZATION

Abstract ID: 419

Individual Paper Submission

WICKLAND, Teo [UCLA] [teo@ucla.edu](mailto:teo@ucla.edu), presenting author

How should planners approach the ideal of climate justice? To frame the question of “climate,” I engage scholarly discussions around the Anthropocene (a putative geological epoch achieved by anthropos, Man) and its critical others (Capitalocene, Chthulucene, and Plantationocene). These conversations foreground the fact that “climate” and the “climate crisis” are, at best, synecdoches—and at worst, obfuscating euphemisms—for broader naturecultural crises of modernity, coloniality and supremacy (Whyte 2018). Planning’s very ability to decouple “climate” from the broader multicrisis is a symptom of “climate”’s epistemic framing as a technical question of quantifiable greenhouse gas concentrations. This decoupling flows from the specious separation of “things” (in this case, “climate”) from their more-than-human entanglements: a false partition which extends throughout modern planning (Jon 2020). In truth, “climate” is inseparable from mass extinction, geo-ecological upheaval and collapse, sociopolitical inequality and instability, and ideologies and histories of coloniality and supremacy (Davis et al. 2019). I therefore argue for the lens of the Plantationocene over other “-cenes,” because it decenters Man; and emphasizes more-than-human “plantation relations” thus far marked by ordering, exploitation, and racial domination.

In response to this unprecedented conjuncture, I first interrogate the basic etymological overlap between “planning” and “plantation.” I then use the example of transportation planning and related technologies (technologies of transportation, technologies of planning) to examine ways in which planning has produced “climate” and related Plantationocene crises. Looking to the near future, I consider ways in which planning practices (a) risk exacerbating the Plantationocene multicrisis, and (b) could potentially respond to this multicrisis in a generative and liberatory fashion. To better understand the latter, I center Indigenous, Black, feminist and decolonial perspectives—voices of and for those who have been the most marginalized in “climate” discussions, and who have thus far endured and continue to risk the worst consequences from the Plantationocene multicrisis. Many of these voices argue that we must radically unlearn, reunderstand and restructure our more-than-human and more-than-Euro-modern relations (Liboiron 2021), and engage radical decolonial futurities (McKittrick 2013).

I close with a set of suggestions for planning: approaches to diversify our knowledges and ways of knowing; ideas for reshaping our inter-human and more-than-human relations; methodologies for planning research and practice; and specific examples applied to transportation planning. My suggestions for planning include:

- Pluralizing planning epistemologies by centering Indigenous, Black radical, feminist, queer, more-than-human and anti-colonial ways of knowing
- Reforming planning’s land relations by centering local, more-than-human lived experiences and historicities; supporting land back; and refusing to plan on stolen land without permission from people Indigenous to the land being planned
- Developing a culture of humility and care wherein we continually and reflexively question not only expertise and objectivity; but the very value of attempting to overdetermine futures rather than adopting a continuous praxis of care for land and radical love for all people

Specific examples applied to transportation planning include:

- Transportation as epistemology: Knowing through movement
- Reverting transportation infrastructures (as land) to Indigenous stewardship
- Pluralizing meanings and values of transportation: Axiologies beyond safe and efficient travel to preconceived destinations

## MOVING GOODS SUSTAINABLY: HOW DO PRACTITIONERS CONSIDER ENVIRONMENTAL SCIENCE ACROSS NETWORKS OF PLANS?

Abstract ID: 447

Individual Paper Submission

CAMPO, Matthew [Rutgers University] [mcampo@ejb.rutgers.edu](mailto:mcampo@ejb.rutgers.edu), presenting author

Campbell's (2016) sustainability planning framework presents a system of governing relationships between social, environmental, and economic risks through on-going planning processes. The on-going nature of sustainable planning is, in part, a result of both individual and institutional capabilities to incorporate uncertain and continuously evolving scientific evidence into the environmental governance of conflict between economic development and environmental protection (Campbell, 2016; Renn et al., 2011). This paper uses three cases to demonstrate how networks of plans in the New York metropolitan area manage this on-going resource conflict relationship in the context of planning for freight-related land uses.

The tension between economic development and environmental protection is particularly salient for freight-related land uses. Warehouses, fulfillment centers, and other freight-related land uses are sprawling in urban areas, exhibiting both the environmental nuisance characteristics of locally unwanted land uses (LULUs) and the job gains sought after by economic development officials (Yuan, 2019). Planning practitioners and public officials use 'networks' of plans to balance future employment gains with concerns about climate resilience, job quality, transportation emissions, and other risks unevenly distributed by growing logistics-related land use (Berke et al., 2019). I propose that both individual attributes and institutional level governance structures influence practitioners' choices for incorporating environmental sciences within networks of plans (Renn and Rohrmann, 2000). In this study, I analyze how these individual and institutional influences can serve as barriers or enablers for including scientific information. I develop a more explicit focus on environmental science related to incorporating climate change in planning processes and how practitioners both observe and act upon perceived environmental risk.

I used semi-structured interviews and archival document review to understand how institutional settings and personal values influence participants' perceptions of economic, social, and environmental risks related to freight-related land uses, and the participants' uses of environmental science to analyze their perceived risks. First, I conducted a content analysis of past planning documents using existing risk management and sustainability theory to develop an initial coding scheme related to managing trade-offs in economic, social, and environmental risk. Then, I conducted hour-long semi-structured in-person or teleconference interviews, followed by focus groups convened among the regional participants to reflect on the participation in the networked planning processes. Study participants include local and regional planners, engineers, public health officials, emergency managers, and other participants in the 'networks of plans' that include long-range transportation, comprehensive land-use, and hazard mitigation planning processes (Berke et al., 2019). I use the interviews and focus groups build on themes reflecting

participants' thoughts on institutional arrangements, personal values, available reference knowledge, and other correlates of risk perception outcomes.

I find evidence that participants' capabilities to take action on environmental science in planning decisions vary based on institutional and individual capacities and frameworks for incorporating scientific information into planning decisions. In particular, participants discussed trade-offs between short-term and long-term planning horizons and inconsistent methods for dealing with presenting and managing the inherent uncertainty in environmental sciences (Renn et al., 2011). Incorporating climate change science consistently across networks of plans was especially challenging across all cases. For planners, these findings demonstrate the continued importance of understanding how and where concepts of uncertainty play a role in planning decisions, and the implications for incorporating evolving science into a complex set of social, environmental, and economic risks during planning processes. Moreover, engaging in participatory co-production strategies between scientific disciplines and planning institutions can develop trust and encourage a more robust scientific base for planning decisions.

Private land conservation in the U.S. is increasingly necessary in order to address sprawl, biome shifts, and other forms of habitat loss (both human and climate-driven). The conservation easement (CE), a negative easement in gross, is one of the most ubiquitous yet under-studied forms of private land conservation. Several scholars have been trying to isolate the landowner motivations to engage in CE placement. Ernst and Wallace (2008) showed that tax incentives, while not the primary reason for CE utilization, certainly facilitated the Larimer County, CO property owners' decision-making processes. Farmer et al. (2011) affirmed this finding with a slightly larger geographic sample of donors to land trusts in seven Midwestern states, using both a survey and interviews to show that place

attachment was the primary reason for CE donation. Farmer et al. (2011) asserted that, while the lowest ranked of their motivations, “potentially one-third less land [would be] under conservation easements without financial incentives” (p. 833). Rissman et al.’s (2007) landowner survey in eight states focused on the conservation purposes within CEs held by The Nature Conservancy, assessing conservation targets and threats to biodiversity, as well as basic CE purpose, rather than donor motivation. Influenced by Kabii and Horowitz (2006)’s conceptual model for landowner motivations to conserve land, Brenner et al. (2013) used a pre- rather than post-test approach to study landowner’s motivations to prospectively place a CE in central upstate New York. Their results revealed that land uses, particularly “recreation and wild food prospecting, are among the most powerful and significant predictors of landowners’ willingness to consider conservation easements” (p. 30), as well as owning a large parcel of land. However, this study was extremely localized. The results of these studies, among others, suggest that owner motivations are complex and potentially conflicting, with no clear prioritization. These findings, in part, may be attributed to the limited scope of the study areas and/or the intent of the original survey, suggesting the need for a broader-based and regionally representative national survey.

To ascertain the motivations for CE use (especially the fiscal policy that promotes public subsidy on private land), as well as the potential effect on other landowners and on the biological value of the conserved lands held by all kinds of land trusts, we built on the work by Kabii and Horowitz (2006), Rissman et al. (2007), Ernst and Wallace (2008), Farmer et al. (2011), and Brenner et al. (2013), among others. We located the property owners in twelve counties in the eco-regionally representative and rapidly growing exurban areas of six states across the U.S. We generated a post-test survey instrument for dissemination via mailed invitation to respond on-line, followed by a mailed hard copy (Dillman et al., 2014) to a stratified, representative sample of the property owners with CEs placed between 1997 and 2008/2009 in each county.

The survey results reveal the effect of federal and state tax incentives on CE placement (Farmer et al., 2011; Ernst & Wallace, 2008; Sundberg & Dye, 2006) and the potential differences in donation motivation based on income or education (Brenner et al., 2013). They also explicate the role of ideology and biological knowledge in individual decision-making regarding CE use. With results from a more expansive and geographically-representative survey, we are able to inform the planning community of the individual motivations influencing CE placement in growing exurban areas. The results may influence future policy changes at multiple governance scales (local to federal) and should give greater insight into how an individual’s landholdings drive the choice and location of a CE, which can impact other land uses within the jurisdiction.

**DISPLACEMENT ON BOTH FRONTS: A SCORECARD APPROACH EXAMINING MITIGATION OF COASTAL AND INLAND DISPLACEMENT FROM SEA LEVEL RISE**

MILORDIS, Anthony [Florida State University] acm11h@my.fsu.edu, presenting author  
BUTLER, William [Florida State University] wbutler@fsu.edu, co-author  
JACKSON, April [Florida State University] ajackson5@fsu.edu, co-author  
HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, co-author

It has been well documented that sea level rise (SLR) impacts from climate change will affect communities throughout the world, displacing populations from coastal areas. What is less studied, however, is the sea level rise impacts on lower-income inland communities which are less vulnerable to flooding but may see secondary housing effects. Without protection measures, these areas may see displacement pressures from the increased desirability of land and incoming investment rather than sea level rise inundation. This study seeks to understand how and at what scale governments are planning to mitigate sea level rise displacement in coastal communities and its effects on inland communities through analysis of plans in coastal Florida cities.

Climate change adaptation initiatives in wealthier communities should be measured relationally to initiatives in lower socio-economic communities (Anguelovski et al., 2016). Since inland areas on higher ground are often home to lower income populations, this incoming investment and rising land values may result in gentrification without proper protections. However, the current literature on climate gentrification focuses primarily on the market-level effects of land values and sales rather than how inland communities are planning for it (Keenan et al., 2018; Keys & Mulder, 2020).

In measuring how plan documents increase or decrease vulnerability, many have turned to the resilience scorecard approach championed by Berke et al., (2015). This approach scores plan language across different jurisdictional levels to determine a level of focus on vulnerability reduction in specific places. Malecha et al., (2019) used a similar approach to measure place specificity, effect on vulnerability, and whether plan language included a recognizable policy tool. Using a modified resilience scorecard approach drawing on these two approaches, this paper analyzes plan language at different scales to determine 1) where plans aim to reduce coastal displacement through SLR protection and 2) where neighborhood stabilization and affordable housing protection policies may reduce displacement pressures in low-income inland communities.

We have scored a network of plans in Miami-Dade County and Pinellas County at the neighborhood, municipal, county, and regional levels. These two counties represent large metropolitan areas that are extremely vulnerable to sea level rise inundation and are susceptible to climate gentrification. For coastal areas, plan language is analyzed for: acknowledgement of sea level rise, level of commitment based on specific policy language, and further specification of protection up to the 1-foot SLR inundation level. For inland communities, anti-displacement language is measured for: acknowledgement of the need for neighborhood stabilization and affordable housing protection, specific policy language, and further recognition of the policy tool as a strategy to slow the process of gentrification or mitigate the effects of displacement.

By expanding on the resilience scorecard methodology, this paper adds new elements to the scorecard approach by incorporating commitment levels and extending the analysis to inland populations with gentrification risks to protect affordable housing and stabilize neighborhoods. This analysis will also help understand the scalar nature of how coastal communities are dealing with these two displacement threats at differing jurisdictional levels. Emerging results indicate that acknowledgement levels are high, but commitment levels are low. Additionally, results show that regional direction setting is high, however specificity and commitment is lower at the regional level compared to the city and neighborhood levels.

## THE USE OF A COMMUNITY DISTRESS INDEX AND GEODESIGN FRAMEWORK IN EXTREME WEATHER EVENT PLANNING

Abstract ID: 496

Individual Paper Submission

MURRAY, Ned [Florida International University] [murrayn@fiu.edu](mailto:murrayn@fiu.edu), presenting author  
 ZYRYANOVA, Nika [Florida International University] [nlangevi@fiu.edu](mailto:nlangevi@fiu.edu), co-author

This paper addresses the design and implementation of a proactive planning response to the potential physical impacts of extreme events. Extreme events are generally defined as disasters or catastrophes where the risk is a function of an area's hazards and the levels of susceptibility – human, economic, environmental - to harm or vulnerabilities of those exposures. Climate change has worsened the frequency, intensity, and impacts of extreme weather events, including sea level rise increases and the impacts of major hurricanes in coastal areas. A healthy and sustainable community ensures the availability of safe, decent, and affordable housing. Safe and decent housing supports the health of its occupants and provides shelter from the elements, especially during and after natural disasters. This is especially important for lower income populations who do not have the financial wherewithal to control for these necessities. The structural damage and devastation of human settlements caused by these more frequent and intense extreme events is well documented. Following Hurricane Katrina, more than 400,000 individuals were displaced from their homes in New Orleans. The dearth of housing options for lower-income residents following Hurricane Katrina resulted in many residents not returning to New Orleans. In South Miami-Dade County, Hurricane Andrew highlighted the vulnerability of Florida's building standards at that time. The Category 5 hurricane damaged or destroyed more than 125,000 homes and left an estimated 250,000 people homeless.

This paper describes the research to locate Miami-Dade County's most vulnerable housing structures and at risk populations. Vulnerable housing structures were defined as structures built prior to the 2002 Florida Building Code which included standards to ensure structures would withstand major hurricane-level winds, the appraised value of the structures, and evidence of structural upgrades. The research methodology applied a Community Distress Index (CDI) supported by ArcGIS Pro geocoding and visualization to establish and visualize the concentrations of unsafe housing structures and pair them with communities and populations in distress, including COVID-related socioeconomic vulnerabilities. The analysis found the highest concentrations of older, unsafe housing structures in Miami-Dade County located in less affluent communities already experiencing the health and economic impacts of the COVID-19 pandemic including, Homestead, Little Haiti, and Liberty City. Most of these structures were constructed using the same building methods and materials for homes constructed in the path of Hurricane Andrew.

The research findings provide a foundation for strategic targeting of high risk structures and economically distressed geographical areas and policy direction for creating a more resilient housing supply for the most vulnerable populations. The potential impact of the geodesign framework provides a more holistic and integrated view of affordable housing, public health, safety, and extreme weather events. This lens enables local governments to develop more accurate risk and capacity assessments (VCAs) by categorizing residential structures according to wind and flood vulnerability; determining whether the existing housing supply is adequate to house the displaced; plan for temporary housing needs; and providing plans for assisting local governments in conducting more rapid analysis to justify investments in housing rehabilitation.

### LEADING WITH LOCAL KNOWLEDGE: CO-CREATING A TOOL AND PROCESS FOR INTEGRATING LIVED EXPERIENCE INTO CLIMATE PLANNING

Abstract ID: 535

Individual Paper Submission

LIEBERKNECHT, Katherine [University of Texas at Austin] [klieberknecht@utexas.edu](mailto:klieberknecht@utexas.edu), presenting author

This article seeks to address the following research question: how can residents, researchers, a community-serving organization, and municipal staff co-design a technological system and planning process to better incorporate local knowledge into climate planning?

Local communities, and the people who live within them, experience firsthand the effects of climate events, such as flooding, heat, and wildfire. Marginalized populations see these impacts further magnified by chronic stressors such as poverty and poor health. As a result, researchers and practitioners must pay attention to equity and justice implications of climate adaptation and mitigation so that planning does not exacerbate existing harms. One pathway towards climate justice includes creating planning processes that better incorporate local knowledge and participation in development of climate strategies. In addition, residents on the frontline of climate events often have critical knowledge about the characteristics of these challenges, the harms they cause, and potential solutions. In response, local agencies, nonprofit organizations, researchers, and communities have identified the urgent need to better link everyday knowledge about people's experiences of and responses to climate events to the larger-scale planning and preparation work conducted by municipalities and their partners—both as a way to improve planning outcomes as well as address climate justice.

In this article, we present a case study of a community-based participatory approach to co-designing a data portal and planning process focused on incorporating local knowledge into climate planning. The neighborhood of Dove Springs (Austin, Texas) is a diverse, socially vibrant, and economically challenged neighborhood experiencing repeated and intense flooding and increasing urban heat. After a severe flood that resulted in loss of life and extensive property damage, residents and a community-serving organization, Go Austin!, Vamos Austin! (GAVA) identified the need for a safe and secure online portal where residents can both share knowledge about their community, climate events, and other chronic stressors as well as find information needed to prepare for and respond to climate events. UT Austin researchers partnered with residents, GAVA, and the City of Austin to secure a three-year National Science Foundation grant to support the development of a portal and planning process to meet this community-identified need.

Our community-based participatory approach centers around the Dove Springs Climate Navigators program, co-developed by neighborhood residents, the City of Austin, GAVA, and UT Austin. The Climate Navigators program uses a “train the trainer” approach adapted from public health to build a network of community members who gather and disseminate climate-related local knowledge. Neighborhood-based Climate Navigators, who receive payment for their participation, use cell phones and program-distributed tablets to upload climate-related local knowledge into a secure online data portal. Researchers, city staff, and community-serving organizations then analyze these data, link them to existing information about climate and social risk, and use them to develop local and regional climate planning and implementation.

This article describes the community-based participatory approach used for portal and program development, shares findings from an interview-based assessment of community resilience conducted to inform portal design, and outlines next steps for community-driven ideas about how to most effectively link information from the data portal to municipal and household-scaled climate-related decision making. Our findings are relevant for planning scholars and practitioners considering how to integrate local knowledge into climate planning, as well as for residents seeking tools and structures that can be used to increase climate preparedness and response—at the household as well as municipal scale. In addition, the models, information framework, online data portal, community engagement processes, policy-making process, and data security protections created for this project can be adapted by other communities experiencing climate events and chronic stressors.

#### CLIMATE JUSTICE AND RESILIENT DESIGN FOR KOREAN COASTAL CITIES

Abstract ID: 541

Individual Paper Submission

HAN, SaMin [University of Pennsylvania] hansamin7@gmail.com, presenting author

South Korea has distinct geographical and socioeconomic characteristics, especially on its coasts. Coastal cities have undergone a variety of urban development processes. Therefore, it is difficult to fully grasp the urgent need for repairs and other community support, simply through national-scale indexes and survey data. This research reveals practical ways of enhancing South Korea's coastal resilience, answering the main research question driving this research: "What interventions would be best for Korea's coastal communities?" This work examines actual coastal conditions and local communities in Busan and Gangneung to connect national research and policy to those communities, in the hopes of proposing better policies and coastal designs.

This research included two field studies in South Korea, from March 5 through June 6, 2019 and September 22 through October 15, 2019. This fieldwork augmented the analysis of geospatial and physical conditions and assisted with identifying specific issues that these communities would encounter in response to climate change. The interview includes interviews with 93 people, including experts in national research centers, government officials (city government, district office, and community service centers), and local community members familiar with the area and who had experienced the physical and financial damage caused by natural disasters.

There were certain urgent issues with regards to municipal policies and projects preparing for climate change and the intensified natural disasters seen in coastal cities in South Korea. First, current top-down standardized policies and programs do not reflect local diversity and frequently ignore local conditions, resulting in a disconnection from local cultures and increased damage. Coastal communities have experienced both small and large natural disasters every year, and there has been no practical long-term policy or project working to prevent this (Rye et al. 2015). Second, water disaster prevention projects in South Korea rely heavily on engineering methods and construction. All coastal areas and riversides are artificially maintained. Concrete blocks and walls surround natural revetments, destroying shoreline habitats. Local residents feel safe behind concrete structures, however, and regularly request more subsidies from local or national government institutions to install more breakwaters and higher seawalls. Third, current policies do not have differentiated programs for more vulnerable populations, even though most victims of natural hazards are old, economically disadvantaged, and isolated from the media (Rye et al. 2015). In particular, socioeconomic factors were found to be more influential than environmental and physical conditions in the minority communities. As revealed in the interviews conducted for this research, many citizens and public officials are aware of this, but no countermeasures have been taken to assist more vulnerable populations.

This study discusses important points currently missing from national policies and city projects, taking a close look at local conditions and communities. The qualitative research carefully identifies ways of connecting national policies to local conditions and community needs, filling gaps in current national strategies for dealing with climate change.

A new planning system should embrace local community participation. Local communities have been excluded from policy-making and the urban design process. However, native people have great insights into their region due to their long experience and wisdom. Comprehensive systematic plans and urban designs will allow for effective preparation for climate change and future uncertainty while also accommodating local characteristics and regional diversity. Through this bottom-up analysis, this study will facilitate community-driven resilience designs for future climate change preparation.

## ESTIMATION AND PREDICTION OF URBAN HEAT ISLAND (UHI) MAGNITUDE IN THE CITIES: CASE OF SAN FRANCISCO AND TORONTO

Abstract ID: 558

Individual Paper Submission

KIM, SeWoong [Texas A&M University] sewoongkim@tamu.edu, presenting author  
BROWN, Robert D. [Texas A&M University] rbrown@arch.tamu.edu, co-author

Increased urbanization has deteriorated the thermal environment of cities by creating urban heat islands (UHIs), which have caused extreme heat events. For the past few years, the level of UHIs in major cities has increased rapidly and become a significant issue in cities, leading to severe health and environmental problems for city dwellers. Cities often perform metabolic energy activities, but studies have various interpretations of these activities. For example, cities can calculate their energy budget based on the weather conditions people are exposed to and what clothing they wear. Each urban form has an energy budget that can hold or emit energy. The energy budget takes into account the specific seasonal or climatic conditions and the urban geometry conditions. Although it is possible to conduct an in-depth study of UHIs to calculate and analyze the urban energy budget, few UHI studies have considered these computational methods. The internal heat sources for a building are the overall energy use rates, including those required to maintain the optimal thermal environment within buildings. The internal heat source for humans is metabolic heat, which adjusts to maintain a constant core temperature in the body. For both buildings and humans, the total amount of energy for each mechanism is generally explained as a budget for the component, a flux for one element, and a flux per unit volume for the building. Using these measurements, it is necessary to describe the total amount of heat and energy balance that is incoming, generated, and stored within the urban system, in terms of the heat per volume unit ( $\text{W}/\text{m}^3$ ).

The primary strategy for this task is to determine which urban geometry and elements of weather data affect the magnitude of UHIs and to calculate the weight of the influence of each factor on the temporal and spatial variations. For a more in-depth estimation and prediction in this study, neural networks were used for the development and validation process utilizing three neural network models in this phase. This study utilized the prediction performance of the recurrence neural network (RNN), convolutional neural network (CNN), and long short-term memory (LSTM) network models with historical weather data collected from Toronto and San Francisco weather databases. For meteorological data, these three network models were chosen because the trend of the data change over time is the most critical factor, and it is essential to utilize a time series neural network.

This urban heat magnitude index (UHMI) will help researchers and city officials calculate the heat magnitude with three-dimensional perspectives of each UHI status and predict the pattern of the magnitude change in a given period in the summer (i.e., in one day or on extreme hot event days). In addition, the results of this UHMI development will provide meaningful evidence for cities that have implemented planning codes to confront extreme heat events. It may also encourage cities to refine their codes and/or decisions with specific guidelines using a useful tool to estimate and predict the magnitude of UHIs within the urban boundaries.

## RAINWATER HARVESTING POLICIES AND PRACTICES: WHAT CAN THE UNITED STATES LEARN FROM AUSTRALIA?

Abstract ID: 566

Individual Paper Submission

FRICANO, Russell [Minnesota State University, Mankato] [russell.fricano@mnsu.edu](mailto:russell.fricano@mnsu.edu), presenting author

SMALL, Garrick [Central Queensland University] [g.small@cqu.edu.au](mailto:g.small@cqu.edu.au), co-author

OLUWOYE, Jacob [Alabama A&M University] [jacob.oluwoye@aamu.edu](mailto:jacob.oluwoye@aamu.edu), co-author

The increase in the world demand of water runs concurrently with factors that reduce its supply. These factors include water pollution/stormwater runoff, water use/extraction trends, population growth, and climate change. Rainwater harvesting is practiced throughout the world as an alternative water source and a way of reducing the usage of surface and groundwater. American rainwater harvesting practices are in a primordial state with most examples in the drought-prone Western United States. In the United States rainwater harvesting is primarily conducted at the local government levels with some guidance provided by the U.S. EPA, state government, and non-profit organizations.

In contrast, Australia has successfully implemented policies, regulations and programs that facilitated rainwater harvesting throughout the country, responding to the severe Millennium Drought of 2001-2009. Most of the impetus has come from the territorial (state) government. For example, local governments in Australia followed territorial mandates which included the Building Sustainability Index (BASIX) program in New South Wales which set a target for local governments of reducing home water usage by 40%.

This research examines whether certain Australian rainwater harvesting approaches can serve as a model for implementation in the United States. Most comparative studies focus on a limited number of cities. This research expands the scope of analysis with two data sources: A survey of Rainwater Harvesting Policy practices sent to government officials in the United States comprising of 117 responses, and interviews and surveys of 13 Australian officials at the local, territorial, and federal level. Four climate zones of the Australian continent were represented in the sample. Using the same survey questions for both American and Australian officials, this study examined differences between the United States and Australia in terms of intergovernmental coordination, implementation and regulation, policy guidelines, consistency in standards and technical support.

Findings suggest better inter-governmental coordination in Australia, especially between local and territorial government. Under BASIX, territorial government sets water reduction standards for local government. Local governments develop approaches to attain these standards. Territorial governments also adopt Integrated Water Management Plans with water utility participation. This ensures that government, water sector and community work together on water supply and conservation issues.

Implementation of water conservation measures in Australia is also more proactive. Most surveyed Australian cities noted that under BASIX a rainwater harvesting system is included as part of the building permit requirement for a

new unit.

Australian municipalities also reduce water consumption by considering both rainwater and alternative water sources. Stormwater serves as an alternative source for irrigating sports fields, parks, and gardens. “Smart Tanks” linked to Bureau of Meteorology with telemetry adjust levels of tanks per rainfall for irrigation. Municipalities have also adopted plans for desalination as a supplementary source.

In Australia local governments also utilize strategic planning and a Development Control Plan (DCP). The DCP contains detailed planning and design guidelines in concert with the Local Environmental Plan and the strategic plan.

Australian governmental agencies also strive for consistency in standards. In contrast to American municipalities following guidelines from state-to-state, Australian agencies promote consistency in standards by following Australian Standards (AS) which are related to the International Organization for Standardization (ISO).

Operating at the national level, the Commonwealth Scientific and Industrial Research Organization (CSIRO), a statutory body, also provides technical support and consulting services to local, territorial, and federal government agencies. This includes monitoring of rainwater harvesting activity, cost-benefit analysis, and scientific and technical publications.

#### MITIGATING COMPOUND WATER HAZARDS IN EASTERN NORTH CAROLINA: PERSPECTIVES OF PLANNERS AND EMERGENCY MANAGERS

Abstract ID: 578

Individual Paper Submission

MUKHERJI, Anuradha [East Carolina University] mukherjia@ecu.edu, presenting author  
VANWAGONER, Philip [East Carolina University] vanwagonerp19@students.ecu.edu, co-author

AUSMITA, Ghosh [East Carolina University] ghosha18@ecu.edu, co-author  
DEPOLT, Kelly [East Carolina University] depoltk20@students.ecu.edu, co-author

Eastern North Carolina (ENC), a predominantly rural region, often experiences the intersection of fluvial, pluvial, and tidal flooding, which lead to complex and impactful outcomes, such as morbidity, mortality, economic disruption and loss of livelihood. Managing these connected hazards is challenging, especially as climate change drivers such as sea level rise and wetter storms will likely lead to a greater incidence of compound coastal water events (CCWE). The combination of multiple hazards that contribute to societal, environmental or health risk is known as a compound event (Zscheischler et al. 2018). Little is known about the nature of CCWEs in ENC and whether they are recognized and accounted for by planners, emergency managers, and engineers. Furthermore, risks, vulnerabilities and pathways to resilience in rural regions such as ENC are less well studied and understood as compared to their urban counterparts (Cheng, Ganapati & Ganapati, 2015), even as rural communities tend to be disproportionately affected (Jerolleman, 2021) by CCWE. Funded by a 2019 NOAA Coastal and Ocean Climate Applications (COCA)/Sectoral Applications Research Program (SARP) grant, a key objective of this research is to assess the perceived risks and needs of the hazard management and planning community in eastern North Carolina. In this paper we focus on the mitigation tools used by hazard management communities in ENC and the barriers they face in coordinating mitigation efforts.

The project focuses on rural counties in eastern North Carolina located along the coast and those adjacent to it that share estuarine environments or linked riverine systems. Data was obtained through focus group interviews conducted with 41 planners and emergency managers during a flood workshop held at East Carolina University campus on February 26, 2020. The recorded interviews were transcribed and analyzed using first cycle (i.e., descriptive coding) and second cycle (i.e., pattern coding) coding techniques (Saldana 2009). Initial findings show that ENC planners and emergency managers use a combination of community education, regulations, and floodplain planning and management to minimize exposure to floods and to protect their vulnerable populations. Communities also actively seek funding to clear streams and channels, to implement buyouts and elevation projects, and for infrastructure maintenance. At the same time, ENC communities face several barriers to mitigation including lack of adequate funding to meet their needs, challenges related to land use planning, and conflicting priorities among governmental entities.

The findings of this study would be of interest to local communities vulnerable to CCWEs in North Carolina and beyond, and to decision makers looking to understand local mitigation needs and challenges.

#### **BUILDING COMMUNITY FOR COMMUNITY-LED RETREAT: LESSONS FROM STATEN ISLAND'S BUYOUT GROUPS**

Abstract ID: 583

Individual Paper Submission

KOSLOV, Liz [University of California, Los Angeles] [koslov@ucla.edu](mailto:koslov@ucla.edu), presenting author

In July 2020, the Government Accountability Office released a report on climate migration planning in the United States (US GAO 2020). The report noted the likely inevitability of retreat (also known as managed retreat or planned relocation) from coastal areas exposed to sea-level rise, as well as from areas subject to repeat disasters and other risks posed by climate change. It acknowledged that federal support for retreat is limited, with existing programs such as home buyouts focused on unbuilding at the individual scale after disasters rather than facilitating more collective, less reactive community-wide adaptive movement. Stressing the importance of community-led retreat planning, the report aligned with a growing consensus among planners and policymakers that decisions about where and when to retreat should not be made unilaterally from the top down. However, as with community-based climate change adaptation and disaster risk reduction efforts generally, who “community” entails and how they come to act in this context remain vague (Faas and Marino 2020).

This paper examines how a community comes to embrace—and define itself in relation to—retreat through an ethnographic analysis of Staten Island’s home buyout process after Hurricane Sandy. Contrary to the typical depiction of buyouts as highly individualized economic transactions, with offers issuing from government to be taken up by willing sellers, Staten Island’s buyouts came about through grassroots collective action. In the weeks following Sandy, resident-led “buyout groups” formed in multiple waterfront neighborhoods to lobby first for the creation of a state buyout program and then for inclusion in it. Drawing on fieldwork and interviews over a four-year period, I show how the mobilization for buyouts emerged and spread, focusing on the role of buyout groups in assembling retreat-ready communities that were willing and able to participate in the state’s program. In particular, I explore how these groups negotiated their boundaries and worked to achieve consensus in ways that reinforced existing lines of social and spatial difference, while also inscribing new ones.

Retreat is controversial, in part, because it implies the dismantling of a set of social relations as well as a physical place. On Staten Island, however, retreat entailed a process of community formation as much as dissolution. I compare the conceptions of “community” that emerged through the buyout process—whose advocates and participants were predominantly white, working- and middle-class, politically conservative homeowners—to how community is being defined and contested in other cases of community-organized retreat that are occurring in radically different contexts, including Alaska Native villages and among tribal nations in coastal Louisiana (Jessee 2020). In so doing, I add to a body of planning scholarship that seeks to understand the potential for retreat to reconfigure urban spaces, communities, power relations, and governance; where retreat fits in the broader push for climate justice; and what a process of more just retreat would entail (Ajibade 2019; Yarina, Mazereeuw, and Ovalles 2019).

#### WHERE ARE STREET TREES PLANTED? URBAN FORESTRY AND ENVIRONMENTAL EQUITY

Abstract ID: 593

## Individual Paper Submission

WEI, Hanxue [Cornell University] hw652@cornell.edu, presenting author  
CARRUTHERS, John [Cornell University] jc3474@cornell.edu, co-author

This paper addresses two fundamental questions about urban forestry, a key dimension of environmental policy, in American cities: (i) how do cities decide where to plant street trees; and (ii) do they distribute new trees in a way that is socially equitable? Previous research has shown a disconnect between environmental amenities (such as tree canopy) and socioeconomic status: low-income neighborhoods do not receive the same level of attention as their high-income counterparts and experience negative environmental consequences (Schwarz et al. 2015). By looking at street trees—specifically, which are trees mostly planted in the public right of way— this paper directly addresses the matter of social equity in the context of urban environmental planning. Previous research has looked into specific street tree planting programs and measured their outcomes in terms of spatial equity (Garrison 2018). There is some evidence that previous street tree planting programs, such as MillionTreesNYC, may not have prioritized disadvantaged neighborhoods (Garrison 2018) which leads to the broader questions of social welfare that motivate this work.

Few studies have conducted longitudinal studies specifically on street tree planting activities—in particular, on how cities decide when and where to plant them. Koo et al. (2019) discovered the changing relationships between tree canopy and changes in socioeconomic/demographic status in Atlanta during the first decade of the 2000s, but their findings are based on an analysis of the city’s the whole tree canopy (which includes not only street trees) using remotely sensed data. Young (2011) investigated stakeholder perspectives on the successes and failures of green infrastructure planning, but did not look into the decision-making process of street tree planting. Recognizing that greater numbers of American cities are implementing street tree planting programs, this study seeks to answers that will inform urban forestry practices that promote social equity and improve quality of life for all residents.

As a first step, this study identifies several metropolitan areas notable for being at different stages of street tree coverage with intensive street tree planting programs—including Seattle, New York City, Los Angeles, and Atlanta—in order to determine whether or not neighborhoods that have historically lacked environmental amenities are getting any greener compared to others in different time periods. This step is based on a variety of panel data, including street tree inventories, measures of urban form and the built environment, and various neighborhood characteristics. Next, this study takes a closer look at street tree planting by using Seattle as an example, a city currently with the highest street tree coverage among these areas, to further investigate how this process works. This step will be based on policy documents and geospatial analysis (Wei et al 2021). In this step, this study will also focus on the areas that have historically lacked environmental amenities.

## EDUCATION AND CLIMATE CHANGE AWARENESS: CASE STUDY OF HURRICANE HARVEY

Abstract ID: 598

Individual Paper Submission

KESHAVARZI, Golnaz [VLK Architects] golnaz.keshavarzi@gmail.com, presenting author  
YILDIRIM, Yalcin [Bursa Teknik Üniversitesi] yalcinyildirim@gmail.com, co-author

This study examines the nexus between educational awareness and climate change through the lens of catastrophic floods. It attempts to address various concerns regarding floods to shed a light on the climate change implications. Urban green infrastructures are one of the best locations to assess such implications. Having three flood events since opening, including Hurricane Harvey, Buffalo Bayou Park in Houston, Texas became an ideal case study for research on climate change awareness through public education. Hurricane Harvey resulted in massive damage to both the natural and built-environment in 2017 and the implications still affect residents from various aspects. Since hurricanes generally hit areas near coasts, coastal regions, that are more flood-prone, should be designed to respond to the adverse impacts of disasters. In addition, to design and engineering solutions, public awareness and education are important factors in establishing more resilient urban environments and communities.

The study applied a mixed-method approach including a survey with park visitors and analysis of secondary data such as archival and digital tools. It also analyzed individuals' experience of educational activities and perceptions of educational strategies. The mixed-method helped to examine educational awareness of climate change, in this case, flood mitigations, from two sides, residents and data. Findings show that the park somehow contributed to educating the public on climate change and flood control strategies. Although participants were not aware of all flood mitigation strategies used in Buffalo Bayou Park they recognized the importance of planting native and local plants and natural curves of the bayou in flood control. They also cherished the importance of educating the public on climate change, flood control strategies, and the role of urban parks to enhance resiliency. The participants highlighted the role of social media and non-profit organizations in educating the public on flood control strategies and controlling climate change implications. The results of this study highlight a number of efficient strategies to improve public awareness on climate change and also making them familiar with the implemented policies and strategies, and the role of green infrastructure in creating resilient communities. Urban planners, landscape architects, designers, and experts can use the results of this study to plan for future steps toward improving education on the subject and involving residents in the planning, design, and implementation of flood mitigation strategies.

## DID THE COVID-19 PANDEMIC AFFECT FLOOD CASES? A SELF-REPORT BASED ASSESSMENT

Abstract ID: 607

Individual Paper Submission

YILDIRIM, Yalcin [Bursa Teknik Üniversitesi] yalcinyildirim@gmail.com, presenting author

KESHAVARZI, Golnaz [VLK Architects] golnaz.keshavarzi@gmail.com, co-author

This study aims to contribute to the nexus between climate change and the COVID-19 pandemic contexts. The COVID-19 pandemic has changed urban life dramatically with various health, social and economic implications that threaten individuals globally. The environmental implication of the pandemic, however, was slightly on the positive side. Reported data shows a reduction in noise and air pollutions in 2020 compared to previous years (Yildirim and Arefi, 2021). While air and noise pollutions reduced since lockdowns started around the world in March 2020, climate change-related problems continue to exacerbate. Combining the effects of climate change with the pandemic, the costs on societies are potentially doubled. For example, floods are one of the consequences of climate change that have caused economic loss, social deprivation, and threatened public health at various scales. While health advisors and authorities encourage individuals to follow social distance and stay-at-home regulations for controlling the pandemic, floods force evacuees to leave their residence, stay with friends and family, or in public shelters. So, the pandemic and floods operate specifically opposite, even though their implications are accumulated and threaten individuals with a combined risk. Hence, considering the specific climate and temporal aspects of floods in the U.S., communities tend to be more vulnerable to this risk.

To our knowledge, this study is the first to examine the nexus between the COVID-19 pandemic and flood effects, specifically based on residents' self-reports floods that were obtained from the City's database. To establish this research, the study first identifies the flooding locations based on a unique method of residents' self-reported data and compares the flood reports before and during the pandemic. In the next step, it incorporates the socio-demographic characteristics of flood reported communities at the census block group. The study performed various statistical analyses including t-tests, ANOVA tests, principal component analysis (PCA), and digital mapping by using ArcGIS tools. The research studies the changes in self-reported floods before and during the COVID-19 pandemic in Dallas, Texas. The findings reveal that flood concerns continue threatening the individuals during the COVID-19 pandemic, although there is a slight decrease (almost 10%) in the reported cases. The results, based on our census block group assessments, also show that vulnerable populations are still critically exposed to those damages. Finally, local authorities require formulating better policies covering both the pandemic and climate change-related concerns, especially for the vulnerable communities. Eventually, the study draws a picture to establish a policy framework at the community level.

In the United States, the majority of the population lives in cities and as populations shift from rural to urban settings, more people will be exposed to higher near surface air temperatures as a result of the Urban Heat Island (UHI) effect. It is important for governments to be able to identify areas in cities that are exposed to unhealthy high temperatures and to understand the built environment drivers that directly enhance near surface air temperature. One tool that can be used to identify communities vulnerable to extreme heat are Local climate Zones (LCZs). Since the urban landscape varies dramatically within and between cities, the local climate zones were developed to more accurately describe the surrounding physical landscape by using a set of physical characteristics to classify the urban form into specific typologies.

In this paper, we classify local climate zones for two Midwestern cities, Bloomington and Indianapolis Indiana and compare different classification approaches. We compare a commonly used remote-sensing classification method developed by the World Urban Database and Access Portal Tools (WUDAPT) program. The WUDAPT method inputs free, open-source Landsat data into a random forest (RF) machine learning model to classify urban areas into LCZs. We compare the WUDAPT method, which relies solely on freely available satellite data, to a method that uses high resolution urban morphological data that include features such as building footprint, building height, and aspect ratio. To further validate the methods, we compare the LCZ typologies using satellite land surface temperatures taken during an extreme heat event.

Our research highlights limitations of both the WUDAPT method and the challenges of using WUDAPT to classify LCZs for Midwestern American cities. We specifically uncover a variety of challenges of using these classification schemes for small-size cities. We identify feature importance for different built environment metrics when classifying LCZs and investigate the transferability of training sites for classifying other cities. We also examine the potential of using LCZs to identify areas within these cities that are more prone to experiencing extreme heat events.

Our work aims to help cities become more resilient to our changing climate by enabling improved classification of the built environment thus increasing planners' understanding of the characteristics of the built environment that are driving local climate change. LCZs are an incredibly useful tool for environmental planners enabling them to identify microclimates throughout the urban fabric that can help them appropriately target policy and resources when it comes to resiliency planning.

## OPTIMIZING PLANTING STRATEGIES FOR URBAN HEAT ISLAND MITIGATION IN HIGH-RISE RESIDENTIAL COMPLEXES

Abstract ID: 639

Individual Paper Submission

JIN, Yeongeun [Seoul National University] yeongeun0811@snu.ac.kr, presenting author

YOON, Heeyeun [Seoul National University] hyoon@snu.ac.kr, co-author

Urban areas are more vulnerable to natural hazards, due to the concentrated population and wealth. The risk of climate changes, therefore, are also expected to larger in those areas (IPCC, 2014). In the region of 30 degrees north latitude - at least 17 countries including Canada, the United States, Europe, Japan, and Korea - extreme heatwave occurred frequently in summer seasons in recent years. The record-high heat waves in Western Europe in 2019 was one of the severe examples of those extreme weather events. Urban areas with a large portion of hard surface pavements as well as the higher density of buildings, urban heat island effect - a phenomenon that the temperature in urban areas is higher than that of the suburbs - has threatened the health of city dwellers, causing heat related diseases.

South Korea is one of the countries that have undergone rapid urbanization. 91.8% of the population is concentrated in the urbanized areas (Minister of Land, Infrastructure and Transport, 2016). The dominant housing type - 62.3% - is high-rise residential complex to accommodate those excessive density (called apartment complex in Korea) (Korea Population and Housing Census, 2019). Over the past 30 years, the average number of tropical nights (the minimum temperature at night is above 25 °C) all over the country was 5.3 days, while that of the major cities in South Korea records 11 days, more than twice of that. The temperature difference between urban and suburban areas has continued to widen. To mitigate the urban heat island effect, landscape design has been used. Vegetation, especially trees, can contribute to city-scale heat reduction in terms of blocking solar radiation, reducing surface and air temperatures, and altering wind patterns. Various studies have analyzed the mitigation of heat island effects in urban areas through landscape design, but only few cases have been modeled on actual sites, especially high-density and high-rise residential complexes, and used time-series data of the weather.

In this backdrop, this study aims to investigate the optimal tree planting scenarios to mitigate urban heat island effect and improve thermal comfort in high-rise residential complex. We selected one apartment complex in Gwanggyo new town - The complex consists of a total of 22 buildings, with average 84.95-meter high. (The lowest apartment building is 30.5m, and the highest one is 114.6m)- that has representative characteristics of large housing development projects in Korea. We then designed six planning schemes and conducted simulation to measure the mitigation effects for a typical summer day in 2018. The criteria for planting schemes were two - the location and quantity. First we selected the two types of locations; planting around the building and planting mainly in open space. Then for each scenario, we set the three cases by the quantity; 10%, 20%, and 30% of the entire complex area based on the local rule for housing constructions. We used a CFD (Computational Fluid Dynamics) program ENVI-met 4.4.5, which is suitable for microclimate analysis. To organize simulation, digital topographic map provided by the National Geographic Information Institute was used for site domain, and AWS data provided by the Meteorological Administration's Weather Data Opening Portal was used for weather data. The findings of this study will suggest design guidelines to ameliorate thermal comfort in environmental planning.

## **WHITE SPACE, GREENSPACES: RACIAL HOUSING COVENANTS, ENVIRONMENTAL INEQUALITY, AND IMPLICATIONS FOR PLANNING FOR ENVIRONMENTAL JUSTICE TODAY.**

Abstract ID: 671

Individual Paper Submission

WALKER, Rebecca [University of Minnesota] walk1134@umn.edu, presenting author

Racially restrictive housing covenants were key tools by which racial segregation was stamped onto the landscapes of American cities.<sup>1</sup> Although enacted by private individuals, they were widely advocated for by urban planners as a tool for producing “racially harmonious” (i.e., homogenous) neighborhoods following the 1917 *Buchanan v. Warley* U.S. Supreme Court decision that ruled that racial zoning unconstitutional.<sup>2</sup> Contemporary patterns of urban environmental inequality have been linked to other mechanisms of racial segregation, such as “redlining,”<sup>3</sup> but due to a lack of spatialized data on covenant location, the impact of racial covenants on contemporary environmental inequality has previously gone unexamined. Here we utilize a novel data set, produced by the Mapping Prejudice Project, of every racial covenant in a metropolitan area to understand the legacy impact of these legal designations of White space on environmental quality today. Using Mapping Prejudice’s digitized covenants map for Minneapolis, MN and its suburbs, we quantify intra-urban patterns of heat, tree canopy cover, and impervious surface cover relative to the location of racial covenants, identifying strong correlations between the historic location of covenants and spaces of high environmental quality (i.e., lower heat exposure, high tree canopy cover, low impervious surface cover) today. The presence of a racial covenant today is correlated with reduced heat exposure, conferring a 1.05°C (1.87°F) cooling effect in comparison to the study area average. To understand how the impact of covenants compares to other mechanisms of racial segregation, we compare covenants to “redlining” maps, considering how the environmental quality of covenanted areas compares to that of areas rated as A (“Best”) through D (“Hazardous” or “redlined”) by the Home Owners’ Loan Corporation. This analysis finds covenants confer environmental benefits comparable to an A or B rating from HOLC. Together these results show that racially restrictive housing covenants, despite being ruled legally unenforceable for more than half a century, continue to confer deep environmental privilege today.

Using archival sources, we point to planning decisions made by city park planners in collaboration with the real estate developers of racially restricted developments during the first half of the twentieth century that led to

disproportionate investment in green amenities in segregated White neighborhoods of Minneapolis.

Finally, using a reparative planning framework,<sup>4</sup> we conclude by considering the implications of this research for planning for more just environmental futures. As conceptualized by Williams et al. (2020), reparative planning points to the way in which, since the origins of professionalized urban planning, planning has served to produce urban landscapes that enable and reinforce White supremacy. Given this history, a reparative framework argues that, if planning is to play a role in bringing forth a more just future, it must make decisions that explicitly seek to ameliorate the harm caused by historic racial planning. We argue that, to bring forth more just environmental futures, environmental planners must make decisions that are explicitly in conversation with the legacy of White supremacist planning that produced the spatial inequality in American cities today, and use strategic planning decisions as a tool for enacting environmental reparations.

#### ***POSTNORMAL ECOLOGICAL PLANNING: HOW PLACE-BASED ECOLOGICAL CONCEPTS STIMULATE RADICAL PRACTICE***

Abstract ID: 673

Individual Paper Submission

ZANG, Michael [Florida State University] mcz18b@my.fsu.edu, presenting author

Urban planning's long history of Enlightenment thinking is well known and documented. In the same vein, the environmental subfield of ecological planning has adhered with equal vigor to Western scientific ideals, confined to instrumental and quantitative methods to guide decision-making and vision. Epistemologically, ecological planning's strict rationalist approach has kept the discipline largely removed from the communicative and collaborative revolutions, missing out on practical synergies and social-ecological advancements. Over a similar period, the field of ecology itself has gradually developed an interdisciplinary systems approach that acknowledges the inseparability of

social and ecological systems (Walker and Salt, 2012). This reality has been slowly realized by the broader conservation community, exemplified by large environmental nonprofits such as The Nature Conservancy. This paper pulls together socio-ecological literature to examine the conflict and balance between rational ecological approaches and place-based ecological identities and narratives, focusing specifically on ecological citizenship and eco-region as lenses. By juxtaposing disparate ecological literatures, this research begins to understand the social, political, and ecological implications of ecological citizenship and eco-region, their influence upon regional landscape and land use patterns, and how environmental actors may help broaden citizens' ecological imaginaries and increase the presence of 'Othered' ecological identities (Gilbert, Sandberg, & Wekerle, 2009).

From a rational perspective, ecological citizenship and eco-region are the result of standard ecological measurement processed through quantitative analysis. Through the postmodern disillusionment of rationality and modernism has, however, effectively undermined scientific objectivity and universality, as posited by Actor-Network Theorists (ANT) and Science and Technology Studies (STS) scholars (Law, 2008). Their theories portray modern science as a non-neutral Westernized product, imbued with political bias, cultural conditioning, and personal judgments, thereby guilty of reproducing a limited scientific reality. Likewise, an ecological planning anchored solely in normative science faces limited potentials and exclusionary practices, 'Othering' other ecological realities. Despite the past success of rationalist ecology, ecological standards alone overlook the historical legacies and sociocultural elements that overlay ecological regions. Additionally, rational ecology by itself may ignore the collaborative rationalities and systems thinking advocated more recently by planning and ecology, respectively. This literature review delves into how ecological planning continues to uphold rational ecology while beginning to integrate (reluctantly, at times) new ecological realities and identities beyond that of conventional science. Insights into this phenomenon may spur unforeseen opportunities for both urban and ecological planning, and proffer greater social and environmental justice benefits.

Within this theme, I explore the role of environmental organizations and their potential to facilitate, build, shape, and define regional concepts of ecological citizenship and eco-region (Agrawal and Bauer, 2005). Diverging from Agrawal, however, I frame this process as recursive and cyclical, conducted through collaborative, co-creative channels. Furthermore, I examine the impacts upon regional ecological landscape planning and the latent radical potential, asking "How do environmental organizations help integrate place-based knowledges and histories, cultural practices, and modern urbanities?" alongside their own ecological ideals of citizenship and region. In sum, I posit that an integrated, non-normative ecological planning increases ecological democracy by listening to and infusing subaltern imaginaries of Feminist theory, Indigenous planning, and traditional ecological knowledges (TEK) (Neves, 2019), and how they inform place-based versions of ecological citizenship and eco-region. Re-envisioned ecological imaginaries for a postmodern ecological planning encapsulate the spirits of Sandercock's mongrel cities and Lefebvre's right to the city and have the potential to transcend the hegemonic scientific and cultural order of the day, transforming orthodoxies of land use and ecological landscape planning for the improvement of all.

## DETERMINANTS OF URBAN HEAT-HEALTH RISK: A RE-EXPLORATION ON DIMENSIONALITY USING LATENT VARIABLE ANALYTICS

Abstract ID: 678

Individual Paper Submission

PENG, Binbin [University of Maryland] bpeng91@umd.edu, presenting author

**Introduction.** Extreme heat events have rapidly increased over the last several decades and is a leading cause of health threats in cities and communities worldwide. Despite the seriousness of this situation, urban planning scholars have yet to sufficiently examine the multidimensional nature of health risk to extreme heat in the scope of the built environment. Furthermore, the extant studies that explores the health risk or health vulnerability to extreme heat ended up with a composite index to represent this concept (e.g., Hua et al., 2021; Johnson et al., 2012; Reid, et al., 2009; Wilson & Chakraborty, 2018). More meaningful representation of the complex characteristics needs to be developed.

**Methods.** The study applied latent variable analysis analytics to explore the dimensionality of health risk associated with extreme heat by integrating a wide range of data sets from multiple disciplines, including but not limited to public health, applied geography, environmental science, and urban planning. Socioeconomic and socioenvironmental variables related to extreme heat are examined altogether with human behavioral risk variables and heat-induced health outcomes variables were collected and aggregated to the census tract in Maryland. The following research questions will be addressed. First, what are the major dimensions of the heat-health risk in a multidisciplinary dataset? Second, which counties in Maryland are most salient in heat-health risk dimensionality? Third, what are the common characteristics of the census tracts and counties in Maryland? Last, which socio-environmental determinants make a difference in county heat-health risk dimensionality? Principal component analysis coupled with factor scoring were used to generate representative dimensions of the heat-related health risk. An oblique rotation method—Velicer’s Minimum Average Partial (MAP) was applied which allowed the extracted components correlated. This is a reasonable assumption in the social science. Cluster analytics was used to sort out the common profiles across the extracted dimensions for all census tracts in Maryland.

**Results.** According to MAP’s rule, this study generated 5 components that accounted for 68.22% of the total variance of the original 27 variables, namely air temperature sensitivity and mortality, social isolation and socio-environmental vulnerability, heat-related morbidity, Hispanic and socio-economic vulnerability, and land use and adaptive capacity. Spatial visualization of extracted component score by census tract showed different spatial variations. Moreover, cluster analytic showed the majority of Maryland’s census tracts share similar characteristics across 5 dimensions. However, both intra-county variation and inter-county variation were observed. For example, census tracts in Baltimore City clustered differently from the other census tracts. The root causes were discussed as well.

**Conclusion.** This study is the first attempt to utilize latent variable analysis technique in a more sophisticated way to explore the dimensionality of health risk to extreme heat. The improved accuracy in reconceptualizing heat-health risk help better understand the underlying factors of the health risk disparity in times of extreme heat events. Creating a cluster profile based on dimensional information for health risk associated with extreme heat to present the differences among census tracts is a more thoughtful reconceptualization framework in the dimensionality analysis. This warrants a better understanding of the natural, social, and environmental factors that contribute to heat-health risk. Doing so also helps planners identify the root causes of vulnerability to heat.

## A LONGITUDINAL ASSESSMENT OF URBAN GREEN INFRASTRUCTURE CONDITIONS ACROSS COASTAL TEXAN CITIES

Abstract ID: 690

Individual Paper Submission

BAE, JINHYUN [Texas A&M University] jinhyun2009@tamu.edu, presenting author

NEWMAN, Galen [Texas A&M University] gnewman@tamu.edu, co-author

SOHN, Wonmin [Michigan State University] wonmin@msu.edu, co-author

Flood events are a chronic and growing issue in urban areas globally, causing both property damage and mortality. From 1984 to 2013, in the US, floods resulted in \$238 billion of property damages, excluding coastal hurricanes. The Gulf of Mexico region has suffered the largest portion of flood events in the U.S., accompanied by an increasing number of residents and impervious development (Kim & Newman, 2020; Michel-Kerjan, et al., 2012). To mitigate urban flood effects, the quantity and quality of green infrastructure (GI) has received much attention for helping prevent significant economic losses from floods (Coutu & Vega, 2007). Brody et al. (2017) examined coastal counties along the Gulf of Mexico, demonstrating that the size of open spaces and wetlands have significant effects on flood damage reduction. Lewellyn, et al. (2016) assessed Philadelphia from 2012 to 2014, revealing that GI captured around 59 percent of the storm water volume. It was found that amount of seized water could increase up to 93 percent by proper GI designation. Although many prior studies have demonstrated the role of GI in mitigating flood damage, the assessment of longitudinal change in GI land configuration has been several neglected. For guidance of future land use and long-term GI management, research must be conducted on how well coastal cities have managed GI over time, related to various environmental and socio-economic factors.

This research assesses the GI land configuration across sixty-eight coastal Texan cities (with a population of over 10,000 residents) by statistically examining changes from 2001 to 2016. As a measure of GI landscape patterns, multiple land configuration indices were considered including size, shape, isolation, and connectivity. As a methodological approach, the research applies spatial panel data models developed in 5-year intervals to assess the longitudinal effects of GI while controlling for a set of socio-economic, climate/biophysical, and development factors. Results indicate that GI conditions, especially the amount of GI and its connectivity levels, appear to be improving in cities with a relatively small percentage of the 100-year floodplain (low risk) while worsening in cities that have a relatively high percentage of the floodplain within the city's area (high risk). In terms of the GI shape, the value decreased significantly, indicating that the shape of GI has become simpler over time due to increased development. For control variables, a reduction in imperviousness was found to be more effective in managing GI quantity and landscape conditions. These results suggest that planners should enhance efforts to improve current GI conditions, specifically in cities with high flood risk. Additionally, conservation planning and development rights should be examined together with imperviousness regulations to help increase current GI related landscape quantity and quality.

## QUANTIFYING HIGHWAY AGENCY ROADSIDE TREE REMOVAL USING HIGH-RESOLUTION SATELLITE DATA

Abstract ID: 693

Individual Paper Submission

WHITE, Ellen Oettinger [Rutgers, The State University of New Jersey] eo.white@rutgers.edu, presenting author

In 2017, the Georgia Department of Transportation began a new tree removal program, clear-cutting trees on all highway agency property across the state (Hurt, 2018). Far from an isolated case, large-scale tree removal is common along roadsides across the country. Since 2015, for example, public outcry against tree clearing along highways has been documented in parts of California, Connecticut, Florida, Maine, Pennsylvania, and South Carolina. These actions are often classified as maintenance projects, which carry no requirements for environmental review or public input, unlike new highway construction that must abide by NEPA regulations. As justification for roadside tree clearing, highway agencies most often cite safety, pointing to the potential for run-off-the-road crashes with trees. AASHTO encourages a roadside kept free of fixed objects such as trees, called the clear zone, in its Roadside Design Guide, though the dimension is not meant to be uniform (AASHTO, 2012). While this idea of a roadside clear zone has been maintained as an absolute rule for over 50 years, its relationship to road safety is still disputed (Wolf & Bratton, 2006; NCHRP, 2000).

Few states track vegetation management practices along the roadside, and thus the impacts of highway agency tree removal are unknown (FHWA & Volpe, 2010). Without knowledge of the spatial extent of clearing, highway agencies cannot assess the environmental trade-offs of their actions. In this study, I address the research question:

What are the impacts of large-scale roadside tree removal by highway agencies in states that have increased this practice in recent years?

Using the USDA Farm Service Agency's National Agriculture Imagery Program (NAIP) one-meter imagery and machine learning image analysis in ArcGIS, I analyze the before and after tree canopy cover along roadsides in Georgia. Roadside dimensions can be narrow, so high-resolution satellite imagery is necessary for capturing change at this scale. NAIP data captures leaf-on vegetation conditions every two to three years. After classifying the images, I reclassify into a binary tree canopy/ non-tree canopy raster. Then, I compare the before/after target years, with a resulting tree canopy change raster (change/ no change). My goal is twofold: 1) to quantify the acreage of cleared land and 2) to produce a map depicting the spatial distribution of cleared roadsides.

Results are intended for both applied and theoretical contexts. Understanding the spatial distribution of tree removal is the first step necessary to assess impacts and evaluate trade-offs. Impacts may include removal of sequestered carbon, soil loss, increased erosion, increased sedimentation to nearby streams, habitat loss, degradation of the visual environment, and loss of enclosure from tree canopy. Findings can be utilized by both state highway agencies and the Federal Highway Administration, which is currently updating its roadside tree management guidance and best practices for training and distribution to state highway agencies.

For theory, results from this study point to how certain epistemologies are privileged over others in a highway agency decision-making context. Results illustrate how application of a single engineering practice, devolved from federal guidance and applied as a uniform rule instead of a contextual guideline, can result in drastic changes to the roadside landscape.

#### **SPATIAL ANALYSIS OF STRUCTURAL BIASES IN FEMA DISTRIBUTIONS TO COASTAL PROPERTY**

Abstract ID: 695

Individual Paper Submission

GERONIMO, Laura [Rutgers, The State University of New Jersey] [laura.geronimo@rutgers.edu](mailto:laura.geronimo@rutgers.edu), presenting author

Climate justice requires both micro-analysis of the lived experience of socially vulnerable populations, and macro-analysis of social, economic, political, and institutional systems that shape those experiences (Emrich et al., 2020). This paper builds off an emerging literature that examines systemic, structural biases in the U.S. disaster aid system, with a focus on FEMA's Hazard Mitigation Grant Program (HMGP) (Siders, 2019; Elliott et al., 2020). Exploratory empirical evidence suggests that HMGP distributions have resulted in disparate impacts. Given these findings, how can spatial analysis help us further understand the distribution of HMGP buyouts and property elevations, the relative importance of social vulnerability in explaining this spatial distribution, and the planning and policy implications?

Hazard mitigation for flood risk has historically focused on the exposure of physical assets, their structural vulnerability to current risk, and loss estimates in terms of property damage in dollar values (Highfield et al., 2014). Social vulnerability and social equity research provide more holistic paradigms for understanding disasters and evaluating disaster aid programs. Social vulnerability emphasizes that socioeconomic characteristics are an important and understudied component of risk. Population characteristics like income, race/ethnicity, tenure, and language ability impact the capacity of a household to prepare for, cope with, and recover from hazardous events (Highfield et al., 2014). Past policy and planning practices have resulted in socially-stratified landscapes and power structures where some populations are more vulnerable to disaster than others (Emrich et al., 2020).

Social equity in disaster recovery has been defined as an ideal state where "all people have full and equal access to resource distribution and opportunities that enable them to meet their needs" (Emrich et al., 2020). Social equity may be thought of as a moral yardstick against which we can evaluate programs and policies. A growing literature

seeks to empirically evaluate federal disaster aid programs using social equity metrics. These include efforts to develop social vulnerability indices based on socioeconomic characteristics (Flanagan et al., 2011), integrate social vulnerability considerations in flood risk management (Cutter et al., 2013), and evaluate disparities in disaster recovery and hazard mitigation efforts (Siders, 2019; Elliott et al., 2020; Emrich et al., 2020).

Papers evaluating FEMA's HMGP program have focused on the distribution of buyouts and their social justice implications (Siders, 2019; Elliott et al., 2020). This paper extends this analysis to consider other property actions funded by FEMA besides buyouts, like property elevations. The sample includes more than 15,000 HMGP-funded properties in the coastal zone. Due to competing pressures, the coastal zone is a dynamic area to study coastal adaptation and hazard mitigation policy implementation. Preliminary findings indicate that there are statistically significant differences in the socio-demographic composition of ZIP Codes where elevations occur compared to where acquisitions occur. Compared to ZIP Codes with buyouts, ZIP Codes with property elevations have on average significantly more White people, wealthier populations, higher home values, increased rates of homeownership, and greater proximity to the shoreline. These findings deepen concerns that the HMGP may be exacerbating patterns of spatial inequality.

The purpose of this paper is to apply spatial analytic techniques to better understand regional patterns of HMGP distributions, the principal factors explaining that distribution, and the planning and policy implications. This paper uses enhanced social equity criteria, superior exposure and flood risk metrics, and improved damage estimates to extend previous work in the area. The paper applies k-means clustering, principal components analysis, and spatial regression techniques to further explore HMGP distributions and their implications for climate justice. This paper contributes to a literature advancing the application of social equity criteria in program evaluation, with broad implications for hazard mitigation planning and policy.

#### **BRIDGING THE SCIENCE-STAKEHOLDER DIVIDE IN ENVIRONMENTAL POLICY & PLANNING: A CONVERGENT APPROACH TO ADDRESSING FRESHWATER SALINIZATION**

Abstract ID: 722

Individual Paper Submission

SCHENK, Todd [Virginia Tech] [tschenk@vt.edu](mailto:tschenk@vt.edu), presenting author

GRANT, Stanley [Virginia Tech] [stanleyg@vt.edu](mailto:stanleyg@vt.edu), co-author

The salinization of freshwater bodies across the United States and around the world—referred to as the *freshwater salinization syndrome (FSS)*—represents a major threat to both ecological and human health, with salt concentrations significantly increasing in watersheds across very diverse regions (Kaushal et al. 2018). FSS threatens human health directly as concentrations approach or exceed World Health Organization and U.S. Environmental Protection Agency thresholds for drinking water, posing particular risks to individuals on sodium restricted diets (Bhide et al. forthcoming). Human health (and other species) can be further impacted as salts mobilize previously sequestered nutrients and heavy metals, including in drinking water supply infrastructure. Ecosystems are threatened through declines in pollution-intolerant invertebrates and the loss of habitat. There are many sources of increasing salt concentrations—with their relative prominence varying by region—including road salts, agricultural and other land use activities, and wastewater from industrial and residential sources, and treatment processes (Kaushal et al. 2018).

FSS is particularly problematic for water utilities, potentially necessitating the widespread adoption of desalinization technologies with significant cost and environmental consequences; the cost estimate for Fairfax Water alone is \$1B, not including operational costs (Bhide et al. forthcoming). Given the salt contributions from wastewater, the problem is particularly acute when indirect potable reuse is being practiced, such as with the Occoquan Reservoir in Northern Virginia. In such situations, FSS represents a wicked problem requiring coordinated responses involving a wide range of stakeholders, including potable water and wastewater utilities, local officials, state regulatory officials, key emitters, and scientific and technical experts.

The NSF-funded *Growing Convergence Research (GCR): Common Pool Resource Theory as a Scalable Framework for Catalyzing Stakeholder-Driven Solutions to the Freshwater Salinization Syndrome* project is testing a potentially generalizable ‘bottom-up’ approach to reversing FSS that involves bringing stakeholders together to build a shared understanding of the problem and how it can be addressed in a coordinated, collaborative fashion (NSF 2020). The project team is testing this approach to tackling FSS in the Occoquan Reservoir, which serves as the drinking water supply for almost two million people in Northern Virginia. Through convergence research, education, and outreach the project team is developing mechanisms to facilitate collaboration among stakeholders to address FSS.

A core component of our GCR project is convening key local stakeholders and scientific and technical experts from the associated research universities—through a mechanism called the Executive Committee on the Occoquan Sewershed—to develop a shared understanding of FSS and possible implications of various potential interventions. The team is employing *joint fact-finding* techniques to facilitate the collaborative identification of research needs, development of research questions and methods, research process, and subsequent interpretation of findings (Matsuura & Schenk 2017). The ultimate goal is to bridge the science-policy divide by producing boundary objects that are salient, credible and legitimate to all stakeholders.

We are employing a novel approach—*fuzzy cognitive mapping (FCM)*—to track convergence among stakeholders and the researchers involved with the project over time. FCM is a technique for understanding stakeholders’ mental models of complex socio-ecological systems, and lessons can be learned through looking at both individual and aggregated models (Aminpour et al. 2020). We are applying this approach to assess how individual and collective models change over time as learning and deliberation occurs, and if/how the models can serve as useful artifacts or heuristics for facilitating shared understanding and ultimately consensus on how to tackle the freshwater salinization syndrome.

This paper will introduce the GCR project as an initiative exploring how we can better foster shared learning and collaboration around environmental policy and planning challenges and share initial findings.

## FROM PLANNING TO ACTIONS: HOW PLAN QUALITY INFLUENCE THE IMPLEMENTATION OUTCOMES

Abstract ID: 723

Individual Paper Submission

LIAO, Lu [Cornell University] ll743@cornell.edu, presenting author

Making a stringent plan is the first step of action in climate change and sustainability. But how to turn the ambitious planning vision into actual actions might be the greatest challenge for governments at various levels. Tang et al. (2010) evaluates 40 local climate change plans in the United States and find that most plans have a high-level of awareness of the climate change risk, but relatively limited action approaches to address the problem. Millard-Ball (2012)'s research examines 478 climate action plans in California and find little causal evidence that climate plans influence environmental performance. More recently, Liao et al. (2020)'s research tracks the sustainability actions of 651 US local governments and finds that the impact of the sustainability plans on actions is short-term and declines over time. In general, the local governments are more likely to pick the "low-hanging fruit" of sustainability actions, and tend to design policies that yield short-term benefits and requires little investment and fundamental changes (Ji and Darnall, 2018). Although some studies start to examine the implementation of the plans, most research only focuses on whether localities have adopted a plan but fall short of examining how the plan quality influence the environmental outcomes.

This paper addresses this gap by examining how plan at different quality level influence the environmental outcomes in 104 jurisdictions within the Bay Area Air Quality Management District (BAAQM) in California. The authors compile plan and environmental performance data from various sources, including the local government climate action plan database from BAAQM, and Greenhouse gas emission from CoolClimate Network of UC Berkeley. Among the 104 jurisdictions, 82 of them have adopted a climate action plan, while 22 of them are without a climate action plan. This allows us to compare the environmental performance of cities with and without a plan. The authors manually read the implementation and monitoring sections of these plans, and coded the plans according to year of adoption, whether the plan specifies responsibility among departments and staff, plan update and adjustment, funding strategy and sources, implementation timeline, requiring monitoring reports, etc. Then quantitatively examine the heterogenous impact of plans on environmental outcomes using these variables. The initial results show that whether the localities have a climate action plan does not causally reduce greenhouse gas emission. Among all implementation variables, clearly specified funding sources and responsibility distribution are the most important factors that influence plan implementation.

## COMMUNITY RESILIENCE IN THE 'NEW NORMAL' – INSTITUTIONALIZING RELOCATION AS ADAPTATION IN NEW YORK'S SOUTHERN TIER

Abstract ID: 724

Individual Paper Submission

ENRIQUEZ, Jared [State University of New York at Albany] jenriquez@albany.edu, presenting author

The COVID-19 pandemic and climate-induced events are radically and rapidly restructuring city governance. Traumatic events lead many to seek a 'return to normal,' but entrepreneurial agents might use disasters as an opportunity to imagine new possibilities for a more inclusive and sustainable society. While a 'great reset' might offer platitudes that global economic, political, and social systems will revisit their relationships with the effects of capitalism that created today's crises, the hard work of such transformations will be at the local-level, and city planners face significant challenges to assert relocation as a strategy for climate justice within community planning efforts. The provisions to deal with COVID19 in the United States hardly signal a dramatic shift away from the austerity measures that have weakened local governments' abilities to maintain and manage essential services. Millions of homes may soon become uninhabitable due to sea level rise, shoreline erosion, floods and wildfires, and many inhabitants do not possess viable options for permanent shelter or rebuilding, so where will they resettle, and what will become of their homes after natural and political forces disassemble their communities?

Managed retreat is the strategic relocation of structures or abandonment of land to manage natural hazard risk." (Hino, Field, and Mach., 2017; Neal, Bush, & Pilkey, 2005) Governments are at the very nascent stages of considering managed retreat to relocate those at risk, and pilot communities are still grappling with full implementation of community-scaled relocation (Scott et al., 2020). This paper evaluates contrasting approaches to community relocation through a comparative case study of the Village of Sidney and Town of Union, two municipalities along the Susquehanna River in New York State devastated by Tropical Storm Lee and Hurricane Irene in 2011. The Village of Sidney attempted a community-scaled, collective relocation and participated in the New York State Buyout and Acquisition Program, while the Town of Union has worked to dissolve four target neighborhoods over a gradual period of time and did not opt for collective relocation projects or participate in the NY State Buyout and Acquisition Program. From April 2018 to December 2020, I conducted semi-structured interviews and conversations with county planners, went on site visits, and completed coding procedures for plans, policies, and reports to analyze processes and outcomes in the two municipalities.

Neither municipality has completed a full community-relocation, but both effectively demonstrated how to utilize flood buyouts for community stabilization and offer lessons for planners in overcoming the external and internal forces that complicate the processes of institutionalizing relocation as adaptation. Local planners effectively instrumentalized practices of bricolage to compensate for insufficiencies in disaster recovery policies. As crises are compounding, however, overlapping recovery periods are constraining their abilities to transform exigencies into innovations. Further, both communities have encountered a paradox, which is that effective community planning has required flexibility in approaches to dealing with flood risks, including accommodating ad hoc and micro-

adaptations, which counter the commitments necessary for effectively institutionalizing retreat.

I conclude that in the absence of substantive federal action to address climate change and economic inequality, local governments must have the imagination and audacity to adopt incremental approaches of adaptation, which aim to preserve existing communities, while simultaneously experimenting with transformational and ambitious plans for retreat that will attempt to improve the lives of individuals in new communities.

#### **GREEN SPACE AND URBAN HEAT ISLAND: FOCUSED ON THE EFFECTS OF URBAN STREET TREES IN SEOUL, KOREA**

Abstract ID: 725

Individual Paper Submission

LEE, Seoyoung [Chungang university] lyb3611@naver.com, presenting author

JIN, Jangik [Chungang University] arcane03@cau.ac.kr, primary author

JIN, Jeongkyu [Chungang university] jjkl40424@naver.com, co-author

Recently, the urban heat island phenomenon has become a hot research topic along with the issue of climate change because the temperature in urban areas with high population density is gradually increasing all over the world. This urban heat island phenomenon causes severe heat waves during an extremely hot summer, which increases energy consumption and thus causes higher level of ozone. These simultaneous effects may have a negative influence on human lives, so that various studies have been conducted to reduce urban heat island effects. One way to mitigate extreme temperature during the summer is to increase urban green space. A number of previous studies have empirically shown that green space can alleviate the urban heat island phenomenon by increasing the cooling effect. However, some scholars have argued that green space simply created by a park cannot be a perfect solution because creating an urban park is not easy but complicated due to the limited space and complex individual interests in urban areas. Nevertheless, since green space reduces local air and ground temperature as well as have a natural ability to filter air pollution, it is necessary to expand urban green space for citizens' quality of life. Alternatively, scholars have argued that street trees have a positive effect on the mitigation of urban heat island phenomenon by blocking sunlight, and thus street trees can lower the temperature of the urban land surface. However, empirical studies on the cooling effects of street trees have not much conducted so far, especially in Seoul, Korea.

With this perspective, we attempt to empirically examine whether street trees reduce urban heat island phenomenon by lowering temperature of the urban surface in Seoul, Korea. For doing this, we collect detailed street tree data that contain information on the exact locations and tree size, satellite image data for measuring urban temperature, and spatial data including buildings, roads, streams, and land use types. Particularly, we (1) investigate how the street trees reduce urban temperature using a hierarchical linear model, and then (2) compare the effects of street trees on the urban temperature of the central business district where has the highest surface temperature and those of other places in Seoul. After controlling for other variables, our empirical analysis results show that the vegetation of street trees has a significant cooling effect on lowering the surface temperature of the surrounding area, and this effect is much larger in areas with large living population, such as commercial areas, especially in the central business district. Our findings suggest that the cooling effects of street trees are clear, so

that urban policy for planting more street trees needs to be considered as an alternative to creating more urban parks. Particularly, planting more street trees in commercial business districts as well as areas with high density commercial development would be more efficient in reducing urban heat island phenomenon.

#### SCENARIO PLANNING AS A TOOL FOR EMERGING WATERSHED MANAGEMENT PROGRAMS

Abstract ID: 728

Individual Paper Submission

BIRCH, Traci [Louisiana State University] tbirch@lsu.edu, presenting author

Watershed management as a means to reduce hazard risk has emerged as a priority for government agencies as they develop and update strategies to address increasing climate change impacts. This is driven by rising costs for disaster recovery and growing recognition that communities are increasingly vulnerable to environmental impacts that exceed local capacities. However, these efforts are confounded by the mismatch between changing economic, social, and environmental conditions (Folke et al., 2007) and relatively inflexible governance and planning structures. It is widely recognized that within multi-jurisdictional regions, planning is highly fragmented across community decision-making bodies with different goals. Each has authority to determine its own land uses, development practices, and management strategies to achieve locally-determined objectives, often to the detriment of adjacent watersheds. This incongruity between dynamic systems, and static and fragmented governance, suggests barriers exist to implementing resource and risk reduction policies necessary to limit impacts and improve regional resilience (Lipiec et al. 2018).

Regional planning requires consideration of complex issues spanning diverse landscapes, coordination across a range of management units with disparate interests, and trans-disciplinary communication and coordination (Trammell et al. 2018). It is no surprise then, that these large-scale shifts in resource management are costly and difficult to implement. A range of tools have been developed to help facilitate these transitions. In particular, scenario planning has shown promise as an effective way to address the complexities of regional systems by presenting diverse issues within a small set of alternative 'visions' for how the future may unfold. These processes are often oriented toward influencing collective decision-making (Wollenberg et al. 2000), which means they can have a wide range of implications for a diverse set of stakeholders.

In 2016, Louisiana experienced two catastrophic inland floods that highlighted weaknesses in regional water management and risk reduction. In response, the Louisiana Watershed Initiative (LWI) was created to coordinate long-term recovery response and resource management by state, regional, and local agencies. LWI divided the state into eight watershed units, and early efforts have worked to generate regional governance structures, data, and public support. But where do we go from here? Questions remain on how the state can turn data into visions,

policies, and investments that overcome the challenges of a dynamic natural systems and disjointed local land use practices. To better understand the challenges facing LWI implementation, the LSU Coastal Sustainability Studio held a series of scenario planning workshops bringing design professionals, public officials (both elected and agency representatives), and national experts together to discuss the future of Baton Rouge and the Amite River Watershed. The workshops took place in two distinct parts. The first included multi-day participatory design exercises centering around multiple future scenarios developed using the FUTURES framework (Meentemeyer et al 2013). Participants included resources agencies, university researchers, as well as design professionals who are often left out of the resource management conversation. The second set of workshops presented the outcomes of these design-driven efforts, and focused on consensus building between designers, agency representatives, researchers and elected officials around potential implementation strategies, legal/policy frameworks, and best management practices. These trans-disciplinary teams expanded upon the State's watershed approach to consider long-term visions for local and regional multi-functional infrastructure networks that can provide stormwater management, multi-modal transportation, and regional recreational benefits. Results of the workshop indicate that there are opportunities for coordination when regional economic benefit and infrastructure investment are the focal point. This talk will focus on the processes and results of these workshops, successes, challenges, and next steps. Work is supported by the National Academies of Sciences Gulf Research Program and the Robert Wood Johnson Foundation under award number 2000008299.

#### **PUBLIC PERCEPTION TOWARD GREEN INFRASTRUCTURE ON STREETS FOR STORMWATER MANAGEMENT**

Abstract ID: 730

Individual Paper Submission

KIM, Chaeri [University of Pennsylvania] chaeri@upenn.edu, presenting author

Cities are increasingly implementing green infrastructure for stormwater management with expectations of cost-effectiveness and co-benefits. One of the popular implementation strategies is retrofitting streets where stormwater runoff occurs. In addition to managing stormwater, green infrastructure provides co-benefits, including neighborhood beautification, air quality improvement, urban heat island effect mitigation, and walkability enhancement (Meerow 2020). Unlike traditional gray infrastructure, such as sewers, green infrastructure is visible and may affect public support for green infrastructure policies or programs (Everett et al. 2018; Finewood, Matsler, and Zivkovich 2019). Although research has demonstrated the benefits of green infrastructure in urban areas, few

studies have evaluated whether the public also perceives such benefits and what factors may influence their perception (Miller and Montalto 2019; Gao et al. 2018).

This paper investigates how residents perceive green infrastructure on streets and analyzes whether their perceptions are related to environmental awareness and satisfaction with neighborhoods. I surveyed residents living in zip codes where the Philadelphia Water Department (PWD) or New York City Department of Environmental Protection (NYCDEP) implemented various types of green infrastructure on streets. The online survey asked four sets of questions to 300 residents. The first set queried the residents' awareness, preferences and concerns regarding green infrastructure. The second set inquired if residents agreed that green infrastructure constructed in their neighborhoods provides well-known benefits. The third set questioned the residents' awareness of environmental issues, such as the water quality of local rivers and the impact of climate change. The last set assessed residents' satisfaction with their cities and neighborhoods.

Statistically analyzed survey data advances an understanding of public perception of green infrastructure. The findings of this study contribute to our grasp of potential relationships between public perceptions, environmental awareness, and neighborhood satisfaction. By investigating these public perspectives, this research provides insight into how cities can enhance new and existing green infrastructure policies and programs in the public realm to achieve stronger public support.

#### **RACIAL EQUITY PLANNING IN THE FACE OF A CHANGING CLIMATE**

Abstract ID: 745

Individual Paper Submission

ZOLL, Deidre [University of Texas at Austin] deidrezoll@utexas.edu, presenting author

As the impacts of climate change intensify, a growing number of cities are developing climate adaptation plans and projects (Aaros et al., 2016; Lyles, Berke, & Overstreet, 2018). How cities address existing racial inequalities in their planning efforts varies widely, raising concerns that climate adaptation actions may continue patterns of disparate risk for communities of color (Anguelovski et al., 2016; Shi et al., 2016). Simultaneously, growing public attention to anti-Black violence in the United States has prompted a resurgence in racial equity approaches to urban planning (Solis, 2020). Limited research examines the confluence of these two areas of planning, with little scholarship on how racial equity climate adaptation planning processes are designed, managed, and perceived (Schrock, Bassett, &

Green, 2015; Solis, 2020). This case study contributes to this body of research through examining how the cities of San Antonio and Houston developed racial equity approaches to the San Antonio Climate Action and Adaptation Plan (2019) and the Houston Resilience Plan (2020). Through interviews with city planners, community activists, and technical professionals I detail the tensions between city commitments to racial equity and community expectations for participatory justice.

This paper engages with theories of governmentality and the racial state (Cooke & Kothari, 2001; Kurtz, 2009; Taylor, 2007) to draw out three implications for planning practice and theory. First, I describe how community organizations frame their decisions to engage with the climate plan development process as a harm reduction strategy. I detail how few organizers expected city-led racial equity planning approaches to fundamentally change the material realities for communities of color or their protection from climate risks. Instead, they strategically decided to participate in these processes to minimize harms that could result from them not being at the table. Second, I contrast organizers' harm reduction strategies with city staff's beliefs that racial equity approaches to climate planning hold the potential to address racial and climate inequalities in their cities. Third, I bring these divergent perspectives into larger conversations on the politics of reform strategies to discuss the ways participatory planning can conscribe planners and community activists into racialized systems that allow for incremental progress but limit the potential for fundamental challenges to the logics of environmental racism (Pulido, Kohl, & Cotton, 2016; Cooke & Kothari, 2001). This case study contributes to our understanding of how emerging urban planning responses to climate change and anti-Black violence represent a shift in traditional planning practices and how planners and communities navigate the potentials and limitations of this evolving terrain.

#### **APPLYING NETWORK ANALYSIS AND PLAN EVALUATION (NAPE) METHODOLOGIES FOR REGIONAL INSTITUTION BUILDING WITHIN THE LOUISIANA WATERSHED INITIATIVE**

Abstract ID: 766

Individual Paper Submission

DOUTHAT, Thomas [Louisiana State University] tdouthat1@lsu.edu, presenting author

LAMANA, Lindsey [LSU] llaman2@lsu.edu, co-author

IRVING, Jennifer [LSU] jirvin6@lsu.edu, co-author

SANDERSON, Rachelle [Capital Regional Planning Comission] rsanderson@crpcla.org, co-author

Regional problems related to planning involve integrating multi-scalar and multi-jurisdictional processes. In the case of watershed hazards, this involves local floodplain management practices, environmental processes and ecosystems, regulations, and infrastructural strategies. These are often governed by their own domain specific planning and regulatory approaches, which materialize as intermediary documents such as ordinances and plans,

but in a piecemeal, fragmented, fashion (Bodin 2017, Bacau et al 2020, Berke et al 2019). Existing planning efforts, such as Local Hazard Mitigation Plans, transportation planning, and storm water and non-point source plans, are all crucial for regional planning for watershed hazards, but do not exist as a discretely defined system. Instead there is a need to derive the relevant issue-specific planning network from this complex interaction of diverse governance efforts. In doing this, many planning efforts involve assessment and incorporation of local and regional planning efforts, using plan evaluation methods (e.g., Lyles and Stevens (2014) and Brody (2008)), and more recently incorporating network methodologies (e.g., Berke 2019 et al, Bacau 2020).

We have developed a uniform methodology for extracting relational data from planning documents for the purposes of complimenting established regional plan evaluation methods Network Analysis in Plan Evaluation (NAPE). NAPE is currently being used to assist the Louisiana Watershed Initiative, Region 7, and Capital Regional Planning Commission, in its efforts to create a regional watershed coalition structure. These methods allow for the initial visualization of the regional planning network (derived from planning documents), as well as answering questions around fragmentation in local, state, and federal objectives around water quality and adaptation (e.g., concurrence between current activities, planning goals, and current programs.), stakeholder, and key broker identification. These methods also allow for initial understandings of existing multi-jurisdictional collaboration around watershed issues, and if existing patterns of collaboration can be explained by attributes of the network's constituent organizations, plans, and jurisdictions. Measures involved include centrality, clique analysis, brokerage, and multi-level visualization techniques. We will provide a GIT-Hub repository for this analysis, and use the network and scorecard attributes for testing hypotheses around the questions posed above.

Our paper will discuss the utility of NAPE in terms of creating practitioner-relevant knowledge about the regional planning system, as well as discuss findings related to fragmentation and the structural properties of collaboration within the informal watershed planning network in LWI Region 7.

#### EVALUATING THE LAND USE IMPACTS OF UTILITY-SCALE SOLAR ENERGY DEVELOPMENT IN VIRGINIA

Abstract ID: 767

Individual Paper Submission

PITT, Damian [Virginia Commonwealth University] dpitt@vcu.edu, presenting author

BERRYHILL, Aaron [Virginia Commonwealth University] berryhilla@mymail.vcu.edu, co-author

Like many other states, Virginia is experiencing a rapid increase in utility-scale solar energy capacity. Declining costs, combined with supportive state legislation, indicate that this rapid development will increase for the foreseeable

future. While utility-scale solar provides many benefits related to climate change mitigation, pollution reduction, and tax revenue for the impacted localities, it also has its share of limitations, controversies, and detractors. Of particular concern are the land use impacts of utility-scale solar, specifically the possible loss of high-value farm or forest land or sensitive ecosystems (Hernandez, et al., 2014; Kaza and Curtis, 2014) and the potential environmental justice implications from concentrating these facilities in low-income and/or minority communities (Mulvaney, 2019).

Local planners and policymakers have an important role in understanding the impacts of utility-scale solar, and mitigating them through siting agreements, local regulations, and other policy innovations. One promising method for maximizing the net benefits of utility-scale solar is to use GIS methods to assess the impacts of existing or proposed solar facilities, or to identify ideal sites for future solar energy development (Dias, et al., 2019; Poggi, Firmino, and Amado, 2018). Such analyses can help planners guide the future location of utility-scale solar projects through their zoning codes, comprehensive plans, and other policy tools.

This research examines the land use impacts of utility-scale solar facilities in Virginia, in order to inform recommendations for sustainable solar energy development in the Commonwealth. The key research questions are as follows:

- ❑ What is the total acreage of land dedicated to utility-scale solar development in Virginia thus far, and the average acreage per megawatt (MW) of installed utility-scale solar generation capacity?
- ❑ What types of land uses are most often converted to utility-scale solar development (agricultural, forested, open lands, etc.), and do these patterns vary significantly by region?
- ❑ To what extent is utility-scale solar development impacting “high value” agricultural and forest lands, vs. more marginal land within those categories (e.g., forest land with higher vs. lower conservation values)?
- ❑ Does utility-scale solar development occur disproportionately in counties that are lower-income and/or have high minority populations compared to the statewide average? To answer these questions, we built a new Geographic Information Systems (GIS) database of the 38 utility-scale solar facilities currently operating in Virginia. This required meticulous cross-referencing of information from aerial photos, site maps (e.g., from county-level special use permit applications), and other sources to geo-reference the actual impacted site areas for each project. This includes the solar panel footprints as well as additional land converted around the panel area, but not any undisturbed land on the applicable parcels. After geo-referencing the individual project sites, we overlaid those project footprints with the Virginia Land Cover Dataset to identify the previous land uses at those locations. Preliminary results show that over 80% of the impacted acreage has been former forest (58%) and cropland (25%). Additional datasets from the U.S. Census Bureau and other sources are being used to answer the subsequent research questions.

This research will inform policy recommendations to support the further development of utility-scale solar while mitigating potential negative land use impacts. It will also identify new best practices for data management and analysis to track the impacts of utility-scale solar in a given state or community. Finally, it will contribute to the evolving body of research on the impacts of utility-scale solar on forest and agricultural use as well as potential equity concerns stemming from utility-scale solar development.

## **"BOUNCING BACK" TO LONGSTANDING URBAN ALLIANCES IN THE FACE OF THE CLIMATE CRISIS? EVIDENCE FROM METRO-BOSTON**

Abstract ID: 773

Individual Paper Submission

RACITI, Antonio [University of Massachusetts, Boston] [antonio.raciti@umb.edu](mailto:antonio.raciti@umb.edu), presenting author

NEGRÓN, Rosalyn [UMass Boston] [Rosalyn.Negron@umb.edu](mailto:Rosalyn.Negron@umb.edu), co-author

REBECCA, Herst [UMass Boston] [Rebecca.Herst@umb.edu](mailto:Rebecca.Herst@umb.edu), co-author

This paper uses a prism of urban theories to unpack rationales, research agendas, and ongoing planning efforts by exploring mechanisms of mobilization of resources and collaboration of urban actors around climate adaptation strategies in Metro-Boston. The paper reviews the literature on urban growth and regime theories and connects these with more recent theoretical strains in climate justice to analyze why and how urban actors cluster to face climate change challenges through adaptation.

Urban growth theory (Molotch, 1976) builds on the assumption that any locality is the physical expression of land-based elites who compete to mobilize resources to promote their interests through physical and economic growth. Urban regime theory (Stone, 1993) offers a critical heuristic device to explore how the capacity to govern is profoundly conditioned by the type of alliances that government bodies established with non-government actors. On the one hand, these strains of literature point to the need to look at the content of urban development proposals related to their proponents to unpack rationales and logic underpinning advanced growth imperatives and powerful elites alliances. On the other hand, recent theorizations on degrowth alternatives and mass mobilization of grass-roots organizations have been questioning longstanding urban development logics by conceptualizing a plea for new governance arrangements for degrowth agendas and a reawakening of the "democratic political" to perform staging and acting of equality in the face of instituted "democratic order" (Swyngedouw, 2014, p. 123).

Growth/degrowth and regime/post-political longitudinal developing theories are instrumental in navigating contemporary challenges posed by climate change and inquiring about existing and construct different climate change politics. Two decades of climate justice literature have, in fact, demonstrated how processes and pathways of adaptation strategies have been continuously reinforcing the elitarian status quo by re-proposing dispossession cycles. Underpinnings of this conclusion stand on the large body of research inquiring about the connection between climate action and social justice (Fitzgerald, 2020), and pointing to the need for innovative roadmaps to reorient research toward the social dimension of adaptation (Shi et al., 2016).

By using stakeholder network mapping analysis and in-depth key-informant interviews, this paper explores how climate justice issues are strictly dependent on the social processes embedded in existing urban regimes whose mainstream climate adaptation agendas are set and maintained by prominent urban actors. More specifically, this research's empirical component analyzes a stakeholder network of 148 people, spanning public, private, non-profit, and academic sectors, and operating in Boston, Brookline, Cambridge, Chelsea, Everett, and Somerville (Massachusetts). The paper offers critical insights on the controversial nature of the content of these agendas in Metro-Boston and opens an arena to discuss both contents and social processes that could lead to more just efforts. It points out how existing small forms of diversity, inclusion, and participation alone are insufficient to intervene in the existing powerful alliances in the climate adaptation field and advocates for a more drastic re-imagination of the

existing stakeholders' network if just outcomes are desired.

### **ADAPTING TO CLIMATE CHANGE IN THE STATE OF NEW YORK: WHAT DOES SUCCESS REALLY MEAN FOR MUNICIPALITIES?**

Abstract ID: 800

Individual Paper Submission

AHMAD, Sonia [Cornell University] fta8@cornell.edu, presenting author

The State of New York State is emerging as a strong subnational actor in the climate change policy arena. The State's ambitious Climate Leadership and Community Protection Act (Climate Act) demonstrates how to confront a rapidly changing climate to the rest of the world. While the state's policy declarations and initial spell of activities are impressive, it remains to be seen to what extent the climate action goals will be successful at the level of the municipalities. This paper examines Kingston and Beacon, two metropolitan areas in New York that have made significant progress in adopting and implementing climate action plans. It asks, what adaptation strategies are being used by the cities? What barriers and challenges did they overcome? And what implications do they hold for other cities in the State? The study finds that these cities progressed quickly by implementing actions that achieved significant economic benefits and great cost-savings. They also involved the business community in the implementation of the plans. However, this achievements comes at the expense of actions that were more effective, equitable and could have led to more sustainable changes in the long run. The results are distilled into 5 lessons for planning practitioners and establish a basis for future research on municipalities in managing competing environmental, societal, and economic claims in planning for climate change.

## COVID-19 PANDEMIC: EFFECT ON BUILT ENVIRONMENT PREFERENCES

Abstract ID: 827

Individual Paper Submission

GROVER, Himanshu [University of Washington Seattle] groverh@uw.edu, presenting author

Historically, public health crises have played an important role in shaping our modern cities. For example, mid-19th century urban sanitation systems, developed in response to cholera outbreaks. Current COVID-19 outbreak is also forcing us to reassess our built-environment especially in dense areas. During this outbreak, public health concerns have forced residents to practice social/ physical distancing, avoid public places, and reduce reliance of public transportation systems. Dense urban environments such as Seattle and New York have become the epicenters of this pandemic. Therefore, it is expected that there is likely to be an increase in perception of public health risks associate dense urban environments (Andersen et al. 2021; Sharifi and Khavarian-Garmsir 2020). Continued public support is critical for future formulation and implementation of policies to create sustainable built environments. Past research on public policy support suggests that risk perception plays a critical role in influencing support for local development (Glasbergen, Biermann, and Mol 2007; Macnaghten and Jacobs 1997; Taylor 2003). Similar relationship has also been identified in related disaster research studies wherein risk perception is often identified as a key determinant of household adjustments to reduce risk from extreme natural events including pandemics (Adame and Miller 2016; Frank and Engelke 2001; Kent and Thompson 2012; Lindell and Perry 2012; Strahan and Watson 2019; Youssef 2018). These risk reduction adjustments can range from lack of support for policies perceived to exacerbate the risk to behavioral changes such as decreased use of public transit systems.

This timely research aims to capture the change in public support for common sustainable development policies that promote higher housing densities, increased reliance on public transportation, and use of public spaces. Superficially, the following three key questions are addressed in this research: 1) How has the present pandemic influenced public preference for dense urban development, housing choice, transit preferences, and use of public places? 2) What challenges are faced by people with respect to their built environment in practicing physical isolation while continuing to address their daily needs? 3) What is the impact on public perception of existing built environment regulations and growth management policies?

This research focuses on Seattle–Tacoma–Bellevue Metropolitan Statistical Area, which was the first epicenter of the coronavirus outbreak and continues to be one of the severely affected areas in the US. Till now it has experienced 2,972 positive COVID-19 cases and 153 deaths (Jan 2021). Its average population density is 648 people/sq mile (2018), which is roughly three times the US average population density in Metro and Micropolitan Statistical Areas. Further, a number of state and local policies including the Washington state’s Growth Management Act has played an important role in shaping the dense urban environment in this region. This region thus represents an ideal location to assess the changes (if any) in local preferences for sustainable development policies that have traditionally enjoyed significant support in this region. Presently, survey data is being collected through an online survey (data collection period ends on July 15th, 2021). The results of the survey and analytical outcomes will be available in time for final paper submission.

Many cities worldwide face the converging challenges of aging stormwater management infrastructure and the uncertainties posed by climate change. Inadequate stormwater management and infrastructure results in public health and safety threats, water quality issues for receiving waterbodies, and equity issues in resource allocation, accrued benefits, and adverse impacts. Concepts that re-envision stormwater as a resource rather than a hazard incorporate multi-purpose solutions built on closed-loop stormwater management systems (Cesane et al., 2017). However, funding and capacity issues are a significant barrier to implementing forward-looking solutions in stormwater management. Even though pollution from stormwater runoff is the leading cause of water quality issues in the U.S., investment in stormwater management often lags behind drinking water purveyance and wastewater management (Stormwater Infrastructure Finance Task Force, 2020). Unlike drinking water and wastewater, which are conventionally governed as utilities, stormwater management programs have often competed with other municipal public works programs for funding and prioritization when there is no dedicated stormwater enterprise fund.

In response, municipalities have adopted stormwater utilities (SWU) or stormwater fees, which create a designated revenue source specifically for use on stormwater-related infrastructure, management, or maintenance. Having a dedicated fund for stormwater systems ensures that property owners directly pay to address a ubiquitous issue, raising awareness of the problem. Moreover, incentives or credit systems can encourage specific behaviors and technologies toward practices that reduce runoff by individual landowners. By-and-large, stormwater fees are assessed by total impervious area (TIA), a fee structure that has been upheld through several U.S. court cases. However, TIA alone may not be the best predictor of stormwater runoff (Lim, 2016).

In this study, I explore both concepts of efficiency and equity in implementing a stormwater fee. In the implementation of stormwater fees, equity and efficiency are considered to go hand-in-hand (Lindsey, 1990). However, such a framing with roots in economic epistemologies may serve to perpetuate underlying inequity (Finewood, 2016). Issues of "fairness" have frequently been raised during community meetings exploring options for implementing a SWU in the City and County of Honolulu. Unfairness is often associated with variable rainfall patterns in Honolulu and whether precipitation should be considered in the stormwater fee. To understand whether underlying spatial patterns emerge between demographics and potential stormwater runoff drivers, I first conduct a socioeconomic correlation analysis. I find there is only a slight positive correlation between median income and precipitation ( $r = 0.18$ ), slope ( $r = 0.25$ ), and building area ( $r = 0.15$ ) for residential parcels. Second, I consider whether a "fair" fee should be based on slope, soil, and rainfall rather than TIA. I use the U.S. Environmental Protection Agency's National Stormwater Calculator rainfall-runoff methodology to conduct a spatial comparison of runoff generated from impervious and bare ground land cover. I suggest that a stormwater fee based on pricing the potential infiltration loss (PIL) creates greater efficiency than TIA. Finally, I examine whether there are uneven burdens of payment for a fee based on TIA compared to PIL.

## SPATIAL RESILIENCE IN THE CHENGDU PLAIN: NEW PLANNING VALUES OF AN ANCIENT COUPLED HUMAN-NATURAL SYSTEM

Abstract ID: 833

Individual Paper Submission

WU, Shuang [University of Washington Seattle] [shuangwu.chn@gmail.com](mailto:shuangwu.chn@gmail.com), presenting author  
 ABRAMSON, Daniel [University of Washington Seattle] [abramson@uw.edu](mailto:abramson@uw.edu), co-author

This paper reports on agrarian communities and agroecosystems in the Chengdu Plain, southwest China. It focuses on the spatial distribution of a unique agricultural landscape element, linpan (wooded lots), which combines forest, farmland and farmers' dwellings in a patchy, biodiverse and remarkably scattered pattern across a densely populated and exceptionally productive region. For more than two millennia, this landscape has demonstrated long-term productivity and resiliency, and supported sustainably some of China's earliest and most stable urban centers with very few major disturbances, due to the nourishment and flood control provided by the ancient Dujiangyan Irrigation System (Abramson 2020). Over the past two decades, urbanization and expansion of the central city of Chengdu has put pressure on farming communities to spatially consolidate habitation, according to conventional planning wisdom that correlates compact settlement footprints with more sustainable modern development (Ye and LeGates 2013). However, as modern development evolves to include new forms of building and infrastructure and new ways of achieving livelihood, health and well-being, time-tested indicators of spatial resilience in the landscape may accrue new value. Building on previous efforts to identify and measure resilience-related features of the linpan landscape (Tippins 2014), we present new findings on the spatial distribution of linpan and its implications for rural development planning in this and other densely populated, richly productive agricultural regions. Using GIS, land ecology metrics, and historic maps and remote imaging of the landscape before and during rapid urbanization, we quantify the distribution of linpan patches (i.e. patch size, patch shape, patch density) in five 4km-by-4km sample study areas, and correlate the result with the density of the waterways, the age of the irrigation system, and social survey and interview data on residents' livelihoods and response to the COVID-19 pandemic. The oldest and most central sections of the irrigation system correlate with the highest number of linpan, which are smaller but separated by shorter distances, distributing the agrarian population more evenly across the landscape even though these areas are closest to the urban center; in newer and more peripheral sections of the irrigation system, individual linpan become bigger and more distantly separated, and habitation is more concentrated, the further settlements are from the center. The correlation of the spatial pattern of settlement with the age of the irrigation system's expansion suggest important functions of dispersed dwelling for land and water use and management. Patch sizes, population density and dwelling dispersion help maintain an equilibrium of carrying capacity in this coupled human-natural system. The dispersed pattern of dwelling and the spatially intimate relation of habitation to productive land and water has demonstrated continued relevance to the ability of residents to adapt to unpredicted disruptions, such as changing market conditions and pandemic restrictions, despite many changes in material and economic life in recent decades.

## DISENTANGLING THE RELATIONS BETWEEN URBAN FORM AND URBAN ACCESSIBILITY, A DISASTER RESILIENCE PERSPECTIVE

Abstract ID: 834

Individual Paper Submission

HAO, Haiyan [University of Florida] hhao@ufl.edu, presenting author

WANG, Yan [University of Florida] yanw@ufl.edu, co-author

Form-based codes have dominated the municipal planning for few decades. For example, the Growth Management projects promote compact urban developments while the New Urbanism initiatives, though initially proposed to improve civility and residents' livability, are ended with form-based planning practices such as mixed land use and compacity. The recent COVID-19 pandemic has exposed the risks of these streamlined planning practices (Grant, 2020) that the city planning should consider the locally social, geographic, and climatic contexts. This study examined the relations between three popular urban form characteristics, i.e., compacity, polycentricity, and mixed land use, and urban accessibility in the context of disasters. The hidden reasoning is that urban forms that provide sufficient and equitable access to essential facilities (e.g., groceries, healthcare, and gas station) can better accommodate city residents during disasters and avoid exacerbated disaster impacts (Logan & Guikema, 2020; Paton, 2017). In particular, this research uncovers what types of urban forms (e.g., compactness, mixed land uses, and polycentricity) are associated with higher accessibility levels under disaster impacts and to which extent could urban form changes improve existing accessibility levels in the community.

The study used an integrated method that coupled Cellular Automata (CA) and agent-based modeling (ABM). Specifically, we used CA to create four artificial cities displaying the disparate urban form characteristics referring to the land-use patterns of the city of Tallahassee in Florida. We simulated human agents that seek resources/services in these artificial cities under three designed scenarios, i.e., business-as-usual (BAU), limited resource provision (LRP), and built environment disruption (BED) scenarios. The impacts of disaster perturbations and urban forms on accessibility are measured with the varying traveling distances (i.e., median values and cumulative distribution functions) of human agents.

The implications of this research are as the following: 1). the analysis results provide quantitative validations to previous semantic and ontological studies that relating urban form and accessibilities; 2). the research findings inform future retrofitting and resettlement projects that help hazard-prone communities adapt to recurring extreme events; 3). the study implies the advantage of computer-aided approaches, e.g., CA and ABM, in assisting scenario planning that considers the cities' social, geographic, and climatic contexts.

## THE IMPACT OF AIR POLLUTION ON HOUSING PRICES AND THE EFFECT ANALYSIS OF ENVIRONMENTAL POLICIES: A CASE STUDY OF HOUSTON, USA

Abstract ID: 837

Individual Paper Submission

JIN, Zhonghua [Texas Southern University] tonyjintsu@gmail.com, presenting author

PAN, Qisheng [UT-Arlington] qisheng.pan@uta.edu, primary author

In the past few decades, the United States has been committed to improving air quality by empowering the Environmental Protection Agency (EPA) and has achieved excellent results nationwide. However, many large metropolitan areas still experience serious air pollutions. The majority environmental studies often emphasize on environmental justice, fewer studies have involved quantitative methods to assess the effectiveness of existing environmental policies. Take the Houston region as an empirical case, this study discusses the impact of air pollution on local housing prices and racial distributions, as well as examines the impact of government environmental policies on housing prices. This study adopts the Hedonic price model and uses housing prices in the Houston area to quantify the impact of urban ozone (O3) pollution on local communities and populations, and to test the responses of housing market to existing policies. First, the study found that the housing prices follow the general market law that housing prices are negatively correlated with house age and positively correlated with variables such as floor area, school district quality, transportation accessibility, and household income. Second, accessibility analysis shows that housing prices are inversely related to the urban centers, which reflects the special pattern of urban development in the United States. As cities sprawl and people are pursuing spacious living environment and open courtyard country life, most of the family-based populations live in the suburbs. Most urban centers are dominated by businesses and financial entities and long commutes become a part of people's daily norms. In addition, this study found that air pollution has an unbalanced impact on communities where ethnic minorities gather. Finally, the evaluation of government environmental standards shows that existing environmental policies have two major impacts. First, the policies have lagged effects on housing prices; Second, environmental policies, in general, have positive significance for local housing prices. This study explored the relationship between air pollution and the housing market in the Houston area for the first time and explained the relationship between urban development and the urban environment in the United States by taking Houston metropolitan area as an example.

## **EFFECT OF CONTEXTUAL FACTORS ON GREEN INFRASTRUCTURE IMPLEMENTATION LIKELIHOOD: A STUDY OF STORMWATER MANAGEMENT IN FAST-GROWING, ARID-CLIMATE UTAH CITIES AND TOWNS**

Abstract ID: 856

Individual Paper Submission

BANERJEE, Debolina [University of Utah] banerjee15d@gmail.com, presenting author

JACKSON-SMITH, Douglas [The Ohio State University] jackson-smith.1@osu.edu, primary author

HINNERS, Sarah [University of Utah] sarah.hinners@utah.edu, co-author

Urbanization dramatically affects water quality, given impervious surfaces and stormwater. Thus, alternative means of managing stormwater to prevent nutrient overloading and pollution of streams and waterbodies are crucial in the twenty-first century. Green infrastructure [GI] represents an umbrella of alternative approaches that infiltrate, evapo-transpire, or reuse water to address existing problems.

In the context of sustainability and urban planning green infrastructure has gained the attention of academics and practitioners as a promising concept to enhance sustainable spatial planning. Although advocacy for GI to manage urban stormwater is on the rise, the actual adoption rate is still low. While ‘cognitive barriers’ have been identified as a major roadblock to GI adoption behavior (Dhakal & Chevalier, 2017), it is clear that local fiscal, institutional, and biophysical contexts are also important (Shandas et al., 2020).

While some municipalities might indeed face funding and staffing constraints, it is important to realize that local stormwater managers so called ‘resistance and negative attitude’ (Carlet, 2015) towards GI might be grounded in negative experiences with poorly performing GI in their municipalities. Thus it is important to understand the factors that shape their attitude and perception towards GI. Since municipalities vary in their resource base, bio-physical environment, and public support, the performance of different types of stormwater GI can vary widely (Armstrong & Jackson-Smith, 2019).

The purpose of this paper is to assess variation in municipal managers’ intentions to recommend use of different forms of GI across diverse Utah municipalities. We test whether key social psychological drivers of behavioral intentions are mediated by characteristics of the municipality and specific attributes of different GI technologies. Taking advantage of the theory of planned behavior (Ajzen, 2019) we hypothesize that it is important to account for the variability in the biophysical and built environment of different communities as it effects decision-making by local stormwater managers regarding GI adoption. The specific research question is how do biophysical and built environments influence intentions to use different types of GI among storm water managers in Utah.

We use data from a survey of 67 stormwater program managers from a wide range of municipalities in Utah to develop a structural equation model. Background factors like size of municipality, built form [population density], growth rate, soil and groundwater condition, existing stormwater issues in the municipalities, extent of past GI implementation in a municipality, and years of experience working in stormwater management form the exogenous variables in the model. The endogenous variables in the model include attitude, social approval and perceived usefulness of GI. The intention to use GI is the outcome variable. Data on background factors are collected from secondary sources [USDA, NRCS, US census, etc.] and questionnaire survey. The model helps to determine the best predictors of intentions to use GI among stormwater managers in Utah.

Our findings expand our understanding of the factors affecting local stormwater managers’ attitudes and intentions toward adoption of an innovation. The results in particular illustrates that in addition to characteristics of

municipalities, the decision to implement GI hinges on the perceived effectiveness of GI in their locality, sources of funding, the scale of implementation, cost of implementation and maintenance, and levels of public acceptance of GI in each location. Thus with the variation in specific contextual factors which propel a community to consider GI varies, it directly affects the pace, extent, and diversity of these facilities. The relevance of this study lies in highlighting these opportunities and challenges perceived by local municipal stormwater managers, thus paving a way to improve efforts to disseminate and implement GI technologies through future research, policy, and community interventions.

### URBAN CONNECTIVITY IN MONTRÉAL: A BIOPHILIC URBANISM APPROACH TO CITY DESIGN AND PLANNING

Abstract ID: 863

Individual Paper Submission

MACEDO, Joseli [Dalhousie University] [joseli@dal.ca](mailto:joseli@dal.ca), presenting author

O'LEARY, James [Dalhousie University] [jm304986@dal.ca](mailto:jm304986@dal.ca), co-author

Natural environments, habitat, and biodiversity around the world are under continued threat from urbanization, population growth, resource exploitation and the effects of climate change. Cities have a significant ecological impact on the urban environment, extending far beyond their boundaries. Biophilic design principles have been applied in several cities to mitigate this impact. The City of Montréal recognizes the connection between nature and environmental health and has been taking steps to expand green infrastructure in neighbourhoods throughout the city.

This paper argues that a biophilic approach to city planning can reduce negative ecological impacts of heavily built-up urban areas and contribute to the success of local biodiversity, urban resilience, and sustainability. The innate affiliation we humans have with nature can be nurtured and developed, even in urban environments. The benefits of contact with nature often depend on repeated experience so, urbanites should have a constant connection with the natural world; however, having abundant nature and biodiversity in and around a city is not enough. Biophilic design provides residents opportunities to engage, enjoy, and celebrate nature and biodiversity, including direct and indirect experiences of nature. In addition, the natural qualities of a biophilic city have important benefits not only for humans, but all life in urban environments.

A review of the literature reveals two aspects of biophilic design that are pertinent to urban planning. First, from an environmental perspective, the survival of wildlife populations depends on their ability to move between habitat

fragments, and this movement is directly related to connectivity of the landscape; thus, preserving habitat connectivity is important to ensure the survival of urban species. Biophilic design can increase connectivity within urban ecosystems, allowing fragmented patches of urban green spaces to be linked together and supporting a rich diversity of species. Second, from a human perspective, exposure to nature provides a wide range of physical, mental, and social benefits, and is essential to human well-being. Studies have shown that when people are in contact (direct or indirect) with nature, recovery rates go up, performance improves, creativity increases, stress levels decrease, and cognitive function and psychological restoration improves. Entire communities benefit from biophilic environments; there is a stronger sense of neighborliness and a stronger sense of place in biophilic communities compared to communities with lower-quality environments.

The specific case exemplifying the virtues of biophilic design discussed in this paper is the City of Montréal, where a planned urban biodiversity corridor will be developed over the next 20 years and, once completed, will cover 450 hectares in residential, commercial, and industrial areas. The project includes flowering meadows, pedestrian trails, and bike paths and will expand local biodiversity by connecting currently fragmented green patches created during several decades. The most notable of these are the ones created by the green alley (“ruelle verte”) program. There are currently over 400 green alleys in the city, covering a length of over 69km across a number of boroughs. We use geographic and spatial analysis in conjunction with biophilic design principles to determine the connectivity potential of different areas with the purpose of creating a continuous green corridor between the planned biodiversity corridor and the existing green alleys.

This work is relevant to urban planners, ecologists, urban designers, and landscape architects, particularly in light of recent debates around climate justice and the role of cities in mitigating the adverse effects of climate change. If we are to make our cities livable, just, and sustainable places that offer decent quality of life for all, we will need to discuss ways to increase environmental stewardship of the natural systems that contain and sustain our cities.

Extreme temperatures pose a significant risk to human health, and are projected to worsen in a warming climate with increased intensity, duration and frequency of heat waves in the coming decades. The frequency of regional electrical grid failures is also rising in recent decades, resulting in a growing number of blackouts during periods of extreme heat. As mechanical air conditioning is a primary adaptive technology for managing personal heat exposure, we examine in this paper the impact of a prolonged blackout on interior temperatures in residential structures during heat wave conditions, when air conditioning is most critical to human health. It is all the more important we understand interior temperature extremes as people spend more time at home due to the COVID-19 crisis. Passive cooling strategies such as light-colored "cool" roofing or direct shading from nearby tree canopy can provide benefits without the need for an active power grid. This study seeks to answer: to what extent can cool roofing and direct tree shading reduce indoor heat exposure for residential structures during a concurrent heat wave and blackout event, as compared to conventional roofing?

#### Data & Methods

Our research approach combines a coupled global and regional climate modeling system with a building energy performance model to simulate how a concurrent heat wave and grid failure event would impact residential building interior temperatures in Atlanta, Detroit, and Phoenix. Historic heat wave conditions are simulated across the three cities using Weather Research & Forecasting (WRF) regional climate models. These conditions drive interior temperatures in typical building prototypes generated by EnergyPlus in dense urban and sparse suburban environments, with simulated tree shading, cool roofing, and conventional roofing materials, with and without air conditioning.

#### Results

We find building interior temperatures as high as 114°F for single-family structures during the late afternoon of the simulated heat wave and blackout event in Phoenix. Furthermore, we find a substantial increase in heat exposure across residential buildings of up to 21.6°F in response to the loss of electrical power and mechanical cooling systems. Despite substantially higher outdoor temperatures due to the urban heat island, we find high density residential zones to experience only marginally elevated building interior temperatures during blackouts relative to lower density zones. Our simulation of temperatures for three common residential structures with cool roofs finds only a modest impact on building interior climates. When averaged over the three building types, the benefits of cool roofs during blackout conditions was found to be less than 2°F, while tree shading was found to provide cooling over 4°F, though the results varied widely by location due to varying urban heat island intensity.

#### Significance

This study is the first of its kind to analyze linked indoor and outdoor temperature models during a concurrent heat wave and blackout event across multiple climate zones. For populations lacking access to continuous mechanical air conditioning on a routine basis, building interior temperatures represent a significant health risk even when electrical grid systems are fully operational. The marginal thermal benefits of tree shading and cool roofing found in this study imply that it should be only one part of a comprehensive heat mitigation plan. Planners should look to a combination of policies such as vulnerability assessments targeting heat-sensitive populations to better locate cooling centers. The importance of mechanical air conditioning found in this study further implies that planners should encourage greater local grid resilience through district energy or local renewables while also promoting energy security programs like the Low-Income Home Energy Assistance Program (LIHEAP) and distributing AC units to heat-sensitive populations to enhance adaptive capacity during extreme heat events.

## **GREEN URBANISM AND SUSTAINABILITY PLANNING: LEARNING FROM MUNICIPAL PRACTICES**

Abstract ID: 923

Individual Paper Submission

GOCMEN, Asli [University of Wisconsin - Madison] gocmen@wisc.edu, presenting author

Since the 1990s, communities across the United States have been developing sustainability plans and identifying other ways to develop green communities. Green urbanism aims to create communities that are environmentally sustainable, with strategies that target reduced carbon emissions and ecological footprints of communities as well as the integration of nature within urban areas to benefit humans, wildlife, and plants (Beatley, 2000; Lehmann, 2011). The devastating impacts of the changing climate have exacerbated the need to plan our communities using green urbanism principles.

While there has been significant study of who plans for sustainability and the quality of these plans in general (Conroy and Berke, 2000; Jepson, 2004; Svara et al., 2013), we do not know the extent to which a holistic set of green urbanism principles are integrated in these plans. This paper will help address this gap in the literature.

This paper investigates forty municipal plans for the extent of integration of eleven green urbanism principles identified by Lehmann (2011). The municipal plans included in this assessment were selected based on the findings from a recent nationwide survey of local governments, which found that 586 local governments, representing approximately one-third of the surveyed governments, have completed a sustainability plan (ICMA, 2016). The sample selected for this paper is a random sample of municipalities with over 10,000 population that had indicated that they completed a sustainability plan in ICMA's survey.

Preliminary findings suggest that overall communities have prioritized certain green urbanism principles over others and the strength and the extent of integration of green urbanism principles in municipal sustainability plans differ among communities. I expect to find these differences to be based on the characteristics of the communities (e.g., population size) and environmental stressors that these communities have (e.g., being prone to sea level rise).

## WHAT DETERMINES GREEN CONSUMERISM? A CASE STUDY OF KATHMANDU MUNICIPALITY, NEPAL

Abstract ID: 925

Individual Paper Submission

GHIMIRE, Jiwnath [University of Hawaii] [jiwnath@hawaii.edu](mailto:jiwnath@hawaii.edu), presenting author

NEPAL, Ratna Mani [Tribhuvan University] [ratna.nepal@cdtd.tu.edu.np](mailto:ratna.nepal@cdtd.tu.edu.np), co-author

Consumption habits are vital determinants of sustainability. Cities are often being criticized for wasteful consumption and unsustainable practices. They are also the pioneer of innovations to promote sustainable behaviors. One such habit is green consumerism. It is the behavior of considering the environment while making purchasing and non-purchasing decisions (Sharma & Joshi, 2017). Previous scholarship has used social, environmental, demographic, and economic factors as the determinants of green consumerism. Research also identified green consumerism as a process that includes the values, norms, and habits of the consumers (Peattie, 2010). Some studies have noticed a significant role of education and gender in green consumerism (Chekima, Syed Khalid Wafa, Igau, Chekima, & Sondoh, 2016). But there lies a research gap on how the historical background of individuals, economic and social situations, and the availability of goods and services influence the practices of green consumerism. Specifically, there is no research on how migration, access to products and services, and social stratification can change sustainable consumption behaviors. Using the case study of Kathmandu Metropolitan City in Nepal, this research strives to explore the role of migration patterns, socioeconomic characteristics, economic stresses created by COVID-19, and market access in determining the behavior of green consumerism.

Using stratified simple random sampling, a survey among ten wards of the Kathmandu Metropolitan City was administered. A total of 300 questionnaires were carried out at 20 shopping malls in those Wards. Survey questions focused on understanding green consumerism, individual purchasing behaviors, household consumption practices, availability of goods and services, socioeconomic characteristics, the individuals' migration pattern, and change in behaviors during social and economic stresses due to COVID-19. The data was organized and analyzed using statistical analysis software (SPSS 14.0). Besides inferential statistics, multiple regression models were built to identify the relationship between the habits of green consumerism and migration history, access to goods and services, household consumption habits, and socioeconomic variables. Based on the results, it was found that there is a significant relationship between the practices of green consumerism and education, income, migration history, and access to goods and services. Social status and gender do not have a significant role in the behavior of green consumerism. COVID-19 has created challenges to practice green consumerism among consumers who want to continue environmental friend behaviors. This research's contributions are: 1) urban residents who have some migration history tend to practice sustainable consumption behaviors, and 2) The fear of scarcity of goods and services hinders the practices of green consumerism. In the case of Kathmandu, the uncertainty of the availability of certain household goods negatively influenced the practices of green consumerism.

Nature-based Solutions (NbS) is a recent concept developed to promote nature as a means for providing solutions for societal challenges. The concept has been widely adopted for environmental science and policies addressing issues such as water security, food security, disaster risk management, human health, economic and social development, and climate change (IUCN 2016). While NbS operate under ecological principles, the social systems that NbS are being operated within and the potential negative impacts that NbS perpetuate in communities (e.g., green gentrification) have brought justice concerns. NbS including green infrastructures have been integrated into spatial climate justice planning through identifying social-ecological-technological systems vulnerability to climate change (Cheng 2016). As policies and resources are becoming available in support of implementing NbS in communities for addressing climate change challenges (e.g., EU's European Green Deal, US's The Green New Deal), cautions and inquiries are requested to ensure equity is addressed while systemic injustice are rectified in the politics of planning (Goh, 2020). Just NbS include opportunities to transform systemic injustice associated with race and class, meaningful participatory process for transformative co-production, and using value articulation to prioritize resources, measure successes, and create culture shifts to address issues of environmental justice (Cousins 2019).

The Nature-based solutions for Urban Resilience in the Anthropocene (NATURA) is a global network of networks linking researchers and practitioners working on NbS. The NATURA Design for Justice thematic group focuses on understanding how NbS projects achieve justice goals. We aim to answer the question: what are the fundamental grounding of justice principles within NbS for climate actions? Drawing upon an expert review from the network and existing literature related to social and environmental justice, we propose a justice framework integrating five concepts: 1) Restorative Justice recognizes the harms and damages that the institutional and systemic injustice caused to historically disadvantaged and minority groups and the inequitable outcomes that exist in institutional policies and that shaped our built environment today. Thus the NbS shall seek to restore just systems by recognizing and acknowledging the injustice, repairing and mitigating the damages in communities, providing space for community to heal and regenerate. 2) Procedural Justice focuses on fairness in the decision-making process to ensure equitable access to power and voice concerns from all groups, especially from the less heard, to address injustice issues, environmental policies, and distribution of resources and assets through meaningful engagement and ultimately allowing the process to empower communities for self-determination. 3) Transformational Justice demands that inequitable systems of decision making and power imbalances are addressed and fundamentally restructured so that past harms may not be perpetuated 4) Distributive Justice is outcome-based justice and focuses on fairness in the distribution of environmental quality, ecosystem services, amenities, and resources while in the meantime aims to avoid disproportionate exposure to environmental hazards and pollution or climate change impacts. 5) Generational Justice considers dynamics over time and thus decisions made today shall consider the impacts of plans and projects over generations.

Comparing the theoretical framework to the results from a separate NATURA survey study that aims to gauge the network partners' perceptions and current practices on achieving justice goals, a discussion on the gap between theory and practice shed some light on the need for a holistic view of justice in NbS. The justice framework for NbS project has implication for climate justice planning through integration of all five justice principles that allow systemic inequity to be identified and rectified, prioritize NbS resources toward vulnerable communities via climate justiscescape assessment (Cheng 2019), establish measures for making NbS projects accountable for equity outcomes, and enhance coping capacity of communities and stewardship for sustainable development goals.

#### COVID-19, FINE DUST AND THE USE OF URBAN PARKS IN SEOUL, KOREA

Abstract ID: 948

Individual Paper Submission

JUNG, Yeerim [Seoul National University] [yrjung@snu.ac.kr](mailto:yrjung@snu.ac.kr), presenting author

CHUNG, I Re [Seoul National University] [ire.chung@snu.ac.kr](mailto:ire.chung@snu.ac.kr), co-author

PARK, In Kwon [Seoul National University] [parkik@snu.ac.kr](mailto:parkik@snu.ac.kr), co-author

The spread of COVID-19 pandemic and fine dust are causing significant changes in the outdoor activities of urban residents. The COVID-19 pandemic has undoubtedly affected their behavior, and the fine dust problem was a major concern in Korea prior to the COVID-19 outbreak. The risk of fine dust tends to attract urban residents to a more pleasant indoor spaces rather than outdoor activities (Sexton, 2012). There are, however, some variations in findings of empirical studies that incorporates the mobility constraints due to the spread of COVID-19 pandemic in recent years. Specifically, there are conflicting results concerning the effects of the COVID-19 on the use of urban parks. Some studies indicate that the number of visitors to open spaces has increased relative to the period prior to the pandemic (Frima et al., 2020), while others point out that it has decreased with an overall decline of movements in all urban spaces (Ugolini et al., 2020).

Urban parks might function as an important public space at the city level, since these are easily accessible to all, as well as can replace indoor sport facilities, which involve high levels of interpersonal contacts. Therefore, it is important to precisely understand people's behavior of park use in the context of health risk factors of COVID-19 and fine dust. In particular, if we understand how the effects of these health risk factors vary depending on the features and locations of parks and the surrounding environment, this could suggest important implications for the planning and design of urban parks.

This paper aims to investigate the seasonal changes in movement patterns of urban park visitors according to the risks of the COVID-19 pandemic and the fine dust that occurred in Seoul, Korea for the period from 2019 to 2020 and to identify the characteristics of parks that influence the use of parks under the health risks. For this study, we first build a panel dataset that includes the number of visitors to urban parks based on the cell phone signals from base stations located in Seoul, Korea as a dependent variable, and independent variables involve the seasonal factors, such as the level of fine dust and temperature. Also, the characteristic of parks, such as their location, green coverage ratio, shape and size and amenities are added to the model to explore the effects of attractive factors.

The findings will be as follows. First, the number of park visitors sharply declined due to the shock at the beginning of the pandemic, but as time passed, this number has gradually increased because of pandemic fatigue with social distancing driven by a prolonged COVID-19. Also, many would not have chosen to go out on days when the risk of fine dust is high. Second, park visitors are more likely to use parks with a high green coverage ratio, outdoor sports facilities and large in scale due to concerns about the fine dust and infectious diseases impacts. In terms of land use in the surrounding areas near parks, there would be more visitors in parks near the residential areas than parks near the commercial areas since it often requires a relatively long distance to avoid closed spaces, crowded places and closed-contact setting. These findings suggest some implications for planning urban parks under these health risks of COVID-19 pandemic and fine dust.

## THE SOCIAL NATURE OF INFRASTRUCTURE: RACISM, JUSTICE, AND URBAN CLIMATE CHANGE PLANNING

Abstract ID: 958

Individual Paper Submission

GOH, Kian [University of California Los Angeles] [kiangoh@ucla.edu](mailto:kiangoh@ucla.edu), presenting author

The urgency of climate change and the emergence of a political-environmental movement should change the way planners understand and plan urban infrastructure. In 2019, the US Congress announced the Green New Deal (GND), a set of policies to drive renewable energy and the low-carbon economy and eradicate poverty while protecting against climate change. Large-scale infrastructure, such as transportation, energy, and water management, was a prominent part of the original 1930s New Deal. Such infrastructures are now a critical part of any broad effort to reduce greenhouse gas emissions and protect against climate change impacts. To what extent do we understand the potential of the GND, with its environmental and social goals, to remake our cities and regions?

Accomplishing the GND's goals depend on whether planners are able to understand the contested social and spatial conditions of the present and envision more sustainable and just urban futures (Goh 2020a). This paper focuses on one aspect of this contestation: historical racism in planning, community participation and protest against infrastructural plans, and large-scale urban climate change response infrastructure. While initiatives such as the GND promise renewed public investment and coordination of infrastructure, large-scale environmental plans have

encountered opposition in cities in the US and beyond. Plans to “green” or protect once neglected sites can often displace residents and cause gentrification, further excluding poor residents, often communities of color, pushed to vulnerable sites by prior waves of racist urban development and exclusionary land policies (Gould and Lewis 2017; Anguelovski et al. 2019).

Researchers have asserted that the most promising approaches to resisting both the impacts of climate change and unjust actions in response are those that are politically organized from “below” – from the viewpoint of systemically marginalized groups – and coordinated across a broader range of activists, sites, constituents, and collaborators (Routledge et al. 2018; Agyeman et al. 2019; also Goh 2020b). This is particularly important when making claims of justice against structural oppression, while the coordination is essential if such struggles are to extend beyond specific places and threats to challenge broader systemic social, political, and environmental inequities. But such community-based organizing is more often in opposition to environmental infrastructural development, citing racist and unjust development. How do we understand these oppositional histories and present dynamics, in order to plan better? This paper analyzes the politics of contemporary climate change plans and community-based responses through the author’s mixed-methods empirical from sites in Boyle Heights, Los Angeles, and the Lower East Side and Red Hook, New York City. It is based on spatial ethnography, mapping, interviews, and field observations. The paper illustrates the histories of racist and exclusionary development, and the contemporary dynamics of grassroots and community organized responses.

Climate mitigative and protective initiatives such as those promised by a GND offer alluring glimpses of better ways to imagine more sustainable urban futures. But they also bring up the intractability of particular structures of urban governance and the continual injustices of dominant modes of urban development. The paper concludes by proposing a new framework of urban climate development, a “marginalized first” model that, from the start, systemically prioritizes historically vulnerable people and places on questions about who, where, and how to implement plans. Such a model would break historically oppositional dynamics of “big plans” and community engagement, and build and maintain trust in new urban climate infrastructural development when we need it most, the very near future.

**LOCATING THE CITIZEN (WASTE GENERATOR) AS A FOCAL ACTOR IN THE WASTE MANAGEMENT: A CASE STUDY OF PATNA, BIHAR**

SARMISTHA, Uma [University of Florida] sarmistha@ufl.edu, presenting author

Today, Solid Waste Management (SWM) is a relatively new concept for most Indian cities, more so for a city growing and urbanizing exponentially (Sudhir and Gururaja, 2012). To make the situation worse, most of India's cities are unplanned and urban service delivery is collapsing, and the most significant causality has been solid waste management. Indian cities generate approximately 62 million tons of Municipal Solid Waste (MSW) annually, and by 2031 the total waste generated will be 165 million tons (Planning Commission Report, 2014). Currently, only 20 per cent of the solid waste is processed, and the remaining 80 per cent is dumped untreated every day in the landfill sites (India Today, 2019). Managing these mammoth quantities of waste rests solely with the local Municipalities. SWM is by no means an easy task for any government and requires coordination between many local and State departments and private bodies. In most cities, the current practice of disposing of MSW is either dumping or burning the trash in designated lower-lying areas. The principles of sanitary landfilling are rarely followed. This daunting problem is amplified in unplanned cities. Unfortunately, most of the Indian towns and especially Patna falls in this category. Patna, India's dirtiest capital city, is facing the enormous problem of untreated waste (Panday, 2014). Undoubtedly, municipalities and local bodies are putting their best foot forward to tackle this critical issue. However, acute density and congestion exacerbate the matter.

It is paradoxical that, in many cases, solutions for these mammoth challenges already exist. Innumerable scientifically proven waste recycling technologies are available for most components of solid waste. For instance, hundreds of technologies exist to recycle organic (biodegradable) waste by households. They can be adopted at the most decentralized level - even by waste generators (families, institutions, office etc.) themselves. In India, nearly 70% of all Municipal Solid Waste and almost 90% of all household waste are easily recyclable. The availability of these recycling options implies that waste generators can be made responsible for recycling their own waste and for the State to take responsibility for the remaining 10% of household waste (the non-recyclable component). This would lead to tremendous savings for Municipalities to take care of other infrastructure and service-related issues, lead to substantial environmental and economic gains and take cities towards long-term, environmentally sustainable economic growth.

Studies have shown that apart from the awareness-driven sustainability and waste management practices, the incentives given to households have also helped reduce waste. Many specific approaches such as weight-based billing approach, fair allocation of the costs depending on the amount of waste generated, an overall reduction in waste generation, increased quality of recyclables, and encouraging composting household level have proved to be quite successful (Dahlen, 2007; Houtven & Morris, 1999; Linderhof, Kooreman, Allers, & Wiersma, 2001; Noehammer & Byer, 1997).

With this background, the present paper seeks to explore the possibility of locating the citizen (waste generator) as the focal actor in the waste management system, with the agency to recycle their waste and pursue the support of other actors (including the State and NGOs) as and when required. The study utilizes 500 household survey data collected from 5 wards in Patna to understand the waste management systems and practices and their implications. Their level of satisfaction/dissatisfaction with existing processes and finally to measure citizens' willingness to adopt and pay for waste recycling. The survey data is supplemented with 20 focused-group discussions and 25 in-depth interviews with stakeholders (including government officers, NGO personnel, University Professors) and several case studies of households recycling their organic- waste.

## **ADAPTATION PLANNING FOR CLIMATE CHANGE IN MEGACITIES: A CASE STUDY BETWEEN NEW YORK, SHANGHAI, AND LONDON**

Abstract ID: 963

Individual Paper Submission

LI, Chun [Tongji University] lichun@tongji.edu.cn, presenting author  
 SHEN, Qingji [Tongji University] sqjj5688@126.com, primary author  
 SILANG, Jiangze [Tongji University] 2359100736@qq.com, co-author

As global temperatures continue to rise, climate change has become one of the most significant, persistent and highly dynamic challenges facing society (Birchall & Bonnett, 2021). Cities are seen as particularly vulnerable to climate change because of the concentration of people and wealth in limited space (UN General Assembly, 2015). Although mitigation and adaptation are two parallel lines of coping to climate change in UNFCCC, mitigation has traditionally received much greater attention in the climate change community than adaptation, both scientifically and from a policy perspective (Füssel, 2007). However, there is increasing evidence that the climate will continue to change for the foreseeable future. And the global cities will increasingly need to be prepared well to adapt to the following climate change (Betsill & Bulkeley, 2003). Due to the coastal megacities facing similar climate change risks and apparent in vulnerability, we select different cities in global areas, including New York in North America, Shanghai in Asia and London in Europe as the research objects. Therefore, we plan to answer the research questions: 1) Who is adapting to climate change in megacity planning? 2) In what way should the megacities adapt to climate change in urban planning? 3) What are the driving power and barriers of climate adaptation planning in megacities?

To evaluate and compare the state of urban adaptation, systematic data collection and analysis methods are used in this paper. We used web-based urban planning documents on climate adaptation as a proxy for identifying and characterizing the occurrence of adaptation (Araos et al., 2016). By using the search engine Google, we collected the following documents of the three megacities to extract information on urban adaptation to climate change: 1) urban master plans; 2) Strategic planning of climate change adaptation; 3) Decision documents for the departments of urban development, built environment and infrastructure. Firstly, we developed a coding system to conduct the content analysis of the planning documents. The coding system classified the content based on the climate impact and affected sector, as well as its policy type. Secondly, the types of planning models for climate change adaptation in megacities under different development stages are summarized. Finally, we used the dynamic mechanism framework of institutional, political and social technologies to compare the driving power and barriers of climate change in megacity (Betsill & Bulkeley, 2003).

The result shows that the adaptation planning of the three megacities is all led by the local government. Besides, the departments of urban planning and development, built environment, and infrastructure are involved the most. Adaptation in London's adaptation is the self-made model of managing government action; Adaptation in Shanghai is the supply model of products with adaptive ability; Adaptation in New York is an enabling model that promotes other participants through collaboration. In general, our findings suggest that the adaptation of megacities in

developing countries (Shanghai) will also take place at the policy level, rather than at the community-based level as is normally believed. The megacities in the developed countries (London and New York) have improved in the course of long-term adaptation planning, which is instructive for other cities.

The findings in this study may help cities to learn from each other and encourages planners to think about how cities in different stages of development and different social contexts can design and implement adaptation planning for climate change. The methodology in this paper will also provide a framework combining objects, models, and mechanisms for evaluating and comparing climate change adaptation planning between cities.

This study is funded by National Natural Science Foundation of China (No. 51778435 and No.51408248) and National Social Science Foundation of China (No. 17AZD011).

#### A PROBABILISTIC FRAMEWORK TO MODEL THE EFFECTIVENESS OF EMISSIONS REDUCTION POLICIES

Abstract ID: 964

Individual Paper Submission

SHUKLA, Shivani [University of San Francisco] sgshukla@usfca.edu, presenting author

RIGGS, William [University of San Francisco] william.riggs@usfca.edu, co-author

Communities throughout the United States are consistently or incongruously experiencing unhealthy levels of air pollution (US EPA, 2019). The regulatory frameworks designed to curb local or state-wide air pollution issues address the industrial and domestic forces behind the pollution while not always being able to account for sudden natural disasters that prompt drastic measures (Kioumourtzoglou et al., 2016). The two major pollutants that our study focuses on are Sulfur Dioxide and Carbon Dioxide, gases emitted in millions of metric tons from the consumption of fossil fuels.

Sulfur Dioxide is the component of the greatest concern among the larger group of Sulfur Oxides. Control measures around SO<sub>2</sub> are normally expected to control people's exposure to all gaseous SO<sub>x</sub> (US EPA, 2019). High concentrations turn into Particulate Matter that have long term health and environmental issues, some of them being creation of haze (reduced visibility) and respiratory issues. The largest source of emission is burning of fossil fuels by power plants and other industrial facilities. Smaller sources of SO<sub>2</sub> emissions include: industrial processes such as extracting metal from ore; natural sources such as volcanoes; and locomotives, ships and other vehicles and heavy equipment that burn fuel with a high sulfur content (EPA, 2019). While there has been an 82% reduction in the emission of SO<sub>2</sub> in the past 10 years, the upper Midwest and Southwest regions of the country are way above the national average (US EPA, 2020).

The regulatory frameworks designed to curb local or state-wide air pollution issues address the industrial and domestic forces behind the pollution while not always being able to account for sudden natural disasters that prompt drastic measures. This is probably why SO<sub>2</sub> is managed in some parts of the country and CO<sub>2</sub> is comparatively a lot more unpredictable.

In this paper, we create an air quality heat map across a 10-year timeline along with a comparative policy evolution heat map. The objective is to compare the policy around pollution from natural disasters with the policies around industrial sources of pollution. We create a probabilistic understanding around the air quality and devise a resource allocation framework for planning purposes. The heat map provides a view of the current policies around both the pollutants. Under the world's largest cap-and-trade system or allowance trading system for SO<sub>2</sub>, benefits have been reaped in multiple regions around the country yet not all (Chan et al., 2012). Similarly, spurred by the 2018 IPCC Special Report on Global Warming 1.5 degrees Celsius, net zero emission targets or Carbon Dioxide Removal (CDR) have emerged as a new organizing principle of climate policy (Schenuit et. al., 2021).

The framework aims to explore the costs and risks associated with these policies. For SO<sub>2</sub>, we create a dynamic programming allocation model to investigate the allowance trading and for CO<sub>2</sub> in the context of natural disasters, we create a model to optimize resource allocation for containment and the minimization of emissions. The framework works around stringent climate goals while accounting for the difference between the larger issue of climate change and local or state-wide air quality index.

## USING GOOGLE STREET CAR SENSOR DATA TO IMPROVE AIR POLLUTION MODELING FOR PLANNING

Abstract ID: 992

Individual Paper Submission

BISSIRI, Tony [The University of Texas at Austin] [bissiri@utexas.edu](mailto:bissiri@utexas.edu), presenting author  
ZHAO, Yingrui [The University of Texas at Austin] [yinguizhao@utexas.edu](mailto:yinguizhao@utexas.edu), co-author

Air pollution is a leading cause of premature death worldwide. Planners have many tools to help abate air pollution in the city (e.g., tree canopy cover, greenspace, etc.), however modeling high resolution data to inform the use of those tools is challenging (Abhijith et al., 2017). Without high-resolution pollution measurements, street-level planning decisions to abate air pollution exposure to citizens is difficult if not impossible (Gurram et al., 2019). Current air pollution models require data from spatially references sensor readings. The most common sensors used are those operated by the EPA or other public organization, of which there are typically less than 10 reliable sensors in each major city (Hu et al., 2017). In this study, we used a novel air pollution dataset in tandem with open-source

software to create a high-resolution air pollution grid: data gathered by sensors affixed to Google street cars. The data, which is available for use by the public with Google's approval, was measured in Los Angeles between May 2016 and September 2017. Other studies have verified the efficacy of this large data set (with more than 10 million sensor readings of PM2.5 during the study period), however none have evaluated it in context of planning decision making (Messier et al., 2018).

We used Land Use Regression (LUR) predictive modeling to create gridded surfaces of estimated air pollution across all of Los Angeles County. Modeling was performed using the utilizing open-source XLUR software and used both Google street car and stationary EPA sensor data (Molter, 2020). XLUR is an open-source ArcGIS Pro package is free and easy to use and could be easily used by planning offices. In addition to sensor data, we used various geographic co-variables in our model (e.g., sum of building footprint, road width). We found that the coefficient of determination ( $R^2$ ) value for our model is substantially higher when incorporating the non-stationary Google street car data. This suggests that the gathering of air pollution data from mobile sources should be encouraged by planning departments to develop higher quality air pollution models to inform planning decisions.

#### **ANALYZING IMPACT OF URBAN FORM AND NEIGHBORHOOD CHARACTERISTICS TO BUILDING ENERGY USAGE: A CASE OF SEOUL METROPOLITAN AREA, SOUTH KOREA**

Abstract ID: 994

Individual Paper Submission

SUNG, Sangwoo [East Carolina University] sungs16@ecu.edu, presenting author

JUNG, Seunghyun [Korea Institute of Civil Engineering and Building Technology] shjung@kict.re.kr, primary author

JE, Minhee [Korea Institute of Civil Engineering and Building Technology] minheeje@kict.re.kr, co-author

Creating sustainable urban form is an imperative task in climate change planning because urban form would affect energy use in transportation residential and non-residential building. Reducing building energy use is imperative in urban planning because building energy consumption is either the largest or larger than industrial-transportation consumption in many developed counties in these days. According to Rattie et al (2005), building energy use is a function of urban form, building design, energy system efficiency and occupant behavior. Building design, energy efficiency, and occupant behavior undoubtedly have direct impact on energy use at building scale; however, whether planning variables associated with urban form would have significant impact on building energy use or not

is still unclear.

In this study, we examine the relationship between building energy consumption and urban built environment characteristics related to urban form by obtaining building scale energy consumption Bigdata in Seoul Metropolitan Area, South Korea. This study focuses on answering following questions: (1) “Would urban form or community neighborhood characteristic have impact on building energy use?” : (2) “How can we effectively identify and visualize the hotspots of building energy use based on built environment and community neighborhood characteristics?”

In order to answer these questions, we employed multiple statistical models using the annual building energy consumption big data (electricity and natural gas) between January 2018 and December 2018 in Seoul. This bigdata were derived from governmental billing database and incorporated to Geographic Information Systems (GIS) to analyze the spatial pattern of energy consumption varied by neighborhood types. In order to assess the association between energy consumption and physical built environment characteristics of different neighborhood types, we performed spatial join with the annual energy consumption data and individual building features. We also created a 100x100-meter-grid spatial layer covering Seoul, which includes physical built environment attributes and energy consumption data. The main variables representing physical conditions of community neighborhood characteristics are land use type, house type, size of building floor space area, compactness, population/dwelling unit density, street configuration, building weatherization, building configuration, vegetation, and surface coverage.

Preliminary result shows that building energy consumption would be affected by main urban form variables and neighborhood types variables such as a size of building floor space area, dwelling unit density, building weatherization, vegetation, and housing types. We also found that hotspots analysis or local Moran's I (Anselin, 1995) is useful in visualizing certain pattern of high/low clusters of electricity and natural gas usage, which varies by cohort characteristics and building weatherization.

Until recent days, the effects of different urban forms on energy saving and consumption have not been rigorously discussed due to lack of rich energy database available to public. This study demonstrates the methods how energy big data can be incorporated into GIS and be utilized to understand building energy consumption pattern varied by neighborhood types. Most importantly, this research supports the proposition that the energy savings regulations and strategies should include incentives not only building by building design principles approach but at community-neighborhood-district scale.

#### **FROM NATIONAL INTEREST TO LOCAL BENEFIT: CHANGES IN AMERICAN NATIONAL WATER RESOURCES POLICY AND ITS IMPLICATION FOR LOCALIZED WATER PLANNING**

Abstract ID: 995

Individual Paper Submission

STEVENSON, Dylan [Cornell University] dms547@cornell.edu, presenting author

Conflicts surrounding water is nothing new. Since the Colonial Era in American history, there has been ongoing debates regarding how populations and geographies should engage with water that often run along differing -and at times, opposing- ideological lines. Controversial water projects as products of wider, national water planning practices, have been recognized as sites of contestation, particularly between Indigenous communities and the non-indigenous. These controversies exemplify the commitment between Tribes and the Federal Government where respective values are brought to the forefront and oftentimes communicated in explicit terms. Projects like the Dakota Access Pipeline and the Pick-Sloan Plan serve as reminders of ongoing value-based clashes when it comes to Water Resources Planning, and the degree to which certain values are prioritized within the water planning process (Lawson 2009).

One of the goals of water resources planning is to seek a balance between values put forward in the planning process and aims to serve a broad public interest. The Federal government is deeply involved in water resources planning and thus, does not operate as a value-free bureaucracy but instead aims to achieve national goals through localized project plans, most notably through federal funds (Griggs 1985). Given that it both produces legislation and helps implement project plans, it is imperative to be critical about the underlying values imbedded within water-related laws because local water projects become physical manifestations of value-based stances that promote national interests. As the activities at the Dakota Access Pipeline have shown, sites of development can become sites of contested values. It will be key for policy makers and planners to begin to recognize what ideological components they may be reproducing through their work to strive for a form of water planning that more holistically understands differing worldviews.

This paper analyzes significant legislation related to water resources to understand changes in national values from the 19<sup>th</sup> Century to the present. Using scholarship on ideological frameworks, a discourse analysis is used to distill conceptual components that constitute value-based positions which, depending on their combinations, indicate a given ideological background (Freeden 2013). A history of American water resource policy is constructed to illustrate where certain values take priority within the legislation from which generalizable ideological trends can emerge. Preliminary findings suggest that values like efficiency and productivity have been historically durable within federal legislation whereas concepts related to environmentalism continue to struggle against economic interests. The paper concludes with recommendations to how water resource planners can become more involved with the federal legislative process and the importance of local water entities to forming holistic water policies.

## **USING SCENARIO DEVELOPMENT FOR WATER DEMAND FORECASTING UNDER COMPOUNDING PRESSURES OF POPULATION GROWTH AND CLIMATE CHANGE**

Abstract ID: 1086

Individual Paper Submission

FOLLINGSTAD, Gretel [University of Colorado Denver] gretelfollingstad@gmail.com, presenting author

Communities face increasing uncertainty with looming climate change impacts, population migration and growth, posing new challenges for long range community planning. Preparing for these challenges requires discernments of these foreseeable futures in terms of the needs of human and natural resource sustainability (Agarwal, 2002). There

has never been a more important time for applying resilience planning frameworks to navigate the complexity, uncertainty and transformation across scales to persist, self-organize, and innovate (Berkes et al., 2003; Folke, 2016; Olsson et al., 2014, Berkes, 2017), against climate impacts. Resilience requires the preservation of the core function of cities, while increasing the capacity to absorb and bounce forward from a disturbance.

To adequately address the impending complexities and needed capacity to maintain a community's core in the face of dramatically changing circumstances (Zolli & Healy, 2012), greatly benefits from forecasting multiple conceivable futures (Bishop et al., 2007; Quay, 2010; Van der Heijden, 2011). This study presents a new approach to scenario planning for future residential water demand projected to the year 2050. The study area is the City of Aurora, CO, located in the Denver metro area of Colorado's Front Range. Like most communities in the area, Aurora faces compounded pressures of intense growth and climate impacts on available water supply. Additionally, Aurora predominantly holds junior water rights, which leaves the community vulnerable to priority calls on the Colorado River, in times of drought; aggravating the challenge to secure a water resilience future. This study provides better insights for possible trajectories of future water demand and offers planners a tool to prioritize policy changes to meet water adequacy goals.

Scenario planning helps create transformations in problem solving (Ramirez & Wilkinson, 2016), by identifying various options for a decision-making process (Van der Heijden, 2011). By creating and comparing plausible future conditions and assessing different outcomes, scenario planning can improve policies for possible futures (Kim & Newman, 2020). Various sectors of community planning employ scenario planning tools, including transportation, economic development, land use, natural resources and ecological systems and resilience planning (Goodspeed, 2017). This research contributes to other notable efforts in improving scenario development processes, tools, and evaluation, reaching beyond the limitations of the more stochastic "predict and plan" approach, to foresee future uncertainties (Chakraborty et al., 2011). By combining both the typical predeterminants and plausible complexities stemming from climate change and population relocation dynamics, the scenarios improve the ability to rank levels of impacts and uncertainties (Kim & Newman, 2020; Postma & Liebl, 2005).

This study applies a strategic approach to planning for water scarcity, using a compilation of tools, frameworks and technologies (Ringland & Schwartz, 1998) to help Aurora best manage future water uncertainties. Using 50 distinct future growth planning scenarios projected to the year 2050, the scenarios forecast outdoor water demand defined by variations of 6 factors: predicted development extent, pervious lot area, home value, climate change severity, plant composition, and irrigation efficiency. The forecasts are based on a housing typology developed in a previous study, which distinguishes 8 distinct housing types by yard size, home value and current outdoor water demand. By using improved synergies for water and land-use scenarios (Couclelis, 2005) this research simulates development beyond the currently approved Master Planned developments for Aurora. The collection of insights for growth strategies (Schwartz, 2012) that can influence planning decisions based on combinations of changes in land use zoning, ordinances and technologies to address climate and population impacts (Bowman, 2016; Bunn & Salo, 1993; Phadnis et al., 2016; Van der Heijden, 2011). This study supports the notion that creating strong land use planning regulations can foster greater long-term water sustainability and resilience.

## **BUILDING COMMUNITY EXTREME HEAT RESILIENCE THROUGH SCIENCE ENGAGEMENT WITH MIDDLE SCHOOL STUDENTS**

Abstract ID: 1095

Individual Paper Submission

LIM, Theodore [Virginia Polytechnic Institute and State University] [tlcim@vt.edu](mailto:tlcim@vt.edu), presenting author  
WILSON, Bev [University of Virginia] [bw6xs@virginia.edu](mailto:bw6xs@virginia.edu), co-author

Extreme heat events pose a growing threat to human health and urban infrastructure and are a major consequence of climate change. Extreme heat is exacerbated in cities, where temperatures can range from 10°C to 15°C hotter than in rural areas. In the US, the historical effects of residential segregation and disinvestment in Black neighborhoods persist today and are reflected in higher temperatures in these neighborhoods (Wilson, 2020). In addition, fatalities and hospitalizations due to heat exposure disproportionately impact low-income communities of color. However, community-based extreme heat resilience planning remains an infrequent planning activity (a notable exception includes Guardado et al., 2020).

In this research, we explore the potential of science engagement with middle school students as a way to increase community thermal landscape legibility and improve extreme heat resilience. Through a partnership with Roanoke City Public Schools which will take place in the summer of 2021, the project team will deliver a two-week summer curriculum around sensing of urban thermal environments. Students will receive background information on the physical phenomena of urban heat island effect, urban microclimates and the effects of specific landscape elements; as well as the social factors that have shaped the spatial distribution of infrastructure, vegetation, and housing stock. Using handheld air temperature sensors, and an infrared camera mounted on an Unmanned Aerial Vehicle (drone), students will map their own school grounds and make observations about spatial correlations between types of urban surfaces, surface temperatures, and air temperature. The project team will collect students and resident perception of their neighborhoods' thermal environments, specifically noting if and how participation in the summer curriculum and data collection activities changes perceptions of the thermal landscape in the community.

This research aims to fill a gap in the current understanding of what kinds of data—what resolutions, what experiences, and what sources—are needed to support neighborhood heat resilience planning. This question is important because science-action interface research shows that data and models used in decision-making, policy, and action contexts need to be evaluated differently than those used in pure scientific inquiry. In decision-making contexts, data should be evaluated by their ability to contribute to: improved communication of the problem through creating shared representations of reality, improved learning about environmental management practices, and creating perceptions among stakeholders of credibility, validity, and trust.

The concept of “landscape legibility” in research-action projects frames our study through connecting questions of what kinds of data can both (1) increase what we know about urban social-environmental phenomenon and (2) lead to increased citizen engagement. Coupled with urban histories and collections of personal experiences of the landscape, citizen data collection helped make visible the histories of the place that were otherwise hidden from sight (Spirn, 2005). Although urban planning for resilience—increasing a city's capacity to adapt in the face of shocks and stress—is a goal of many cities, residents often remain excluded from meaningful engagement in planning processes (Meerow and Mitchell, 2017). Data collection techniques in which residents map their experiences and impressions of place spatially are an effective way to enrich and contextualize physical environment data collection (Lynch, 1960), which is integral to resilience planning. We will share preliminary results of our project, focusing on evaluating the extent to which student perceptions of their neighborhoods changed after participating in science engagement activities.

## **LIVING DURING COVID-19 WITHOUT TOILET FACILITIES: EMPIRICAL EVIDENCE FROM TWO SETTLEMENTS IN THE GLOBAL SOUTH AND NORTH**

Abstract ID: 1112

Individual Paper Submission

RADA-ORELLANA, Mauricio [Columbia University, GSAPP] [mer2245@columbia.edu](mailto:mer2245@columbia.edu), presenting author

As an infectious disease, one of the mediums of transmission of COVID-19 is touching contaminated surfaces. When there is a lack of sanitation and washing services, people tend to not washing their hands, thus transmitting easily the virus. It is worth noting that some recent research shows that there may be a fecal-oral transmission Hindson (2020). Given the relationship between health vulnerability and the existence of sanitation services from the literature review, this study will focus on a specific and contemporary health threat: COVID-19. As a consequence, the research question is framed into: how does the lack of sanitation services relate to the initial impact of COVID-19 in urban settlements?

To uncover evidence that might explain the exacerbated initial impact of COVID-19, I will focus on two geographies: Belen, Peru, and the Southwest of Texas, US. The initial impact will be measured using 6 indicators, which are the result of analyzing 3 periods (30, 60, and 90 days), and 2 measurements (morbidity and mortality). The methodology consists of an explanatory sequential design comprised of two quantitative methods followed by a qualitative one. The first method will show the descriptive statistics, and visually explore spatial descriptive patterns in a longitudinal and disaggregated analysis using the neighborhood level as the unit of observation. We will calculate the spatial dependence of toilet access and COVID-19 cases using spatial autocorrelation and Getis-Ord  $G_i^*$  analysis to identify the hotspots. The second will test whether there are differences in sanitation services between the neighborhoods to identify which ones are statistically distinct and perform spatial regressions. This step will focus on compare neighborhoods with different sanitation levels using a test of differences of means for the six indicators. This analysis will serve to determine whether those areas with higher sanitation levels had a lower, similar, or higher impact on each of the six indicators. Finally, I will run a spatial regression to measure the relationship between the indicators statistically significant from the previous step, the level of sanitation, and the level of spatial dependency of each settlement. The third will integrate the results from both settlements and compare the strength of the relationships between the two settlements.

Preliminary results in Belen show that according to the number of cases, the lack of sanitation infrastructure does not have considerable relationships with COVID-19 impact. However, since the number of tests during the first 30 days was extremely scarce, this measurement is not a reliable one. . This implies that the characteristics of the neighborhood, where sanitation services are one, made Belen the most vulnerable place to live since it was the first one to collapse. It is uncertain whether the initial terrible impact had an awareness effect on lowering the impacts after 30 days or whether there is another reason (like the herd immunity cited by the local expert). As a

consequence, we can conclude that the lack of sanitation services is related to higher COVID-19 impacts in Belen, but only during the first periods of the pandemic.

#### CLARIFYING THE IMPACTS OF ARIDIFICATION AND WATER CONSERVATION

Abstract ID: 1116

Individual Paper Submission

BIERBRAUER, Anna [University of Colorado - Denver] [anna.bierbrauer@ucdenver.edu](mailto:anna.bierbrauer@ucdenver.edu), presenting author  
ANTHAMATTEN, Peter [University of Colorado - Denver] [peter.anthamatten@ucdenver.edu](mailto:peter.anthamatten@ucdenver.edu), co-author

Faced with dwindling resources and burgeoning populations, political leaders and environmental planners are grappling with how to reduce water consumption in the face of pressing climate concerns. In the western United States, a legacy of water availability has created green cities, towns, and agricultural fields in otherwise dry regions, yet there is growing awareness this level of greenness is not sustainable. Outdoor water use is the majority of urban water consumption and identifying landscapes where irrigation can be reduced or removed is one conservation program being pursued across scales and geographies (Gage & Cooper, 2015; Mini et al., 2014; Pincetl et al., 2019; Wheeler et al., 2020). 'Reclaiming the desert' has become relinquishing green areas back to the desert. Donald Worster wrote in *Rivers of Empire* "...one cannot have a life both ways - cannot maximize wealth and empire and maximize democracy and freedom too" and encourages the desert to emerge as it wants to be in order to re-balance life in the arid US (Worster, 1992, 334). At a time of reckoning with issues of systematic racism and environmental injustices, the re-emergence of the desert brings Worster's call to center equity and justice into the process of planned aridification.

The desert is also re-emerging on its own terms. Often mislabeled as increasing frequency of drought, the western US is undergoing overall aridification (Overpeck & Udall, 2020). Without fore fronting equity and justice in planning this next phase, climate-induced aridification and water conservation efforts may amplify the deleterious effects of aridity on vulnerable communities. To understand how increased aridification due to climate change and water conservation measures are going to interact, there needs to be a better understanding of where the driest areas of the city are currently and how they overlap with other risks. Through Land Surface Temperature, vegetation coverage, and socio-economic data, areas where heat mitigation might be needed can be identified. Geospatial tools can also positively identify areas where water conservation might be appropriate. However, if these two processes are not considered together, a strict focus on water conservation measures may amplify neighborhood vulnerabilities. This research investigates how the effects of increased aridification coupled with water conservation programs might complicate heat vulnerability mitigation. Do water conservation projects put communities already at risk of heat vulnerability at greater risk by removing potential cooling sources?

This research project uses geospatial methods and measures of association to determine how arid land covers, heat risk indicators, and water conservation programs are related to socio-economic status in Denver, Colorado. Research is conducted at two units of analysis: the city neighborhood scale and the park scale (Nesbitt et al., 2019). Neighborhoods rather than block groups are used to more closely align with city planning efforts on equity and green space. Neighborhood scale is evaluated to assess the context of arid land cover and relate this information to socio-economic status. The park scale is evaluated to determine how management of park land might contribute to overall aridity, or how park land management might serve as cooling source for the area (Voelkel et al., 2018). This research contributes to the literature by developing a method for detecting urban areas where long-term arid conditions put communities more at risk for environmental injustices related to water conservation programs and climate change. Community leaders and professional planners will find this research helpful in their water conservation policy and program decision-making processes.

### **THE IMPACT OF CLIMATE CHANGE IN THE DYNAMICS OF ALABAMA’S LANDSCAPE**

Abstract ID: 588

Poster

FARIJANA, Riffat [Auburn University] rzf0025@auburn.edu, presenting author  
LEBLEU, Charlene [Auburn University] leblecm@auburn.edu, co-author

The paper aims to through light on the “Climate change” in the magnificent Mobile Bay and adjacent areas in Alabama and the low impact development as a strategy to mitigate the future risk. Climate change has become the most severe and challenging global concern today that is threatening public health, ecological and biological systems, and the economy of the world simultaneously. The complexity of climate change and natural hazards makes it difficult for most people to recognize the short- and long-term consequences, which prevent people from understanding the seriousness and the urgency of the issue. Keep in line with the other parts of the world, Alabama’s coastal areas face the impact of climate change, including repeated tornados, land erosion, and marshland sinking. The effect of repeated tornados and sea-level increase for the mobile bay in recent times will engender the possibility to submerge wetlands, marshland, and drylands and erodes beaches, and amplify the coastal flooding. Which later exacerbates tropical storms and hurricanes that affect the other portion of Alabama

eventually. The combined effect of rising sea levels and coastal storms has a significant impact on cities, infrastructure, and amenities around Mobile Bay. The Vulnerable community of this area later provokes climate migration that creates an effect in the more significant job sector, support, and other Alabama cities. The urgency to address the impact of tornados and rising sea levels on the vegetation and aquatic life of coastal bay has become vital to conserve those state assets. Alabama and Mobile Bay themselves house thousands of endangered species, and small climate changes would significantly impact the extinction of those unique species. This paper will focus on researching the rising natural hazards due to climate change of the mobile bay area and Alabama and its effect on the landscape, species, humans, and coastal landscape dynamics. The research also sheds light on low-impact development and materials strategies to enhance the economy, ecotourism and slowing down climate change risk. Analyzing maps and data is the primary methodology to execute the research. This ongoing research is an opportunity for designers, policymakers, and conservationists to work together toward future sustainable management practices, integrated planning, and adaptation strategies to mitigate future climate change risk in Alabama's landscape.

As urbanization has progressed over the centuries around the world, the decline in population decline, environmental pollution and economic crises are frequently occurring. These problems threaten the safety and daily life of people living in cities and are creating new uncertainties and challenges. Among various solutions, the need for a sustainable urban spatial structure is being suggested.

At the UN Conference on Environmental Development (UNCED) held in Rio, Brazil in 1992, the concept of sustainable development emerged and compact cities were discussed as a feasible urban spatial structure. The concept of a compact city can be said to promote high-density development and mixed land use, increase direct accessibility, and activate public transportation commuting rates and pedestrian activities. Research results are accumulating that the function of the compact city is directly or indirectly interpreted as a positive factor in

sustainable development.

On the other hand, there are also issues of concerns and criticisms about compact cities. Claims that low-density urban spaces improve welfare more than high-density spaces, and claims that high-density urban spaces are not desirable from the perspective of residents due to low park and green area ratios and that an increase in crime levels in a negative aspect to safety, etc. In addition, the Thesis on the disaster vulnerability of dense spaces is also being presented. The claim that the higher density made urban area disaster risk, the claim that the denser city causes inappropriate housing conditions and excess capacity, and that it causes conditions that are vulnerable to floods, landslides, and fire disasters. The rationale for the vulnerability is supported by the assertion that the densified metropolitan city has a disaster risk during the disaster risk identification process.

Nevertheless, it is regrettable that research on the characteristics of compact city planning in terms of disaster prevention has not been conducted in-depth. For example, a compact city pursuing a functionally rational approach means concentration and the creation of high-density buildings rather than the distribution of urban functions. However, this planning approach is a structure that increases vulnerability to crime and fire, as well as natural disasters. In particular, the vulnerability in a large city with a population of 10 million or more acts as a significant negative external effect. Since the side can be offset, research on this needs to be carried out.

This study aims to empirically analyze the impact of the density index of compact cities on disaster vulnerability using multiple regression and to measure the disaster prevention vulnerability of compact cities. The results show that cities with higher density were more vulnerable to disaster prevention. The significance of this study can be found in that the results of this study can be reflected in the disaster prevention plan prior to establishing the direction for building a compact city.

Exposure to extreme heat is a climate justice issue that requires a combination of urban climate science and an environmental justice framework for effective and equitable cooling solutions. More deaths are attributed to extreme heat than all other weather related disasters, meanwhile Black and Latino residents are 52% and 21% more likely to live in high heat-health risk areas (Guzman et al., 2020; Hulley et al., 2020). While local (100s-1000s meters) and regional (1000s+ meters) assessments of urban climate are well developed, they are often too coarse to inform municipal interventions that occur at micro scales (10s-100s meters), like a street segment. Thermal comfort within cities is highly heterogeneous and dependent on local vegetation, surface materials, and the form and spatial configuration of urban features (Middel et al., 2014; Stewart et al., 2014). There's a dearth of empirical data on micro and local scale dynamics and how specific design interventions influence thermal comfort. Moreover, there is little known about which land-uses create the largest pedestrian heat burden based on thermal conditions related to urban form. This project examines how urban form across three land-uses and planned cooling interventions influence thermal comfort through a community engaged microclimate modeling process in four CalEPA "disadvantaged" communities receiving funding from the Transformative Climate Change (TCC) program in California.

Using field temperature data gathered with residents from Ontario, Fresno, and Watts, and remote sensing methods, we have found that baseline conditions at these three TCC sites have low vegetation with air temperatures ranging on average between 35 to 50 celsius. Additionally, an evaluation of land surface temperature at playgrounds in elementary schools in Watts, an age where children are particularly vulnerable to extreme heat, average 51 celsius. Next steps in this study include: (1) Baseline assessment of Pacoima, (2) Building base models in the microclimate modeling software, ENVI-met, of commercial, residential, and school sub areas selected with community stakeholder input to model human thermal comfort, (3) Evaluating TCC planned cooling interventions and future scenarios selected through community stakeholder input, (4) Creating an urban form and design cooling strategy guide with community stakeholder input for cooling solutions at the street-level. This study will evaluate planned TCC and future cooling interventions, while ensuring TCC communities are empowered through participatory urban climate science and engagement throughout the microclimate modeling process. Additionally, this study will contribute empirical data on urban climate dynamics at the micro and local scales across three land-uses and for a set of specific heat mitigation design interventions.

Nonprofit organizations perform a crucial role in disaster recovery management. Their horizontal and adaptive structures serve as intermediaries between the government and residents in the community (Arlikatti et al., 2012; Chandrasekhar et al., 2014; Chikoto-Schultz et al., 2019). Nonprofit organizations are also better suited to promote the creation of social cognition, trust, and reciprocity, which often results in the creation of social capital (Ganapati 2006; Islam and Morgan 2012). Despite nonprofits' crucial role in disaster recovery, the literature in disaster planning policy has lacked insight as to how nonprofits deal internally with the recovery process themselves. This study examines recovery actions of nonprofits within the health and related community development sectors in response to compound and consecutive disasters. We examine how health and non-health-focused nonprofits resolve competing priorities when extreme weather and/or geohazard events or the recovery process occur simultaneously with a public health disaster? We conducted a telephone survey of 250 health and non-health sector registered nonprofits in Puerto Rico and 30 key informant interviews in the context of three consecutive and simultaneously occurring disasters in Puerto Rico, namely, the 2017 Hurricanes Irma and Maria, the 2020 Southwest Puerto Rico Earthquake sequence, and the 2020 COVID-19 pandemic. The survey asked questions about the impact of the disasters on the organization, actions are taken to cope with these impacts, and how organizations changed their operation to manage the effects of multiple disasters. Quantitative data was analyzed using descriptive statistical methods, while qualitative data were analyzed using thematic content analysis techniques. The results of this study show that health and non-health-focused nonprofits in Puerto Rico were able to use the Hurricane Maria and earthquake experiences to become more efficient at coping and managing the effects of multiple disasters while mediating between the government and residents in recovery planning efforts during the COVID-19 pandemic. Our study provides insights into the challenges faced by organizations as they adjust their mission and goals, program and activities, service provision, community engagement, advocacy efforts, etc. The findings also suggest that nonprofit organizations engaged in a variety of capacity-building strategies, including but not limited to information seeking, networking, and resource sharing. This study will help planners, emergency managers, governments, and other stakeholders to better engage with nonprofits during recovery from the compound and consecutive disaster events. This study is supported by funds from the Center for Disease Control (CDC) and the National Science Foundation (NSF) received through the Natural Hazards Center at Boulder CO.

# Track 5 – Gender & Diversity in Planning

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### 5.29 PRE-ORGANIZED SESSION - WHITE SUPREMACY AND URBAN PLANNING

Pre-Organized Session 29 - Summary

Session Includes 283, 284, 285, 286, 287

BRAND, Anna [University of California, Berkeley] annalivia@berkeley.edu, organizer

As a discipline, we have yet to confront the ways that white supremacy is connected and spatialized through urban planning. While planners often attend to racialized outcomes and metrics of racial inequality (McKittrick and Woods, 2007), our attention to the myriad ways that white supremacy is a spatial and phenomenological praxis (Lipsitz, 2011; Ahmed, 2007) is disturbingly lacking. Indeed, only recently have planning scholars begun to theorize the intrinsic connections between white supremacy and urban planning (Goetz, Williams and Damiano, 2020), including recent work to articulate reparative planning (Williams, 2020). This panel expands, more fully articulates and names (Brand, 2018) how whiteness and white supremacy appear and disappear in our discipline. Scholars on this panel highlight the methodological, temporal and theoretical entanglements of white supremacy and planning and are actively naming, enumerating and depicting these entanglements and centering frameworks of racial justice. Topics addressed on this panel include settler futurity, seeing whiteness in planning processes, planning historiography and theories of redress.

Objectives:

- Understanding the connections between white supremacy and urban planning

### SETTLER FUTURES: COLONIZING THE IMAGE IN REPRESENTATIONS OF FUTURE URBAN LANDSCAPES

Abstract ID: 283

Abstract within Pre-Organized Session 29

BRAND, Anna [University of California Berkeley] annalivia@berkeley.edu, presenting author

Urban renewal policy in the mid-20<sup>th</sup> century was premised on the dual promise of clearing blight and revitalizing urban landscapes. While communities of color were the ones who bore the brunt of modernist spatial logics and large-scale clearance (Fullilove, 2016), racism was tacitly obscured through denigrating accounts of brick and mortar. However, urban renewal narratives depicting the slums and enumerating conditions of blight were paired with images implicitly linking blackness to the problems of the city and whiteness as the remedy for the future. While urban renewal is critiqued for its devastating impacts on communities of color, less discussed are the nuanced ways that whiteness worked in the pairing of text and image.

The language of blight is circulating again in urban planning, paving the way for new forms of clearance and dispossession (Morrill & Tuck, 2016). Again, the image does racial work that texts elide. Yet now, however, tracing how race saturates representations of futurity in urban planning is complicated by the dominating paradigms of colorblindness and a post-racial development ethos. Although positivist narratives in planning processes and comprehensive plans do depict the outcomes of racial inequality in and as racial geographies (McKittrick and Woods, 2007), the descriptions and visualizations of urban futures pair this analytic with neoliberal, multicultural representations of the future (Melamed, 2006; Mele, 2013) where racial diversity appears as a normative ideal and can be seen in the diverse images of inhabited future urban landscapes. Despite these normative goals, racial inequality and racialized forms of dispossession and vulnerability persist, in part as a result of the everyday decision-making of urban planners and policy makers. How do we name and analyze the ways that racialization persists in

and through our discipline, despite normative goals of inclusion and equity? How might race work through planning futurity in contemporary processes, methodological approaches and imaginaries? This research explores the racial dimensions of futurity, asking who appears and disappears in visualizations of the future and, relatedly, who must appear and disappear in order to enact these futures. By tracking the ways that diversity operates in a normative and depoliticized sense, I examine diversity as a future elongation of the settler state through the planning imaginary. In other words, this research analyzes visions of the future via planning text and image and explores how these futures represent unexamined trajectories of racialization and whiteness. Through content and empirical analyses of planning image and text, this study focuses on planning futurity and how planning settles and colonizes the future through new forms of race and racialization.

This research posits that we have failed to interrogate how whiteness works in and through the future imaginary of urban planning. Though racial processes have shifted since the mid-20<sup>th</sup> century, the future again tacitly hinges on white presence and black dispossession. To explore how planning colonizes the future, this research explores the intersection between settler colonialism and urban planning, asking how unexamined ideas of race and whiteness saturate representations of the future. It interrogates implicit and ongoing forms of anti-blackness at work in urban planning by considering how race works through text and image in planning imaginaries. Tracing the imaginary of the future city, I analyze state-led urban planning efforts in Chicago and New Orleans across two distinct eras, Urban Renewal and the post-Civil Rights, neoliberal city. By applying settler colonial logics to urban planning futures, I interrogate how racial processes are given new life through representations of the future and examine how normative commitments to diversity conceal racialized imaginaries.

#### **“WHITE EYES, THE ONLY REAL EYES”: MEASURING, MODELING, AND THE EPISTEMOLOGICAL FOUNDATIONS OF URBAN PLANNING**

Abstract ID: 284

Abstract within Pre-Organized Session 29

BATES, Lisa [Portland State University] lkbates@pdx.edu, presenting author

Frantz Fanon, writing of the production of “the fact of Blackness,” describes the White observational gaze as the only view considered valid in sociological study. Urban planning scholarship and practice has built on the explicitly White observations of urban sociology from the Chicago School—incorporating the ‘human ecology’ concept into its measurements and models of cities and neighborhoods. The epistemological and ontological foundation of planning is perpetuating an essentializing view of population management, even when we abjure the kind of racism that led Robert Park to describe the “Negro” as “the lady among the races.” This paper considers how we might remake Black people as subjects, rather than objects, through practices of surveillance and oppositional gazing—in other words, through Black epistemologies and empirical practices that tell planners what planning is, so that our field

might begin to address its history and present.

### **ERUPTIONS OF WHITENESS: CENTERING RACIAL EQUITY IN THE PUBLIC FUNDING OF NEIGHBORHOOD ASSOCIATIONS IN MINNEAPOLIS**

Abstract ID: 285

Abstract within Pre-Organized Session 29

GOETZ, Edward [University of Minnesota] egoetz@umn.edu, presenting author  
ANDERSON, C Terrence [University of Minnesota] canders@umn.edu, co-author

The ability of the U.S. planning field to address problems of inequality, crime, housing, education, and segregation is hampered by a neglect of Whiteness and its role in shaping urban outcomes (Goetz, Williams, and Damiano, 2020). Planners need to develop a vocabulary for naming Whiteness and its role in limiting racial equity outcomes. Efforts to achieve racial equity in urban planning frequently confront the issue of Whiteness, manifest either as conscious or intentional opposition to racial equity efforts, or as more indirect expressions that erect obstacles for achieving racial equity. Examining how obstacles to racial equity are overcome in specific instances allows better theorizing about both Whiteness and its role in urban planning, and the development of practical approaches to address it. Racial equity efforts are difficult in no small measure due to the fact that they require a public conversation about race. Researchers across a range of disciplines have studied and noted the challenges of public (and private) conversations about race and the unstated rules and norms that dominate such talk (see, e.g., Feagin et al., 2001 on sincere fictions, McKinney, 2004 on the denial of white privilege; and Mills, 2017 on white ignorance). An entire nomenclature has been developed by researchers describing the dynamics of inter-racial conversation and debate. Many make reference to "race talk" as a special form of communication that involves a distinct set of rules and procedures (Sue 2013), and the difficulty that Whites have in perceiving their racial position (Foster, 2013; Hayward, 2013). In this paper we offer a case study of a racial equity initiative that was threatened by White fragility (DiAngelo 2018). In 2019 and 2020, the City of Minneapolis endeavored to change its policy of support for neighborhood associations (NAs) in the City, and to apply a racial equity framework to determine the distribution of public funds to support NAs. Despite almost universal support for the principle of racial equity, an 'eruption of Whiteness' almost stalled the process when a faction of white neighborhood organizers objected to the racial equity analysis underpinning the effort. Feeling that they were personally being called racist, they undertook a series of steps to challenge the process and to insulate themselves from taint of racism. The group was, in the end, unable to delay or derail the process. We examine the factors that led to the eruption of whiteness and to the particular form it took on in this case, as well as the factors that rendered it ineffective.

## **TWIN CITIES, SPLIT POLITICS: REPARATIONS, THE POLITICS OF RECOGNITION AND REDISTRIBUTION**

Abstract ID: 286

Abstract within Pre-Organized Session 29

WILLIAMS, Rashad [University of Minnesota] will5638@umn.edu, presenting author

Signaling the devolution of the Black redress movement in the face of continued congressional intransigence, cities across the country have begun to experiment with municipal reparations programs. The approaches taken by cities, however, differ in that they tend to typify either a politics of recognition or a politics of redistribution. Using comparative case study analysis, I explore why two bordering cities at the center of the largest protest movement in U.S. history wound up on opposite sides of this continuum, with one city establishing a reparations commission and the other establishing a truth and reconciliation commission in the wake of urban rebellions following the murder of George Floyd.

## **RELATIONS OF POWER: THE US CAPITOL INSURRECTION, WHITE SUPREMACY AND US DEMOCRACY**

Abstract ID: 287

Abstract within Pre-Organized Session 29

INWOOD, Joshua [Penn State University] jfi6@psu.edu, presenting author

Since the 6 January insurrection at the United States Capitol and the impeachment trial and subsequent acquittal of former President Donald J. Trump, new information continues to reveal how close the demonstrators came from fulfilling their goals of overturning a democratic election. Fomented over the years by a President and his allies who peddled misinformation and lies, actively courted white nationalists, and consistently tended to a politics of white injury and rage, the 6 January came astonishingly close to a coup. However, to locate white supremacy within the realm of militias, mobs, and Trumpism not only misunderstands white supremacy as a structuring relation but reinforces it by reducing it to the extraordinary and spectacular. Here I make two interrelated arguments: First, I revisit the meanings of white supremacy and challenge reductionist framings for their potential to obscure white supremacy's systemic deployments. Second, I discuss the fundamentally undemocratic nature of whiteness and white supremacy. I contend that the 6 January events have historical resonance, they signal a racial realignment and reworking of racial regimes in the context of new contradictions. This connects the events of 6 January to longer

histories within the US, even as they are grounded within present conditions.

### 5.83 PRE-ORGANIZED SESSION - QUEER SPACE: LOCATING LGBTQI+ LIBERATION IN PLANNING

Pre-Organized Session 83 - Summary

Session Includes 428, 429, 430, 475, 1060

AZHAR, Awais [University of Texas Austin] awais.azhar@utexas.edu, organizer

There has been an urgent call for planning academics and practitioners to engage with queer spaces that serve the Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex (LGBTQI+) community. These historically overlooked urban spaces are critical for the LGBTQI+ community to safely live, work, and play (Doan, 2011). These locations "simultaneously engage and transgress the social, architectural, and juridical meaning attributed to the areas that they occupy by means of the subversive bodies that collectively inhabit and pass through them" (Avilez, 2011). However, the concept of queer spaces does not need to be restricted to geographical or architectural space alone but rather can transcend notions of physical space, as in the case of the blurred boundaries of virtual queer spaces (McKee, McNair & Watson, 2014). In this pre-organized session, presenters will share different ways in which to conceptualize and engage with queer spaces in an effort to advance LGBTQI+ liberation and civic engagement.

#### Objectives:

- Developing understanding of LGBTQIA+ planning issues
- Expanding knowledge and research on queer spaces

### LGBTQ+ PERSPECTIVES ON SEEKING SAFE SPACE IN CENTRAL FLORIDA

Abstract ID: 428

Abstract within Pre-Organized Session 83

SANTIAGO, Luis [University of Central Florida] luis.santiago2@ucf.edu, presenting author

RAMOS, Estelli [University of Central Florida] Estelli.ramos@ucf.edu, co-author

AN, Seongho [University of Central Florida] Seongho.An@ucf.edu, co-author

On June 12, 2016, forty-nine individuals, most Latinx of Puerto Rican background, lost their lives in the PULSE massacre in Orlando, Florida. PULSE was considered a safe space by many in Central Florida's LGBTQ+ community, and the event led to dramatic changes in the way LGBTQ+ residents perceived their surroundings, particularly considering overlapping identities that combine race, ethnicity, class, gender and sexuality (Goh, 2018; Doan, 2015). Our study seeks to explore the present-day characteristics and locations of urban spaces perceived as safe or unsafe in the Central Florida region, considering intersecting forms of discrimination faced by the LGBTQ+ population. Safety perceptions will be explored along the following gradients: public vs. private space, LGBTQ+ businesses vs. non-LGBTQ+-businesses, rural vs. urban, and seasonal (PRIDE parade, Disney Gay Days) vs. non-seasonal.

Besides identifying particular physical characteristics of an individual's surrounding that may be associated with variations in perceptions of safety, the study will explore attitudes towards the development of an LGBTQ+ district in the Central Florida region, particularly considering the construction of a PULSE memorial and museum, slated for completion by 2023 (OnePULSE FOUNDATION, 2021). We also aim to explore changes in perceptions of safety as a result of key changes in legislation affecting the LGBTQ+ population, such as the Marriage Equality Act of 2015 and a series of policies, ordinances and initiatives undertaken by the City of Orlando to support the LGBTQ+ Community (City of Orlando, 2021).

LGBTQ+ community participants will be recruited through non-profit organizations who serve the LGBTQ+ community in the area as well as City of Orlando liaisons. A racially and ethnically diverse group of participants of various age groups will be invited to participate in two focus groups to explore perceptions of safety at the individual, community and city level. Content analysis will be used to identify given code within each participant's speech, both within and between focus groups. Inferences made about the level of consensus or dissent on various themes will be validated through participant counts.

The study seeks to inform relevant government and NGOs on short- and long-term actions that will lead to the creation or maintenance of safe public spaces for LGBTQ+ individuals, explicitly considering intersecting forms of discrimination. Although physical/spatial, regulatory and enforcement recommendations will be framed considering the Orlando MSA, applicability to other US MSA's is fairly likely due to the strong influence of broader structural conditions that have led to the marginalization of the LGBTQ+ population in the United States, and the similarity in regulatory and enforcement frameworks to address the issue across the country.

#### **UNDERSTANDING BARRIERS TO FULL CIVIC PARTICIPATION BY THE LGBTQ+ COMMUNITY: THE CASE OF ATLANTA**

Abstract ID: 429

Abstract within Pre-Organized Session 83

ATALAY, Ozlem [Florida State University] oa17b@my.fsu.edu, presenting author

In particular since the 1980s, we have observed the emergence and diversification of collaborative and participatory governance models as alternatives to adversarial and managerial modes of policy making and implementation (Ansell & Gash, 2007). Progressive local municipalities value diversity and broad-based participation, and have been exploring ways to be more inclusive (Doan, 2016). LGBTQ+ advisory boards and commissions are one of the actualizations of such efforts. Local LGBTQ+ advisory boards are comprised of voluntary LGBTQ+ individuals who are appointed by the mayor. Their primary role is to offer recommendations to the mayor, city council and departments to address the needs of local LGBTQ+ residents, though their efficacy has not been studied.

At the same time the queer political movement that arose in the 1990s argued that LGBTQ+ people should resist assimilation and stand against the dominant norms of society. Engaging in political efforts to gain status through a concept such as citizenship was seen as regulatory and oppressive (Phelan, 2001; Warner 2002). Queer theory's debunking of stable categories of sex, gender, and sexualities through post-structuralist deconstruction of identity also encouraged resistance to attempts to obtain full citizenship rights that were rooted in the heterosexuality. According to this queer perspective, merely gaining long denied rights for the LGBTQ+ community was not sufficient; the more pressing task was to challenge and transform the existing concepts and structures. It is thought that concerns that only demand "equality with the others" enable the possible co-optation of the movement and assimilation of the LGBTQ+ community into the values which are deeply grounded in heterosexuality (Jagose, 1996).

Within this framework, works of some voluntary LGBTQ+ groups including AIDS activists of 1990s, non-profit LGBTQ+ organizations, and strategies of local municipalities have been studied. Are they assimilating or liberating? Are they preventing the creation of autonomous spaces of queer representation rather than constituting them? (Andrucki and Elder, 2007). Are they contributing to the homonormative and/or heteronormative mainstreaming? (Duggan, 2002; Murray, 2015). But how can we read the recent involvement and participation of the LGBTQ+ community in the city politics through recently emerged Advisory Boards? Where does such a formation of civic engagement of the LGBTQ+ community stand in the discussions of assimilation and homonormative mainstreaming? To answer these questions is both theoretically and practically important. Theoretically advisory boards represent a new form of civic engagement and participation and present the possibilities of a nuanced definition of citizenship where board members blur the lines between the bureaucrats and citizens (Brown, 1994). Practically such advisory boards may help to create bridges among the LGBTQ+ community and the municipality to build healthier redistributive and recognitional policies and inclusive cities where the LGBTQ+ individuals are not seen as customer citizens or as spectacle through assimilative policy and practices (Bell & Binne, 2004).

Focusing on Atlanta LGBTQ+ Advisory Board, I research the motives and operations of the board which was established in 2018 through the utilization of a queer lens. I apply semi-structured in depth interviews with board members, Atlanta city officials including city planners, and the local LGBTQ+ community on issues about civic engagement, involvement in the city politics and decisions, urban services, LGBTQ+ inclusion, representative power of the board, queer spaces as well as researching secondary data resources such as related news reports, local LGBTQ+ magazines and blogs.

#### **LESBIAN AND OLD: COMPLICATING QUEER SPACE, SAFETY, AND HEALTH**

Abstract ID: 430

Abstract within Pre-Organized Session 83

TURESKY, Marisa [University of Southern California] [turesky@usc.edu](mailto:turesky@usc.edu), presenting author

This examination of queer space centers the interaction between the built environment and the older lesbian, a triply subversive body in terms of age, gender identity, and sexual orientation. The changing socioeconomic context urban communities has led to shifts in the landscape of queer spaces and, specifically, lesbian spatial practices throughout the United States (Giesecking, 2021). This paper contributes to planning research that advances the liberation of a heterogeneous LGBTQ+ community by exploring the everyday spatial and safety needs outside of traditional gayborhoods (Doan & Higgins, 2011; Goh, 2018). Through a gender life course framework (Carpenter, 2010), this paper argues that older lesbians' attachment to place reveals gendered and queer pathways toward identity and community development over time. Based on the oral histories of ten lesbians aged 65 to 85 in Los Angeles County, I explore how older lesbians interact with the built environment to expand and complicate definitions of queer space, safety, and health. This paper asks: does aging change the kinds of queer spaces that lesbians need and desire? How does lesbian identity shape the spatial practices of a person over their life course? Studying the spatial practices of older lesbians demonstrates older adults' differentiated needs based on sexual orientation and gender identity so that planners, policymakers, and service providers must acknowledge how these differences influence people's access to places, resources, and services.

#### **PLANNING AS A QUEER INCLUSIVE PROJECT: AN EXAMINATION OF LGBTQ+ COMMUNITY CENTERS IN THE PLANNING PROCESS AND IMPACTS ON PUBLIC HEALTH**

Abstract ID: 475

Abstract within Pre-Organized Session 83

JOHNSON, Bonnie [University of Kansas] bojojohn@ku.edu, presenting author  
STRASSLE, Austin [Copy Institution] austin.strassle@ku.edu, co-author

In general, urban planning has often been silent to the ways it reinforces notions of heterosexuality and thus then overlooks impacts of this thinking on community health (Buckley & Graves, 2016; Petra L Doan, 2011, 2015; Petra L. Doan & Higgins, 2011; Frisch, 2002; Kinahan & Ruther, 2020; Moe, 2016; Moe & Sparkman, 2015; Sen, Umemoto, Koh, & Zambonelli, 2017). In the early 1900s, urban planning and public health professionals addressed the poor living conditions of cities together, but then diverged as each profession honed their professional identities. Recently, the professions have come back together over issues related to obesity, aging, and the built environment (Checkoway, 2008; Hall, 2002; Leyden, 2003; McAndrews & Marcus, 2014; Sloane, 2006). We propose reconsideration of an early cornerstone of public health and planning; the community center (Estes, 1997; Hall, 2002; Lloyd Lawhon, 2009; Spain, 2001). However, we focus on LGBTQ+ community centers (Fish, Moody, Grossman, & Russell, 2019; Phillips li et al., 2020), the planning process, and breaking away from the "heterosexist project" of planning to an "inclusive project" (Frisch, 2002).

#### Queer Inclusive Project and Health

The success of public health initiatives relies on communication and external supports (Freimuth & Quinn, 2004). Urban planning links communication and external supports and has leaned on the public value of equity as a key

connector. Other planning researchers, particularly in the realm of sustainability have sought to find “equity” in major planning documents and have found little (Berke & Conroy, 2000; Brand, 2015; Cuthill, 2010). There is evidence that robust public participation processes result in more equity visible in resulting plans (Loh & Kim, 2020) and a focus on inclusion makes for more effective participation (Quick & Feldman, 2011). However, being able to achieve equity and inclusion is contingent on being able to acknowledge oppression in order to dismantle it.

As with any public service-oriented communication, multiple channels and techniques are necessary for success (Bernhardt, 2004; Johnson & Halegoua, 2014). In the public health communication literature, they emphasize that “deep structure” (Freimuth & Quinn, 2004; Resnicow & Braithwaite, 2001), going beyond superficial representations of culture, is necessary for reaching minority communities and improving equitable health outcomes.

An “external support” long associated with urban planning has been the community center. Community centers play significant roles in the public health of their constituencies. We examine whether planners are drawing on community centers, particularly LGBTQ+ community centers, to practice deep structure, and advance equity in public participation processes and their resulting plans.

### Methodology

We utilize a random sampling method to select 19 LGBTQ+ Community Centers listed on the CenterLink LGBTQ+ Community Center Member Directory (CenterLink: The Community of LGBT Centers, 2021) and have a physical presence within their respective city. We include the Kansas City Center for Inclusion as our case study for a total of 20 centers in an equal number of cities distributed across the four Census regions and nine Census districts in the United States. Data is collected by reviewing public planning documents and compiling a comprehensive list of each reference to a public or private organization that aided in the development of a plan with particular focus on whether the LGBTQ+ Community Center located within the city was included as part of the plan development. Understanding the importance of language in creating an inclusive environment, we also examine whether plans include LGBTQ+ terminology by searching for key words including queer, gay, lesbian, bisexual, transgender, intersex, sexual orientation, or gender identity.

### Conclusion and Results

Considering the social and cultural significance of queer-centered community spaces on LGBTQ+ public health, we try to find whether planning departments consider these organizations as major stakeholders and participants in the planning process. Our findings show planning departments did not include any LGBTQ+ centers in participant or stakeholder lists in their community-wide plans. Opportunities exist for city planning agencies to further engage with LGBTQ+ residents to create a more equitable planning process and advance the “inclusive project”. Recommendations for future research and implications to planning practice and public health are made.

## TRANSFORMATION AND RESISTANCE: SEATTLE'S GAYBORHOOD IN FLUX

Abstract ID: 1060

Abstract within Pre-Organized Session 83

CHALANA, Manish [University of Washington Seattle] chalana@uw.edu, presenting author

Seattle's traditional queer neighborhood – the Pike/Pine section of Capitol Hill - used to be a predominantly mixed-use district with numerous “grungy” establishments, social organizations and affordable housing. Its urban form, however, was mostly low-lying (1-3-stories) as a consequence of its origin as an auto row district in the early 20<sup>th</sup> century. The city upzoned Pike/Pine to NC-65/85 in 2006 to bring in more mixed uses with an emphasis on greater residential density as part of its “Center City Strategy”. Despite the slowdown from the Great Recession, the upzone transformed the urban form of Pike/Pine, dramatically increasing density. The subsequent Amazon boom brought an influx of young workers with high salaries, with Pike/Pine's proximity to Amazon headquarters and downtown making it an attractive residential choice. What emerged from these multiple trends, then, was a considerably more upscale and “sanitized” district, with numerous gay establishments dismantled or radically changed. Several attempts by the city since then to slow down the gentrifying aspects of the district's transformation have not quite yielded the intended outcomes. If anything, they have accelerated the transformation as developers see incentive-based legislation as even more attractive for locating projects there. Throughout all of this, the city has left single-family zoning—which comprises the majority of the residential land—largely untouched.

In one sense, Pike/Pine's trajectory is not unique; most “gayborhoods” in the country have in the first two decades of the 21<sup>st</sup> century become less “queer” (in multiple senses of the word) due to increasing social acceptance and a declining need to self-segregate (Bitterman & Hess, 2021; Ghaziani, 2014). However, these communities continue to serve an essential purpose for the health and well-being of GLBTQ+ populations, particularly those with less familial, economic, and social support, including many trans folk, people of color, working class queers, and immigrants. Given the rapid increase in property values and rents in Pike/Pine, however, these folks are the most likely to be priced out. The queer life that does remain, then, becomes increasingly White, cis-gender, affluent, gay-identified men. Other queer folk, even if they are able to find a way to stay in the area, see less and less of the supportive community that makes the neighborhood such a crucial safe haven (Doan, 2015).

The Pike/Pine transformation thus demonstrates the persistence of planning as a practice that, regardless of how well-meaning its intentions, continues to “reinforce repression of lesbians and gays through laws, ordinances, and regulations” (Frisch, 2002). When it does serve the needs of the queer community, it does so by privileging a narrow section of it. Gentrification is undoubtedly one of the greatest challenges that planners face, and the toolkit for ameliorating its effects on marginal communities is incomplete. However, it is also not empty, and includes multiple forms of more inclusive and equitable zoning and development than is current practice in Seattle. If they wish to avoid unwilling reinforcement of long-standing heteronormative paradigms, planners need to fully understand and take steps to address the consequences of their policies for gayborhoods on individuals and communities.

ZAMBRANO-BARRAGAN, Patricio [University of Pennsylvania] pzb@upenn.edu, participant  
GONZÁLEZ, Erualdo R. [Cal State at Fullerton] egonzalez@FULLERTON.EDU, participant

As planners turn more attention toward improving the social justice perspectives of research and practice, the needs and barriers for diverse communities have become a priority. For Latinx majority cities and neighborhoods in the United States, the traditional social dynamics and research strategies may not apply. There is considerable diversity of ethnicity and culture across the Latinx identity itself and planning equity models, data, and literature often consider equity in terms of black vs white communities. Therefore, alternative approaches and mindful considerations are required for effective and reliable results when researching and planning for Latinx majority communities. The roundtable will draw on the recent empirical work of the participants to illustrate how social justice and activist planning research can best fit the unique culture, histories, and sociological considerations of the United States' Latinx majority cities and neighborhoods including; (1) What are important data and methodological considerations necessary when conducting research for these communities? (2)(a) What are the needs of varying types of Latinx majority cities and neighborhoods throughout the country? (2)(b) and how do cultural and social dynamics vary by nationality, region, and ethnicity? And (3) What are the economic, practical, cultural, and regulatory barriers to successful planning equity for these communities?

### **5.330 ROUNDTABLE - WHITENESS AND PLANNING: UNCOVERING WHAT IS UNSPOKEN, ASSUMED, AND MISSING**

Abstract ID: 330

HARRIS, John C. [University of Oklahoma] johncharris@ou.edu, moderator

LEE, C. Aujean [University of Oklahoma] aujean@ou.edu, participant  
ARROYO, John C. [University of Oregon] jarroyo@uoregon.edu, participant  
GOETZ, Edward G. [University of Minnesota] egoetz@umn.edu, participant  
BRAND, Anna Livia [University of California, Berkeley] annalivia@berkeley.edu, participant  
WILLIAMS, Rashad [University of Minnesota] will5638@umn.edu, participant

Whiteness and white supremacy are dominant forces in urban planning. However, planning scholarship and practice have yet to fully recognize the depths of these phenomena. How has planning perpetuated racial disparities in and across urban spaces and racist framings that problematize communities of color as the cause of inequities? Despite disciplinary neglect, white supremacy has shaped planning practice in different ways, from its emergence through regulatory frameworks such as racial zoning to forms of racial domination like settler colonialism and slavery to more recent forms of color evasiveness after the Civil Rights Movement in which race is presumed to no longer affect individual or neighborhood outcomes. This refusal to acknowledge and confront the continual role of whiteness is glaring given the historical, recent, and ongoing manifestations of racialized violence and growing inequality that we see evidenced across all scales of urbanism. Indeed, while scant progress has been made in expanding racial representation, cities continue to be shaped by racial crises and “eruptions of whiteness” that go both under-theorized and under-researched in urban planning.

To better understand whiteness and white supremacy, scholars on this roundtable have drawn from ethnic studies, sociology, geography and other fields to illuminate how race is at the center of planning and upholds white supremacy. The participants will share case studies of how to uncover and reveal the role of white supremacy in planning processes, government statements, and in pedagogy. The discussion also explores how to incorporate whiteness into an urban planning curriculum, and addressing some of the challenges educators face when teaching about whiteness.

Questions the roundtable panelists seek to address include:

1. How do planning scholars examine whiteness and white supremacy?
2. What methods might planning scholars use to analyze and critique how, where and when whiteness appears in and across the urban landscape?
3. How can whiteness be exposed, discussed, and critically engaged in urban planning curriculum?

#### 5.645 ROUNDTABLE - RACE AND DIVERSITY AMONG PLANNING FACULTIES: TESTIMONIES FROM PLANNERS OF COLOUR

THOMAS, Ren [Dalhousie University] planningutopia@gmail.com, moderator  
VAZQUEZ, Teresa [Universidad Autónoma de Ciudad Juárez] ma.tere.vazquez@gmail.com, participant  
BETANCUR, John-Jairo [University of Illinois Chicago] betancur@uic.edu, participant  
SEN, Siddhartha [Morgan State University] siddhartha.sen@morgan.edu, participant

This roundtable will explore the issues of race and ethnicity in the context of public perceptions of faculty members teaching at ACSP Member Schools. Ten years ago, planners of colour exposed the challenges and issues that diverse faculty of color face through their own testimonies in order to substantiate the Climate Survey that POCIG and ACSP carried out (2009). With that roundtable, we aimed to initiate a wider conversation about the current state of affairs for faculty of color and to generate recommendations.

Although diversity has been widely discussed in theory at ACSP conferences, included in PAB recommendations, and increasingly in planning curriculum, the reality that faculty of color face in academia is in many cases far removed from the theory advocated by our association, our planning accreditation board, and planning departments. Faculty of color face environments that do not value difference. Hiring biases and discourses that portray minority faculty of color as unqualified candidates continue to prevail in conversations about faculty and administrative searches, as well as in processes of retention, tenure, and promotion. Job descriptions are crafted to disqualify and “define out” applicants of color. Faculty of color face unfriendly environments and marginalization, lack of resources and mentoring, and uneven distribution of support, which affects their academic and professional trajectory. Prejudice, bullying, rumors, and unfriendly environments are all too common. This animosity comes not only from administrators but also from colleagues, staff and increasingly from students, regardless of the intersectionality in their identities.

We would like to compare the testimonies that we collected 10 years ago with the current ones to see if anything has changed. We would also like to collect testimonies from people of color working at Historically Black Colleges/Universities and Hispanic Serving universities to see if there is a difference, and testimonies of Whites working at such institutions to see they are treated differently.

The testimonies collected will help us to pinpoint specific challenges and lessons. Recommendations will emerge from the voices of those providing testimonies, but also from the discussion generated after the paper is presented. These recommendations could be added to the Climate Survey and will be provided to ACSP and POCIG.

*\*This session is sponsored by FWIG.*

In recent years, work from the ‘southern’ and ‘south/eastern’ contexts (Bhan, 2019) has widened theoretical discussions and geographical foci of the contemporary planning debate. In what we embrace as a hopeful shift in planning, scholars working in these contexts have pushed the planning field to reevaluate the applicability and usefulness of dominant theories and methodologies to address residents’ lived inequities throughout the world (Yiftachel, 2020; Miraftab, 2009, Waston, 2012).

Inspired by Arturo Escobar’s (2018) notion of the ‘Pluriverse,’ we understand “pluriversal planning scholars” (Vasudevan and Novoa, forthcoming) as those who embrace multiplicity, coexistence, and situated knowledges in their community-centered planning work. Importantly, these scholars not only draw from other fields to highlight the everyday experiences and resistances of residents. They also actively contribute to community-based work through reciprocal theory development with community members, capacity building, and visibilizing residents’ stories when appropriate.

This session continues the important conversations that emerged from last year’s ACSP roundtable entitled “Feminist Futures of Radical and Insurgent Planning” and 2019’s ACSP roundtable entitled “Radical and Insurgent Planning: Reflecting on Concepts, Stories, Geographies, and Futures.” However, in this session we turn away from purely theorizing the possibilities of radical, insurgent, and critical planning theories to focus on planning scholars’ tangible contributions to the communities they work with. We are interested in discussing how these scholars learn from and contribute to the ongoing contemporary challenges that communities face while centering the needs and voices of community members who lead urban struggles. We also want to reflect on our roles as planners and how community-based work prompt us to occupy complex positions in our academic and pedagogical efforts (Porter, 2015).

In top planning journals we have noted a dearth of explanations, engagement with, and reflection about what it means to do community-based work. Indeed, the very same scholars who say they ground their work in the community often write more about theory and methodology than about the tough questions around community engagement, ethics, positionality, and the role of the planning scholar vis-a-vis the ‘community.’ However, centering scholars’ community-based commitments in planning has the potential to ensure that a pluriversal planning project does not “become yet one more academic endeavor” (Escobar, 2017: 216). It would lay the ground to imagine and build transnational solidarities by acknowledging historical specificities while imagining radical and (inter)connected futures beyond the modern/colonial system.

At this roundtable session we ask: How do pluriversal scholars actively engage in a reciprocity of learning and sharing with community members? What are the practical aspects of collaboration? How do we understand the relationship between community contributions and anti-colonial and anti-racist work? What is our role(s) as researchers doing this work? Are there particular methods that have been useful in the process of knowledge co-production?

## **INDIVIDUAL PAPER SUBMISSIONS**

### **DOWNTOWN COMMERCIAL GENTRIFICATION AND *GENTEFICATION*: USING BUSINESS DIRECTORIES TO ASSESS CHANGE AND CONTINUITY**

Abstract ID: 189

Individual Paper Submission

GONZALEZ, Erualdo [California State University, Fullerton] egonzalez@fullerton.edu, presenting author

SEELEY, Tiffany [East L.A. College] seeleytr@elac.edu, co-author

Commercial gentrification is a social inequity, and a small and growing quantitative literature primarily focuses on the ways businesses that are upscale or target middle- or upper-class consumers are changing the landscape of neighborhood businesses corridors that have historically targeted black residents and now heavily market to white consumers (Freeman, 2005; Sullivan & Shaw, 2011; Zukin, 2008, 2009). We have a small but growing body of commercial gentrification work that examines additional racial and ethnic business profiles and changes (Kosta 2019). However, we lack scholarship that systematically describes changes to businesses that marketed to Latinx immigrants marketing to both second-generation Latinx Americans and White people. This research focus is essential because no scholarship quantitatively examines gentefication, a small but growing gentrification phenomenon in the Southwest whereby Mexican-American or Chicanx owned businesses are targeting middle-classes and multi-generational consumers, most of Mexican-American or Chicanx background. Our study addresses such gaps by systematically and cross-sectionally examining trends tied to business count, store types, and consumer groups that these stores target by class, race/ethnicity, and generational status and focusing on the downtown commercial core. What does commercial change and continuity look like across time in a downtown of central city undergoing gentrification? We use a reverse directory: the Haines Criss + Cross Directories to assesses changes across occupancy type and their target population in 1980, 1990, 2000, and 2011 in the inner zone of the central downtown core of the Southern California Mexican city of Santa Ana, where the city has led aggressive efforts to gentrify the retail heart, 4<sup>th</sup> Street, popularly known among Spanish speakers as La Cuatro, since the 1990s. Using Google Street View, Yelp, Facebook, and archival and personal pictures of storefronts and relying on our lived experiences in the area, we examined keywords, phrases, and statements and the products and services that were for sale. We reviewed newspapers, magazines, community development plans, city minutes, and popular and scholarly articles about gentrification in Santa Ana to help us code target consumers by ethnicity, class type and generational status. Despite widespread consensus from locals and regional residents that the area has gentrified, we found a consistent working-class, Mexican, and immigrant commercial identity across the study period, though gentrifying businesses surged from 1990 to 2011. La Cuatro went on to include a different retail landscape than had existed during the 1970s and mid-2000s. We found a small but a recognizable surge of businesses, such as art

studios and bars and restaurants, targeting middle and upper classes white people. Yet, aside from general on the ground debate about white gentrifiers, we noticed another emerging controversy referred to as gentefication (portmanteau combining “gentrification” with “gente,” Spanish for “Latinx people”). Within about five years from our last study period, 2011, five new gentefying businesses opened, including a barbershop and a café, owned by Mexican-Americans or Chicanxs, primarily children of immigrants, and their target consumers were middle-classes and multi-generational, most of Mexican-American or Chicanx background. These types of businesses will likely grow and add to our understanding of commercial gentrification. Suppose we suggest that too few commercial districts in the central city undergoing gentrification are remaining affordable and welcoming to consumers of modest means and that this is unjust. Gentrification and gentefication research questions could look at the meanings and practices of the “socially just distribution of businesses.” To what extent may gentefication represent spatial equity? To what extent does gentefication represent a combination of revanchist and affirming practices? These questions could help build a more systematic and fuller understanding of change and continuity in Latinx commercial spaces across the country.

### COMMEMORATING HISTORICALLY SIGNIFICANT GAY PLACES ACROSS THE UNITED STATES

Abstract ID: 235

Individual Paper Submission

MILLER, Camden [University at Buffalo, State University of New York] camdenmi@buffalo.edu, presenting author  
BITTERMAN, Alex [State University of New York, Alfred State] bittera@alfredstate.edu, co-author

The stories of gay spaces across the United States are largely unrecorded, undocumented, and are not centrally collected or archived beyond informal reports and oral histories. Evidence demonstrates that the preservation of historic sites allows for future generations to benefit from intangibles related to community and identity. However, the LGBTQ+ community has been unable to gain benefits that place-based, historic sites can provide, due to an inability to commemorate spaces that have shaped LGBTQ+ history in significant ways. This study explores the disparities between the preservation and commemoration of significant LGBTQ+ spaces and the amount of funding distributed to these sites. As of 2016, LGBTQ+ sites comprised only 0.08 percent of the 2,500 U.S. National Historic Landmarks and 0.005 percent of the more than 90,000 places listed in the National Register of Historic Places. This representation is well short of the share of American adults that identify as LGBTQ+, which in 2017 was approximately five percent of the United States population. In 2010 the Administration of President Barack Obama launched the LGBTQ Heritage Initiative under the National Historic Landmarks Program. This effort underscored a broader commitment to include historically underrepresented groups, including LGBTQ+ individuals. As a result, LGBTQ+ communities became eligible to receive funding for projects through the Underrepresented Community Grant Program. An in-depth analysis of the distribution of Underrepresented Community Grant Program funds from 2014 to 2019 revealed that the LGBTQ+ community receives considerably less funding for the preservation of

historic sites compared to other underrepresented communities. The findings from this study also suggest that there is still a significant amount of work that remains to be done integrate LGBTQ+ histories into historic preservation programs that exist at various levels of programming (local, state, and federal). Based on the findings from the analysis of funding and several interviews that were conducted with professionals in the field, three takeaway messages were formulated: (1) creativity should be used in understanding and applying nomination criteria to LGBTQ+ spaces, (2) although funding is available, the mechanism to apply for funding is not widely disseminated among smaller groups or organizations, and (3) LGBTQ+ organizations are applying for funding and want to landmark significant LGBTQ+ places.

The establishment of Native American reservations in the United States of America was fraught with gross injustices, repeated incursions on to tribal lands, and the shrinking of reservation boundaries. The histories of these assaults on tribal land holdings are etched into the morphology of reservation borders. Tribal lands are often found in areas with the fewest agricultural resources and often at great distances from population centers established by European settlers. In particular, the size and shape of reservations may make them susceptible to being carved into different governing jurisdictions and districts including states, counties, school districts, and congressional districts, thus requiring tribal governments to negotiate with multiple, non-tribal governing bodies. This project applies a typology of border characteristics to inventory the differences in reservation geographies and boundaries with the end goal of determining how contemporary boundaries impact tribal sovereignty, tribal governance, and equity.

Two research assistants categorized the 397 reservations, off-reservation trust lands, and state-recognized American Indian reservations in the continental U.S. identified by the U.S. Census Bureau for the presence of nine, non-mutually exclusive, border characteristics. These characteristics include the presence or absence of the following: (1) a discrete land mass (discrete); (2) a portion of the border defined by natural features such as waterways (natural); (3) a compact size with a radius of 3 miles or less (compact); (4) an elongated shape

(elongated); (5) a portion of the reservation that protrudes from the main reservation land mass (prorupted); (6) a main land mass that is identifiable as a basic shape (simple); (7) a main land mass that does not have an identifiable shape (irregular); (8) a border with another reservation (shared); and (9) a portion of the tribal land that is interspersed with non-tribal land forming a checkerboard pattern (checkerboard).

Mean reservation area in square miles and mean area-to-perimeter ratio (a measure of border complexity) were calculated for each characteristic. The characteristics were then used to predict the presence of more than one of the following types of jurisdictions within the reservation borders: states, counties, school districts, and congressional districts.

Differences in mean square miles were significant for six of the nine characteristics ( $p < 0.05$ ). Differences in area were not significant for discrete, prorupted, or simple borders. Reservations with larger areas had natural borders, irregular shapes, shared borders, and/or checkerboarded land masses. Mean differences in border complexity were significant for all characteristics except for shared borders. Reservations with more complex borders had non-discrete, natural, elongated, and/or prorupted borders, and/or were less compact, had irregular shapes, and checkerboarded land masses.

#### **BENEFICIAL OR DISRUPTIVE CHANGE? PERSPECTIVES OF NEIGHBORHOOD CHANGE IN SANTA ANA, CA**

Abstract ID: 408

Individual Paper Submission

ZUÑIGA, Michelle [University of California, Irvine] [mzuniga@uci.edu](mailto:mzuniga@uci.edu), presenting author

In this study, I explore opposition to increased investment to sustainable infrastructure in Santa Ana, California, a predominately low-income and Latinx community in central Orange County. My overarching goal with this study is to acquire a deeper understanding of local opposition (Devine-Wright, 2009) to sustainable urban development (i.e. compact high-density housing, transit-oriented development, light-rail transit) occurring in Santa Ana by learning how residents make sense of observed changes and how they respond to change. Opposition to change is often times dismissed as a barrier for progress by developers and public officials. However, it is important to study further why and how individuals come to oppose particular projects despite their sustainability goals to enhance planning efforts.

To study opposition, I focus on the context of increased investment of sustainable urban development in Santa Ana (a low, income, Latinx community in central Orange County, California). Diving deeper into the thought process residents undergo before responding to observed changes brought on by increased investment of sustainable urban development, I pose the following questions, (1) How do perceptions of neighborhood change vary among

stakeholders?; (2) What are the factors that influence whether stakeholders view neighborhood change as a disruption or as a benefit?; and (3) How do these perceptions and assessments of neighborhood change shape the protective actions they take? With qualitative research methods, I draw from environmental psychology and planning literature to investigate how individuals perceive change and respond to disruptions to place.

Data collected include 41 semi-structured interviews with neighborhood association (NA) and community-based organization (CBO) leaders, field notes from participant observations of city council and neighborhood organization meetings, and archival documents including local newspaper articles and city government meeting minutes. Individuals from NAs and CBOs in Santa Ana are selected for this study given their active opposition to urban development since the 1970s and because they contrast greatly by age, race/ethnicity, class, and level of education. In light of their differences, particularly related to the underlying tensions related to race and class, individuals may perceive place differently and interpret and evaluate change and disruptions distinctly, influencing how they respond to change brought on by sustainable urban development. How their perception of place attachment and change vary given these differences, is what I uncover with this research. Findings highlight the variation of perspectives that exist across race, generation, and among homeowners and renters. Findings also reveal race and class divides driving opposition to projects regardless of their sustainability goals and shed light on a history of environmental inequality. In addition, results provide detailed narratives of how residents experience neighborhood change and gentrification and help shape the response residents take towards perceived changes.

#### **PLANNING SCHOLARSHIP AND POPULATION WITH DISABILITY (PWD): A SYSTEMATIC REVIEW**

Abstract ID: 432

Individual Paper Submission

TERASHIMA, Mikiko [Dalhousie University] mikiko.terashima@dal.ca, presenting author

CLARK, Kate [Dalhousie University] Kate.Clark@dal.ca, co-author

One in five people in the world are said to have some type of disability, making them the largest minority population. However, most cities are far from accessible for persons with disability (PWD). The concept of disability, in relation to the built environment, is not merely about individuals' compromised capability in navigating spaces, but rather points to the 'misfit' of capabilities with how a given living environment is organized (Hamraie, 2013). Planning is largely responsible for how built and social environments are organized—therefore, it has a crucial role to play in responding to the needs of this significant population. However, consideration of persons with disability (PWD) appears to be limited to more specific realms of 'design,' and largely absent in broader planning research.

Our systematic literature review aimed to inform potential directions for planning scholarship by exploring the current and historic research investigating ways to address the needs of PWD in the planning realm. We compiled papers that focus on PWD or include PWD in their discussions from five prominent English language planning journals, some of which are long-standing (Town Planning Review, 1910–, Journal of the American Planning

Association, 1935–). We use keywords such as *disab\**, *access\**, *handicap*, *impair\**, and common medical conditions that lead to disability and impairment such as dementia, autoimmune, and stroke.

Our review confirms existing claims made by some researchers on the ‘paucity’ of attention to the topic in planning research (McCormick et al., 2019). A very limited number of papers ( $n = 20$ ) focusing on PWD of any type have been published in the five journals throughout their existence—which is, on the average, less than 2 papers per decade per journal. The papers we found encompassed subareas of planning including housing, transportation, land use, policy, and urban design. Very few papers were published until 1980s. Papers in the 1980s and 1990s started revealing challenges in legislation and policy related to PWD and accessibility—especially in the UK and the US—reflecting their early start in establishing versions of disability rights legislations. The increase in the number of papers found in recent decades is partially attributable to the increasing attention directed to topics related to population aging. Many of the papers found called for participation by PWD in the planning and decision-making processes, and some recent papers advocated for the production of evidence related to costs of creating accessible infrastructure. Overall, the concept of PWD has been largely limited to persons with mobility issues, and very few investigated the issues related to vision, hearing, cognitive, and other types of disability.

Of a few possible reasons for the small numbers of publications related to PWD in these journals, a key reason seems to do with the (mis)perception that disability needs are design needs for individuals, therefore outside of the planning realm (Staples & Essex, 2016). Some scholars cautioned the consequence of such a disciplinary divide between planning and design, reflecting that even some contemporary planning concepts such Smart Growth and New Urbanism still differentially “influence the well-being and participation of diverse groups” including PWD (Baldwin & Stafford, 2019).

Our review was limited to several prominent journals in the English-speaking world of the North and cannot be generalized to other regions. The inquiry into how the needs of PWD and disability perspectives are addressed in other regions should be a future agenda for research. A critical look at the role of planning research in accelerating creation of accessible built environment across different socio-political contexts, both globally and regionally, would be critical.

#### **SITUATED METHODS IN PRESERVATION PLANNING: USING THE PAST TO REVENDICATE FEMALE EXPERIENCES AND URBAN IMAGINARIES USING *ARPILLERA URBANA***

Abstract ID: 487

Individual Paper Submission

NOVOA E., Magdalena [University of Illinois Urbana Champaign] mnovoa@illinois.edu, presenting author

As historic preservation globally often continues to constrain people's voices, memories, and stories and their pasts and futures told on their behalf, this paper reflects on the critical project of decolonizing methods to contest dominant narratives and representations in preservation planning (Segalo et al, 2015). I examine how what I refer to as “situated methods” challenge the limitations of more conventional ones, including interviews, and bring about coproduced validated knowledge. The paper draws on a collaborative workshop I co-organized with 52 women in Lota, an ex-coal mining town in Chile, using the local applique textile technique of *arpillera urbana*, to create a counter-narrative of the urban history of the city from a female perspective. Despite women having a crucial role in Lota's urban past and present as community organizers, carers, and political activists, they are rarely considered in scholarship and remain invisible from official preservation narratives. Instead, these narratives highlight the capitalist development linked to the mining industry and the miners' role in the extraction of coal.

The *arpillera* workshop resulted in a sixteen feet long textile entitled *Memorias de la Mujer Lotina* (Memories of the Lotina Woman), coproduced in an accessible format for participants, residents and authorities, and that Lotinas transformed into an advocacy tool (Zaragocin & Carreto, 2020). The *arpillera*, as an “urban memory cartography” of multiple spaces-times-bodies allowed participants' to articulate multiple experiences, practices, and places through their own voices and interactions.

Feminist methodologies in planning have become increasingly useful as a response to conventional methodologies' limits to capture the experiences of women and others who have been marginalized from planning processes (Sweet & Ortiz-Escalante, 2014). With its focus on experiential knowledge, feminist thought directs attention to and recognizes a broad range of knowledges and knowers that exist beyond the experts and authorities, its traditional scientific methods, and the dominant patriarchal culture. It allows to include what Watson (2006) defines as ‘deep difference’, encouraging planning scholars and practitioners to seek alternatives to dominant methodologies for understanding urban issues and implementing change (Speak, 2020).

*Memorias de una Mujer Lotina* illustrates that research and practical agendas grounded on the cultural practices and knowledges of communities produce situated responses to complex urban histories that shape present dynamics. It fosters the exercise of memory, creativity, and coexistence, promotes diversity, and enhance participatory planning opportunities. It also suggests that integrating other epistemologies in planning theory and methodology is not sufficient, but rather that we must disrupt the structures that uphold knowledge production (Zaragocin & Carreto, 2020). *Memorias de una Mujer Lotina* highlights three main contributions of advancing situated methods in planning research and practice: 1) It helps to identify the silences in urban history that are perpetuated through planning and preservation processes 2) The use of memory-work as an activist tool to democratize the uses of the past in the present to produce new urban imaginations that may inform planning processes 3) The research ethic's impacts and its ability to empower and bring about change.

## REDEVELOPMENT AFTER REBELLION: TRACING THE BLACK GEOGRAPHIES OF POWER IN LOS ANGELES, 1965-1992

Abstract ID: 560

Individual Paper Submission

STEPHENS, Pamela [UCLA Urban Planning] pstephens@ucla.edu, presenting author

In Los Angeles's history, rebellion has often illustrated the ruptures between communities of color and the dominant order. For the Black population in particular, the Watts Rebellion of 1965 and the 1992 Uprisings were not only illustrative of such ruptures, but they also brought to light their spatial dimensions. That is to say that the geographic locations and arrangements of Black communities do not merely represent systems of domination and exclusion, but they are instrumental in reproducing these systems (McKittrick & Woods, 2007). In the aftermath of these rebellions, redevelopment programs were summoned as reparative measures, not only for physical destruction, but for the social and economic harms garnered by decades of exclusion, which were assessed by study after study as causal factors of these rebellions (Abu-Lughod, 2007). However, narratives concerning the efficacy of such redevelopment programs are quite contradictory. On one hand, they have been promoted as a means to stimulate economic development in historically under- and disinvested areas (Grigsby & Caltabiano, 1998). On the other hand, redevelopment has a legacy of displacing and destabilizing precarious Black communities and other communities of color (Fullilove, 2016; Thomas, 2003). Ultimately, this calls into question the extent to which redevelopment practices and their underlying goals and ideologies reinscribe racialized relations of power in new ways.

This study examines the ways in which transformations in redevelopment logics and practices illustrate changes in the dynamics of racialized relations of power in Los Angeles from 1965 to 1992 through two lines of inquiry. First, drawing on spatial analysis and archival research, the study analyzes how city agencies implemented redevelopment project areas and plans in and around Black communities by considering their geographic location and boundaries, project activities and strategies, and the broader public discourse around these projects. The latter discourse analysis particularly explores how these projects articulate a place for Black communities in the vision for the city's future. Second, the study expands on the notion of rebellion towards its broader meaning of active opposition to dominant order. Working with community archives and oral histories, this line of inquiry illustrates the continuities of rebellious spatial practices in response to or in absence of redevelopment activity in the Black communities targeted by redevelopment projects, highlighting the ways that these communities insert themselves into Los Angeles's future and create futures for themselves.

The larger contribution of this research is to add to a growing body of planning and spatial science scholarship attending to the relational production of Black space by illustrating the ways that rebellious spatial practices are heavily entangled with state processes like redevelopment. Additionally, though the formal redevelopment agency in Los Angeles—the Community Redevelopment Agency of Los Angeles—dissolved nearly a decade ago, redevelopment activity still continues today, especially in low-income communities of color. To this end, it is important to question the ways that the transformations in redevelopment activities and their underlying logics maintain systems of exclusion. Furthermore, it is important to recognize how communities look beyond normative planning practices to articulate their futures, breaking away from these systems of exclusion.

DAVISON, Mark [University of Florida] [davison.mark@ufl.edu](mailto:davison.mark@ufl.edu), presenting author

In the fifteen years following devastation by Hurricane Katrina, the neighborhood of East Biloxi, Mississippi, has been variously described by political leadership as a blighted slum area, a possible model for New Urbanism, and as a casino-resort center. East Biloxi is the city's oldest neighborhood and has a history firmly attached to the traditional maritime activities of commercial fishing and seafood processing. East Biloxi is home to most of the city's immigrant communities, including Yugoslav and Vietnamese, and is home to the city's oldest African-American community. Today, the neighborhood residents' effort to withstand economic change, preserve the neighborhood's historic character, and maintain their cultural identity, is strongly contrasted by the city government's neo-liberal stance encouraging casino-resort and related development.

Forester (2009) notes that as culturally framed dispositions lead to conflict, the communicative aspects of planning become more important. Communicative planning's goal as building greater consensus through shared meaning and group intelligence is paramount to increased equity and social justice. The stories told about a place, and its future, express culturally informed, context-specific, meaning. Stories illuminate complex ideas, create community through shared experiences, and are used to build support for, or against, planning policy. Throgmorton (2003) describes planning as persuasive storytelling about the future. Storytelling is a natural process for humans; it is a compelling method of succinctly sharing information in easy-to-process ways.

Rhetoric provides the means of persuasion (Aristotle & Hobbes, 2010). Central to the study of rhetoric is the framework of ethos, logos, and pathos. Respectively, ethos, logos, and pathos describe an appeal to authority, emotion, or logic. Through characters, setting, and plot, rhetorical narratives develop a story that persuasively explains the teller's position. Politicians and special interest groups use rhetoric to create stories that selectively configure language in a way that distorts the truth and leads to an unequal distribution of social and economic benefits (Covino & Jolliffe, 1995). Conversely, shared stories build community and define a place—the rhetorics found within community narratives brim with ideas of origin, destruction, rebirth, and future possibility.

Through narrative analysis, this study analyzes the rhetorical frames used by local politicians, as well as neighborhood residents, in telling stories of the neighborhood's future. Fifty-eight public speeches delivered by Biloxi Mayors Holloway and Gilich between 2005 and 2020 and the directed interviews of thirty East Biloxi residents conducted between 2019 and 2021 are analyzed and categorized as appeals to ethos, logos, or pathos. The resulting narrative analysis specifically answers the following questions:

1. What are the dominant narratives used by political leadership concerning the planning of minority and underserved communities?
2. What are the dominant narratives concerning planning within minority and underserved communities?
3. What are the most commonly used rhetorical frames in persuasive storytelling in future development narratives?
4. How does storytelling shape community attitudes and opinions concerning planning and future development?
5. How can planners utilize rhetorical framing and storytelling in expressing the crucial ideas of social justice and equity?

The stories told about planning can define a neighborhood's past and propel citizen imagination towards new prospects. The stories told about East Biloxi reveal important insight into how planners can better communicate policy, understand community aspirations, and bridge the gap between community voices and political leadership.

#### **MOVING TOWARDS SAFETY: STUDENT'S PERCEPTION AND EXPERIENCE OF UNIVERSITY TRANSIT**

Abstract ID: 595

Individual Paper Submission

MENDEZ, Joel [University of Kansas] JMendez2@ku.edu, presenting author

Public spaces and services are meant to be equally accessible to members of the community. The reality is that how one navigates and experiences these elements can very much be influenced by their race, gender, and/or sexual orientation. Studies which explore how public transportation service is experienced by members of the community at large commonly share one conclusion, women are less likely to feel safe in transit environments. This fear can lead women to make significant behavioral changes in hopes of reducing their risk of victimization. One common change that is made is the reduction of transit use. This decision can have adverse impacts on the quality of life of members of this segment of the population as it can significantly limit their mobility and access to essential services. Within a university environment, this decision can impact the college experience for women as it can limit both academic and social opportunities. When members of the student body do not have equal access to such opportunities, equality has not been achieved.

This study seeks to explore the female student body's experiences and perceptions towards university transit service. Particular attention is placed on examining how their perception of this service impacts their educational experience. Questions which drive this study include: 1) How do female students perceive their personal safety within university transit spaces? 2) What factors impact the perception of their personal safety? and 3) How do female students navigate these spaces as a result of their perceived safety?

Necessary data to conduct this study was collected via a university wide survey and student interviews at one major university. These methods are geared towards seeking participants' perceptions and assessments of travel on university transit services. The deployment of a university wide survey allowed the research to see how the travel behavior of members of the female student body varied from that of their male counterparts. The survey also allowed the researcher to identify any deviations in behavior which may be influenced by a respondent's race, gender, sexual orientation, or other personal characteristics.

Findings from this study will allow university transit agencies to gauge how effectively serving the needs of vulnerable members of their ridership base. This can inform planning and policy decisions that may contribute to the delivery of services that more adequately serves the needs of their patrons and expands opportunities available to women within a university environment.

This study will inform a larger study which seeks to explore the prevalence of these issues at a national level. This will see the inclusion of the experiences of members of the student body at numerous universities throughout the country.

#### **BARRIERS FOR THE ACTIVE USE OF PARK AMONG MARGINALIZED COMMUNITIES IN THE CITY OF ARLINGTON, TX**

Abstract ID: 667

Individual Paper Submission

HASHEMI YAZDI, Mona [University of Texas at Arlington] mona.hashemi.yazdi@gmail.com, presenting author  
ZANDIATASHBAR, Ahoura [San Jose State University] ahoura.zandiatashbar@sjsu.edu, co-author

While obesity has remained the number one public health challenge in the U.S, there has been a consistent disparity by race and ethnicity in obesity (Wen & Kowaleski-Jones, 2012). On the other hand, it is well-documented that physical activity is an effective means of preventing obesity which is supported by access to parks (Hobbs et al., 2017). However, still members of racial minority groups are among those who are less attracted to use parks for being physically active (Carlson et al., 2010). The decisions on forming a healthy community are mostly driven by what literature explained as general factors that could encourage all residents to use parks. Accordingly, the needs of ethnic communities could be overshadowed by findings of general studies. The less attended but still crucial question is what are the barriers that deter members of racial minority groups from using parks which also could hold those individuals from adopting an active physical lifestyle and exacerbate the obesity disparities by race.

This study aims to address this gap and derive the factors that could constrain physical activity in parks for those who have disproportionately experienced disparities despite preceding policy, systems, and environmental changes. Such understanding could also play a key role in addressing the obesity disparities and providing healthy environments for all. Our study area is the City of Arlington where healthy urban lifestyle via green spaces is a key driver of city policies. Moreover, as Arlington becomes more racially and ethnically diverse, it is more important to understand these sub-population barriers to active use of parks.

We will draw upon a 3-step mixed-method research design to address this question. In the first step, using spatial analysis and visualization, we will identify our target communities. Our target communities will be selected from the areas that are the racial minority groups and obesity hotspots in Arlington while access to park is not a challenge. In the second step, we will draw upon community engagement activities including semi-structured interviews to define the categories of barriers that our study needs to focus on. Ultimately, these categories will be the key in designing an effective survey. While the final survey design will depend on the results of the interviews, the state-of-

preference survey design is a tentatively selected method that could result in a sufficient level of detail in our findings.

Cities are keen to support residents' healthy lifestyle and therefore direct investment in expanding and improving their park systems. However, our understanding of the public need is limited to the lack of studies that focus on the minority communities. To the best of our knowledge, this study is among the first attempts that address this gap. While our findings could enlighten the decisions in the city of Arlington and alike communities, the method of this study will be generalizable to use in empirical analyses of other cities.

#### **DOES PARK SEGREGATION STILL EXIST? THE CASE OF URBAN PARKS IN MONTGOMERY, ALABAMA**

Abstract ID: 675

Individual Paper Submission

MAHATO, Binita [Auburn University] bzm0054@auburn.edu, presenting author

This study investigates the contemporary connotations of segregated urban parks in the context of Montgomery, Alabama. Racial segregation of urban parks in Montgomery has been a key yet less discussed component of the civil rights movement. In the Jim Crow era, the city officials and Southern Whites segregated access to urban parks with a fear of racial mixing. Even after the 1964 Civil Rights Acts and several other laws against segregated public facilities, the government was reluctant to desegregate urban parks in Montgomery. In the 1950s, there were only four parks that African Americans were allowed to use among a total of fourteen city parks. Not just by quantity, these Black-only parks were also of inferior quality compared to their White counterparts. The White-only parks will often be located in African American neighborhoods but will deny access to the immediate residents. In the 1970s, when the city officially integrated the parks, Montgomery neighborhoods experienced a White flight to the suburbs, leaving the city parks in poor conditions for the African Americans. Today, Montgomery has a desegregated park system with sixty-four parks spread across its different neighborhoods. The question remains whether park segregation still exists in Montgomery and, if yes, in what forms?

Literature on park access and equity shows that minorities and low socio-economic groups lack access to good quality urban parks. Access to urban parks profoundly contributes to the issues of environmental justice. Nevertheless, the design and management of park facilities and amenities often indirectly affect the diversity, inclusion, and equity of park users. This study empirically examines park segregation from the perspective of park quality and access by surveying sixty-four parks in Montgomery using five quality indicators – accessibility, recreation, amenities, natural features, and incivilities. The survey involves site visits and field observations to analyze and document the quantitative and qualitative measures of the indicators for each park. The study compares the evaluations with respect to the demography of people who live within a half-mile area from the parks, assuming them as potential users. The 2019 American Community Survey data shows, thirty-six parks are located in areas with more than 60% of African Americans while White neighborhoods surround the rest.

The parks' quality assessment shows that there are some significant correlations between the potential users of the parks and their qualities. African American parks, located mainly near downtown and southwest neighborhoods of the city, have limited walkability, degraded amenities, fewer recreational facilities, and signs of incivilities. As the African American neighborhoods suffered from urban renewal plans in the 1960s, many parks in such areas are disconnected by highways and have severe noise pollution issues. The superior quality parks are mostly found in White-dominated areas and are primarily used as sports and recreational facilities. Small neighborhood parks, especially in African American neighborhoods, have minimal amenities and fewer natural features than privately maintained large recreational parks. The observations suggest that park segregation still exists in forms of quality-based inequalities for park facilities and access in Montgomery. Assessment of park quality is crucial to practice environmental justice, especially in cities with a history of racial segregation of public amenities. In 2020, Montgomery adopted the 2040 Comprehensive Plan, which aims to create a citywide parks and recreation master plan. The parks and recreation department can benefit from this study by addressing the quality-based inequality issues in the future master plan.

#### LOCAL BATTLES FOR PRO- AND ANTI-IMMIGRANT POLICIES: THE CASE STUDY OF ORANGE COUNTY, CALIFORNIA

Abstract ID: 716

Individual Paper Submission

NICHOLLS, Walter [University of California Irvine] [wnicholl@uci.edu](mailto:wnicholl@uci.edu), presenting author

DE WILDE, Marieke [University of Amsterdam] [amdewilde@hotmail.com](mailto:amdewilde@hotmail.com), co-author

How do pro- and anti-immigrant political forces fight to enact policies across metropolitan regions? Municipalities and counties have become a central arena in battles over immigration policies. Whereas pro-immigrant groups have sought to enact an array of sanctuary policies, anti-immigrant groups have introduced a broad of policies to deter immigrants from residing within their jurisdictions. Though scholars have examined the conditions that give rise to and animate pro- and anti-immigrant battles, they study each side apart from one another and conceptualize them as unfolding within a single municipality. For instance, some have studied the anti-immigrant politics of Hazleton, Pennsylvania (Longazel 2016) and others the pro-immigrant politics of San Francisco (de Graauw 2016) or Los Angeles (Milkman 2005). This paper takes a different approach by examining the entanglements of pro- and anti-immigrant forces and taking the metropolitan region of Orange County as the unit of analysis.

The main data source for this paper consists of newspaper data that includes articles published between 2010 and 2018 on immigration issues in Orange County, CA. We located 262 newspaper articles and extracted 1,751 statements from different actors. This dataset contains information on the articles (author, title, date published,

newspaper) and all claims made in the articles (claim, actor making the claim, affiliation of the actor, location that the claim pertains to). For each claim the attitude of the actor regarding immigration was coded (negative (-1), neutral (0), positive (1)), and to what policy the claim referred (if applicable). The data was then analyzed using the political claims analysis method (Koopmans and Statham 1999). We identified who was participating in mobilizations, what their policy demands were, justifications for their demands, the locations of their battles, and the level of support elected representatives.

The paper shows that advocates on both sides were advancing policies in direct reaction to their adversaries, and these battles unfolded across jurisdictional lines. Pro-immigrant organizations consisted largely of nonprofit organizations in Los Angeles and Santa Ana. These organizations campaigned against restrictive federal immigration policies and launched a sanctuary city campaign in the city (Santa Ana) with most political opportunities. The intent of the campaign was to provide some protections for immigrants in one jurisdiction against law enforcement incursions from another (federal). Once the Santa Ana campaign succeeded, resource-rich Los Angeles organizations mounted a statewide campaign while their Orange County allies provided support. The anti-immigrant side was led by municipal elected officials. These officials used the authority of their municipalities to enact policies to restrict immigrants, express solidarity for other allied governments, and launch attacks against adversarial jurisdictions like the state of California. For both sides, friendly municipalities were used as political strongholds to attack adversarial jurisdictions and defend their own.

This study is important for the planning literature because it identifies the complex political underpinnings driving local immigration policies.

#### **PLANNING WITH DIVERSITY IN SMALLER CITIES IN CANADA: A STUDY OF IMMIGRANT LIVED EXPERIENCES IN BROOKS, ALBERTA**

Abstract ID: 755

Individual Paper Submission

LOK, Ryan [Ryerson University] ryan.lok@ryerson.ca, presenting author  
 ZHUANG, Zhixi [Ryerson University] zczhuang@ryerson.ca, co-author

Immigrants to Canada have predominately settled in large and medium-sized cities as compared to smaller cities. According to the 2016 Census, 91% of immigrants settled in 35 Census Metropolitan Areas, where 61% of the share were distributed between gateway cities of Toronto, Vancouver, and Montreal. This uneven settlement pattern contributes to rich research on large gateway cities, yet little is known about the lived experiences of racialized immigrants in smaller cities, the factors that attract and retain them, and the implications for planning with diversity in non-gateway contexts (Nguyen, 2020). The imbalanced settlement outcomes in various sized cities have also

triggered imperative policy issues drawing the attention of all levels of governments, as smaller cities have already faced challenges such as labour-force shortages and an aging and declining population. The uneven distribution of immigrants further marginalizes these smaller regions affecting their economic prosperity and social stability, as well as immigrants' settlement and integration experiences.

There is emerging research focusing on the effectiveness of immigration policies of various scales in facilitating the dispersion of immigrants to lesser populated areas (Carter et al., 2008; Pandey & Townshend, 2011; Shannon, 2015). However, it remains largely unknown as to what smaller cities need to consider when planning for and with diversity in order to build welcoming and inclusive communities (Fincher et al., 2014). This study differs from the previous policy approach as the facilitator of immigrant settlement in small cities. Instead, it explores the challenges and opportunities facing racialized immigrants by addressing the following research questions: 1) How do racialized immigrants experience settlement and integration in small municipalities in Canada? 2) What is the role of local municipalities in creating welcoming and inclusive environment to attract and retain immigrants?

This research adopts an ethnographic case study approach to explore the lived experiences of racialized immigrants settling in Brooks, Alberta, a small-sized city with a population of 14,451. Semi-structured interviews were conducted with racialized immigrants from Africa, Asia, and South America, as well as municipal officials and local settlement agency staff. The findings reinforce employment opportunities and family-related factors as the primary reason of immigrant settlement in small cities. But beyond these factors, the findings also point to the importance of developing a sense of belonging which can be enabled by inclusive community spaces, cultural representation, and creative placemaking. It further highlights the importance of municipal and community partnerships towards promoting diversity and cultivating place-based inclusion within a multicultural context. The research not only provides empirical learning of immigrants' lived experiences in a smaller city, but also offers place-based recommendations for smaller municipalities to leverage diversity and inclusion as an attraction and retention strategy.

#### **APPLYING DISASTER PLANNING THEORY TO UNDERSTAND RACISM AS A PUBLIC HEALTH CRISIS**

Abstract ID: 772

Individual Paper Submission

OBERLY, Tonni [Ohio State University] oberly.16@buckeyemail.osu.edu, presenting author

Central Theme and Research Question:

Amidst the intersecting crises of the COVID-19 pandemic and ongoing police brutality against Black people,

jurisdictions across the United States declared racism to be a public health crisis in the summer of 2020. According to the American Public Health Association (APHA) website, 190 jurisdictions have published such declarations as of March 2021 (APHA, 2021).

What does it mean to frame racism as a public health crisis? Racism is not new to the United States. From the genocide of Indigenous peoples to the chattel slavery system and government-sanctioned Jim Crow laws and urban renewal, to the ongoing violence against Black, Indigenous, and People of Color (BIPOC) communities including the surge of violence against the Asian American/Pacific Islander (AAPI) community, white supremacy shaped the foundation of the United States and continues to shape lived experiences in this country.

The appropriate research question is not “Does racism impact health?” There is indisputable evidence that racism is a major threat to the health and lives of many in the United States (and around the world) (Orchard & Price, 2017; Wallace et al., 2017). Racism impacts health through a plethora of avenues including but not limited to chronic stress, housing, education access, policing and mass incarceration, transportation, and food access (Daniels et al., 2020; Hilbert et al., 2014; Lu et al., 2010; Wallace et al., 2017). Racism is at the foundation of the social determinants of health that result in poor health outcomes and is a fundamental cause of racial disparities in health (Jones, 2002). These social determinants of health fall within the intersection of the fields of city and regional planning and public health and are shaped by historical and current local and regional policies and practices.

Instead, the research questions addressed by this paper are as follows:

1. Given the long arc of racism in the United States, is it appropriate to categorize racism as a public health crisis?
2. What theoretical underpinnings from crisis planning research can be applied to understand racism as a public health crisis?
3. What are the planning implications of categorizing racism as a public health crisis?

#### Approach and Methodology

This paper explores and compares theoretical and practical definitions of crisis from the planning field through a review of the literature. Crisis definitions are then categorized by hazard agent and speed of onset. The applicability of various definitions to the conceptualization of racism as a public health crisis is explored.

#### Findings

The author concludes that there are streams of crisis planning in which racism can be understood as a crisis. Specifically, theoretical approaches to understanding disasters as systems failures along with the small subset of research on slow-onset disasters (Staupe-Delgado, 2019) are especially relevant. However, the existing frameworks do not provide holistic approaches for addressing this category of crisis.

#### Relevance and Implications:

The paper problematizes the current dominant crisis planning paradigm and proposes alternative planning and public health frameworks for addressing racism as a public health crisis. Implications for future research and practice include highlighting the theoretical and practical connections between the planning and public health fields (Corburn, 2012). There is value in conceptualizing racism as a public health crisis, but only if such declaration elicits appropriate action to dismantle structural racism and build empowered communities that are physically, socially, and economically resilient. Without action, the declarations only perpetuate uneven power dynamics while continuing to traumatize BIPOC communities. Planning has a unique set of theoretical and practical tools in crisis management and community development to be part of the interdisciplinary solutions needed to address racism to achieve health equity.

Participatory design (PD) processes are often celebrated as a valuable way to ensure engagement, not just in the abstract, but in the details of producing and building places, policies, and practices. PD, a form of user-centered-design, includes end users (or “participants”) in the design of products and systems. The Design Charette (DC) is one methodology of PD that has become increasingly popular in disciplines from urban planning to information technology and education, likely because DCs meets many institutional goals. They are fast-paced, efficient, results-oriented processes that produce buy-in through engaging end users. However, despite their considerable uptake, there is little academic research that advances critical discussion or evaluation of DCs (Kennedy, 2017).

While participatory methods and engagement strategies are central to planning and design processes, the tools used for engagement are still evolving. Work is needed to foster the tools responsiveness, effectiveness, efficiency, and inclusiveness. Within a project using participatory methods to design an intervention for improving the accessibility of practicum educational spaces, we are reconsidering the DC from the perspective of disability related accessibility. Throughout the literature, very few studies directly address DC or charrette-like activities and participants with disabilities (Kowaltowski et al., 2015; Drain et al. 2018; Frauenberger, Good, & Keay-Bright, 2011).

The present paper documents our work to collaboratively reconsider the DC process from the perspective of disability accessibility and inclusivity. It rests on two assumptions: 1) for a process to be inclusive, it should be able to engage participants with a range of abilities, 2) Changes made with the goal of disability accessibility might also make the process more accessible for a range of participants. Our team is comprised of members with expertise in the design charette process, planning, critical disability studies and occupational science. The choices we made about the process respond to broader conversations about accessibility and simultaneously speak to key criticisms of PD processes. Our changes to the process in large part focus on considerations of time, power and facilitation.

In evaluative literature on DC, we found that the fast-paced nature of charrettes may pressure participants, exacerbating inequities and vulnerabilities (Carlson et al. 2020). Conversations about the role timing and pace play

in accessibility more broadly, also figure strongly in disability scholarship. To address these concerns from both literatures we have made interventions to the overall schedule and timeframe, as well as modifying the time for activities and deliverables in our DC.

Although DCs are typically undertaken as a method that promotes a redistribution of power towards communities, there is more to be understood about their possibilities and limitations on this front. When diverse participants are brought together (a goal of charettes), there may be internal and external power structures that restrict the voice of marginalized participants in collaborative activities (Drain et al. 2018). Modifications we made to our DC consider power more explicitly. This work draws on our teams' awareness of the ways ableism and structural inequality are embedded in a design process with mixed teams of students, instructors, and administrators, with and without disabilities.

The modified plan for the DC process is currently being finalized using both expert and experiential knowledge, and drawing on a wide range of design tools and best practices. The charrette will be conducted in the summer of 2021 and this paper will share the final modified process, how it was created, and how it was received by participants. This exploration will contribute to a growing critical literature on strengthening the accessibility, inclusion, and effectiveness of this participatory tool.

#### ***AGE-FRIENDLY COMMUNITIES IN A DECLINING REGION? CHALLENGES AND POSSIBILITIES IN WESTERN MANITOBA***

Abstract ID: 785

Individual Paper Submission

MILGROM, Richard [University of Manitoba] richard.milgrom@umanitoba.ca, presenting author  
CAMPS, Dom [University of Manitoba] campsd@myumanitoba.ca, co-author

Over the Winter 2021 term, a University of Manitoba planning studio examined five rural municipalities in western Manitoba, including ten settlement areas ranging in population from 80 to 1,300. We sought to understand how the region was changing and how this change had negative impacts on quality of life for older adults. Working with local age-friendly committees, studio groups studied the potential of various initiatives to improve the lives of seniors, or at least to maintain their independence as long as possible in a region that was both declining in population and, within the context of the province, aging disproportionately.

This work is part of a broader research project funded by Social Sciences and Humanities Research Council of Canada (SSHRC) that is examining the lasting contributions and sustainability of the Age-friendly Manitoba Initiative

(AFMI), that was initiated in 2008. The communities in this study were chosen because, they had expressed an eagerness to continue developing age-friendly projects. Also, any analysis of the communities required an analysis of the region, since most of the settlement areas are too small to host all the amenities and services that the older populations needs.

The planning studio conducted GIS analysis (e.g., demographics, travel distances to amenities and services) and held engagement sessions with members of the age-friendly committees that included older adults, elected officials and service providers. The initial discussions were used identify the successes that the communities had with the AFMI, to identify ongoing issues faced by older adults in their everyday lives as well as to develop a better understanding of potential threats to their quality of life as services are being withdrawn as the populations decline. As work progressed, we used precedent studies as vehicles to discuss strategies that might help stabilize communities, to explore alternative systems to deliver services, and to seek approaches to economic development that could take advantage of local and regional assets.

The final meeting (in late April) will bring all of the communities together with the hope that they will learn from each other's successes (e.g., some have implemented successful age-friendly trails, others have found ways to provide more accessible housing), and challenges that they face (e.g., threats to the renewal of town populations if the local school has to close). Others who may have expressed an interest in the work will also be invited. This includes the Manitoba Resource Team that support seniors' living, a group that has some influence on policy and the implementation of programs.

Major stakeholders from each of the communities will be invited to an early summer focus group to reflect on the experience of working with the studio, and to discuss how this type of work and engagement may increase the continuing interest in and sustainability of the Age-friendly Manitoba Initiative (<https://agefriendlymanitoba.com/>).

While many programs were initiated in response to the World Health Organizations (2007) research and publications about age-friendly cities (and the Public Health Agency of Canada's (2008) work about rural and remote age-friendly communities (2008), there has been little research about their success, or about how well they have been sustained over time. The focus of most initiatives and research has focused on individual communities, but this work starts to develop an understanding of the regional supports needed to for older adults to enjoy a good quality of life in smaller and more remote communities.

#### **IMMIGRANTS' EXPANSIVE AND CONSEQUENTIAL LEARNING: THE IMPACT OF SERVING ON DECISION-MAKING BODIES ACROSS THE STATE OF OREGON**

Abstract ID: 820

Individual Paper Submission

MELÉNDEZ, Jose W. [University of Oregon] jmelende@uoregon.edu, presenting author

The research presented in this paper was specifically conducted to shed light on the unknowns related to the common government practice of including members of the public in decision-making bodies. For members from under-represented groups, such as immigrants, engaging in decision-making/planning bodies and processes can result in expansive and consequential learning (Meléndez & Parker, 2021). This is due to how under-served communities usually lack meaningful representation at all levels of government bureaucracies, be they at the state, county, or city (Ricucci, & Van Ryzin, 2017; Bradbury, & Kellough, 2011). Thus, their involvement in decision-making processes can be seen as an alternate way to have them influence policy and outcomes (Hafer, & Ran, 2016; Quick & Feldman, 2011).

With a focus on immigrants and their communities across the State of Oregon, the research presented interviewed 48 immigrants who sat on a variety of decision-making bodies to identify the layers of findings related to the objective and subjective interplay of how they made sense of their roles and engagement in decision-making bodies. We posit that public participation on these bodies represents a third and under-researched type of civic engagement that bridges more well-known forms. The more well-known forms include, on the one hand, community service and civic acts such as volunteering for community-based organizations, voting, and include more cultural forms of civic engagement that use immigrant lived experiences as a starting point, such as church activities (Meléndez & Martinez-Cosio, 2021). On the other hand, more formalized political civic acts include running for public office, volunteering for campaigns, petition drives, and other forms of policy advocacy. Between these two forms of civic engagement lies voluntary public involvement on decision-making bodies that advise and/or govern at various levels of government.

Our findings demonstrate how these groups give members of the public opportunities to develop new skills; collaboration that expand their networks; new knowledge on the intricacies of how government works; and eye-opening experiences that expand members' concepts of the possibilities and limitations of government work. Additionally, we found that for immigrants sitting on these bodies, the value of participating effectively bridges the continuum of civic engagement from local/cultural acts to more explicit political ones. In fact, sitting on these bodies is a pre-requisite experience that many elected officials share. This third type of civic engagement is less documented in the literature on immigrants, a gap this research begins to fill by framing it as a bridge that completes the civic engagement trajectory of immigrants finding a voice in and for their communities.

This paper will present findings related to what immigrant interviewees reported learning while sitting on these bodies. Indeed, there was a lot of learning that took place while serving on the boards. We were able to identify three distinct types: dispositions, professional development, and government. Learning new dispositions involved new attitudes, ways of seeing the world, or understanding people as a result of board service; while government related to new knowledge about the processes of government institutions as a result of their service; finally, professional development referred to a broad array of skills and knowledge building acquired as a result of service on the board. Regardless of the combination of the type of learning that individuals spoke about in their interviews, it is clear that the experience of serving on a board is expansive and consequential on a number of levels.

## **CAN E-TRIKES IMPROVE THE MOBILITY OF OLDER ADULTS IN INNER-SUBURBAN AREAS? EXPANDING COMMUNITY-BASED TRANSPORTATION OPTIONS IN NORTH WEST TORONTO THROUGH A MICRO-MOBILITY INTERVENTION**

Abstract ID: 836

Individual Paper Submission

BIGLIERI, Samantha [Ryerson University] [samantha.biglieri@ryerson.ca](mailto:samantha.biglieri@ryerson.ca), presenting author  
 SPRINGER, Roxanne [Wilfrid Laurier University] [rspringer@wlu.ca](mailto:rspringer@wlu.ca), co-author

Background: 80% of Canadians live in suburbs, including most older adults who have expressed a desire to age-in-place. This is problematic, as it is well-known that residing in car-dependent suburban communities can have negative impacts on the physical and mental health/wellbeing, social engagement, and mobility of older adults, more so than other populations (Kerr et al., 2013). The distances created by suburban designs pose accessibility issues for older adults, particularly those without a car, and it can take decades to change these land-use patterns. Research has shown an opportunity for micro-mobility options (e.g. e-bikes/e-trikes) to overcome these land-use barriers to expand the activity space of older adults, and enable them to age-in-community (Leger et al., 2019; Golant, 2018). However, while most research on e-bikes and older adults is promising in terms replacing car trips, this research has focused on retroactive surveys of those who already have an e-bike, or on future-based perspectives of the potential of owning an e-bike (Van Cauwenburg et al., 2018; Marincek & Rérat, 2020). The cost of a well-built e-bike/e-trike (\$1000-\$7000 CAD for a base model) is prohibitive to many older adults living on fixed-incomes and/or below the poverty line.

Research Goal: This study addresses this identified gap by examining an intervention of e-trike use with lower-income, racialized older adults living in suburban north west Toronto, in addition to understanding their narrative mobility histories. This research will also understand from the perspective of the older adults, the key characteristics of a community lending program that would enable them to continue to use the e-trikes, instead of having to purchase one.

Study Location: The inner-suburban area of north west Toronto was selected as it is home to a higher-than-average proportion of older adults living in poverty (Social Planning Toronto, 2020), and is also an area facing substantial vulnerabilities through a lack of proper infrastructure access (Young & Keil, 2014; 2010).

Methods: 10 participants will be recruited through the community partner organizations – Our Greenway Conservancy and the Toronto Council on Aging. Participants will complete an introductory interview answering life course questions about their present neighbourhood and mobility patterns and past residences and mobility patterns during their youth and middle age. They will also be asked about perceived changes since getting older, and about their mobility concerns for the future. Next, they will keep a travel diary and wear a GPS tracker for a two-week period, without the e-trike. After receiving training on how to ride and secure the e-trike, they will keep a second travel diary and wear the GPS tracker for another two-week period while using the e-trike. Finally, there will be a post-interview asking participants about their experiences with the e-trike, followed by a focus group with all participants to discuss what a community lending program should look like.

Expected Outcomes + Implications: This study will document modal changes with access to the e-trike, over a period of a month for participants. It will also measure the types of routes (and streetscape infrastructure) that participants prefer to use for diverse modes (e.g. walking, e-trike, public transport, car) by analyzing the GPS and travel diary

data. It will report on their perspectives of using these e-trikes, as well as their mobility histories and how that influences micro-mobility use. This study will explore how these older adults prefer to use e-trikes through a community lending program. The idea of building a program from the perspective of older adults upends the common ageist bias towards developing general biking programming for younger/middle age groups, who are less likely to experience accessibility issues.

#### QUEER THEME PARKS: STONEWALL NATIONAL MONUMENT AND SYMBOLIC LANDSCAPES OF EXCLUSION

Abstract ID: 840

Individual Paper Submission

GALLEGOS, Joe [University of California Irvine] [jgalleg@uci.edu](mailto:jgalleg@uci.edu), presenting author

Stonewall National Monument is one of the newest monuments run by the National Park Service, where it was set up in 2016 by former President Barack Obama in Manhattan's Greenwich Village. The Stonewall National Monument is a monument to the Stonewall riots, an event that occurred over six nights in June 1969 at a gay bar called the Stonewall Inn, where LGBT patrons of the bar fought back against years of police harassment and brutality.

This monument, which commemorates a crucial and even radical moment in queer history, now exists in what is now one of the most heavily gentrified and expensive areas in the United States. I argue that Stonewall is a sort of theme park that tones down the radical history of the moment, while allowing space for a sanitized narrative about Greenwich Village. In doing so, Stonewall National Monument becomes a tool of urban biopolitics, providing amenity while also creating a place of exclusion. This idea of urban biopolitics, as proposed by Ted Rutland, allows for urban spaces to determine who does and does not belong. These urban biopolitics also allow for the expansion of revanchist politics, thereby allowing even more gentrification.

As an amenity, it creates a sort of symbolic landscape that presents a particular kind of politics. These politics allow New York City to portray liberal acceptance towards LGBT people by celebrating this moment in much the same way as liberal politics often portray figures like Martin Luther King, Jr., in a sanitized nod to radical politics. The flip side of this is that it excludes radical politics in the present day that seeks to make life better for LGBT poor people and people of color. This is evidenced by the processes that led up to the designation of the monument, where there is evidence based on interviews and archival documents, that most of the people who were invited to and involved in the designation process were not poor people, people of color, or people involved in radical activism on their behalf.

Through in-depth interviews of people involved in the designation process of Stonewall National Monument and analysis of various contemporary news reports and other archival documents, I have found evidence that Stonewall National Monument gave voice to the elite among the LGBT community in Greenwich Village, while excluding those who were not within that elite and who engage in radical politics. This occurred primarily through the designation process, where the voices that were heard the most at public forums and meetings were not those of poor people, people of color, and radicals. Indeed, attempts at bringing those voices in were met with consternation and annoyance by proponents of the monument.

With a better understanding of urban monuments to radical activism like Stonewall National Monument, we can better understand their role in neighborhoods and how they can be interpreted and used in a way that preserves the radical history of the moment. Instead of being a symbolic landscape to sanitized activism, they can instead stand as monuments to the radical moments they represent. This may even have some effect on the neighborhoods that surround them.

### **STUDYING GENDER IN LOCAL PLANNING: A CONVERGENT ANALYSIS OF THE COLOMBIAN CONTEXT**

Abstract ID: 882

Individual Paper Submission

LOZANO TORRES, Yancili [Alabama A&M University] [yancili.lozanotorres@aamu.edu](mailto:yancili.lozanotorres@aamu.edu), presenting author

How can we best understand local planning efforts to advance gender equality? Despite an influx of studies considering gender within the different planning concentrations (Gutierrez Rivera, 2020; Oliviera & Fageda, 2021), planning practice and theory is still in an early stage when it comes to framing and developing strategies in which women's interest are well served (Fainstein and Servon, 2005; Greed, 2016; Lozano-Torres, 2020). This study contributes to the literature in urban planning by offering a comprehensive empirical assessment on the need to conduct both qualitative and quantitative approach to better understand the multifaceted problem that is gender responsiveness in planning.

I used a sample of 21 city plans of Colombian municipalities to compare a quantitative measurement of Gender Responsive Planning in the plans (GRP Index) and a qualitative assessment exploring the local understanding and strategies sought to advance gender equality. This is done through a Convergent Parallel Mixed Method (CPMM). While the index assesses responsiveness towards gender equality, the qualitative analysis studies the making of it at the local level.

This analysis demonstrated convergence of qualitative and quantitative results for cities that had the highest and lowest values of GRP Index, meaning that that levels of GRP were matched to the efforts towards GE by local governments. However, divergence was found for middle ground cities that were neither excellent nor deficient in their efforts for GE. The CPMM is thus particularly helpful for cities in a gray area, as each analysis captures a different dimension of gender responsiveness for cities that are more advanced in certain aspects of gender responsiveness but less so in others.

The results imply that gender equality in local planning, like most multidimensional issues, needs to be addressed from different lenses for a complete understanding of both the situation and the actions needed to address it. The use of a mixed methods approach with a convergence analysis is then an important tool in the field to frame and approach gender responsive planning in a local context.

#### **FROM 'WHAT IS GENDER' TO 'NOT MY JOB': INSTITUTIONAL BARRIERS TO GENDER MAINSTREAMING IN TRANSPORT PLANNING IN PANCHKULA, INDIA**

Abstract ID: 908

Individual Paper Submission

SINGH, Seema [Cornell University] ss3625@cornell.edu, presenting author

Gender mainstreaming is an umbrella policy strategy to achieve gender equality. It aims to transform organizational processes and practices by eliminating gender biases in existing routines involving the regular actors and institutions. In this paper, I study the aspirations of gender mainstreaming and the readiness of local transport planning institutions in cities of the global South. The specific questions this study addresses are: How do policymakers and transport planners understand and approach gender mainstreaming in cities in the global South? How does integrating 'gender' as an analytical category fundamentally challenge and alter the existing planning institutions and methodologies? Can transport planning institutions escape their existing gendered structure and practices to influence long-term change? I use gender planning frameworks (Levy, 1996; Moser, 1993) and scholarship on sociological institutionalism (Sorensen, 2017) to examine and identify the institutional difficulties in seeking to transition towards gender-sensitive planning approaches. I investigate these questions in the case of Panchkula, a medium-sized city in northern India.

The article draws on a collaborative research study undertaken between 2017-19 for the Panchkula Municipal Corporation (or the PMC) that aimed to understand and address women's concerns in transport access and use in its jurisdiction. PMC is the primary planning body that is responsible for city-level urban transport functions. Additionally, the research study was also conceptualized, carried out, and executed in the PMC office, making it an appropriate choice for institutional analysis. I use findings from on-site observations, document analysis, and in-depth interviews conducted with diverse planning actors and stakeholders to ascertain the current level of gender mainstreaming in PMC with a focus on identifying institutional challenges.

The case findings reveal that transportation planning practice in Panchkula is essentially an 'informal institution' encompassing a set of formal rules and informally agreed-upon practices (Martens, 2017) that collectively shape

and influence city-level transport infrastructure investments. Without any overarching policy commitment to inclusive and equitable transport planning, I argue that the existing institutions and inequalities remain unchanged. From conceptual ambivalence around 'what is gender' to 'not my job,' interviews of transport planners and actors highlight a host of problematizing attitudes/beliefs that underpin daily transport planning practices. The everyday practices of transport planning actors are embedded in their own socio-cultural lived realities just as they are within the gender blind organizational practices and transport methodologies. My analysis thus expounds continued discussions around how gender mainstreaming requires a polycentric approach involving interventions across multiple scales of governance.

The study calls for a need to bring gender issues into focus in daily planning practices by highlighting the genderedness of the existing institutions and practices. The findings would be of particular interest to planners and policymakers interested in realizing an effective transition from a gender-neutral to gender-sensitive transport planning paradigm.

Linkages between neighborhood and life satisfaction offer evidence that planning makes a difference in people's connectedness (Cao, 2016). In particular, social interactions can be improved through accessible and communal spaces (Raman, 2010), with some places offering improvement to health and well-being, such as with outdoor spaces (Kruize, 2020). However, there are limited studies that offer insight into how the evidence relate to people living with disabilities.

Unfortunately, people with disabilities already deal with a combination of social disadvantages which can lead to vulnerability and disproportionate effects relative to people without disabilities (Armitage & Nellums, 2020; Constantino et al., 2020; Pineda & Corburn, 2020). All the knowledge around planning and community design

reveals limited information about how activities of daily community living (ADCL) differ between the groups (those with and without disabilities). This leads to a gap in evidence-based decision-making and policies to facilitate land use planning and policy to create a more equitable place to live for people with disabilities.

This study aims to understand how COVID-19 impacted people with disabilities, particularly focusing on social satisfaction and the relationship to this satisfaction and various land uses. Here, land use is defined more specifically associated with specific types of facilities that are associated with ADCLs, including: home, workplace, grocery stores, restaurants, retails, recreation (indoor and outdoor), community centers, healthcare facilities and others. To answer those questions, we conducted a web survey using Qualtrics' online panel data. The final sample includes 161 people with disabilities and 232 people without disabilities across the United States.

Each participant was asked to estimate their activities "pre-COVID" (2019), "during COVID" (2020 after the COVID-19 outbreaks), and "post-COVID" (the time when COVID-19 is no longer a concern in the U.S.). We ran bivariate inferential statistics such as t-test and Chi-square test of independence to see if the mean differences are statistically significant. Then, multiple regression models were developed for different hypotheses that explain travel behavior outcomes by internal and external factors. To model moderating effects of socio-demographic factors, interaction terms were added between disability status and personal income variable.

Our survey produced a number of confirmatory knowledge about COVID-19, as well as some unique findings associated with the different study groups. We found that across adult demographics, that those who are older rated their overall social satisfaction lower than younger populations. Interestingly, for our regression model, we found that workers (part and full-time) had an increase in social satisfaction, but this was due because of the overall increase was associated with men, whereas for women satisfaction dropped when comparing pre- and during-COVID-19. While neighborhoods offer a connection to community, it was apparent from our data that individuals associate social satisfaction with online activities, their home, workplaces and other place types. While it was clear that the association between social satisfaction and restaurants and retail dropped, this was not the case for outdoor recreation opportunities – for people without disabilities. However, for people with disabilities, there was a significant drop in the connection with outdoor spaces and social relationships, as well as with health care facilities.

As we look toward planning activities to facilitate engagement and equity across the range of people living with and without disabilities, it is important to understand the mechanisms that create disadvantages. The reason for the drop in relying on outdoor recreation places to facilitate social satisfaction needs additional study. In particular, because these places have a well-defined body of literature suggesting multiple health and well-being benefits.

#### ARE WE COMPLICIT? INTERROGATING THE NOTION OF TRAVELING THEORIES AND RACE TALK FOR PLANNERS

Abstract ID: 959

Individual Paper Submission

SWEET, Elizabeth L. [University of Massachusetts, Boston] [betsy.sweet@umb.edu](mailto:betsy.sweet@umb.edu), presenting author

There is an acknowledged resistance in Mexico to engage with race dialogues, which has stunted the study and theorizing about Blackness and Nativeness in Mexico. The common response from academics is “we don’t have racism here like in the US.” “No one ever had to sit in the back of a bus because they had dark skin.” But based on my more than 25 years of working in Mexico, I have seen/experienced it and heard many stories about how it is impacting peoples’ everyday life. With that context, I have recently written about the erasure of Blackness and Nativness in Mexico (Sweet 2021). I used a combination of Latin American scholars’ work on colonialism and scholarships from Black feminist geographers from Canada and the U.S. to think about race and gendered race in Mexico to help build a path toward better understanding race and gendered race in U.S. Mexican communities, that would presumably lead to more equitable planning. One goal was to engage with Mexicans as much more than immigrant communities by seeing the complexity of race in Mexico: historically, territorially, and viscerally. I make the case for understanding the legacies of colonialism, slavery and genocide to better comprehend contemporary experiences of Mexicans in US white settler domination.

As a U.S. based Native American cis woman, I am interested in interrogating my role as an outsider studying and theorizing about Blackness and Nativeness in Mexico. Is my thinking and writing another expression of colonization? Is applying/using Black feminist geographies as a framework in combination with Latin American/Mexican scholarship to help think about Blackness and Nativeness in Mexico an act of imperialism? How do ideas and theories of race and gendered race travel? In what ways does the author validate or invalidate these experiences? How can these types of analysis be used in cultivating conversations and ideas about race, and gendered race in Mexico and the U.S.? Are there boundaries that prelude traveling ideas from North to South and back because of the risk of theoretical colonization/imperialism that would lead to practices of the same?

Based on 25 years of work in Mexico and with Mexican communities in the U.S., I use a series of three auto-ethnographic essays (Sweet et al. 2029) to grapple with these important considerations for planning as it slowly and gingerly embraces a broad mandate to move toward feminist, anti-racist, and decolonial theory, pedagogy, and practice. My goal is to advance multiple conversations important to the discipline’s aspirations toward diversity equity and inclusion (Córdova 1994). Specifically, I want to provide critical insights about global planning education, add to theories of feminist, anti-racist, and decolonial practice (Cordova 1998), and engage with culturally humble self-reflection about my and planning’s possible continued collusion with imperialism. Each of the three autoethnographic essays will address one of these concerns. My conclusions will document the overlapping spaces of global education, planning equity, and cultural humility (Sweet 2018) in planning theory.

#### **(DE)CENTERING WHITENESS: LESSONS FROM COMMUNITY DIALOGUES ABOUT POLICING PROBLEMS AND SOLUTIONS**

Abstract ID: 991

Individual Paper Submission

QUICK, Kathryn [University of Minnesota] ksquick@umn.edu, presenting author

What happens to problem and solution pathways when race is prominent in a public management issue, efforts are made to facilitate constructive dialogue among stakeholders, and the majority of dialogue participants are White? This paper is an ethnographic case study of community deliberations about policing, race, and safety. I explore the effects of process design features and facilitation practices that were intended to alleviate commonly observed problems in community participation, namely domination, suppression of voice and influence of systemically marginalized groups, and the fragility of White participants. In addition, the deliberations were designed to de-center White participants' assumptions, values, and expectations about safety, inclusion, and community-police relationships.

The location of the study is Falcon Heights, Minnesota, where the killing of Philando Castile by a police officer in 2016 was a watershed moment in the international Black Lives Matter movement. Castile's death was met by a mixture of shock, grief, rage as well as by recognition of the necessity to reform policing and re-set community relationships. Community leaders described the circumstances of his death and the community upheaval that followed as "a microcosm of what vexes America."

As a scholar specializing in participatory planning and deliberation, I worked closely with Falcon Heights residents for four years to design and facilitate extensive community dialogues on race, policing, and healing. My approach to this product of my engaged scholarship is ethnographic, drawing upon over 225 hours of participant observation, minutes and fieldnotes of 23 dialogues (13 task force meetings, 5 community conversations, and 5 city council meetings), surveys completed by 60 of the total 180 participants in the dialogues, 4 focus groups with community conversation facilitators and participants, and 7 interviews with key stakeholders. Because of my involvement in the deliberations, other researchers conducted and analyzed the survey, focus groups, and interviews with participants about their experience of the deliberation. Through longitudinal, ethnographic analysis, I trace how the deliberative process rendered White complicity in racism visible.

Participants began with divergent points of view about safety, policing, and race issues, and the differences frequently aligned with race and class identities. Over the process of deliberation, they came to reframe their priorities to be less focused on disciplining a bad police officer and his department and more oriented towards creating safety and welcome for everyone through reducing profiling, strengthening relationships across the community, and addressing White privilege. Their problem redefinition process led to a consensus commitment to embrace the necessity of broad-based equity and inclusion, alongside the initial, narrower focus on policing reform. Many participants attributed their change in view to the duration and pacing of the process, which allowed them to get to build trust, discover new perspectives, and discuss issues in depth. They also credited a circle process design in community conversations with reducing domination, which they found allowed them to express or to hear and take in non-White perspectives without as much silencing, judgment, or censure as they felt in other settings. However, White residents did not mobilize their learning into sustained, effective advocacy to reciprocate BIPOC residents' labor to activate and educate them.

The concerns and questions that Falcon Heights is grappling with – racial inclusion/ exclusion in cities, safety, community identity, and power relations in community engagement – are of critical relevance to planners in communities everywhere. Specifically, the learning and labor imbalance in this case resembles the Whiteness of many planning and other public decision- making spaces - particularly, but not exclusively about policing - so I conclude with suggestions for more constructive deliberative processes to advance equity and anti-racism

## THE PREFERENCE OF DIFFERENT ELDERLY GENERATIONS FOR ENTERING A NURSING HOME: FROM THE PERSPECTIVE OF FAMILY INTERGENERATIONAL RELATIONSHIP

Abstract ID: 993

Individual Paper Submission

SONG, Shan [Nagoya University] crystalshanshan@sina.com, presenting author

OKAMOTO, Kohei [Aichi University] okamotok@vega.aichi-u.ac.jp, primary author

WANG, Can [College of Architecture and Urban Planning, Tongji University] wangcan1213@gmail.com, co-author

Background: Shanghai's household registered population is highly aged. The baby boomer generation born in the 1950s-60s with generally only one child because of the One-child Policy since the 1980s has been becoming the elderly recently. Compared with the older multi-children elderly, the one-child parents' eldercare preferences show some new characteristics.

Purpose: This study aims to examine the preference for and influential factors of entering a nursing home for the different elderly generations, especially from the perspective of intergenerational relationship of elderly people's family.

Data and method: Data was collected by in-depth interviews based on a semi-structured question list in Shanghai, 2016. Both household registered elderly people living in nursing home and at home were surveyed. The main content of interview included the family intergenerational relationship, the preference for or decision-making process of entering a nursing home, and demographic information.

Findings: First, as the traditional care-by-child is not as feasible as before due to the smaller size of family, heavier life pressure, and longer parent-child geographical distance in modern China, younger elderly with only one child is more open to enter a nursing home. Second, the main influential factors of entering a nursing home for the elderly include the family's inability of care provision, the limitation of their house for elderly people, the condition of nursing homes, and financial factor. Third, the Confusion Filial Piety still has great effect on eldercare in Chinese society, but elderly people tend to not regard the choice of entering a nursing home as a symbol of child's unfilial piety. They choose the alternatives of care-not-by-child to meet the care demands, meanwhile, they show stronger dependence on mental intimacy with their children. The findings of this study is expected to provide suggestions for the planning of nursing homes.

## **WORSHIPPING ON THE MARGINS: DISPLACEMENT, DISPOSSESSION, AND BLACK SPIRITUAL LANDSCAPES IN BRAZIL**

Abstract ID: 996

Individual Paper Submission

REDDEN, Ty [Gettysburg College] tredden@gettysburg.edu, presenting author

Brazil has long been celebrated for its supposed fusion of Indigenous, Black, and European culture. The perceived exoticism of the “cosmic race” has enticed countless tourists and adventure-seekers to its tropical climate and lush locales. Even international pop star Beyoncé was inspired by the cultural landscape of Brazil, releasing the 2016 best-selling visual album, *Lemonade*, that included frequent references to the diasporic nation. Despite the cultural fascination it engenders, in recent years, scholars have written intensely about increasing spatial inequalities, environmental concerns, and human rights abuses in Brazil. Yet, scant literature centers the experiences of Brazilian women enduring and resisting racialized and gendered spatial injustice. This research explores Yoruba-based spiritual practices as expressions of Blackness, particularly Candomblé, and its cultural and physical erasure from Brazil’s urban landscapes via state-sanctioned evictions and increasingly frequent acts of civil violence amid global celebrations of Brazilian history and culture.

Employing the case study method, Crenshaw’s intersectionality theory as the analytical lens, and Beyoncé’s “*Lemonade*” as a cultural artifact, this paper reveals how the challenges faced by Candomblé mães (mothers) are in fact, layered and compounded as a result of their gender, class, and race resulting in a state-driven patriarchal whitewashing of Brazil’s urban and cultural landscapes. Interrogating the dispossession and displacement of Candomblé mães provides a timely opportunity to revisit Crenshaw’s assertion that intersecting marginalized identities can render an individual or population invisible in policy-making considerations and justice-centered action, explaining the absence of their narratives in mainstream public discourse regarding Brazilian favela evictions. Beyoncé’s visual album “*Lemonade*” illustrates the vibrant world of Candomblé and other syncretic religions and created an international platform for Yoruba-inspired imagery selling well over 2 million copies and garnering numerous industry awards including a Grammy nomination for Album of the Year. The researcher uses the convergence point of *Lemonade*’s release and state-sanctioned evictions and dispossession in Brazil as a revelatory point of examination, asserting that the critical acclaim and commercial success of Beyoncé’s album is a stark reminder and testament that amid Eurocentricity and *Latinidade*, Black cultural products are often praised while Black bodies are reviled.

Further, the author details the historical context and stigmatization of Yoruba-based spirituality in Brazil, the trajectory of state policy regarding its practice, and the dispossession and evictions experienced by Candomblé mães. The author suggests the demolition of Candomblé temples are not coincidental but disguised by the state as favela evictions, a new phase in state’s intentional violence towards mães and their spiritual practices which were historically outlawed in Brazil. Essentially, Brazilian women engaged in Candomblé have been hidden in the analytical shuffle of the Brazilian state’s campaign to erase Blackness from the urban landscape while simultaneously commodifying the exoticism of Blackness for a global audience of consumers. State policy has not gone unnoticed and empowers the worst elements in civil society in their efforts to violently target mães, most of whom are Black and mixed-race.

The author concludes with thoughts on the dangers of cultural co-option and appropriation as it pertains to

Blackness. Contributing to the body of literature examining the experiences of Blackness in Latin American generally and Brazil specifically, this paper adds nuance to scholarly discourse regarding the intersection of cultural suppression, dispossession, and spatial injustice in the African Diaspora.

#### **EQUITY AND INCLUSION IN REGIONAL CLIMATE CHANGE COLLABORATION: A COMPARATIVE STUDY**

Abstract ID: 1083

Individual Paper Submission

RENIRIE, Alex [University of Oregon] arenirie@uoregon.edu, presenting author

MARGERUM, Richard [University of Oregon] rdm@uoregon.edu, co-author

Collaboration has been increasingly used to address complex regional problems that cross political boundaries and jurisdictions. (Forester, 2013; Healey, 1997; Innes & Booher, 2009; Koppenjan, 2008; Margerum, 2011). In particular, across the United States stakeholder-based collaboration efforts have emerged to address climate change mitigation and adaption. These action plans have been initiated by a range of different parties at the local level due to the absence of state and federal leadership. However, there has been mixed attention to addressing the socioeconomic dimensions of climate change that often differentially affect lower income communities and in particular BIPOC communities.

Planning has long incorporated public and stakeholder engagement in planning processes, but these efforts have often been dominated by those with more power and income while excluding less powerful communities (Arnstein 1969). It is common practice in participatory process design to consider mechanisms for engaging diversity productively and managing power dynamics (Bryson, Quick, Schively Slotterback, & Crosby, 2013). Meléndez & Martinez-Cosio (2019) call for the use of design thinking when engaging diverse communities in local planning arenas. Rongerude & Sandoval (2016) critique the very notion of the “table” in collaboration theory, asserting that collaboration processes around the metaphorical table reflect institutions of power and privilege that continuously exclude and marginalize groups whose “very right to occupy space” is contested (319). Additionally, discussions about power are often divorced from broader systems of privilege, access, and oppression. Without a unified approach for understanding and addressing systemic power, collaborative groups will likely miss opportunities to advance equity within group processes and in society.

This paper examines six groups across the United States engaged in a regional climate collaborative. Three groups were selected based on their forefronting of equity and inclusion efforts. These were then paired with comparable cases in which there were less explicit equity and inclusion strategies employed. The project is using semi-structured interviews with conveners and stakeholder participants in order to better understand what kinds of power dynamics are at play within each group and collect strategies for promoting equitable participation. We also analyzed the plans, documents, and proposed policies in each region to catalog where they are focusing their efforts, and extent

to which they have incorporated equity and inclusion. In each case, we also interviewed community groups who were included and not included in these efforts to understand how these efforts related to (or failed to address) their concerns.

The case analysis identifies a range of strategies employed to better incorporate diverse perspectives, including explicit recruitment, compensation for participation, careful facilitation, principled leadership, and other strategies. A comparison of policies and approaches in each approach is currently underway across all of the cases, and it is revealing differences in how different regions are tackling these efforts and the kind of issues that are being raised in each region. However, all of the regions face a number of significant barriers, including historic mistrust, community capacity, lack of diversity among existing organizations, and resources to fully support an inclusive effort. This research will identify strategies for more inclusive processes and potential ways to better incorporate concerns related to equity and inclusion.

#### **EMBRACING NEWCOMERS IN THE GREATER TORONTO AREA: MUNICIPAL RESPONSIVENESS TO MIGRANTS AND THEIR ENGAGEMENT IN PUBLIC PLANNING**

Abstract ID: 1088

Individual Paper Submission

GHAEM-MAGHAMI, Shervin [University of Toronto] [shervin.ghaemmaghami@utoronto.ca](mailto:shervin.ghaemmaghami@utoronto.ca), presenting author

As the Greater Toronto Area (GTA) continues to welcome over a third of all migrants and refugees within Canada, more than the next four cities combined, its experience provides considerable insight into how newcomers are accommodated into Canadian urban life. The relocation and integration of migrants and refugees into Canadian society depends in large part on the policies and programs pursued by their local governments, which can serve to embrace newcomers and the ideals of multiculturalism or, either inadvertently or purposefully, undermine their successful settlement. This paper focuses on three municipalities in the GTA, namely: the City of Brampton, the Town of Markham, and the City of Toronto. In one influential study on municipal responsiveness to migration and cultural diversity across Canada, the three selected cities were categorized as ‘unresponsive’, ‘semi-responsive’, and ‘very responsive’, respectively (Good, 2009; also supported in part by Tossutti, 2012). The present research begins by offering an in-depth content analysis of each of these local governments’ public records to examine the extent to which city policies and programs can foster a multicultural environment aimed at facilitating migrant settlement. In line with Fourot’s (2015) findings with respect to the need for a longitudinal dimension to inform mechanisms that assess how policy trajectories are established and change over time, an initial conclusion of the present study is that

the categorizations of responsiveness associated with the selected municipalities are not static and that local governments are able to adjust course within only a few years to adopt a more welcoming attitude toward newcomers.

Based on an analysis of interviews with municipal planners and representatives of locally based migrant-serving civil society organizations, the research then pivots to an exploration of how municipal governments can integrate newcomers through more-effective techniques of inclusion in processes of public collective decision-making. The results of research on this understudied theme indicate that such processes should strive to utilize creative participation techniques to engage not one, but multiple ‘publics’ (Nguyen et al., 2015) and that planners must accept that they are uniquely positioned to facilitate marginalized groups’ access in taking their rightful seat at the table in decision-making within planning (Rios, 2015). The present study finds that while planning practitioners in the GTA have demonstrated some degree of innovation in engaging newcomers in public participation activities, there is still considerable room for improvement in this regard, even as planners seek to navigate the barriers to entry inherent to the top-down planning logic informing most local governments’ development practices. To conclude, recommendations are offered concerning how municipalities can shape their policy frameworks to better embrace their increasingly-diverse populations and how public planning decision-making exercises can be designed in such a way to meaningfully engage newcomers and best accommodate their strengths and adapt to their particular needs.

## **INTERSECTIONAL SPACES DURING THE TIME OF COVID: CONFLICT AND SOLIDARITY BETWEEN THE HOUSELESS AND IMMIGRANT RENTER COMMUNITY**

Abstract ID: 1092

Individual Paper Submission

SARMIENTO, Carolina [University of Wisconsin-Madison] carolina.sarmiento@wisc.edu, presenting author

Institutional and governmental failures to address the particular needs of communities including undocumented migrants and houseless individuals who are made especially vulnerable by the pandemic have treated these communities as dispensable. These communities have experienced the impacts of the pandemic differently as a consequence of multiple intersectional and relational factors. This research seeks to better understand the spaces that are at the intersections of these diverse experiences, needs and inequalities, and examines the changing nature of public and private space as communities that have largely been left out of relief efforts struggle to survive this economic and health crisis.

Theoretical foundations help us understand intersectionality and the ways the state addresses diversity in terms of income inequality, housing, and race. Intersectionality considers mutually constitutive forms of identity and social oppression, where power relations and inequality are compounded with factors like gender, race, employment status, ethnicity, and health (Crenshaw, 1991; Sweet 2016). In terms of space, previous research on the democratic possibility of space to express difference and diversity recognizes the coming together of various interests in its development (Mitchell 1995; Lees 2003). Most recently, Mitchell points out that the struggle over public space by homeless communities is an illustration of the limits of capital. As part of his argument, homelessness is not an attribute of individuals but rather a class and a condition necessary for capital circulation. Not having shelter is just another form of housing (or lack of) in a capitalist society.

The paper examines the role of planning and the state in shaping these intersectional spaces where various needs around health and housing come together. It asks how the state shapes community mobility and immobility by managing public and private spaces and services during a pandemic; and in what ways community based efforts develop and at what cost. In order to examine these questions, the research takes place in the Willard neighborhood in the City of Santa Ana, in Orange County, California. The Willard neighborhood experienced some of the highest pre-pandemic eviction rates in the city and some of the highest COVID infection rates in the county. The Willard neighborhood has also increasingly become a space where both renters and houseless individuals are increasingly concentrated due to the housing crisis and more recently due to the pandemic. This research analyzes interviews with community based organizations, residents, city staff, as well as field notes taken at the site of a cultural center that has become the center of conflict and home to over forty houseless individuals. The case illustrates the conflicts and solidarities that emerge at the intersections of immigrant and shelterless community members, and the role of the state in either providing relief or contributing to criminalization and displacement.

The case demonstrates the limits of capital in addressing the needs of those who have largely gone under the radar of not only pandemic relief efforts but of accessible and decent housing, stable jobs, and health care. It also demonstrates the role of planners in concentrating these conditions in specific areas in a time when inequality influences the ability of community members to not only move in terms of finding homes, but also move in and out of their homes due to specific health risks. The research also illustrates relations of solidarity that transcend the effects fear and instead enact some hopeful alternatives between communities. The research concludes with how planners can develop approaches that do not replicate the harm and violence already experienced by these communities but rather build on actions that enhance care and well-being and consider our interdependence and mutuality.

#### THE GREEN SPACE PARADOX: WHO BENEFITS AND WHO SUFFERS FROM URBAN GREEN SPACE IN NEW YORK CITY?

Abstract ID: 1101

Individual Paper Submission

JUNG, Eunah [Cornell University] ej254@cornell.edu, presenting author

Urban green spaces have been a key component of cities around the world, as they bring a variety of benefits related to aesthetic and recreational opportunities, and environmental and economic advantages. Given the links between green spaces and such benefits, an emerging concern is whether green spaces and amenities are equitably distributed across different groups of the society on the basis of their socio-economic conditions. Scholars and practitioners have pointed out and agreed upon inequities in green space provision and distribution between different socioeconomic groups: minorities and low-income populations have poorer green space accessibility in general. Such geographically uneven distribution of urban green spaces and amenities has increasingly been recognized as a significant indicator of environmental justice issues exacerbating social inequality in low socioeconomic status communities (Anguelovski et al., 2018; Jennings et al., 2019; Rigolon & Németh, 2020; Wolch et al., 2014).

Adopting urban greening initiatives or green space planning strategies in underserved communities to address such environmental injustice problems, however, could also cause paradoxical results – the green space paradox. As housing and land value increases resulting from improved attractiveness and environmental conditions, it could potentially lead to the influx of new residents and businesses and the displacement or marginalization of existing populations whom the green space was intentionally meant to benefit, commonly described as green or environmental gentrification (Anguelovski et al., 2018; Rigolon & Németh, 2020).

As such, not all parks and green spaces are designed equal and bring about uniform outcomes – not necessarily advantaging or disadvantaging certain social groups, but differently influencing a wide group of populations depending on their historical, political, social, or geographical contexts. Although previous studies on the topic of sustainable development and environmental justice have identified parks and green space inequities across different socioeconomic groups or their gentrifying effects, little research has examined the diversity of neighborhood types in which green spaces are either concentrated or scarcely distributed and the characteristics of the neighborhoods.

This study thus asks: Whether equitably, and if not, how are urban green spaces located and spatially distributed across a geographically diverse collection of neighborhoods in New York City? First, the paper adopts an exploratory spatial data analysis to examine the spatial distribution and clustering patterns of urban green space provisions in New York City. Second, using a latent profile model, the study classifies neighborhoods into different typologies based on their socioeconomic characteristics as well as green space provision indexes. The main datasets in the study are 1) the map and records of New York City's green space properties, which are obtained from the Planning and Development Division of the New York City Department of Parks and Recreation, and 2) U.S. demographic and socioeconomic data in New York City from the 2000 U.S. Census and the American Community Survey (ACS) 2015-2019 five-year estimates at the census tract level.

Findings from this study could yield valuable reference data for policymakers and urban planners to establish appropriate policies and strategies for green space development across different segments of society that might need different actions, in a more equitable and sustainable way.

# Track 6 – Housing

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### 6.24 PRE-ORGANIZED SESSION - COLLEGE AND UNIVERSITY STUDENT HOUSING I: THE BIG PICTURE

Pre-Organized Session 24 - Summary

Session Includes 173, 174, 175, 176

EHLENZ, Meagan [Arizona State University] meagan.ehlenz@asu.edu, organizer

Large-scale, student-oriented housing developments are (re)shaping neighborhoods around college campuses, with implications for municipalities, neighborhood residents, universities, and students. This housing development trend is emerging in the context of growth in post-secondary enrollments, a decline in the share of state aid to public higher education institutions, and interest from investors (especially REITs) and developers in student housing as an asset class. In a multi-session series, we examine the global trends and implications of student housing, including perspectives from North America, Europe, and South Asia. In this session, authors explore the “big picture” of student housing, interrogating the role of student housing in the post-industrial city and broad concerns related to large-scale rental development, gentrification, and regulatory approaches in a US context.

Objectives:

- Attendees will become familiar with contemporary trends in student-oriented housing development in an array of settings.
- Attendees will understand how large-scale, student-oriented housing development impacts campus-adjacent neighborhoods.
- Attendees will learn about a range of planning approaches and community responses to student-oriented housing development.

### STUDENT HOUSING AND THE POST-INDUSTRIAL CITY

Abstract ID: 173

Abstract within Pre-Organized Session 24

NEWMAN, Kathe [Rutgers University] kneuman@rci.rutgers.edu, presenting author

SEYMOUR, Eric [Rutgers University] eric.seymour@rutgers.edu, co-author

This paper situates student housing in the context of the dynamics shaping post-industrial cities. It analyzes the surge of interest in student housing, the actors that support its development and their differential rationales for doing so, and the impact of this development on places and people. The objective is to frame the significance of the growth of student housing in the broader processes shaping the urban and to reconsider the place of the “eds” in the post-industrial city. It does this by exploring: (1) the reduction in financial support for public higher education institutions that coincided with their growth and the emergence of an increasingly competitive higher education market place where institutions compete for students by offering upgraded amenities such as luxury housing; (2) the logics and practices of entrepreneurial city and state decision making logics and processes. This includes a focus on the resources, tools, and techniques states and cities use to support higher educational institutional growth as an economic development strategy. It also includes an intersecting set of programs that are targeted at reviving urban communities and to supporting transit-oriented development including tax credits, municipal debt products and markets, land use regulations, and alternative local taxing schemes such as payments in lieu of taxes; (3) the expanded use of public private partnerships (PPP) to produce student housing, and the institutional, financial, and legal relationships that make this partnership viable, and (4) the increased use of finance in everyday life and the financialized products and processes that have made investing in student housing possible and attractive. This

includes the ability of students to take on increased debt, a shift towards multifamily investment in the wake of the financial crisis of 2008, and the use of real estate investment trusts (REITs) to fund student housing.

The paper is a work of synthesis, integrating separate literatures on student housing, entrepreneurial city and state logics, programs, and processes, and the ways in which the financialized turn has enabled the expansion of student and other multi-family housing. It considers the implications for students, the places where student housing is located, higher education institutions, and the local and state governments that have supported these developments. Risk and debt are considered throughout. Student housing is often viewed as counter cyclical in that institutions of higher education have increasing enrollments during economic downturns, but the pandemic introduced an entirely new set of logics to the mix and magnifies the challenges associated with risk and debt.

Finally, though student housing is often discussed in monolithic terms, it is varied in practice. Context and contingency matter in understanding what housing is categorized as student housing, who develops it, who owns it, where it is located, how it is paid for, governs its production and allocation, and who absorbs the risk/benefit profile associated with it. The paper focuses on what student housing can tell us about the place of educational institutions in governance and they everyday reality of life in the post-industrial city.

#### **STUDENT HOUSING, GENTRIFICATION AND AFFORDABILITY: THE CASE OF URBAN UNIVERSITIES IN THE US**

Abstract ID: 174

Abstract within Pre-Organized Session 24

BAGLAN, Deniz [Howard University] deniz.baglan@howard.edu, presenting author

KURBAN, Haydar [Howard University] hkurban@howard.edu, primary author

MCLEOD, Kirsten [Howard University] kirsten.roach@gmail.com, co-author

Constraints to on-campus university student housing abound amid marked growth in student enrollment across the US over the past few decades (Ong et al, 2013). This tendency has been exacerbated by limited land capacity, strict zoning regulations and privatization of university housing. Meanwhile, there has been considerable gentrification of low-income neighborhoods in several US urban areas where college graduates and college students are seen as important players of this process (McKinnish et al 2010). This paper seeks to determine the impact of changes in student housing patterns on local housing markets and urban development as well as how these changes have contributed to affordability around gentrified university neighborhoods in major metropolitan areas. We merge data from National Center for Education Statistics, US Census Bureau and US Department of Housing and Urban Development (HUD) over the period 2000 to 2019 in order to examine the relationship between student housing and affordability in neighborhoods around urban universities. This data set allows us to explore school characteristics, affordability and neighborhood characteristics at a granular level. We utilize panel regressions and difference-in-difference techniques to study how changes in student housing affect affordability in gentrified neighborhoods relative to non-gentrified neighborhoods. Our a priori expectations are that having detailed information on enrollment, student housing supply, neighborhood characteristics, local economy and enrollment

status (part-time versus full-time and graduate versus undergraduate) will allow us to better identify and measure the impacts of the changes in demand and supply of student housing on affordability.

### STUDENT-ORIENTED HOUSING DEVELOPMENT AND SHIFTING RENTAL MARKETS IN UNIVERSITY NEIGHBORHOODS

Abstract ID: 175

Abstract within Pre-Organized Session 24

MAWHORTER, Sarah [University of Southern California] [smawhort@usc.edu](mailto:smawhort@usc.edu), presenting author  
EHLENZ, Meagen [Arizona State University] [Meagen.Ehlenz@asu.edu](mailto:Meagen.Ehlenz@asu.edu), co-author

University neighborhoods are increasingly experiencing an influx of large, student-oriented housing development projects. Several factors have contributed to this trend. Enrollments expanded rapidly and outpaced dorm expansions (Arbury, 2012). Housing demand remained strong in campus-adjacent neighborhoods throughout the 2008 foreclosure crisis, as well as the subsequent recession and recovery. This stimulated new investments in multi-family housing marketed towards students and young adults, coinciding with commercial lending trends that supported large rental projects (Gallun, 2016). Emerging research offers insights into the dynamics of student-oriented housing construction in neighborhood contexts (Revington and August, 2019; Revington et al., 2018; Smith et al., 2014), yet the wider scope of this development—and its impact on local rental markets—remains underexplored.

Student-oriented, rental superblocks have the potential to shift local rental markets, in terms of housing supply, prices, and affordability. In this paper, we investigate how recent large-scale residential projects have impacted the US housing landscape in campus-adjacent neighborhoods. We ask three questions: (1) What was the scale of large rental development in campus-adjacent neighborhoods?; (2) What contextual and institutional factors are associated with these development trends?; and (3) Is more intense student-oriented housing development associated with campus-adjacent shifts in the rental housing stock, rental prices, and housing affordability? We use the Integrated Postsecondary Education Data System (IPEDS) to identify an analytic sample of doctoral institutions with full-time enrollments above 10,000 (n=176). We couple IPEDS data on enrollments and dorm capacity with neighborhood-level estimates of recent large-scale rental development, derived from 2000 and 2010 Census and 2014-2018 ACS data.

We find that large-scale rental construction in campus-adjacent neighborhoods is both widespread—not limited to one type of place or university type—and idiosyncratic, shaped by multiple local factors. The local and regional housing market context helps inform campus-adjacent development trends. Large-scale developments were more intense in some places than others: more than 75% of rental units in large-scale developments occurred in just 25% of campus neighborhoods; meanwhile, 50% of campus neighborhoods accounted for just 9% of the large-scale rental units. Collectively, these findings have implications for the residential fabric around campuses, including shifting housing demand from small-scale rentals to superblocks, ongoing rental affordability problems, and new challenges related to an emergent “luxury” apartment market.

## HOUSING STUDENTS: LAND USE REGULATORY SYSTEMS IN LA AND BOSTON

Abstract ID: 176

Abstract within Pre-Organized Session 24

SUNGU-ERYILMAZ, Yesim [Boston University] [yesims@bu.edu](mailto:yesims@bu.edu), presenting author

BULL, Marijoan [Westfield State University] [marijoanbull@gmail.com](mailto:marijoanbull@gmail.com), co-presenter

As major urban centers contend with tight housing markets, attention has turned to the role of off-campus student housing in issues of affordability and displacement. These concerns go beyond the traditional town-gown tensions of nuisance, congestion, poor building maintenance, and a concentration of retail serving young adults.

This research examines how Boston, MA, and Los Angeles, CA, have used regulatory authority to monitor and control the forms and amounts of student housing within their borders. Drawing from a content analysis of plans, regulations, and permits, and interviews with regulatory staff, this research compares the tools adopted to manage the adverse effects of student housing while embracing the contributing features of institutions of higher education (IHE).

Boston and Los Angeles are selected as cases because of their meaningful similarities and differences. Both cities have strong local housing markets with similar 2019 rental vacancy rates, 4.6% in LA and 3.9% in Boston. They also have large, comparable numbers of IHEs and student populations, with accompanying concerns for residential displacement. However, the two contexts show substantial differences from each other regarding the regulatory tools adopted.

The approaches pioneered by Boston and Los Angeles are assessed along the dimensions of rationales, tools, community involvement, and outcomes. Provisions such as institutional master plans, off-campus student data collection, community benefit/development agreements, neighborhood stabilization districts, student fair housing protections, and more, are reviewed. Boston and Los Angeles highlight how the local market conditions, authority, community group involvement, and nature of IHE, can shape the regulatory response communities choose.

Comparing and contrasting these two urban centers, reveals unique features and common foundations to managing student housing. This research provides a better understanding of municipal initiatives for managing the traditional

and emerging concerns with student housing in strong urban housing markets, where the issue has become a flashpoint.

The COVID-19 pandemic has led to the new normal that changes our perceptions of living and working at home. This debate continues to be held globally and the effects of the pandemic crisis on student housing is no exception. The corona pandemic has also shaken up the student accommodation and private housing market in Germany. This is clearly supported by the recent trend of less supply and demand in the student housing sector that include public student accommodations, private (student) apartments and shared housing. Many international students had to leave; other students stayed in their hometowns due to the online semester; both university and students aware that no one can reliably predict how long a remote education substitutes on-site campus teaching and learning. Therefore, this study aims at analyzing how have universities and students adapted to the new normal and what the profound impacts of new university-student adaptations on student housing in the future. Different types of secondary sources were taken into account in review including journal articles, books, technical reports, policy documents and statistical sources and interviews with key informants, including stakeholder in varying sectors. The evidence showed that fewer applications for public student accommodations were made and thus the unoccupancy rates, conversely, were increased in 2020 compared to the previous year. As a result, a couple of ad-hoc administrations to avoid room vacancies have been widely adopted by the student union (studentenwerk). Moreover, there were around 30 percent fewer offers and decline in the demand for both private apartments and shared housing than in the same time in 2019. What remains unclear, however, is whether the less demands on housing in the market are related to decline in the number of students during the pandemic.

#### STUDENT HOMES IN VIENNA. SHIFTING FROM A 'BASIC NEED' TO AN 'ASSET CLASS'?

Abstract ID: 178

Abstract within Pre-Organized Session 41

GRUBER, Elisabeth [Austrian Academy of Sciences] [Elisabeth.Gruber@oeaw.ac.at](mailto:Elisabeth.Gruber@oeaw.ac.at), presenting author  
FRANZ, Yvonne [University of Vienna] [yvonne.franz@univie.ac.at](mailto:yvonne.franz@univie.ac.at), co-author

Student homes represent an important residential market segment to provide affordable accommodation in European university towns and cities. Depending on the national and local context, the provision of student homes ranges from historical social welfare ideologies to purpose-built accommodation in neoliberal and financialized housing contexts. In the last decade, the landscape of student homes provided was observed to become more diversified due to an increasing involvement of commercial student home developers and the international expansion of not-for-profit developers. Even in countries with traditional social welfare-oriented housing provision,

new (partly luxury) types of student homes in different price segments are emerging. The paper stems from research conducted in the city of Vienna, where in the last two decades, a pluralistic mix of student home providers (national and international) entered the market. While traditional providers still widely follow the logic of providing affordable living spaces to students, for (private) investment groups, the student housing market is further an opportunity for financial investment. This paper draws on qualitative research results and expands theoretical debates on studentification and the financialization of student housing embedded in a local housing market context. The following research questions have guided our study: (1) What current developments are observed in Vienna concerning the supply and demand of student housing. What are the market interests of the different providers? (2) Which role does the city have in the development of new student housing and their location (e.g. in urban development areas)? (3) Which lifestyle characteristics and student's demands shape current student home offers? The paper concludes on the recent patterns of change in student home provision in Vienna and presents wider implications, both for the context of Vienna as a university city as well as for new research foci on financializing housing (sub-)markets.

#### **AN ANALYSIS OF THE UNIVERSITY DEVELOPER EQUITY MODEL: THE CASE OF BOSTON**

Abstract ID: 179

Abstract within Pre-Organized Session 41

VICINO, Thomas [Northeastern University] t.vicino@northeastern.edu, presenting author  
 SOOD, Arushi [Northeastern University] sood.a@northeastern.edu, co-author

Recent popular and scholarly work has drawn attention to the issue of the lack of affordable housing in urban America in large, dense urban centers like Boston (Bluestone and Huessey, 2017). In particular, a growing body of literature has focused on the causes and consequences of neoliberal housing policies on longtime residents of urban neighborhoods (Shaw, 2018). However, fewer scholars have examined the role that anchor institutions such as universities play in the production of housing. This paper presents an exploratory study on the evolution of the policy and planning challenges of housing the nation's largest student population in Boston. We ask the following questions: 1) What are the characteristics shaping the problem of affordable housing in Boston?; 2) What is the impact of the university developer equity model on the production of housing?; and 3) What lessons can be drawn for urban planners and policymakers? We begin with a synthesis of the literature on the role of anchor institutions in community and economic development, and we find that key themes emerge around the ideas of the incentivizing the innovation economy, creating livable communities, fostering social inclusion, and advocating for collaborative governance (Perry and Wiewel, 2015; Rodin, 2007; and Trani and Holsworth, 2010). Then, we draw on an in-depth case study of a novel housing development project to examine the impact of the university developer model. We identify the Columbus Avenue Student Project at Northeastern University, a \$160 million housing project in the Roxbury neighborhood of Boston as the case study. Drawing on archival analysis of public documents and key informant interviews with university officials, local planners and policymakers, developers, community organizers, and other stakeholders, we find that the university as an anchor institution facilitated the production of new housing by partnering with a private developer, American Campus Communities, through an innovative public-

private partnership. Through a ground lease to the developer, 812 new housing units will be created. Our results identify the tensions of this development model: 1) university-driven development that expands into a historically low-income urban neighborhood; 2) the impact on the production of affordable housing; and 3) public and transparent nature of housing development. We conclude by reflecting on the consequences of the developer equity model on the local housing market by considering the roles of anchor institutions, local government, and private developers.

## STUDENT RENTAL DIGITAL PLATFORMS AND LOCAL HOUSING MARKETS IN LISBON, PORTUGAL

Abstract ID: 180

Abstract within Pre-Organized Session 41

MALET CALVO, Daniel [Iscte, University Institute of Lisbon] daniel.malet@iscte.pt, presenting author  
COCOLA-GANT, Agustín [IGOT, University of Lisbon] acogant@gmail.com, primary author

Taking Lisbon, Portugal, as a case study, this paper explores the rise of student accommodation digital platforms as a new disrupting element of the private rental market. In the Portuguese capital, the demand for student housing has been fed by the growing arrival of international students. This growth is the result of the recent political effort to put Lisbon on the map of global tourist destinations, confirming the student mobility literature suggestion that international students are often pulled by leisure possibilities in their hosting cities. However, the development of purpose-built student accommodation has been scarce and, instead, new digital platforms have emerged that connect landlords with international students, fueling a process of conversion of the private rental market into mid-term rentals for these transnational users. We will explore here the different actors involved in the development of student accommodation for the last 10 years, including Uniplaces, a digital platform created in 2012 and that like Airbnb has growth aggressively backed by venture capital to secure a monopolistic position. Drawing on the analysis of annual real estate consulting reports on student housing in Lisbon and in-depth interviews with international students and staff from student associations, the paper will show (i) that the geography of student housing in Lisbon reaches the entire central district, meaning that they add further housing pressures on areas experiencing gentrification and touristification; and (ii) that international students are privileged consumers of housing that are feeding a growing disconnection between local salaries and housing prices, with serious consequences on the access to housing for the local population, including Portuguese students. As a conceptual contribution, we will put into conversation the literatures on platform real estate and student housing to argue that in a Southern European destination the arrival of international students strengthens a broader process of rental gentrification in which the private rental market increasingly caters to transnational and transient populations.

## **6.42 PRE-ORGANIZED SESSION - COLLEGE AND UNIVERSITY STUDENT HOUSING III: NEIGHBORHOOD PERSPECTIVES ON STUDENT HOUSING**

Pre-Organized Session 42 - Summary

Session Includes 181, 182, 183, 184

EHLLENZ, Meagan [Arizona State University] meagan.ehlenz@asu.edu, organizer

Large-scale, student-oriented housing developments are (re)shaping neighborhoods around college campuses, with implications for municipalities, neighborhood residents, universities, and students. This housing development trend is emerging in the context of growth in post-secondary enrollments, a decline in the share of state aid to public higher education institutions, and interest from investors (especially REITs) and developers in student housing as an asset class. In a multi-session series, we examine the global trends and implications of student housing, including perspectives from North America, Europe, and South Asia. In this session, authors consider neighborhood perspectives on student housing, exploring neighborhood changes influenced by student housing and municipal responses/approaches in Canada, the US, and India.

Objectives:

- Attendees will become familiar with contemporary trends in student-oriented housing development in an array of settings.
- Attendees will understand how large-scale, student-oriented housing development impacts campus-adjacent neighborhoods.
- Attendees will learn about a range of planning approaches and community responses to student-oriented housing development.

## **LOCAL POLICY APPROACHES TO NEAR-CAMPUS NEIGHBOURHOODS AND STUDENT HOUSING DEVELOPMENT TRAJECTORIES IN ONTARIO, CANADA**

Abstract ID: 181

Abstract within Pre-Organized Session 42

REVINGTON, Nick [Institut national de la recherche scientifique] Nick.Revington@ucs.inrs.ca, presenting author  
WRAY, Alexander [Western University] awray22@uwo.ca, co-author

Many near-campus neighbourhoods across North America have experienced rapid change in recent decades with increasing post-secondary enrolment, and changes in housing needs and expectations among students. In general, Canadian post-secondary institutions have taken a more passive role in student housing and local community development relative to their American counterparts. As a result, development in near-campus neighbourhoods is left largely to private sector actors. Development pressure and concentrations of students in near-campus neighbourhoods – or “studentification” – have caused considerable conflict between local communities and their institutions (Frierson, 2005). Resident concerns include a range of behavioural issues, such as excessive noise,

partying, public drinking, littering, petty vandalism, and parking issues (Munro & Livingston, 2012; Woldoff & Weiss, 2018). To date, however, most research regarding local government policy concerning student housing has taken a single-city case study approach (e.g., Hubbard, 2008; Revington et al., 2020).

We present an analysis of official plans, policy statements, and bylaws in all 15 Ontario municipalities with a primary campus of the province's 20 public universities. We conducted a qualitative document analysis to investigate how these jurisdictions manage student housing development in near-campus neighbourhoods, with an overarching aim of identifying common elements across cities and major departures from widely adopted approaches. This sample represents varied urban contexts – from downtown Toronto to surrounding mid-sized cities and far-flung regional centres, with differing patterns of urban growth and stagnation – and a diversity of institutions, including smaller undergraduate-oriented regional universities and large, nationally and internationally significant research universities, allowing us to consider how local contextual factors may influence the policy approach adopted.

We identify three broad policy approaches from our analysis. The first approach, residential conversion, guides student housing development to previously non-residential spaces such as greenfield and brownfield sites, while the second approach, residential intensification, permits redevelopment of existing residential areas. The third – and most common – approach, restricted growth, strongly limits development in near-campus neighbourhoods. We turn to exemplars of each approach to illustrate their impacts on student housing development trajectories in local communities. These case studies are Niagara Region (Brock University, residential conversion), Waterloo (University of Waterloo and Wilfrid Laurier University, residential intensification), and London (Western University, restricted growth). These communities have adopted very different planning approaches for near-campus neighbourhoods despite geographic proximity and similar urban form and size. We demonstrate the role of local policy in producing different trajectories of student housing development within a common provincial policy context. In addition to local growth machine dynamics, local policy approaches in Ontario are equally influenced by provincial growth management policies and by the community-institutional relationship.

While the specific policy choices available to Ontario municipalities may differ from those of other jurisdictions, we believe the three broad approaches we identify will be of wider applicability in research, practice and policymaking. For instance, given their generality, these categories may allow for more meaningful international comparative research on planning for student housing than a focus on locally specific regulations, or a useful starting frame for regulating student housing from which planners and policymakers can then identify suitable mechanisms to match the chosen approach. Most importantly, by considering policy approaches and student housing development patterns in tandem, our research points to the potential implications of such a choice for near-campus neighbourhoods and urban development more generally. Surely these implications ought to be carefully considered to ensure an appropriate resolution to local town and gown conflicts.

## WHO DRINKS BUBBLE-TEA? HIGH-RISE STUDENT GATED COMMUNITIES IN TORONTO'S WEST CHINATOWN

Abstract ID: 182

Abstract within Pre-Organized Session 42

ZHENG, Corals [York University] corals.zheng@gmail.com, presenting author

Chinatowns have traditionally offered cheap rents, affordable retail, central locations and diverse housing typologies (e.g., rooming houses and family associations) to both, those in the Chinese diaspora and non-Chinese populations, including students. However, Chinatowns are at present facing development pressures and displacement (Acolin & Vitiello 2018). In the case of Toronto's West Chinatown, the distinctive mechanisms of the current wave of neighborhood change are tied to new-build gentrification where inwardly moving students cause indirect displacement of older Chinatown residents and lifestyles. At a larger scale, such process has been driven by the expansion of urban Higher Education Institutions (HEIs), the growing intake of international students—particularly from Asia, and the recent involvement of private developers and investors in Purpose Built Student Accommodations (PBSAs) (Pillai, Vieta & Sotomayor, forthcoming). Neighborhood change in West Chinatown has been further characterized by the rapid establishment of international Chinese chain restaurants and bubble-tea shops, and the loss of long-time and family-owned businesses and buildings with cultural and community significance.

In this paper, we build on recent global debates about urban planning, universities and the role of students in neighborhood change (e.g. Smith & Hubbard 2014; Kinton et. al. 2018; Holton & Mouat 2020) to examine the politics of studentification in Toronto's West Chinatown. The paper also contributes to highlight the interconnected nature between HEIs and their locality, and the volatility of student-focused neighborhoods to urban politics by shedding light on the transnational dimension and global linkages of studentification, such as the internationalization and marketization of higher education, the global financialization of student housing, and the immigration trajectories and housing aspirations of South Asian students in Toronto.

Using a mixed-method design (including descriptive statistics, spatial analysis and interview data), we first establish three recent waves of gentrification, the most recent one characterized by new build vertical studentification. We then zoom in to examine the tensions and controversies caused by recent PBSA projects in the West Chinatown, contrasting diverse perspectives, including those of residents, stakeholders and students.

Our findings indicate that PBSAs further town and gown disparities and contribute to the financial exploitation and social isolation of students in what can be characterized as high-rise student gated communities. At the same time, the growing intake of international students—particularly from China in proximity to the West Chinatown creates new narratives, tensions and organized reactions around neighborhood change and the future of the area that are strongly mediated by class-based urban visions and aspirations within the Chinese community. While some entrepreneurial community members are pro-growth and support PBSA development, other long-term residents are concerned about older residents' displacement and play out their politics to strategize and contest PBSAs. Overall, responses from long-term Chinese residents and other members of the Chinese diaspora raise an important question on the future of Chinatown, who is Chinatown for, and how might a historically working class and marginalized neighborhood be preserved in a rapidly gentrifying city.

## DO NEW STUDENT RENTALS AFFECT OTHER HOUSING SUBMARKETS? EVIDENCE FROM CHAMPAIGN-URBANA

Abstract ID: 183

Abstract within Pre-Organized Session 42

PENDALL, Rolf [University of Illinois at Urbana-Champaign] rpendall@illinois.edu, presenting author  
 HILLYARD, Caitlin [University of Illinois at Urbana-Champaign] cah9@illinois.edu, primary author  
 ALLRED, Dustin [University of Illinois at Urbana-Champaign] dallred2@illinois.edu, co-author  
 PROCHASKA, Natalie [University of Illinois at Urbana-Champaign] prochask@illinois.edu, co-author

This paper explores the relationship between student rental housing and other submarkets. We use Champaign-Urbana, Illinois as our case study area — home to the flagship University of Illinois campus. We examine university enrollment data from 1980 to 2018 to track demographic changes in the student population. Then we use decennial census and American Community Survey 5-year estimates from 1990 on to determine the spatial distribution of student renters over time. Finally, we examine shifts in the distribution of rents to determine how the movement of students has affected what Champaign-Urbana's landlords charge across the metropolitan area. We find evidence that a highly visible expansion of luxury student housing since 2008 in Champaign's university adjacent Campustown area has thus far accommodated student growth without spillover to other neighborhoods. Over the past four decades, enrollment at the University has increased rapidly, with much of that growth due to international and out-of-state students, and particularly students from Asia. This occurred parallel to substantial tuition increases — a reaction to decreasing state appropriations for higher education. Because international and out-of-state students pay higher tuition rates and are less likely to receive financial aid, we infer we that they also have access to enough income to afford high rents. As enrollment skyrocketed, decades of public investments and regulatory decisions by the City of Champaign enabled the development of new, high-rise housing in Campustown. This included infrastructure upgrades that nullified the risk of flooding in the area, which lessened risk for developers seeking to build large-scale projects. In addition, the City routinely eliminated parking minimums and eased open space requirements, first through its Planned Unit Development process and later through rezoning. Together, this incentivized denser development near campus. Areas of Champaign-Urbana with more constrained land use regulations did not see a similar increase in student renter populations, although the neighborhood just north of Campustown has begun to attract more students than in the past.

As Campustown has absorbed higher densities of student renters, we also find areas near campus contain disproportionate numbers of housing units in the top rent quartile for Champaign County. Rents in the area often top \$1,000. We conclude that the student housing boom that began around 2008 and continues today is a direct builder response to the University's courtship of upper-income students from the U.S. and abroad. This boom has added a new segment to the metropolitan housing market, essentially making room for new students close to campus with little spillover into surrounding areas. As this boom occurred, the City's regulatory, infrastructure, and placemaking actions funneled growth to one neighborhood.

Because student demographic changes have an impact on housing demand, planners in college towns may benefit from increased coordination with University administrations. In addition, flexible land use regulations, along with strategic investments in infrastructure, can make certain neighborhoods favorable for student housing

development, thereby shielding nearby residential areas from the effects of studentification. That said, planners should be mindful of which boundaries to student neighborhoods are most porous, especially since luxury student housing can push rents upward — something that could have negative effects for existing residents.

### **CHALLENGES OF OFF-CAMPUS STUDENT HOUSING IN INDIAN CITY PRAYAGRAJ AND THE POTENTIALS OF PURPOSE BUILT STUDENT ACCOMMODATION (PBSA)**

Abstract ID: 184

Abstract within Pre-Organized Session 42

TIWARI, Alok [King Abdul Aziz University Jeddah, Saudi Arabia] atwari@kau.edu.sa, presenting author

Prayagraj city (formerly known as Allahabad) is the home of the third oldest university of modern India that attracts students largely from the eastern Uttar Pradesh, Bihar, Madhya Pradesh, and Jharkhand among others. For most students, it is a hotbed of selection in the provincial and union public services. As per various estimates, there are 600 thousand students in the city, out of which 35 thousands are enrolled in the University of Allahabad. Even after the large number of students, the university provides on campus accommodation only to 8.5% students, while the rest are compelled to live in off campus informal student housing. Unlike Delhi, Pune, Bengaluru and many other metropolitan cities of India, Prayagraj lacks any sort of Purpose built student accommodation (PBSA). So, drawing on 30 interviews with the students living in the various localities of Prayagraj we conclude that these students do not have any legal contracts with the landlords, there is no rent control, and students are the victim of arbitrary attitudes of landlords. These informal student accommodation provides just the living space without any associated housing features such as common hall and openspaces. Majority of the students cook, read and sleep in the same rooms that are not well ventilated. Most of the students also complained regarding the affordability of such houses. In such a scenario, we recommend planning for an adequate number of PBSAs in the proximity of the university campus in compliance with the proposed National Urban Rental Housing Policy 2015 that has special provisions for Affordable Rental Housing Complex (ARHC), and Need Based Rental Housing (NBRH).

## **ROUNDTABLES**

### **6.499 ROUNDTABLE - A GLOBAL PERSPECTIVE ON LAND USE REGULATIONS AND HOUSING OUTCOMES**

Abstract ID: 499

HEIKKILA, Eric [University of Southern California] heikkila@usc.edu, organizer, moderator  
 MONKKONEN, Paavo [UCLA] paavo.monkkonen@ucla.edu, participant  
 GOYTIA, Cynthia [UTDT] cgoytia@utdt.edu, participant

Housing affordability is a challenge for urban planners throughout the world. It is not always clear, however, what the nexus is between land use regulations and housing outcomes. In this roundtable session, active scholars in this field will engage the audience in an exploration of the underlying issues. Examples of questions to be addressed include:

\* To what extent do overly restrictive land use regulations contribute to the prevalence of informal housing (including homelessness)?

\* Are there notable and significant regional variations, globally, in housing affordability and land use regulations, including enforcement thereof?

If yes, what might explain such regional "fixed effects"?

\* To what extent do land use regulations, in practice, exacerbate prevailing patterns of social inequality?

\* What is the role of basic services (water, sanitation, etc.) infrastructure planning in housing affordability?

\* Under what conditions is it more effective to:

-- accommodate more housing closer to employment centers, versus

-- invest in transportation infrastructure that eases access to employment centers?

## **INDIVIDUAL PAPER SUBMISSIONS**

### **BUILDING A NATIONAL COMMUNITY TYPOLOGY OF REGULATIONS FOR ACCESSORY DWELLING UNITS (ADUS), MOBILE, RV, AND TINY HOMES**

Abstract ID: 8

Individual Paper Submission

ANACKER, Katrin [George Mason University] kanacker@gmu.edu, presenting author

Over the past several years, many communities and many residents have been affected by a housing affordability crisis in the U.S. (Anacker, 2019). Most planners and policymakers have difficulties addressing the demand for housing as there is freedom of movement. Housing policymakers have directly addressed the housing supply through public housing for renters and the Section 8 New Construction and Substantial Rehabilitation for builders. Housing finance policymakers have indirectly addressed the housing supply through Low Income Housing Tax Credits (LIHTCs), Community Development Block Grants (CDBGs), the HOME Investment Partnership program, federal, state, and local housing trust funds, and grants to Community Development Corporations (CDCs). Recent discussions of affordable housing supply have focused on Accessory Dwelling Units (ADUs; Anacker and Niedt, forthcoming) and converted garages (Brown et al., forthcoming). Interestingly, not much work has been undertaken on mobile, RV, and tiny homes in connection with the housing affordability crisis (Sullivan, 2018). This study fills this cap.

I utilize the National Longitudinal Land Use Survey (NLLUS), conducted by Pendall in 1994, by Pendall, Wegman, and Martin in 2003, and by the Urban Institute and Pendall in 2019 (Urban Institute, n.d.). The NLLUS 1994 Land Use Dataset includes data on jurisdictions in the 25 most populous metropolitan statistical areas (MSAs) or Combined Metropolitan Statistical Areas (CMSAs) as of 1990 ( $n = 1,168$ ). The NLLUS 2003 Land Use Dataset contains data on jurisdictions with populations over 10,000 in the 50 most populous MSAs and CMAs as of 2000 and 50 additional jurisdictions with fewer than 10,000 residents in metropolitan areas where jurisdictions with more than 10,000 people covered less than 60 percent of the total MSA land area ( $n = 1,845$ ). The NLLUS 2019 Land Use Dataset includes data on jurisdictions with populations over 10,000 with the top 50 Core Based Statistical Areas (CBSA) and a sample of land use planning empowered jurisdictions with populations under 10,000 in select CBSAs ( $n = 1,703$ ). For the combined three data sets there are 446 repeat respondents. I also utilize data from the decennial 1990, 2000, and 2010 Censuses and the American Community Survey (ACS; 2000s and 2010s).

I analyze demographic, socioeconomic, and housing characteristics in connection with regulations for Accessory Dwelling Units (ADUs), mobile, RV, and tiny homes through descriptive statistics and t-tests to build typologies for the 1994, 2003, 2019 data sets, and for the longitudinal data set. Preliminary results indicate that more communities regulate mobile homes compared to tiny homes, RVs, and ADUs and that there are statistically significant differences in terms of demographic, socioeconomic, and housing characteristics.

## THE EFFICACY OF ALLOCATING HOUSING GROWTH IN THE LOS ANGELES REGION (2006-2014)

Abstract ID: 11

Individual Paper Submission

RAMSEY-MUSOLF, Darrel [University of Massachusetts Amherst] darrel@larp.umass.edu, presenting author

California is known for home values that eclipse U.S. housing prices. To increase housing inventory, California has implemented a regional housing needs allocation (RHNA) to transmit shares of housing growth to cities. However, no study has established RHNA's efficacy. After examining the 4<sup>th</sup> RHNA cycle (i.e., 2006-2014) for 185 Los Angeles region cities, this study determined that RHNA directed housing growth to the city of Los Angeles and the region's outlying cities as opposed to increasing density in the central and coastal cities. Second, RHNA directed 62% of housing growth to the region's unaffordable cities. Third, the sample suffered a 34% shortfall in housing growth due to the Great Recession but garnered an average achievement of roughly 93% due to RHNA's transmission of minimal housing growth shares. Lastly, RHNA maintained statistically significant associations with increased housing inventory, housing affordability, and housing growth rates—indicating that RHNA may influence housing development.

## IT TAKES A TINY HOUSE VILLAGE: A MIXED METHODS ASSESSMENT OF BARRIERS, STRATEGIES, AND STAKEHOLDER PREFERENCES FOR TINY HOUSE VILLAGES FOR THE HOMELESS IN MISSOURI

Abstract ID: 15

Individual Paper Submission

There is increased interest in using tiny house villages to confront the growing issue of homelessness in the United States (U.S.) (Heben 2014; Segel 2015; Jackson et. al 2020). A recent inventory found that there are at least 115 tiny house villages for the homeless in the U.S. that are currently in operation, slated to open in the future, where efforts have been abandoned, or where the operational status of the villages is unknown (Evans, 2020). Although interest in addressing homelessness with tiny house villages continues to grow, these villages face numerous barriers, from restrictive land use laws to resident concerns about homeless populations. This research examines such barriers, strategies for urban integration, and stakeholder perceptions of various visual, physical, and social elements pertaining to these developments.

This mixed methods research involves a comparative case study of two tiny house villages for the homeless recently constructed and opened in Missouri: Eden Village, located in Springfield, and Veterans Community Project (VCP), in Kansas City. The comparative case study research was performed to answer the following questions: What are the challenges to integrating tiny house villages for the homeless and how have/are such challenges being addressed? What are strategies for the successful integration of these villages into communities? The comparative case study explores barriers and challenges faced by each tiny house village, in addition to strategies that allowed for the successful integration of the villages into urban communities. The study also involved a survey (including an embedded visual preference survey) of stakeholders in each community in order to understand if various visual, physical, and social elements related to tiny houses for the homeless influence community perceptions of these developments. Understanding community perceptions and preferences is important, as stakeholders are key actors in the development of land use policy. It is hypothesized that integrating stakeholder preferences for tiny house villages for the homeless may result in greater community support.

The study finds that NIMBYism (Not-in-my-backyard) is the greatest deterrent to villages. This is in compliance with the literature that finds NIMBYism to be a significant deterrent to both the integration of affordable housing and facilities to serve the homeless (Tighe 2010; Scally and Tighe 2015). However, the survey also finds that stakeholders have distinct preferences for several visual elements related to tiny house villages for the homeless, as well as for specific physical and social factors. For example, survey results indicate that stakeholders have a distinct and higher preference for tiny homes built in a traditional (vernacular) architectural style, over non-traditional (modern) architecture. The survey also finds that stakeholders perceptions of tiny house villages for the homeless are positively impacted by physical and social elements such as indoor plumbing, heating/air-conditioning, and the provision of mental health services, though many villages do not offer such amenities. Integrating stakeholder perceptions and preferences into plans and designs for tiny house villages for the homeless may result in less NIMBYism and greater community acceptance.

The research has resulted in a better understanding of the barriers to, and stakeholder preferences for, tiny house villages for the homeless. It is hoped that this research will aid those aiming to address homelessness through the integration of tiny house villages. The study contributes to a greater understanding of how tiny house villages for the homeless might be not only accommodated, but in a way that is perceived positively among communities.

## UNCOVERING THE EXTENT AND IMPACTS OF RENT GAPS IN LOS ANGELES

Abstract ID: 105

Individual Paper Submission

ROSEN, Jovanna [Rutgers University-Camden] jovanna.rosen@rutgers.edu, presenting author

PAINTER, Gary [University of Southern California] gpainter@usc.edu, co-author

DE GREGORIO, Soledad [University of Southern California] mdegredo@usc.edu, co-author

ANGST, Sean [University of Southern California] angst@usc.edu, co-author

This paper seeks to determine whether and how household outcomes and conditions change based on a household's rent gap (Smith, 1979)—the difference between the actual rent that households pay and the market rate for the unit that landlords could otherwise receive. Housing market pressures have driven an increase in rents and rent burden, or the percentage of income that households spend on housing costs. This shift has placed enormous impacts on renter households. Prior research (such as Porter, 2013; Darling, 2005; Bourassa, 1993) has discussed the existence, extent and impacts of the rent gap. By preventing actual rents from rising alongside market rents, rent control is one factor creating and widening rent gaps. Research has shown how rent control-driven rent gaps can produce deleterious outcomes for renters, including less building maintenance (Sims, 2007). Furthermore, Diamond and McQuade (2018) establish how greater rent gaps, achieved through rent control, drive landlords to engage in harmful behaviors to tenants such as removing tenants or removing units from the rental market through converting units to condominiums.

This work contributes to prior research by drawing from two interconnected datasets to uniquely trace the relationship between the rent gap and the household's social, economic, and emotional outcomes, examined across different neighborhood change contexts. This research will lend valuable insight into the dynamics and cumulative impacts of housing market conditions and neighborhood change. We undertake this novel research by relying on two unique datasets: 1) primary collected data from a door-to-door randomized neighborhood survey of renter households (n=800) completed in 2019 across two Los Angeles neighborhoods; and 2) multi-family and single-family residential rental market data scraped from the real estate companies Rentometer and Zillow, which track market-rate housing prices, including rents and rental estimates.

We surveyed 794 residents across two Los Angeles neighborhoods, Central and South Los Angeles, through a 2-stage random block sampling design and a door-to-door, in-person approach. This methodology utilizes a geographically-based approach that covers all Census tracts within each area and employs random sampling of street blocks as well as households within street blocks to achieve a robust and valid sample. Surveys generally lasted between 40 minutes to 1 hour. We use these survey data to deepen our understanding of the nuanced and far-reaching effects of rent burden. We find strong differences in how residents and families cope with rent burden, including the trade-offs residents make, their duration and impacts, as well as differences across groups.

Uniquely, by linking our survey data with rental market estimates, we are able to trace the rent gap: the difference at the household level between market rents and the actual rents paid by each household. With the rent gap thus established, we examine not just the geographic and socioeconomic variation in rent gap across Los Angeles, but we also observe its relationship to the household's economic, social and emotional well-being. We examine these dimensions through survey measures on income, wealth, social support, stress, housing unit maintenance and harassment. By combining these unique datasets, we are able to study dynamics of neighborhood change, housing and household impacts in new and important ways.

 WEN, Frank [Southern California Association of Governments] WEN@scag.ca.gov, co-author

The shortage of housing inventory has become a significant urban issue. From 2000 to 2015, 23 states in the U.S under-produced 7.3 million housing units in total, which is roughly equivalent to 5.4% of the total housing stock of the U.S (Baron et al., 2018). The lack of housing that meets people's needs disparately impacts renters and low-income families by impacting affordability and increasing average housing costs (CAHCD, 2020). Accessory dwelling unit (ADU) has emerged as a policy alternative to increase housing stock and provide affordable options for areas impacted by housing shortages. ADU refers to a completely independent living facility on a lot with a proposed or existing primary residence. In the case of the State of California, the state passed Assembly Bill 2299 in coordination with Senate Bill 1069, which significantly eases restrictions on building ADUs (Bennett et al., 2019). Previous research has discussed the diverse aspects of ADU policies including communities' perspective on the policies, their compliance with zoning, and their impacts on informal housing (Ramsey-Musolf, 2018; Gabbe, 2019).

However, there has not been much research done on where ADU developments likely occur. It is also reasonable to hypothesize that new ADU policies intervene in the relationship between characteristics of parcel and neighborhood and ADU development, but limited research tested this hypothesis. Employing multilevel logit regression, this paper attempts to identify the factors at neighborhood and property levels contributing to ADU developments in the City of Los Angeles. This paper also examines how the city's new ADU ordinance alters the relationship between the contributing factors and ADU developments by constructing two multilevel logistic regression models that test the relationships before and after the implementation of the ordinance. The models indicate that the physical features of the property are more significant determinants of ADU development than neighborhood characteristics. ADU development likely occurred in small-size parcels with smaller, older housing before the new ordinance was adopted. ADU development tended to occur in areas with low population density and homogeneous land use patterns (predominantly single-family residential areas). The models also suggest that ADU developments in the city have been spread to diverse types of properties and areas since the adoption of the new ADU ordinance. These findings will help planners take appropriate actions and regulations that increase affordable housing production by promoting ADU developments.

## HOW SMALL IS TOO SMALL? ASSESSING THE WELL-BEING IMPACTS OF NANO-HOUSING ON UNIVERSITY STUDENTS

Abstract ID: 152

Individual Paper Submission

HONEY-ROSÉS, Jordi [UBC] jhoney@mail.ubc.ca, presenting author

SHULMAN, Lili [UBC] lili.shulman15@gmail.com, co-author

As cities densify and more residents move into smaller apartments, there are questions about the well-being impacts of living in tiny spaces under 300 ft<sup>2</sup>. Nano-flats and tiny homes have gained popularity around the world as a more affordable housing alternative. To understand the well-being impacts of tiny living, we surveyed residents of new nano-suites (140 ft<sup>2</sup>) built for students at a Canadian university. Using a pre-post survey design, we measured the changes to social and subjective well-being, environmental attitudes and expectations about ideal housing type. After seven months living in a nano-unit, we find no negative impacts on subjective and social well-being and unexpected reductions in environmental concern. We also find that tiny living may change expectations about where residents would like to live in the future, making them more open to the idea of living in an apartment instead of a single family detached home. This finding is particularly relevant in a North American context in which single family detached homes are the norm and the demand for these homes is a barrier to densification and sustainable land use planning. Overall residents were highly satisfied with the nano-suite and motivated to live there because of its affordability. A prolonged housing affordability crisis, in spite of the pandemic related economic downturn, may make tiny units increasingly a part of the housing mix in the city of the future.

## ORANGES ARE NOT THE ONLY FRUIT: VARIETIES OF HOUSING LAND TRUSTS?

Abstract ID: 159

Individual Paper Submission

SPICER, Jason [University of Toronto] jason.spicer@utoronto.ca, presenting author  
STEPHENS, Lindsay [University of Toronto] lindsay.stephens@utoronto.ca, co-author  
KRAMER, Anna [McGill University] anna.kramer@mcgill.ca, co-author

Community land trusts (CLTs) offer the promise of permanently securing tenure, and reducing speculation and gentrification-related displacement. Having spread globally, CLTs are defined as non-profit organizations which own land in trust, typically for a group of housing unit owners (Davis, 2010; Davis et al., 2020). They usually stipulate limits to units' price appreciation, household incomes, or both. Among alternative tenure models, they are argued to be comparatively more flexible than cooperatives, as they can readily be used to own and govern one or more multi-family or single-family structures, with variable unit types (Bunce, 2016; Angotti with Jagu, 2007), including in suburban or less dense settings. Cities have created programs to enable wider CLT use (Moore and McKee, 2012), while scholars have examined purported benefits and limits. Meanwhile, interest in CLTs has continued to grow, particularly in high-cost urban areas. Beyond the traditional CLT, there are other types of land trusts for housing. There is the public land trust (PLT), largely ignored in peer-reviewed literature. Various forms of PLTs are in use in multiple cities, including Canada's two highest housing-cost cities, Vancouver and Toronto, as well as in US cities such as Flagstaff and Irvine (DeFilippis et al., 2018). CLTs have been cast as an orange that is the only fruit, to borrow from the title of Jeannette Winterson's prize-winning 1985 novel, *Oranges Are Not the Only Fruit*. But traditional CLTs are not the only type of housing land trust; they are not the only fruit. Contrasting a PLT in Toronto, a hybrid model in Vancouver, and traditional CLTs in New York, we identify benefits and drawbacks associated with varying public vs. community roles in land trusts.

By directly reducing market exposure and obviating the need to finance a land sale by holding it as a public asset, our research suggests that PLTs can readily leverage the power of the state and publicly controlled land, potentially at greater scale. Toronto's PLT houses ~40x more people than the Parkdale CLT, the city's only CLT to have successfully acquired and converted existing market housing stock<sup>1</sup>. Vancouver's PLT shows similar promise, as its rapid, recent scale-up to 2,600 units attests. Further, as the New York case shows, even when CLTs achieve some measure of success, they may have directly relied on the state to do so. CLTs operating independently of the state can also struggle to find sites to acquire in the market, let alone any at scale, particularly in today's high cost urban centres, as new CLTs in New York are experiencing. They may also require direct technical assistance, grants, and lending from government to be financially viable in high-cost cities. CLTs may also lack the ability to maintain organizational capacity, as has also occurred at one New York CLT, leaving public agencies responsible to cure default or maintenance challenges. PLTs, however, may come with drawbacks reflecting their more direct relationship to the state. Specifically, PLTs may require particular and rare political circumstances to enact, as in Toronto, and may be at risk of privatization, loss of community control, or experience loss of government support as political winds change. Indeed, even their indirect relationship to the government has caused New York CLT resident-owners to express concerns regarding political independence, resulting in resistance when municipal agencies seek to enforce regulatory oversight. Nonetheless, in practice, policymakers and planners might wish to consider the PLT, or a hybrid public-community model, particularly in high-cost cities where viable public land can be leveraged for housing, and where political climates enable such models' consideration.

## **IS BACK TO THE NEST A GOOD DECISION? THE EFFECT OF RETURNING TO PARENTAL HOME ON THE INDIVIDUAL ECONOMIC OUTCOMES AMONG YOUNG ADULTS**

Abstract ID: 165

Individual Paper Submission

CHOI, Seungbee [Virginia Tech] sbchoi@vt.edu, presenting author

Young adults who achieved independent living, one of the key markers of the transition to adulthood, often go back to their parents because they cannot afford to maintain independence. According to the National Longitudinal Survey of Youth 1997 Cohort (NLSY 97), about 58% of respondents who have experience of independent living, move back to their parents' home or someone else's household at some point.

Poverty level, employment status, race/ethnicity, student debt, and college completion are the drivers of returning home at the individual level (Houle and Warner, 2017; Mykyta and Macartney, 2012; Wiemers, 2014). The high unemployment rate during the recent recession and the rising cost of living since then have been found to be factors driving young people to give up their independent life since the Great Recession (Lee and Painter, 2013; Newman, 2012; Pilkauskas et al., 2014). The increase in the number of young adults living with parents by about 2.6 million which accounts for 5 percent of young adults in a year during the pandemic, demonstrates the huge impact of the economic shock on the decision of living arrangement (Pew Research Center, 2021).

While much attention has been paid to the factors related to giving up independent living, the lives of young people after returning to parental homes are unknown. Dependent living – living in parental home or someone else's household – helps them reduce housing and living expenses, but it can increase commuting costs or reduce job opportunities by moving them to a weak labor market. This study, using data from 2003-2017 waves of the National Longitudinal Survey of Youth 1997 Cohort (NLSY 97) which tracks nearly 9,000 individuals born between 1980 and 1984, examines the various outcomes of young people who have returned to dependent living. Unlike household-based panel data that stops tracking when an individual becomes independent of the existing household, NLSY 97 surveys on an individual basis, so it has the advantage of obtaining a complete set of data regardless of the living arrangement. However, it does not include information about expenditures on housing or other goods.

This study answers the following two questions: (1) Do young adults returning to dependent living get more benefits than they were independent? (2) Do young adults returning to dependent living get more benefits than others who remain independent? The benefit used in the two questions above is measured by 4 variables – (1) employment status (2) job stability measured by whether youth employed for a full year (3) income (4) asset. In the first question, it compares year t-1 and t+1 on the basis of the year (t) the youth decide to return. In the second question, the impact of dependent living on economic outcomes is investigated using the different age points when an individual is 20, 25, 30, or 35 years old. The key independent variable is the duration of dependent living (months). NLSY 97 provides rich information on demographics, parental relationships, and various personal traits (e.g., financial risk tolerance and educational performance) as used for control variables in the model. Preliminary findings suggest that the impact of returning to dependent living on the outcomes varies depending on race and educational attainment.

## AN ECOLOGICAL MAP OF IMPLICIT RACIAL BIAS IN LOCAL HOUSING DELIBERATIONS

Abstract ID: 170

Individual Paper Submission

PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, presenting author  
 HU, Xiaoqian [University of Arizona] xiaoqianhu@arizona.edu, co-author

Racism in U.S. housing markets has evolved from the explicit exclusion of racial and ethnic groups to more implicit forms of bias (Lopez 2014) that have disparate impacts on racial and ethnic groups' access to housing and neighborhoods. One example of implicit bias is the use of "code words" for racial and ethnic groups in deliberations about rezoning and other decisions affecting housing planning and development, such as denying a request to rezone a subdivision for higher density (i.e., greater affordability) on the premise that the rezoning will lead to "too many cars parked on the lawn" – coded language for Latinxs. However, comprehensive knowledge on how these code words link to racial and ethnic groups and are used in housing deliberations and decisions is lacking.

This research helps to fill this gap by using a mixed method qualitative approach to 1) identify racial and ethnic code words in the 2000s and 2) contextualize their use in local housing-related deliberations in the Phoenix and Tucson metropolitan regions. First, we explore the range of racial and ethnic code words and how their use varies across diverse geographic and temporal contexts through a systematic review (Xiao & Watson 2019) of empirical evidence on code words in cross-disciplinary peer-reviewed research published in the 2000s. Second, we investigate the use of these code words by stakeholders in housing-related zoning deliberations and decisions in communities with divergent socioeconomic and housing market conditions in the Phoenix and Tucson regions through content analysis of public meeting transcripts and relevant traditional and social media. Finally, we triangulate the systematic review and content analysis findings to create a locally anchored, ecological map of racial and ethnic code words relevant to housing planning.

The broader impacts of this research are twofold. First, our findings contribute to existing and new theories about how planning deliberations and decisions further white supremacy (e.g., Goetz, Williams, & Damiano 2020; Whittemore & BenDor 2019; Tighe 2011). Second, our findings inform efforts to provide racial and ethnic bias training to planning practitioners and adjudicate disparate impact claims under the Fair Housing Act.

## **CLASS MONOPOLY RENT, PROPERTY RELATIONS, AND PORTLAND'S HOMELESS CRISIS**

Abstract ID: 172

Individual Paper Submission

ANDERSON, Matthew [Eastern Washington University] manderson22@ewu.edu, presenting author

HANSEN, Elijah [Eastern Washington University] ehansen@eagles.ewu.edu, co-author

ARMS, Zachary [Eastern Washington University] zrms@eagles.ewu.edu, co-author

TSIKALAS, Stephen [Eastern Washington University] stsikalas@ewu.edu, co-author

This study deepens our understanding of the political-economic drivers of contemporary homelessness by bringing scholarly literature on land rent theory and the political economy of homelessness into closer dialogue. We interrogate the tactics by which the actors that comprise urban growth machines collaboratively work to control the spatiality of the homeless as a means of preserving their investments (and acceptable rates of return) in urban space. The scholarly literature on homelessness is now massive and transcends disciplinary boundaries. However, comparatively few scholars have examined homelessness in relation to property, which is curious because homelessness is defined, following Blomley (2009), as a condition of being excluded from, and produced by (and with), property. It is in this context that this study is situated, by extending Blomley's (2009) insights on property law further with respect to the role of rent in the contemporary neoliberal city. In the process, we hypothesize that it is not just the mobilization of property toward rent-enhancement that both produces and spatially manages homeless populations, but in the neoliberal era, it is specifically the mobilization of property toward one particular category of rent: class monopoly rent.

Based on a case study of Portland's Pearl District and Oldtown/Chinatown, the study empirically illustrates the conceptual value of class monopoly rent in illuminating the specific economic relationships that have underpinned the past four decades of homelessness in urban America. In doing so, the pursuit of class monopoly rent – the proportion of rent attributable to rent-seekers (e.g., developers, investors, landlords, the local state) collaborating rather than competing to simultaneously limit supply and enhance demand in particular housing submarkets – is shown to be notably more prevalent and varied in its manifestations than previously acknowledged. The study identifies certain governing coalitions and disciplinary mechanisms centered on such collaborative strategies in the context of redeveloping the Pearl District, what we hypothesize as a homeless-producing and managing form of class monopoly rent.

In conjunction with investors and local government, the pursuit of class monopoly rent by rent-seekers is shown to be directly implicated in driving-up property values to premium levels, and exacerbating the city's homeless crisis, ironically, in the very prime spaces of redevelopment most threatened by the visible presence of this crisis. It is in this context that the study implicates class monopoly rent as a strategy of controlling where (visible) homeless bodies can and cannot be in the city. Drawing on the case of the struggle to relocate the "Right Too Dream Too" homeless encampment from its long-time location in Portland's Oldtown/Chinatown, developers have routinely pooled their resources to strong-arm the city government with threats of legal action as a means of controlling the outcome of the relocation process. We conceptualize the revenue that is saved by doing this (i.e., the funds sunk into the lawsuits being treated as an investment) as a particular form of class monopoly rent.

In the process, the study widens the scope of land rent theory by deepening our understanding of the underlying causes of homelessness in the USA and beyond, particularly in a neoliberalized land market system structured by the restless pursuit of class monopoly rent. It also indicts the decisions of private sector actors as culpable in the worsening plight of the homeless at a time when such actors are frequently revered by civic elites as benevolent

saviors. The study concludes by discussing the implications of this analysis for property law and housing policy.

#### HOUSING SUPPLY AND PRICE IMPACTS OF UPZONING IN SEATTLE, WA

Abstract ID: 186

Individual Paper Submission

PARKER, Madeleine [University of California Berkeley] [madeleine.parker@berkeley.edu](mailto:madeleine.parker@berkeley.edu), presenting author

Strict land use regulations in cities across the United States have perpetuated supply constraints and high housing costs. Many cities have recently begun a process of upzoning, increasing allowable densities for housing, with the goal of boosting supply and reducing costs. This paper examines the nature and strength of upzoning’s impacts on housing supply and prices across different kinds of neighborhoods in Seattle, WA.

An ongoing debate surrounds the impacts of upzoning on housing supply and affordability. A recent study in Portland found that upzoning in the early 2000’s led to increased development density and housing supply (Dong 2021). Many scholars believe that new market-rate construction will ease housing prices in the long run (Been et al. 2019). On the other hand, research in the short-term found that upzoning in Chicago resulted in increases in land values and little new construction in its first five years (Freemark 2019). Some scholars note that the context in which upzoning occurs has important implications for its impacts (Manville et al. 2020). Others have advocated for universal upzonings, which would likely shift development to hotter markets with higher rents and house prices (Wegmann 2020). The exact nature and strength of upzoning’s impacts in different parts of a city remains an open question.

This paper uses the case of Seattle to examine the effects of upzoning on property values and housing supply, across different neighborhood types. In the 1990s, the City of Seattle began to target new multi-family housing development to over 30 designated “Urban Villages” across the city. Seattle provides a useful site for this research, as it allows examination of the impacts of upzoning over a relatively long time horizon and across different types of neighborhoods. I use a combination of spatial and econometric analysis to examine the impacts of Urban Village rezoning policies on housing prices and supply. The combination of longitudinal data and clearly defined treatment areas allows me to use econometric methods to assess the effects of upzonings on housing supply and prices at both the parcel and neighborhood levels, using cluster analysis to distinguish different neighborhood types.

This research holds significant implications for the understanding of housing availability in US cities and trends in inequality. As the housing affordability crisis continues to grow, an increasing number of cities are looking to upzone

neighborhoods. This research contributes to the discussion by providing new insight into the impacts of upzoning on housing supply and prices.

#### **NEW YORK CITY'S LIHTC YEAR-15 PRESERVATION PROGRAM: WHO, WHERE, AND WHY**

Abstract ID: 223

Individual Paper Submission

KIM, Euna [Cornell University] ek683@cornell.edu, presenting author

Year 2020 was a somber year, not only because of the COVID pandemic, but also, as the dawning of a Low-Income Housing Tax Credit (LIHTC) expiration crisis. Since 1990, LIHTC properties have been under a 30-year affordability restriction period (15 years of compliance period and 15 years of extended-use period), making year 2020 the first year in which some LIHTC properties will be released from this affordability restriction. The increasing affordability expiration of LIHTC units will further challenge state and local governments to balance limited resources between preservation and new construction of affordable housing (Reina, 2018; Schwartz and Meléndez, 2008). Faced with this challenge, it is important to better understand who and where to direct assistance to yield the most out of limited funds. By examining New York City's LIHTC Year-15 Preservation Program, this paper answers three questions: Who are the participating owners? Where are the participating properties located? And why do these owners participate?

There has been rising interest in the preservation of subsidized housing, many specifically focusing on LIHTC (Aurand et al. 2018; Black 2017; Deng 2020; Schwartz and Meléndez 2008). Deng (2020) recently looked into the case of Detroit and pointed out the various actors playing roles in the preservation of LIHTC properties, of which, the City of Detroit was one. Building upon this study, my paper will further shed light on the impact city governments have in preserving LIHTC properties through the examination of NYC's LIHTC Year-15 Preservation Program.

LIHTC was first introduced in 1986 as a dollar-for-dollar tax reduction program with an affordability restriction of 15 years. In 1990, federal law mandated an additional 15 years, extending the affordability period to a total of 30 years, with some states enforcing longer mandatory restriction periods. Although the mandatory affordability restriction period is extended to 30 years, the tax credit benefits are fully collected by year-15, making it common for ownership restructuring to occur at this time, often requiring capital improvements (Deng 2020; Schwartz and Meléndez 2008). Year-15 has been well recognized by many scholars as a critical point that has long-lasting impacts on the future viability of LIHTC properties (Aurand et al. 2018; Black 2017; Deng 2020; Schwartz and Meléndez 2008). In line with this recognition, NYC has implemented LIHTC Year-15 Preservation Program since 2008, which assists financial repositioning and physical improvements for LIHTC properties reaching its year-15. However,

because this is a voluntary program, not all LIHTC properties opt-in.

The focus of this study is to compare owners who do and don't participate in NYC's LIHTC Year-15 Preservation program; identify where participating and not participating properties are located; and understand the factors that contributed to the owners' decisions. By using data from the National Housing Preservation Database, CoreData.nyc's Subsidized Housing Database, American Community Survey (ACS), and New York City Housing and Vacancy Survey, I compare owner profiles, local housing markets, and neighborhood characteristics, using descriptive statistics. I then map the locations of the properties using GIS software, showing the spatial distribution of participating and nonparticipating properties. Finally, I analyze the factors contributing to the opt-in decisions using logistic regression. Through spatial and statistical analyses, the strengths and limitations of the NYC LIHTC Year-15 Preservation program are identified, and I propose recommendations for a more effective low-income housing preservation policy.

## THE ROLE OF INDIVIDUAL LIFE-CYCLE, PARENTAL, AND NEIGHBORHOOD FACTORS IN MILLENNIAL HOUSING TRAJECTORIES

Abstract ID: 236

Individual Paper Submission

LEE, Hyojung [Virginia Tech] [hyojunglee@vt.edu](mailto:hyojunglee@vt.edu), presenting author

MYERS, Dowell [University of Southern California] [dowell@price.usc.edu](mailto:dowell@price.usc.edu), co-author

Millennial homeownership is a topic that has attracted extensive attention but has left many questions remaining, perpetuating widespread confusion and misunderstanding. The stereotypical image of Millennials as urban renters has been prevalent in public discourses, ignoring the fact that they are comprised of diverse backgrounds (Frey 2018; Moos, Pfeiffer, and Vinodrai 2018). Also, the fixation on Millennials as a fixed age group has distracted from their true life-cycle advancement. While the financial crisis of 2007–2008 and its subsequent recessions had delayed the Millennial generation's transition into adulthood, new evidence suggests that their advancement into homeownership and a suburban life accelerated in recent years (Myers, Lee, and Simmons 2020; Lee 2021). Although these studies have contributed to debunk the myth of Millennials' avoidance of homeownership and their permanent urban preference, the diverse and uneven pathways of Millennials in their housing career and potentially associated factors have been less investigated.

Key questions to address are the privilege divisions within Millennials, and how that shapes their outcomes in their

30s. This includes differences by race/ethnicity, educational attainment, and marital status, and according to their parental economic resources. We also seek more qualitative detail about their residential mobility and neighborhood destinations than simply city/suburb, a major limitation of previous literature.

To address this research gap, this paper first analyzes trajectories of Millennials in their housing career using various data including American Community Survey (ACS) and Panel Study of Income Dynamics (PSID). In doing so, we measure housing the status of Millennials not only by conventional quantity measures (e.g., household formation, homeownership) but also by additionally considering qualitative measures (e.g., short- and long-distance moves, single-family rentals, neighborhood quality). With broad contours identified, we then examine the role of individual life-cycle, parental, and neighborhood factors in those pathways using the confidential version of the PSID data from 1999 to 2019. Among individual factors, particular emphasis is given to the lagged effects of life-cycle events such as getting married and having children as these can substantially change the demand for housing immediately or later. Also, the response to the changing housing demand can differ across people with their different backgrounds and capacities, and parental resources can be one of the major determinants of their housing choice, potentially leading to growing inequality among Millennials (Charles and Hurst 2002). From this perspective, we examine how parental wealth, educational attainment, and homeownership are associated with children's housing trajectories in terms of homeownership and neighborhood quality.

Using nationally representative and longitudinal data, the findings of this paper will complement previous literature and deepen our understanding of the association between Millennial housing achievements and individual, parental, and neighborhood factors. The findings ultimately provide insights for making better policy decisions addressing issues related to Millennial homeownership.

There are three features of the research that may hold particular interest for planners. First, the influences of local housing market conditions are examined by using key housing market metrics such as housing affordability and price indices. Second, the study will explore how key associations vary across different metropolitan areas and/or across different periods, and, thirdly, the study examines the perpetuated or expanding inequality of Millennials with particular access (or lack thereof) to key resources that shape Millennial housing trajectories.

#### ACCESSIBILITY AND SPATIAL EQUITY OF EMERGENCY MEDICAL SERVICES FOR SUBSIDIZED HOUSEHOLDS IN SEOUL, KOREA

Abstract ID: 244

Individual Paper Submission

JEON, Junehyung [Hanyang University] koa86@hanyang.ac.kr, presenting author

WOO, Ayoungh [Hanyang University] ayounghwoo@hanyang.ac.kr, primary author

Beyond the creation of affordable housing units, the provision of suitable living environments for marginalized households has been a significant consideration among planners and policymakers. Despite many studies exploring various socioeconomic environments, particularly in terms of education, job, and transportation opportunities, for subsidized households living in public housing, we have a limited understanding of whether subsidized households have suitable environments for accessing adequate medical services in the neighborhoods. Since medical services have a direct impact on individual quality of health life (Arcury et al., 2005; Dai, 2010; Doeksen, 1998), the Korean government has implemented various welfare policies such as medical expense support, health insurance fee reduction, and free health check-ups for vulnerable households. Although there is a growing concern regarding various health issues (e.g., physical activity, walkability, etc.) for neighborhoods where subsidized households are located (Osypuk and Acevedo-Garcia, 2010; Woo & Kim, 2016), there are still limitations and knowledge gaps related to the associations between the spatial location of subsidized households and medical service accessibility.

This study explores the accessibility and spatial equity of Emergency Medical Services (EMS) for subsidized households in Seoul, Korea. We employed a binomial logistic regression model to empirically examine the relationships between the location of public housing and emergency medical services accessibility in Seoul, Korea. Additionally, this research stratified public housing into the long-term rental public housing (e.g., housing units for extremely low-income households) and the short-term rental housing (e.g., housing units for young people, newlyweds, and single-family household) to specify how the EMS accessibility in neighborhoods differs across housing types. Based on a real-time route guidance API service, we estimated the EMS accessibility by calculating the travel time from the centroids of the census block to each emergency medical facility and employing the modified 2-step floating catchment area model. The findings showed that the location of public housing has limited access to medical service opportunities, particularly in terms of the accessibility of primary medical and the EMS services. Furthermore, we found that the relationships between the location of public housing and medical services accessibility varied across the types of public housing. There was difficulty in accessing primary medical facilities and public transit systems for subsidized households living in the long-term public housing units. On the other hand, the short-term rental housing was located in neighborhoods where subsidized households have limited access to EMS services and walkable amenities. The results of this study may be helpful in empirically grasping the spatial accessibility of primary and emergency medical services for subsidized households. Furthermore, our findings may shed light on developing tailored policies for residential location selection and neighborhood built environment improvement for the realization of spatial equity for the vulnerable.

#### ETHNORACIAL HOUSING STABILITY DURING COVID-19

Abstract ID: 308

## Individual Paper Submission

WONG, Karna [University of California Irvine] karna.wong@uci.edu, presenting author  
GONZALEZ, Silvia [UCLA] sil.rgonzalez@ucla.edu, co-author  
ONG, Paul [UCLA] pmong@ucla.edu, co-author

Our research explores the implications of the coronavirus pandemic (COVID-19) for ethnoracial homeowners' precarious road to housing stability in the United States. We analyzed data from the U.S. Census Bureau's Household Pulse Survey, which collects information regarding COVID-19. We analyzed data from the U.S. Census Bureau's Household Pulse Survey, which collects information regarding COVID-19. We pooled 6 weeks of data for the nation, which produces a sample of 719,387 homeowners who either owned their home or apartment free and clear or owned with a mortgage or loan. We constructed logistic regression models for three groups of homeowners to assess factors contributing to their housing stability or ability to pay their mortgage. Our results indicated that an average of 8% of homeowners struggled to pay their mortgage. An average of 41% of homeowners deferred their last month's mortgage, and 62% were concerned about their next mortgage payment. We found that Blacks and Hispanics had a greater likelihood of struggling to pay their mortgage and deferring payment. These groups, in addition to Asians, had a greater likelihood of being concerned about their ability to pay their next month's mortgage. These alarmingly high numbers foreshadow another housing crisis, and similar to the Great Recession, communities of color will be disproportionately affected.

## REDUCING LOCAL IMPEDIMENTS TO ESSENTIAL HOUSING CONSTRUCTION: A MULTI-METHODS ANALYSIS

Abstract ID: 322

Individual Paper Submission

LANDIS, John [University of Pennsylvania] jlan@design.upenn.edu, presenting author

This paper, the first of a two-paper set prepared for the Lincoln Institute of Land Policy, takes a multi-methods approach to identifying key impediments to essential new home production among all U.S. metropolitan areas with more than a half-million residents. The paper makes new contributions in four related areas. First, it measures the sufficiency of new home production as the ratio of new homes constructed in each metropolitan area between 2000 and 2019 to metro area job growth during the same period. This housing unit change-to-job change (HCJC)

ratio serves to normalize the flow of new supply by the principal source of metropolitan-level housing demand: job growth. Nationally, this ratio stands at 1.14, but among individual metro areas it ranges between 137 in Birmingham and 0.3 in Fresno. Metro areas in which this ratio exceeds 1.5 are identified as relative “over-producers,” and those in which it is less than 0.8 are identified as relative “under-producers.” Second, using the HCJC ratios identified above, it develops a series of regression models which are used to identify key factors associated with leading and lagging housing production levels. These include local land supply constraints, excessively stringent planning and development regulations, construction cost differentials, hyper economic activity, and demographic-based housing market segmentation. Third, building on the results of the statistical models, this paper reports on the results of a national Qualtrics survey conducted in early 2021 that asked respondents to identify the sources and severity to housing construction in their metropolitan areas. Uniquely among such efforts, the same survey was administered to a local homebuilding associations and to the primary public planning agency in each metro area. This innovative sample frame allows us to identify the housing construction impediment areas in which local producers and regulators agree and disagree. Last, this paper reports on the results of a series of focus groups composed of the survey respondents (above) that enabled them to react and respond to the survey results, and to provide further clarification regarding the importance of particular impediments and to suggest potential ways they might be productively removed. Among the key impediments to expanded housing production identified by the statistical analysis are: (i) the existence of an inconsistent and easily interrupt-able land supply “pipeline,” especially in metro areas experiencing continuous and high-end job growth; (ii) the existence of too many small local governments, creating a sort of “tragedy of the commons” when it comes to not accommodating additional housing supply; and (iii) and an overly discretionary entitlements process which allows anti-development actors excessive influence in the development permitting process. Among the significant impediments to suburban housing construction identified by the survey respondents are difficulties rezoning land for multi-family projects, and process rather than performance-based environmental impact assessment procedures. In addition to difficulties getting variances to allow for multi-family and higher-density housing projects, among the significant impediments to infill housing identified by the survey respondents are getting community and neighborhood groups to sign-off on any project they regard as too large or different.

#### VALUE OF COMPACT AND ACCESSIBLE BUILT ENVIRONMENT: A COMPARISON OF TRANSPORTATION EXPENDITURE BETWEEN ASSISTED RENTER HOUSEHOLDS AND UNASSISTED LOW-INCOME HOUSEHOLDS

Abstract ID: 359

Individual Paper Submission

YANG, Xinyuan [University of Florida] poppyyang@ufl.edu, presenting author

Housing and transportation are the first- and second-largest budget items for most American families in metropolitan areas (Lipman, 2006). Previous evidence suggests that there is a tradeoff between housing costs and transportation expenditures (Lipman, 2006). Many families that live in lower-cost housing are likely to spend more

on transportation than housing. Housing assistance reduces the rent burden of assisted tenants. In this case, the impact of housing assistance on household travel decisions is still unknown and it is uncertain whether assisted renter households increase household transportation budget. This uncertainty can cast doubt on the issue that to what extent the documented benefits of a compact and accessible built environment, including reduced driving, increased transit use, and decreased energy consumption (Cao, Handy, & Mokhtarian, 2006; Ewing & Cervero, 2017), apply to assisted renter households. This study aims to examine whether the trade-off between transportation and housing expenditure holds true among assisted renter households by examining empirical evidence regarding the impacts of neighborhood built environment on assisted renter households' transportation cost.

This study derives variables mainly from American Housing Survey (AHS) 2013, and focuses on the national sample that was assigned the topical module on public transportation and walkability and was living in the urban areas. AHS is the only data source that surveys subjective observation of housing and neighborhood, as well as household transportation expenditures, in HUD's largest rental assistance programs. Assisted renter households refer to HUD-assisted households, living in public housing and privately owned subsidized housing, or receiving housing vouchers. Unassisted renter households are defined as income-eligible households for HUD housing subsidies, having household income less than HUD's low-income limit, yet were not subsidized at the time of the survey. Means and proportions comparisons, as well as effect size, are introduced to examine the discrepancies between assisted and unassisted low-income renter households on neighborhood and regional built environment, and transportation expenditure. Additionally, a series of multilevel models are designed to assess the impacts of regional and neighborhood built environment on household transportation expenditures, as well as its differences between assisted and unassisted low-income renter households, after accounting for the influence of household socio-demographic characteristics and housing unit features. The results will suggest the connection between compact development and transportation expenditures of assisted renter households. More importantly, the results will imply whether built environment elements have different impacts on household travel costs, given the distinctions in housing assistance status between households. The study will highlight built environment elements of significance for assisted and unassisted households.

The findings are expected to improve our understanding of assisted low-income renter households, especially the influences of locational outcomes on household transportation expenditures. The findings will have some implications on affordable housing policies: it will be discussed whether the current policy initiatives for the physical planning of affordable housing development are consistent with our findings, and have a priority on the elements of significance. In addition, through the analysis of differential effects of built environment elements on household travel costs between assisted and unassisted households, the findings will contribute to an understanding of the possible changes in household travel expenditure as a result of housing subsidies. These findings will provide a basis for affordable housing and transportation planning practitioners to better address the issue of locational affordability, which considers both housing and transportation expenditures, and to improve the overall well-being of disadvantaged populations.

SABOURI, Sadegh [University of Utah] sadegh.sabouri@utah.edu, co-author  
AMELI, Hassan [University of Utah] s.hassanameli@outlook.com, co-author  
YANG, Wookjae [University of Utah] wookjae.yang@utah.edu, co-author  
KIANI, Fatemeh [University of Utah] nedakiani1369@gmail.com, co-author  
KIM, Junsik [University of Utah] junsik.kim@utah.edu, co-author

When it comes to affordability, what counts is not housing costs alone but the combination of housing plus transportation costs (H+T). If transit-oriented developments (TODs) do, in fact, command higher rents due to increased transit accessibility, this creates an issue of social equity, especially if higher housing costs are not offset by transportation-related cost savings.

No study, to our knowledge, has quantified the effect of transit-oriented developments on location affordability using the H+T framework. Further, only a few studies have examined housing prices for TODs while controlling for transit-proximity effects (Duncan, 2011; Mathur and Ferrell, 2013). No one has sorted out these two countervailing effects in the context of TOD to determine (1) which effect is dominant and (2) whether the two together meet standards of affordability for H (30% of household income), T (15% of income), and H+T together (45% of income). In this study, we intend to fill this gap in the literature.

We first compiled a complete (100%) inventory of free-standing TODs adjacent to rail stations (i.e., commuter rail, heavy rail, and light rail stations – excluding regions with only one single rail line) in the U.S. This is the first such compilation since the Cervero and coauthors produced their TCRP 102 report back in 2004, which was incomplete. We contacted all transit operators, metropolitan planning organizations, and major cities in rail-served metropolitan areas to get a list of potential TODs based on eight criteria: (1) adjacent or nearly adjacent to rail stations, (2) dense and multistory, (3) mixed-use with residential and commercial, (4) pedestrian-friendly with public space, (5) built after rail opened, (6) largely built out, (7) with their own parking facilities, and (8) master-planned. We created a list of 187 TODs in 26 regions across the U.S. To verify our initial list of potential TOD projects, we then reviewed candidate projects to see if they meet the criteria using Google imagery. Overall, among 187 potential developments, we identified 85 TODs across the country that clearly meet our criteria. More than half of the developments in our list were excluded as being under construction.

We then identified all apartment projects by name, checked websites for rent levels, interviewed property managers, and established rent levels for market-rate and below-market-rate affordable housing (if available) for all apartments within these TODs. Our results show that rent levels for market-rate housing are generally affordable for moderate-income households (i.e., households earning 80% of the area median income), but not affordable for low-income households (i.e., households earning 50% of the AMI).

Interestingly, more than 35 TODs have at least a subset of below-market-rate housing units. We conducted semi-structured interviews with property managers to learn what public policy instruments (regulations and subsidies) were used to induce developers to provide affordable housing for low-income households. We found that various mechanisms have been used to provide affordable housing, including inclusionary zoning, density bonuses, local

subsidies, and development agreements.

We then, for seven selected TODs, conducted late-night parking counts and intercept surveys of apartment dwellers coming to and from their buildings to determine T costs. In principle, the T costs are estimated from auto ownership, estimated miles driven per day, standard auto operating costs, and transit fare and utilization levels. Our results show that the transportation costs are less than 15% of household income for low-income households. Summing H and T costs, we found that TODs providing market-rate rents are still affordable only for moderate-income households. Thus, if TODs are to be affordable for low-income households, some mechanism must be in place to lower rent levels to low-income standards.

## **AN AFFORDABLE HOUSING POLICY THAT WORKS A REVIEW OF THE ACCESSORY DWELLING UNIT ORDINANCES IN SOUTHERN CALIFORNIA**

Abstract ID: 377

Individual Paper Submission

BAEK, So-Ra [California State Polytechnic University, Pomona] sbaek@cpp.edu, presenting author  
GARCIA, Brian [California State Polytechnic University, Pomona] bpgarcia@cpp.edu, co-author  
KIM, Dohyung [California State Polytechnic University, Pomona] dohyungkim@cpp.edu, co-author  
WEN, Frank [Southern California Association of Governments] WEN@scag.ca.gov, co-author

Southern California requires at least 1.3 million new homes within the next decade (Southern California Association of Governments, 2020). One housing type that offers potential for more affordable housing is the accessory dwelling unit (ADU). An accessory dwelling unit is a detached or attached independent housing unit with a kitchen and bathroom usually sited on a lot behind a primary dwelling unit. While these have existed in the form of garage conversions and other types before, ADUs are expanding across Southern California due to state support with Assembly Bill 2299 and Senate Bill 1069 (Bennett et al., 2019). ADU building permits increased from 6,000 in 2018 to 15,000 in 2019 (Chapple et al., 2020a). However, the academic literature on accessory dwelling units remains scant.

This paper represents a three part inquiry including a literature and best practices review, a collection and analysis of ordinances for ADUs to determine restrictions and opportunities in the individual member city of the local metropolitan planning organization (MPO), Southern California Association of Governments (SCAG) and then finally a geographic case study approach that measures ordinances against census data and ADU permits to gauge their effectiveness at promoting ADU delivery.

A literature review identified key factors in ADU affordability, including the pre-existing ownership of land and inexpensive construction costs for small wood housing units. However, a lack of financing and loan models for ADU type construction currently exists. We determined from the literature review three main strategic categories to address to increase ADU production including, greater leniency in urban design requirements including setbacks, increasing planning aid through professional expertise and financial aid that caters for small projects like ADUs.

From a search through 192 SCAG municipal members we collected 96 updated municipal ordinances and performed a thorough analysis of 68 local ADU ordinances to determine key regulatory restrictions that could be modified for greater ADU construction. While it was found that most municipalities of the SCAG adhere closely to the state prescription, we identified several urban design restrictions that could be reduced, including parking requirements, setbacks and providing ADUs in additional land use zones.

We measured these more lenient scenarios found with census data and ADU permit issuance across a sample of the SCAG members to determine how the ordinance design compares with the ADU production. Sample cases were determined based on permit issuance and previous case study research on ADUs in California (Chapple et al., 2020b). A mixed-methods model for gauging the impacts of ordinances is suggested and provided in this paper. Ordinance design was found to be part of a greater context of socio-economics that promote or discourage ADU delivery.

Southern California's ADU proliferation was found to be more egalitarian than other Californian regions, with construction occurring across a middle income geography (Chapple et al., 2020a). However, this must be supported and maintained in order to provide people with housing in places they want to live. This paper provides an understanding of ADU delivery for greater affordable housing provision across California. California's struggles are not unique and the conclusions of this paper offer insights for other places to design ordinances that work to deliver affordable housing.

#### **TENSIONS BETWEEN STATE HOUSING LAW & LOCAL IMPLEMENTATION IN ORANGE COUNTY, CALIFORNIA**

Abstract ID: 384

Individual Paper Submission

REYES, Alejandra [University of California Irvine] lreyesru@uci.edu, presenting author

Particularly in suburban areas, local land use controls throughout the United States have historically hindered multi-family and rental housing production, leading to pressing issues, such as unaffordability and segregation (Pendall, 2000; Freund, 2007). Recognizing this, California passed the Housing Element Law (HE) in 1969, mandating that all counties, cities, and towns plan for the housing needs of all residents. Local governments must thus assess local

housing needs and develop inventories of available sites for housing development, analyses of public and private constraints hindering housing development, and programs to reduce such constraints. Nonetheless, they rarely meet their Regional Housing Needs Allocations (RHNA). Furthermore, in the 2010s, 42% of the state's affordable housing units were built in high-poverty and highly segregated census tracts, while only 6% of them were built on the highest resourced census tracts. Within Southern California, Orange County is a diverse but segregated region; coastal and southern jurisdictions are significantly more affluent than northern and inland ones. Yet housing is generally unaffordable throughout the county – even more so than in Los Angeles County. Only 25.6% of OC households can afford a median priced home, compared to 31.4% in the state. Likewise, of the RHNA goals set for the 5<sup>th</sup> (2013-2021) HE cycle, OC has only met 6.5% of its very low-income housing goal, 17.2% of its low-income housing goal, 18.4% of its moderate-income housing goal, and 150.6% of its above moderate-income housing goal.

Given important differences between OC jurisdictions, this research 1) evaluates their efficiency to promote affordable housing production during the current HE cycle, and 2) gauges the influence that recent state and assembly bills have had in the revision process of HEs for the upcoming 8-year cycle. In 2017, SB-35 created consequences for failing to meet local housing targets and AB-1397 now requires localities and counties to ensure that proposed development sites have a demonstrated potential for development. Since 2019, AB-686 also pushes local governments to site low-income housing in high-opportunity neighborhoods and grants the California Department of Housing and Community Development increased oversight capacity. Also since 2019, SB 330 limits some jurisdictions' abilities to restrict housing development due to their failure to meet their RHNA goals. Most jurisdictions in Southern California fit such description.

To address the first research query, this research is contrasting OC jurisdictions' 1) 5<sup>th</sup> cycle RHNA goals by income category, 2) applications received for residential development by income category, 3) permits granted per income category, 4) site inventories to accommodate shortfall housing need, 5) socioeconomic, ethnic, and racial shifts, and 6) shifts in housing costs and burdens for owners and renters. Site inventories are not readily available. Thus, this analysis includes the search or request of 1) 5<sup>th</sup> cycle HE sites for OC's 34 jurisdictions; examines 2) whether they have been developed or approved for development, and 3) their development suitability; and will compare 4) 5<sup>th</sup> to 6<sup>th</sup> cycle sites when they are published later this year. Housing advocates in other California regions are using similar strategies to assess sites' development potential. This research is also partnering with local housing advocates, such as the Kennedy Commission and People for Housing OC, to document HE town hall meetings, strategies, and procedures throughout Orange County. The practical goal of this research is to elucidate best and worst practices in promoting affordable housing production in suburban Southern California to inform future policy and decision-making.

#### **ENFORCING UNEQUAL EXCHANGE IN RENTAL HOUSING SUBMARKETS: AN INVESTIGATION OF HOUSING QUALITY, RETALIATORY EVICTION, AND REGULATORY PREEMPTION IN MADISON, WISCONSIN**

Abstract ID: 397

Individual Paper Submission

SIMS, J. Revel [University of Wisconsin-Madison] revel.sims@wisc.edu, presenting author  
CLAYBAUGH, Trent [University of Wisconsin-Madison] claybaugh@wisc.edu, co-author  
MITCH, Mitch [University of Wisconsin-Madison] mitch@wisc.edu, co-author

Recent scholarship on eviction has raised important questions regarding the generative forces that produce eviction-based displacement. For example, while it is understood that most evictions occur due to non-payment of rent, research has shown that other factors such as race, household composition, and proximity to development are additional sources of discriminatory and spatialized causality. A smaller subset of the emergent eviction literature argues that eviction may also serve the strategic interests of specific types of property owners and management companies who use eviction filings to enforce various forms of insecurity and, in particular, lower quality housing conditions. We investigate this question through a parcel-level analysis (n=1024) of eviction filings between 2010 and 2017 and housing quality data in the form of registered complaints to code enforcement and follow-up inspections resulting in short-term, intermediate, and long-term corrective orders and abatement procedures that were opened by the City of Madison between March 2010 and May 2017. After controlling for factors commonly associated with housing insecurity, we use a series of negative binomial regression models to show that within the universe of housing units with complaints that were originated by residents, eviction filings are a consistent, statistically significant predictor of corrective orders and specific housing conditions such as mold and infestation that are known epidemiological threats to health. Second, through logistic regression models and time series analysis we show that the probability of an eviction filing increases progressively after complaints are registered and corrective orders are issued. Together, the findings demonstrate the existence of conditions of unequal exchange in rental housing submarkets where housing quality is reduced through the threat or effect of retaliatory eviction. Lastly, we argue that renters in Madison are not ignorant of their collective vulnerability as demonstrated in a measurable reduction in resident-originated complaints following the commencement of legislation that preempted local municipalities in Wisconsin from conducting routine code enforcement inspections of residential housing units.

#### MOVING AWAY FROM EXTREME HOUSING COST, WHERE DO PEOPLE GO? THE CASE OF THE BAY AREA REGION

Abstract ID: 409

Individual Paper Submission

COMANDON, Andre [University of Southern California] comandon@usc.edu, presenting author  
RODNYANSKY, Seva [Occidental College] srodnyansky@oxy.edu, co-author  
BOARNET, Marlon [University of Southern California] boarnet@price.usc.edu, co-author

Increasing housing cost in expensive cities around the globe has caused higher rates of houselessness, crowding, and unhealthy housing environments. A logical outcome, in the absence of protections like rent control and investments in affordable housing, is migration to less expensive housing markets, if displacement does not force

that decision (Diamond et al., 2019). Where people move to, however, is crucial to understanding the long term welfare implications of high housing cost and residential mobility (Goetz & Chapple, 2010). Economic insecurity will only follow if people face higher commute times, have fewer job opportunities, and move to neighborhoods that are declining or outpricing them again.

In this paper, we analyze migration patterns within and out of the Bay Area, the region with the highest median housing cost in the United States. The analysis focuses on the relationship between the Zip Code rate of out-migration and the characteristics of movers' origin and destination places. While the causes of moves are challenging to measure, the characteristics of the neighborhoods producing high levels of moves shed light on the possible underlying processes (Zuk et al., 2018). Migrants' attributes provide further clues that give the migration patterns greater substantive implications, from increased inequality and segregation in the sending and receiving communities to longer commutes (Schafran, 2018).

We combine data from the Census Bureau and California Franchise Tax Board (FTB) for the 11-county Bay Area region to examine the characteristics of Zip Codes with the highest number of filers who moved out relative to the resident population. The FTB data includes information on location (Zip Code), adjusted gross income, number of dependents, and age for all residents of the Bay Area counties who filed at least once between 1995 and 2015 and continued to file regardless of location. This allows us to identify when filers moved from the Bay Area to anywhere else in the country. We use this information to classify the types of moves (e.g. high vs low income, intra-municipal vs inter-regional move). We then match those patterns to the characteristics of the sending and receiving Zip Code using the Census Zip Code Tabulation Area data for 2000 and 2010.

We find that as the income of Bay Area residents increased, an growing share of movers out of the region were lower income. We also show that despite the high cost of housing, most moves are local. Residents in the neighborhoods labelled as gentrifying tend to move to an adjacent Zip Code rather than outside the region. In addition to local pressures on moving, the existence of a viable alternative appears to drive migration. This produces clear pairings between high-cost cities and the cities directly connected to them via freeways, even when those cities are far away.

#### HOUSING MARKET RESILIENCE IN LARGE AMERICAN METROPOLITAN AREAS: A COMPARISON OF HOUSING MARKET PERFORMANCE IN THE 2008 GREAT RECESSION AND THE COVID-19 PANDEMIC

Abstract ID: 443

Individual Paper Submission

DONG, Hongwei [California State University, Fresno] [hdong@csufresno.edu](mailto:hdong@csufresno.edu), presenting author

In the past 15 years, the housing markets in the United States experienced two major external shocks: the 2008 Great Recession and the COVID-19 pandemic. The housing markets behaved very differently. Housing prices dropped sharply in the 2008 Great Recession and millions of homeowners lost their homes to foreclosure sales. The COVID-19 outbreak spurred the fears that the pandemic and the economic shutdowns would cause another housing recession in American cities. In the first few months after the coronavirus outbreak, there were numerous news stories that housing prices in large American cities such as New York and San Francisco plunged (Kadet, 2020; Paybarah, Bloch, and Reinhard, 2020). A few months later, however, the housing markets quickly emerged from its pandemic-driven freeze in spring and kept heating up in the second half of 2020 (Romen, 2020; Zillow Research, 2020).

The purpose of this research project is to measure local housing market resilience at the neighborhood (zip-code) and metropolitan levels and evaluate the geographic variations of the housing market resilience in the two shocks within and across large American metropolitan areas. The three research questions that this project attempts to address include: 1) What are the geographic patterns of housing market resilience at the neighborhood and metropolitan levels in the two shocks? 2) Are the geographic patterns consistent between the two shocks? and 3) What are the factors that explain housing market resilience in the two shocks?

To address these three research questions, we will utilize the Zillow Home Value Index (ZHVI) to measure housing market resilience in the local and regional housing markets. ZHVI is a smoothed, seasonally adjusted measure of the typical home value across a given region and housing type. The ZHVI is available in the majority of Zip codes in large American metropolitan areas since 1996, allowing us to evaluate housing market resilience in the two shocks.

We will first map the geographic patterns of market resilience in each shock and compare them. At the Zip code level, the analysis explores whether the housing markets in certain locations within a metropolitan area are more resilient. At the metropolitan level, our analysis explores whether certain types of metropolitan areas are more resilient. We will then build spatial regression models to explain what factors predict market resilience in the two shocks. The models will include explanatory variables at both the Zip code and metropolitan levels. The variables at each spatial level represent the locational and built environmental characteristics and the socio-demographic components of each local and regional housing market.

The results of this study will reveal whether housing market resilience is associated with certain locational and neighborhood characteristics, after control for other variables. We are particularly interested in examining whether local housing markets in urban and suburban areas demonstrate different levels of resilience to economic and non-economic shocks. We are also interested in testing whether the housing markets in disadvantaged communities are less resilient than the markets in well-off communities. In addition, we would like to test whether the same factors predict market resilience in the two shocks. This results of this study will help housing and real estate professionals and urban planners to understand housing market resilience and plan for future economic and non-economic shocks.

## MOBILITY PATHWAYS TO SUBURBAN POVERTY

Abstract ID: 446

Individual Paper Submission

ALLEN, Jeff [University of Toronto] jeff.allen@utoronto.ca, presenting author

FARBER, Steven [University of Toronto] steven.farber@utoronto.ca, co-author

Many urban regions have witnessed inner-city gentrification and growing concentrations of poverty in the suburbs over the past several decades (Ehrenhalt, 2012). These trends have led to concerns of polarization and segregation of urban space by class and income (Hulchanski, 2010), negative impacts caused by gentrification and displacement on individual well-being (Elliott-Cooper, Hubbard, & Lees, 2020), poor quality of low-income housing in the suburbs (August & Walks, 2018), and that living in auto-oriented suburban environments can reduce accessibility and the ability to travel to daily activities, which can further compound poverty in suburban areas (Lucas, 2012).

Existing research has described trends of suburbanization of poverty at regional and neighbourhood levels (e.g. by mapping neighbourhood changes in income or poverty rates, and showing how poverty is increasing in some suburban areas). However, it remains relatively unknown how lower-income households have agglomerated in more peripheral auto-oriented environments in recent history. Is suburban poverty primarily a result of 1) residential sorting within cities of low-income residents from central to suburban neighbourhoods (e.g. gentrification and displacement), 2) patterns of immigrant settlement in cities directed towards the suburbs, or 3) becoming and remaining poor while living in the suburbs? Understanding the propensity of these pathways would provide important knowledge regarding the urban dynamics leading to contemporary peripheral geographies of poverty concentration.

The objective of this paper is to uncover the predominant geographic pathways of being poor and living in the suburbs. We first provide a background and conceptual framework of different individual geographic pathways leading to suburban poverty. We then conduct an empirical analysis of land-use data linked with micro-data to analyze whether and how different pathways are observed within the context of major Canadian cities from 2006 to 2016. Specifically, we use a combination of census and transportation network data to create a typology of suburbanization via a hierarchical k-means cluster analysis. We then link this typology to panel data representing 20% of tax filers across Canada to examine immigrant settlement patterns and residential mobility trajectories of low-income households, grouped by typologies of suburbanization. This allows us to quantify to what extent suburban poverty stems from intra-urban residential mobility, external immigration, and remaining poor in-place. Overall, this research provides insight into the changing structure of urban neighbourhoods while also providing pertinent information to aid preventative policy aimed at reducing suburban poverty in Canada.

## LOOKING AT ONE SIDE OF THE COIN: CRITICAL ANALYSIS OF NEIGHBORHOOD DISPLACEMENT RESEARCH IN THE CONTEXT OF DISINVESTMENT

Abstract ID: 460

Individual Paper Submission

HARRISON, Austin [Georgia State University] aharrison45@student.gsu.edu, presenting author

This paper seeks to expand the scholarly conversation on neighborhood change and neighborhood displacement to include how the process of disinvestment and decline potentially leads to neighborhood displacement.

Neighborhood displacement in the context of this project is defined as the process direct or indirect forces leading to the exit of a neighborhood by a resident or household. Previous research on this topic is often contextualized in rapidly appreciating housing markets or sub-markets. There is little previous research examining ways urban shrinkage or decline and the constituent neighborhood-level events and processes that follow contribute to neighborhood displacement (Marcuse, 1985; Tighe & Ganning, 2015).

This paper intends to add necessary nuance to the neighborhood change discussion through a critical meta-analysis of recent neighborhood displacement research. Specifically grounding the analysis through the lens of disinvestment and abandonment, to discern the extent to which processes of abandonment or disinvestment-induced displacement are present in the existing literature. This research lays the foundation for a more nuanced discussion of the complex ways neighborhoods change and can assist in framing a meaningful policy discussion around ways to plan for intentional and equitable redevelopment of systemically disinvested communities.

## HOUSING AFFORDABILITY AND SELF-RATED HEALTH OF MIGRANT WORKERS IN CHINESE CITIES

Abstract ID: 489

Individual Paper Submission

WANG, Yi [University of Minnesota] wang8262@umn.edu, presenting author

Due to institutional discrimination embedded in the hukou system, migrants in China are more likely to experience housing affordability problems than their local counterparts (Huang & Tao, 2015; Wang et al., 2010; Zheng et al., 2009). Housing affordability problems such as a high housing cost burden and a lack of homeownership can lead to adverse physical and mental health outcomes (Burgard et al., 2012; Frank et al., 2006; Joint Center for Housing Studies, 2019; Manturuk, 2012; Meltzer & Schwartz, 2016). Empirical studies on migration and health show that migrant workers, on average, have better health than their local counterparts due to self-selection in the migration process (Fennelly, 2007; Chen, 2011). However, migrants' health advantage tends to diminish over time due to acculturation to the local lifestyle, continuous exposure to poverty, and inadequate access to health care and other social services (ibid.).

While the deteriorating health of the migrant population is of great policy concern, few studies have investigated how financial stress related to housing contributes to migrants' worsening health conditions as they stay longer in the host cities. Using data from the 2017 Internal Migrant Dynamic Monitoring Survey (IMDMS), this paper bridges the gap by answering the following research questions: (1) Do financial housing stress (measured by housing cost burden and homeownership) affect migrant workers' self-rated health (SRH)? If so, to what extent? (2) Does longer stay in the host city result in deteriorating health for both homeowners and non-homeowners?

Logistic regression analyses of 78,047 migrant workers in the 50 most populous Chinese cities suggest that, in general, migrant workers with higher housing cost burden tend to have worse SRH. The association is statistically significant after adjusting for work-related stressors, migration patterns, and other demographic factors. The results also show that migrant workers who are non-homeowners, on average, have better health than those who are homeowners. Further group comparison finds that the negative association between length of stay and SRH is statistically significant only for migrants who are non-homeowners. The finding implies that the lack of access to homeownership among the migrant population might have contributed to their diminishing health advantage over time. The paper calls for policy approaches that promote housing affordability and expand access to homeownership for migrant workers in Chinese cities.

#### **GROWING GRIDLOCK IN RESIDENTIAL MOBILITY: A NEW WARNING SIGN ABOUT HOUSING SHORTAGES IN U.S. METROPOLITAN AREA?**

Abstract ID: 494

Individual Paper Submission

PARK, JungHo [Chung-Ang University] untible@cau.ac.kr, presenting author

MYERS, Dowell [University of Southern California] dowell@usc.edu, primary author

CHO, Seongmoon [University of Southern California] seongmoc@usc.edu, co-author

Housing shortages following the global financial crisis have been accompanied by a new, sharp downturn in rates of residential mobility, largely among renters. The Great Recession is long over (and a COVID recession is a new handicap) but it precipitated major, lingering housing disruptions. A little recognized consequence is that local mobility declined by one-third in the U.S. from 2010 to 2019. Scholars have been very slow to address the causes and consequences of declining mobility, but in this paper the authors will draw on a three-year study that has measured shortages, observed impacts of growing housing demand by Millennials, and that has resulted in rising prices, reduced household formation and a slowdown in mobility of people adjusting their residence to meet

changing needs.

This paper proposes a new indicator of the housing crisis, mobility constriction, that measures declining housing opportunity for lack of adequate supply to make desired housing adjustments. We rank the metropolitan areas with the greatest declines in renter mobility. We also address the offsetting, small effects of rising owner mobility in the period following the Great Recession. We develop a set of metropolitan typologies to display patterns of urban area decline and we assess how these may be related to vacancy rates, new construction, growing demand, and affordability.

Analysis is performed with American Community Survey (ACS) 1-year microdata for years between 2012 and 2019, based on the question asked in the ACS on place of residence one year ago. Research is designed as an aggregated metropolitan-level analysis for the 100 most populous metropolitan areas in the U.S. Renter mobility is defined as movers within the metro who end in rental units, divided by a denominator of all local renters, exclusive of migrants from outside. That works best for analysis of the behavioral factors shaping mobility. However, for comparisons of renter and owner local movers, and to measure offsetting effects, we divide movers of each tenure by a common denominator, the number of households in the metro, exclusive of migrants.

Preliminary results find substantial differences in the metropolitan patterns of renter mobility constriction, with California and Florida metros top-ranked above the 100-metro average of  $-4.9$ . Evidence shows a strong role of diminished multifamily housing construction relative to job growth in explaining metropolitan patterns of mobility constriction. A greater prevalence of rent-burdened households in 2012 has a linkage with sharper declines in mobility in metros such as LA with 58.2% of renters cost-burdened followed by mobility decline of  $-5.5\%$  points, as well as Miami (60.2%,  $-5.5\%$  points) and Riverside-San Bernardino (59.1%,  $-10.3\%$  points).

The findings for homeownership are often opposite those for renting and suggest a substantial substitution effect between the two in metros, such as Atlanta with owner mobility increase of 1.5% points (double of the 100-metro average of 0.7%) while renter mobility decline of  $-8.8\%$ . However, greater decline in renter mobility is found when homeowner mobility is also reduced ( $r = 0.63$ ). Greater housing affordability problems appear to affect both types of movers. And mobility is more constricted in urban areas with larger concentrations of Millennials, likely due to the added competition for rentals.

Planners would do well to emphasize how the different types of housing demand are all linked together in a common fate, which is key to building support for the necessary broad housing solutions. Our findings of the sharp mobility decline at the local level, and the connections of renters and owners, both call for greater research attention to local mobility constriction. It is not only affordability that burdens households, but also the inability to move to a new home of any kind.

#### COLLABORATIVE APPROACHES TO EVICTION PREVENTION: THREE FLORIDA CASES

STROM, Elizabeth [University of South Florida] estrom@usf.edu, presenting author

Research question: How have communities used cross-sectoral collaborative processes to stand up emergency eviction prevention efforts during the COVID-19 pandemic? Cases from three Florida metro areas (Orlando, Miami and Tampa) will be examined.

Background: Evictions are a common experience of low income renters in the US, a problem recently elevated by the work of Matthew Desmond (2017). The COVID-19 pandemic pushed the problem of residential evictions to center stage: widespread and sudden job loss made households vulnerable to eviction. The usual desperation survival strategies of dispossessed households (doubling up with friends or moving to a congregate shelter) could not be done without considerable health risk.

Community/government efforts to avoid evictions during this public health crisis have taken two primary forms. The first has been the imposition of eviction moratoriums, adopted by some states and municipalities and eventually the federal government. (There are differences between moratorium orders, some are more restrictive than others). Next has been the creation of emergency rental assistance funds, also found at state and local levels but largely dependent on significant federal contributions through a series of rescue packages. These emergency funds are meant to pay rent (as well as, in some cases, utility bills and mortgages) for those who have suffered income loss linked to the pandemic (Benfer et al 2020).

While these interventions may seem straightforward, in fact they require local governments, including courts, sheriffs departments, and government agencies across sectors and municipal boundaries, to act with alacrity, creating new court processes, social service programs and application/payment systems. This requires collaboration between agencies and civic groups that may have had minimal previous contact, to be carried out while most offices were closed. This research studies three Florida communities and how they have sought to encourage cross-sector collaboration toward the goal of preventing evictions.

Methods: Qualitative research includes: Participant-observation study of regional eviction-prevention gatherings; semi-structured interviews with key stakeholders in each community across sectors (local government; social services; courts and law enforcement; tenant advocacy; landlords, etc). Written documents and media coverage will also be analyzed.

Preliminary Findings: Rapid cross sector collaboration has been facilitated when “conveners” viewed as trustworthy, credible and well-resourced take the lead. Where collaborative efforts have emerged quickly, working groups have been able to take concrete steps toward preventing evictions, with coordination between courts and social service agencies and heightened capacity for legislative advocacy. But absent appropriate “conveners” communities struggle to forge cross-sector collaboration when faced with an emergency.

Relevance to the field: This research touches on two areas of interest to planners. First, planners have become increasingly concerned with residential evictions (Immergluck 2020; Teresa and Howell 2020), not only as a feature of gentrifying neighborhoods but more generally as a marker of neighborhood instability and racial inequity. Efforts to work cross-sectorally and regionally, especially in emergencies, is a key concern in emergency/disaster planning research (van Zandt 2019).

## **MORTGAGE LENDING AND THE CONTEMPORARY REINFORCEMENT OF SEGREGATION IN THE KANSAS CITY REGION**

Abstract ID: 532

Individual Paper Submission

FRISCH, Michael [University of Missouri-Kansas City] frischm@umkc.edu, presenting author

KIMMEL, Thomas [University of Missouri - Kansas City] tkimmel@gmail.com, co-author

Structural forces have intentionally and profoundly shaped spatial, racial, and economic access in metropolitan regions. These phenomena are broadly displayed through the effects of single-family residential zoning. Historically, municipal land use planning has played a key role in the development of exclusionary single-family residential zones. The contemporary single-family zone invokes the discriminatory legacy of redlining, blockbusting, racial covenants, and exclusionary planning policy. These origins carry residual effects that continue to impact communities today (Rothstein 2017). In recent years, planning efforts and policy instruments have attempted to rectify these disparate outcomes (Manville, Monkkonen and Lens 2020). Most residential areas in the greater Kansas City region exist under single-family zoning. This begs the question, what other factors limit access to single-family homes in specific geographies?

A multitude of developmental actors and cultural ethics support single-family residential districts. Undoubtedly, the home mortgage industry is one key institutional gatekeeper to middle-class wealth-building. Does the home mortgage industry lend without discrimination? Older scholarship shows that while racial discrimination may explain disparities in the home mortgage market, homebuyer credit ratings and wealth account for larger differences in mortgage lending decisions (Munnell et.al. 1996). However, structural racism and exclusionary policies have limited wealth and credit-building effects for black homebuyers (Rothstein 2017).

Using the Home Mortgage Disclosure Act dataset for 2017-2019, we explore the impacts of mortgage lending in the Kansas City MSA on maintaining neighborhoods of exclusion. Specifically, what are the geographic patterns of regional mortgage lending by race and ethnicity? How do these patterns reinforce or break down exclusivity in residential locations? We hypothesize that mortgage lending patterns maintain patterns of segregation in Kansas City (Faber 2018, Hauptert 2019). Visualizing the geography of residential lending will assist decision-makers in supporting inclusive communities.

We limit our analysis to mortgages provided for owner-occupied homes. Not only is black homeownership much less than average in the region, but current lending rates in the Metro will lead to even lower levels of homeownership in the future. In an analysis of loans by defined financial institution “classes” (community credit union, savings bank, regional bank, national bank), we find distinct differences in lending patterns by race and geography through the time period. We find evidence of improved minority mortgage lending as well as slippage by various institutions. We find extreme differences by race and ethnicity in lending for second mortgages and home equity loans. These high rates of denial to black homeowners of home improvement capital are the visible hands of disinvestment.

This evidence suggests it is possible to break down racial barriers to residential housing capital. However, planning inclusive residential communities requires bringing mortgage lenders to the table. Building inclusive communities

requires change and accountability to both urban planning and mortgage lending decision-making.

#### **FINTECH'S IMPACT ON SUBPRIME LENDING IN IMMIGRANT GATEWAY METROPOLITAN AREAS**

Abstract ID: 570

Individual Paper Submission

HAUPERT, Tyler [Columbia University, GSAPP] [th2675@columbia.edu](mailto:th2675@columbia.edu), presenting author

LEE, C. Aujan [University of Oklahoma] [aujean@ou.edu](mailto:aujean@ou.edu), co-author

In recent years, a subset of the mortgage lending industry has been redefined by technological advances culminating in what is today known as fintech – short for financial technology – lending. Traditional mortgage lenders' application processes involve face-to-face interaction between applicants and loan officers and a set of industry-standard underwriting criteria including the prominent use of FICO credit scores, applicant incomes, and loan-to-value ratios. In contrast, fintech lenders offer all-online applications and underwrite loans by analyzing both standard borrower metrics and a vast array of 'big data' sources that undergo machine-learning algorithmic assessments designed to offer additional insights regarding applicant creditworthiness (Buchak, Matvos, Piskorski, & Seru, 2018).

Evidence suggests fintech lenders, like traditional lenders, distribute subprime loans to minority borrowers (Bartlett, Morse, Stanton, & Wallace, 2019) and neighborhoods (Hauptert, 2020) at higher rates than to white borrowers and neighborhoods. However, much of the literature measuring racial patterns in fintech lending focuses on national patterns, which precludes the identification of potential regional differences by race, ethnicity and nativity. Existing literature on metropolitan immigration patterns have revealed greater housing market volatility in established immigrant gateways relative to regions with smaller immigrant populations (Anacker, 2013) and found that race and nativity play a role in mediating credit risk across immigrant gateways (Lee & Greenlee, 2020). Building on these studies, we answer the research question: how do neighborhood-level fintech and traditional subprime lending rates vary across U.S. immigrant gateway metropolitan areas? Using 2015-2017 Home Mortgage Disclosure Act (HMDA) data, we find immigrant gateways are associated with higher rates of subprime lending than low immigration metropolitan areas. Results suggest neighborhood levels of Asian and Latinx residents mediate the relationship between subprime lending and immigrant gateways. There are also notable differences between fintech and traditional lenders. For example, traditional lenders appear more sensitive to increases in neighborhood-level Asian population in immigrant gateways than fintech lenders. Findings suggest fintech and traditional lenders assess risk differently across metropolitan areas depending on their historical patterns of immigration and shed light on the continuing importance of regional patterns of race and ethnicity in the modern mortgage market's distribution of subprime credit.

## PREPAREDNESS FOR POST-DISASTER REHOUSING OF PUBLIC HOUSING RESIDENTS (CASE-STUDY: SALT LAKE COUNTY AND PORTLAND)

Abstract ID: 596

Individual Paper Submission

KHAJEHEI, Sayma [University of Utah] sayma.khajehei@utah.edu, presenting author

CHANDRASEKHAR, Divya [University of Utah] chandrasekhar@arch.utah.edu, co-author

Public housing recovery lags behind the other residential units in the aftermath of disasters since its recovery depends on local disaster housing plans and policies. Policies decide how, when, and where public housing residents may be rehoused in the event of disasters. Research has shown that previous disaster experience is essential to recovery policymaking because it provides institutional learning in managing disasters and preparedness. However, there is not enough research examining pre-disaster recovery planning in communities in high hazard risk regions with no recent disaster experience.

There is a need for research on how at-risk but inexperienced communities prepare for the public housing recovery. This study fills this gap by examining the status of pre-disaster planning for the post-disaster public housing recovery in Salt Lake County (SL Co), Utah, and Portland, Oregon. These two regions are in two fault zones that have a high chance of being hit by a major earthquake in the next 50 years. The Wasatch region, which includes SL Co, one of the fastest-growing areas of the country, currently has a 1 in 7 chance of being hit by a 7.0 magnitude earthquake within the next 50 years. Similarly, The Cascadia Subduction Zone, which includes Portland, has a 37 percent chance of an earthquake with 7.0 magnitude in the next 50 years. According to earthquake scenario reports in each region, thousands of residential units may get affected and resulted in large numbers of the population who search for shelter immediately. Based on these scenarios, nearly 263,300 individuals in the Wasatch region and 500,000 in Oregon will be displaced in the event of an earthquake. These numbers show a requirement of a massive rehousing effort by various governmental agencies, including the Salt Lake Housing Authority, which currently manages 2,576 active housing vouchers, and the Portland Housing Authority that manages more than 3,000 public housing units and Housing Choice Vouchers (HCV).

Using Salt Lake County and Portland as case studies of unexperienced at-risk communities in terms of disasters, this study investigates how well these two at-risk communities are prepared to rehouse their public housing residents and what challenges and opportunities are to promote pre-disaster planning for the post-disaster public housing recovery in these regions. Data collection is done through a review of public housing, disaster mitigation, disaster preparedness, and disaster response plans adopted by Portland and SL Co and its constituent cities, and through 20 semi-structured, open-ended key informant interviews with local emergency management, city planning and

housing officials. Data is analyzed using Atlas.ti software to identify themes related to the motivations, challenges, and opportunities of pre-disaster planning for the post-disaster public housing recovery. Preliminary findings show that these cities are generally not prepared to provide housing to public housing residents after disasters which could result in the high number of public housing families being displaced and staying displaced in the event of an earthquake. They also have not a standalone plan for their public housing recovery. These findings call for action in at-risk communities to conduct pre-disaster planning for the post-disaster public housing recovery and to build a network with communities with experience of recent disasters to prepare joint plans with their city and county in terms of rehousing their public housing residents.

A part of this study is sponsored by the Natural Hazards Center's Mitigation Matters program, which is supported by the National Science Foundation through supplemental funding from the Federal Emergency Management Agency (FEMA).

### **HAS THE COVID-19 PANDEMIC CHANGED PEOPLE'S ATTITUDES ABOUT WHERE TO LIVE? SOME PRELIMINARY ANSWERS FROM A STUDY OF THE ATLANTA HOUSING MARKET**

Abstract ID: 611

Individual Paper Submission

KIM, Ilsu [Georgia Institute of Technology] ikim302@gatech.edu, presenting author

GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, primary author

In March 2020, the national lockdowns and social distancing mandates to contain the COVID-19 pandemic abruptly disrupted all aspects of urban life, requiring people to conduct daily activities including work, shopping, learning, schooling, and socializing, from home using online tools. These lockdowns and stay-at-home orders sharply increased unemployment and hindered active transactions in the housing market (Liu & Su, 2021). While the high unemployment rate was a serious economic and social concern affecting housing demand, monetary easing and low interest rates increased liquidity and flow of money into the housing market (Zhao, 2020). There is a growing body of work examining the overall vitality of the housing market in response to the disruptions caused by the pandemic (D'Lima et al., 2020; Liu & Su, 2021; Yoruk, 2020; Zhao, 2020). In addition, reports in popular media have highlighted trends in cities like New York and San Francisco where many households were giving up expensive central city residences for low-density suburban houses with large yards. The implication of this finding was that cities were losing their appeal given the reduction in need for commuting in a work-from-home culture and the desire for security and open space in a low-density environment in the suburbs. Despite anecdotal evidence, we know very little about how the preferences for housing in different locations are changing in response to the COVID-19

pandemic.

To address the research gap, this study explores whether and how the pandemic affected the housing preferences in the Atlanta single-family housing market. The focus lies on the impacts of accessibility-related locational characteristics on housing prices including the accessibility to the rail transit system, accessibility to freeway systems, and walkability, each of which reflect the housing market participants' attitudes toward the associated travel mode and expected travel behavior. In addition, the impacts of other locational characteristics such as the school quality and whether a house is in the inner city, inner-ring suburb, or outer-ring suburb are also examined.

The main findings from the comparison of the descriptive statistics and hedonic price models for 2018, 2019, and 2020 are as follows. First, even though the number of transactions plummeted during the second quarter of 2020, both the number of transactions and median housing price in the third and fourth quarters far surpassed those before the pandemic. Second, the price per square foot of floor area decreased holding all else constant, while the premiums for parcel size and pool increased since the pandemic. Third, the preference for inner city locations as observed pre-pandemic seem to be less pronounced. Fourth, the pandemic did not significantly reduce the premium for accessibility to the freeway and rail transit systems, *ceteris paribus*. Fifth, the premiums for population density and school quality have been on a downward trend and this was not affected by the pandemic.

Above findings suggested that the pandemic affected not only macroeconomic situations but also the preferences of housing market participants in Atlanta. However, follow up studies will be required to monitor whether these changes will last for an extended period. Purchasing a house entails deliberate consideration of the long-term expectations regarding the permanent income (Olsen, 1987), lifestyle, travel pattern, and telecommuting status of a household; keeping track of the modifications of these long-term expectations, if any, is essential in building well-informed housing, land-use, and transportation plans.

#### DOES HOUSING INEQUALITY AFFECT SOCIAL MOBILITY? EMPIRICAL EVIDENCE FROM SEOUL, KOREA

Abstract ID: 615

Individual Paper Submission

SEO, Jaewon [Chung-Ang University] [tjdjwodnjs@naver.com](mailto:tjdjwodnjs@naver.com), presenting author

JIN, Jangik [Chung-Ang University] [arcane03@cau.ac.kr](mailto:arcane03@cau.ac.kr), co-author

## Abstract

Growing income inequality is one of the important issues all over the world. As Thomas Piketty (2014) have argued that the income inequality will increase much faster in the near future because of a rise of wealth inequality, scholars have worried that the inequality due to the rise of housing prices in a large city may negatively affect social mobility, especially upward and intergenerational mobility. For the past several decades, upward mobility has been explored by focusing on the relationship between socio-economic status of parents and labor market outcomes of their children in the field of economics, public policy, education, and sociology (Rothwell and Massey, 2015; Musterd and Andersson, 2006). However, this topic has not been much explored in planning field. Only a few studies that investigate the relationship between upward mobility and neighborhood characteristics have been conducted so far with a planning perspective (Ewing, et al., 2016).

Hence, we aim to explore how the inequality of property values affects social mobility focusing on the city of Seoul, Korea. After the 1997 financial crisis, polarization and income inequality have been much discussed as important social issues in Korea because it is believed that inequality may have a negative influence on the expectation of upward mobility for individual workers. Although several previous studies that explore the relationship between the perception of social class and inequality have been conducted, our understanding of the relationship between inequality and social mobility is still limited. Like San Francisco, New York, and London, housing prices in Seoul have soared in the 2010s, which causes an increase in the level of wealth inequality. Consequently, people began to believe that the income generated by rising real estate prices is much larger than the income earned by working. Therefore, more recently growing attention has been paid to this topic, the relationship between inequality and social mobility, in Korea.

In order to investigate the relationship between inequality and social mobility, we first measure property inequality using individual housing price data of 2011-2019. Particularly, we employ the GINI index to calculate the spatial inequality of the housing prices by 25 administrative districts in Seoul. For measuring individual social mobility, we use 2011-2019 Seoul Survey Data that contain the information on the individual perception of the social mobility. To obtain a better estimation result of the effects of housing price inequality on social mobility, we employ the ordered probit panel model framework with fixed-effects of region and time. After controlling for other factors, our results show that inequality of housing prices negatively affects the perception of social mobility in Seoul. Particularly, the Seoul citizens' perception of the social mobility has decreased whereas the inequality of housing prices has increased between 2011 and 2019. In addition, findings provide evidence that female, elderly, and low-income people feel lower possibility of social mobility when they recognize the higher inequality of housing prices in their regions. Our results suggest important planning implications that housing and land use planners should mitigate the spatial inequality of housing values by adjusting land use planning as well as social housing supply. We also suggest that more empirical analysis with detailed surveys and housing prices data should be followed for resolving social inequality problems in our society.

There is a growing consensus among planners and policymakers that walkable built-environments primarily affect the individual quality of life. Walkable design features encouraging pedestrian walking behavior may provide multifaceted advantages, particularly in terms of social, environmental, and public health benefits for residents in neighborhoods. Residents in walkable neighborhoods are significantly related with more physical activity, lower transportation cost, better public health, and higher social capital, whereas those in auto-oriented settings are associated with unhealthier physical and social conditions (Frank, Schmid, Sallis, Chapman, & Saelens, 2005; McCormack & Shiell, 2011). The increasing appeal of neighborhood walkability, along with the pursuit of smart growth and sustainable developments, has contributed toward a growing demand for pedestrian-friendly design features in both developed and developing countries.

In response to various benefits of walkable environments, many previous studies have examined the associations between neighborhood walkability and surrounding property values as multifaceted advantages of walkable features may be positively capitalized into neighboring property values. Despite many studies addressing the economic impacts of walkable environments, we still have a limited understanding of how neighborhood walkability and walkable environments may be empirically measured in multiple disciplines. Elements of the 3Ds (i.e., density, diversity, and design) and the Street Smart Walk Score represented by walking accessibility to neighborhood amenities have often been essential components to empirically identify neighborhood walkability (Ewing & Cervero, 2010; Talen & Koschinsky, 2014). However, such measures of neighborhood walkability focusing on two-dimensional indicators may not account for pedestrians' visual attention to the surrounding built environments that may affect individual perception of walkability at the street level (Zhou, He, Cai, Wang, & Su, 2019). Our research addresses this gap by empirically estimating specific walkable design features along street at the eye-level that affect surrounding property values based on the deep learning approach. In that vein, this study addresses a simple question: Do walkable environments positively affect neighboring property values?

Most existing studies on the spatial impacts of neighborhood walkability on nearby housing prices are limited in terms of identifying the quality of walkable environments at the street level. This study addresses these shortcomings by exploring the impacts of walkable environments in Seoul, Korea. Based on single-family housing transaction data from 2017 to 2019, we use a spatial hedonic price method to examine the associations between neighborhood walkability and neighboring housing prices. Additionally, our analyses take account of housing submarkets to explore how spatial impacts of walkable environments differ across neighborhoods stratified by household income levels. This study specifies street walkability at the eye-level by employing deep learning approaches based on Google Street View (GSV) and semantic segmentation. We define a neighborhood as a half-mile concentric ring buffer identifying the walkable distance around each property. Based on 20 meters interval points along street networks within the neighborhoods, GSV 360° panorama images for each point through the GSV metadata Application Programming Interface (API) are obtained to analyze street-level walkability around each property. Our findings will inform planners and policymakers on how to improve walkable environments across neighborhood heterogeneity and maximize the economic benefits of neighborhood walkability.

The forty years of market reform since 1978 have profoundly changed the residential landscape in Chinese cities, with dramatic improvement of housing conditions and yet also the rise of housing inequality (Fang, Liu, Chen, 2020). In the numerous housing literature on Chinese cities, one dominant theoretical foundation has been the market transition debate regarding the changing order of social stratification during the transition from a centrally-planned economy to a market economy. Nee (1989, 1996) proposes the market transition theory that predicts shifts of power, opportunity, and incentives towards market players, whereas others scholars (Logan and Bian 1993) argued for the persistence of redistributive power that determines housing access and outcomes.

Empirical studies of housing inequality inspired by this debate have largely focused on the relative predicting effects of political privilege vis-à-vis individual affordability and preference. The evidence has rather been limited to the time period until the early 2000s, when the housing market was only emerging in most Chinese cities. More recent studies, have been limited to single-city case studies, particularly a few mega-cities, due to the lack of nationwide data.

In this paper, taking advantage of unique access to micro-data sets of most recent population census (2000, 2010) and mini-census (2015), we aim to offer a reappraisal of the changing order of housing inequality in Chinese cities since the emergence of the urban housing market. First, we aim to test whether political privilege gradually lost its predictive power in housing inequality (measured by access to homeownership and housing space) during 2000-2015. Second, we focus on the dynamic shifts of market opportunities and incentives in a market transition process, and investigate whether heterogenous effects of political privilege in different cities that vary in the share of the state sectors and the development of the commodity housing market.

## LOCATION CHOICE IN THE HOUSING CHOICE VOUCHER PROGRAM: DO PORTABILITY AND SOURCE OF INCOME PROTECTIONS MATTER?

Abstract ID: 658

Individual Paper Submission

YANG, Aram [Ohio State University] yang.4201@osu.edu, presenting author

FALLON, Katherine [Ohio Housing Finance Agency] kfallon@ohiohome.org, co-author

KLEIT, Rachel [Ohio State University] kleit.1@osu.edu, co-author

The Housing Choice Voucher (HCV) program allows recipients to find rental homes in the private market, with the goal of deconcentrating poverty among low-income households. Despite this goal, research demonstrates that HCV holders tend to concentrate in more racially and economically segregated neighborhoods, even with the support of a voucher. Two policy interventions may improve the degree to which voucher recipients can relocate to less segregated areas: portability and source of income protection laws. Portability enables recipients to move from one housing market to another by “porting” their voucher from one PHA to another. Source of Income Discrimination (SOI) protections as an element of local fair housing legislation prevents local landlords from using HCV receipt as a basis for refusing to rent to HCV holders.

To understand the impact of both portability and source of income protections, we examine the location outcomes for all the voucher holders in Ohio, where voucher holders port and a subset of local communities have SOI laws. We hypothesize that voucher holders who move using use portability to areas with SOI protections will live in less racially and economically segregated neighborhoods. We use a discrete choice model to understand the interaction of place-level and individual level factors associated with living in such locations. To measure racial and economic neighborhood segregation we use a multiscalar method that delineates varying patterns of homogeneity and spatial proximity of surrounding neighborhoods.

This study will reveal barriers in HCV usage with a particular focus on the outcomes of residential mobility of HCV recipients. We conclude by providing possible policy interventions for advancing the residential mobility of the HCV recipients with a particular focus on portability and SOI protections.

## **HEALTH, FEDERAL HOUSING ASSISTANCE, AND ECONOMIC “SELF-SUFFICIENCY”**

Abstract ID: 661

Individual Paper Submission

JARAMILLO, Atticus [University of North Carolina at Chapel Hill] [atticusa@live.unc.edu](mailto:atticusa@live.unc.edu), presenting author

The Department of Housing and Urban Development (HUD) has long supported “economic self-sufficiency” initiatives that aim to improve the employment outcomes of households who receive HUD rent assistance (Boland et al., 2000). Some have suggested, however, that these initiatives overlook the barriers to employment facing assisted households (Shroder, 2002). In particular, recent studies have emphasized that poor-health may be a major barrier to employment that is overlooked by these initiatives (Fischer, 2018; Frescoln et al., 2018; Jaramillo et al., 2020).

Limited research, however, has directly analyzed whether health is a significant predictor of employment among HUD assisted households. Thus, this paper aims to answer two research questions:

1. Is health status a significant predictor of employment among HUD-assisted households compared to other key explanatory variables?
2. After controlling for health status and other key explanatory variables, are HUD-assisted households at a significantly different odds for employment compared to non-assisted low-income adults?

To answer these questions, I will utilize a novel longitudinal dataset that combines HUD administrative data with data from the National Longitudinal Study of Adolescent to Adult Health (Add Health) – a cohort study that has tracked a nationally representative sample of adolescents as they age into adulthood. I will specifically use data from Wave IV of the Add Health study, which was carried out from 2008 to 2009. At this time, Add Health study participants were between 24 and 32 years old. This study will only focus on the low-income sub-sample of Add Health study participants, which includes 397 low-income Add Health participants who received HUD rent assistance and roughly 1,000 low-income participants who did not.

Using these data, I will answer the first research question by using the Random Forest Algorithm. Specifically, I will use this algorithm to determine whether a variety of health variables (e.g., diabetes, mental health status) are significant predictors of employment among HUD-assisted participants compared to other factors that may impact employment, such as access to a personal vehicle, education, and age. The Random Forest Algorithm will support this analysis by measuring the importance of different variables in predicting employment across multiple, randomly specified regression models.

I will then answer the second question by estimating a weighted regression that tests whether receipt of HUD rent assistance is a significant predictor of employment among all low-income Add Health Study participants. The key explanatory variable for this regression is a binary variable that indicates whether a low-income adult resides in HUD-assisted housing. The control variables will include those identified by the Random Forest Algorithm as important factors predicting employment. This regression will also utilize cross-sectional survey weights to adjust estimates so that they are nationally representative. Through these specifications, this regression model will allow me to produce nationally representative estimates of how, if at all, receipt of HUD rent assistance is associated with the employment outcomes of low-income adults.

Combined, these stages of analysis will contribute to the literature by using rigorous methods and nationally representative data to estimate how receipt of HUD-housing is associated with employment after controlling health status and other employment-related factors.

### **AFFORDABLE RENTAL HOUSING FOR INTERNAL MIGRANTS: A CRITIQUE OF THE AFFORDABLE RENTAL HOUSING COMPLEXES PROGRAMME IN INDIA**

Abstract ID: 669

Individual Paper Submission

CHETTIPARAMB, Angelique [University of Reading] a.chettiparamb@reading.ac.uk, presenting author  
PETER, Benoy [Centre for Migration and Inclusive Development] benoy@cmid.org.in, co-author  
CHEDAMBATH, Rajan [Centre for Heritage, Environment and De] c.hedcochin@gmail.com, co-author

Housing policy in most countries, be it in the global North or the global South, have been biased towards facilitating and promoting home ownership through tax relief on mortgages, help with securing down payments, stamp duty exceptions and so on. Home ownership has been linked to accumulation of wealth through rising property prices; options to leverage ownership as a bankable asset; possibilities of income supplements to pensions; security against evictions by landlords and claims to a general sense of a stake in wider social issues. The ownership bias has been challenged more recently by scholars pointing to rental housing as a preferred mode for certain population segments such as the young who prefer a certain degree of mobility in their lives as they may not have decided on settling in a job or a place; migrant workers who own a house elsewhere but spend a substantial part of their lives in different locations depending on available work; those who cannot yet access mortgages and so on (Gilbert, 2016, Kumar 2011).

The Government of India, since the distressing images of migrant's return migration during the COVID-19 crisis, and following increased scrutiny from the media, academics and human rights activists, has awoken to the need for providing safe and secure affordable housing for internal migrants. A new Affordable Rental Housing Complexes scheme (ARHC scheme) was consequently launched in July 2020 aiming to provide affordable rental housing through partnerships with the private sector (MOHUA, 2020). This presentation provides a critical evaluation of the ARHC scheme.

Research on the scheme was undertaken as part of a Rapid Response Policy Engagement project on rental housing for internal migrants in Kochi, India, funded by Research England QR Strategic Fund. Mixed methods were used to evaluate the scheme. Contextual information was collected on the background of the policy and the reasons for policy formulation through secondary data. Secondary case studies of a major private sector involvement in rental

housing facilitated by Mumbai Metropolitan Regional Development Authority (Adusumili, 2021) and studies of low scale provision of rental housing taking place in the Vehras of Ludhiana, both in India, were then studied (Bannerjee, 2020). The ARHC scheme was evaluated against the experiences from the above case studies and the policy landscape.

The findings from the evaluation show that whilst some of the major issues around private sector involvement that arose in Mumbai have been addressed in the new policy many questions around the efficacy of adopting a centrally directed single pronged strategy for addressing the complex issue of affordable rental housing for migrant workers remain. The presentation will conclude with recommendations on how the policy can be made more diverse and sensitive to the multiple local contexts in India.

The case studies discussed and the findings from the evaluation of the ARHC scheme will contribute to better understandings of issues related to the delivery of affordable rental housing in the global South. In particular it will highlight the limitations of private sector involvement in producing housing for the target populations, why this is so and what alternatives there might be.

#### **RACIAL DIFFERENCES AMONG THE OWNERS OF SMALL RENTAL PROPERTIES: GEOGRAPHIC PATTERNS AND IMPLICATIONS FOR MANAGEMENT**

Abstract ID: 676

Individual Paper Submission

DECKER, Nathaniel [University of California Berkeley] [ndecker@berkeley.edu](mailto:ndecker@berkeley.edu), presenting author

A very large portion of the rental housing stock in the US is held by individuals, not corporations, and there is substantial racial and ethnic diversity among these owners. This is particularly true among the owners of small rental properties of 1- to 4-units, which comprise about half of the total rental housing in the US. Millions of units in this part of the stock are owned by racial and ethnic minorities. The Census Bureau found that, in the mid-1990s, about 24% of units in 1- to 4-unit rental properties were owned by non-Hispanic White owners. It is likely that the racial composition of owners is uneven across geographies, with some neighborhoods having much higher concentrations of non-White ownership. For example, 40% of rental property owners in a large study of Baltimore, Dallas, and Cleveland were Black (Garboden, Rosen, DeLuca, & Edin, 2018).

Very little research has been conducted on the owners of rental properties in general and small rental properties in particular. Özogul & Tasan-Kok (2020), in a comprehensive review of contemporary scholarship on the

categorization of rental property owners, find that scholars have used various categories to analyze owners, but do not mention race as one of them. This may be a missed opportunity. Scholars in the 1960s and 1970s found substantial differences in the racial patterns of ownership by geography and differences in management practices as well (Stegman, 1972; Sternlieb, 1966). There are reasons to suspect that differences still exist. The wealth-building power of homeownership has been found to be different depending on the race of the homeowner. Housing stability and eviction rates have been found to be different depending on the race of the tenant. But the differences in outcomes related to the race of the owners of rental properties are currently under-studied, despite their implications for wealth generation for the owners and the housing stability of the tenants.

The objective of this paper is to (i) examine the patterns of small rental property investment by race, particularly whether non-white owners tend to invest closer to their home or in declining markets, and (ii) examine whether owners of different races manage their properties in different ways. This could include differences in providing below-market rents and demonstrating greater leniency with rent delinquency based on the race of their tenants as well as the race and ethnicity of the owners. I use a series of multivariate regression analyses to examine investment patterns and outcomes for tenants, interacting the race of the owner and the tenants.

One of the principal reasons for the dearth of scholarship on this topic is a lack of data on the owners of rental properties. I addressed this gap by designing and conducting a large survey of small rental property owners. The survey was quite long, asking owners and managers questions about themselves, their properties, and their tenants. The survey was conducted in two waves, in 2019 and 2021, on a random sample of about 93,000 owners of small rental properties in the top 150 metro areas in the US, stratified by portfolio size. A total of about 3,000 unique owners responded to the survey.

Contemporary debates on racial equity and housing have largely ignored the race of the owners of rental properties, despite the prevalence of Black-, Hispanic-, and Asian-owned rental properties. This paper takes some initial steps to illuminate the implications of racial differences present in this part of the housing stock.

#### THE IMPACT OF VARIOUS MEASURES OF HOUSING AND UTILITY INSECURITY ON HEALTH

Abstract ID: 680

Individual Paper Submission

YUN, Jinhee [Cleveland State University] j.yun17@csuohio.edu, presenting author

HATCH, Megan [Cleveland State University] m.e.hatch@csuohio.edu, co-author

Housing instability, broadly defined, is associated with myriad negative outcomes for children, adults, and communities. The importance of housing insecurity is likely to increase even more with the emergence of viruses with a high risk of infection, such as Covid-19. This pandemic can be more challenging for people with housing

insecurity, as the absolute amount of time to stay at home is prolonged. According to the Census Bureau's Household Pulse Survey, nearly 1 out of 5 adult renters were having trouble paying rent during the pandemic, and this trend is more pronounced in people of color.

There are general understandings of housing eviction and homelessness and their negative effects, but less understood is the prevalence and effects of specific types of housing instability. Of particular concern is the mental and physical health impacts of different types of housing insecurity in the short- and medium-term. Factors associated with housing instability, such as financial insecurity, exacerbate this relationship by forcing families to choose between expenses such as rent and medical care.

In this research, we examine the relationship between cost insecurity (the inability to afford rent/mortgage and utilities), housing instability (the number of moves and homelessness), and context insecurity (neighborhood opportunities) and health using Structural Equation Modeling (SEM) and data from the National Longitudinal Study of Adolescent to Adult Health (Add Health). We study a panel of 11,303 adolescents starting when they are between 11 and 21 (the average age was 15.4) through early adulthood (when they were between 24 to 34 years old, the average age was 28.3), measuring whether the respondents experienced housing insecurity in the twelve months prior to Wave III (when they were between 18 to 27 years old, the average age was 21.8) and Wave IV and their health in Wave IV. We measure health in two ways: self-reported general health and the existence of two mental health disorders (anxiety and depression).

Our preliminary results suggest cost insecurity in the short-term decrease both mental and general health. Cost insecurity in the medium-term has significant negative effects on mental health. Housing instability is also associated with poor mental health, but context insecurity is not significant. To analyze the detailed effects of each type of housing insecurity except context insecurity on mental health, we perform binomial logistic regression. We find that each measure of housing insecurity (inability to afford rent/mortgage, inability to afford utilities, homelessness, and number of moves) decrease mental health. In particular, they have significant negative effects on not only short-term but also medium-term mental health.

This research suggests policymakers and advocates need to think more broadly about housing instability. While policies aimed at reducing rent insecurity and homelessness are important for improving public health, greater emphasis should be placed on cash assistance that vulnerable populations can use to address the cause of their specific type of housing insecurity. Doing so may decrease the lasting mental health effects of housing instability.

#### **"DISPLACEABILITY" IN PUBLIC HOUSING CONVERSIONS: A CRITICAL ASSESSMENT OF TENANCY DISPARITIES IN CALIFORNIA'S RENTAL ASSISTANCE DEMONSTRATION (RAD) PROGRAM**

Abstract ID: 692

Individual Paper Submission

STAHL, Valerie [Columbia University] [valerie.stahl@columbia.edu](mailto:valerie.stahl@columbia.edu), presenting author

In the wake of the COVID-19 crisis, keeping American households in their homes has emerged as a pressing issue for both the socio-economic well-being and public health of urban residents. Unfortunately, the housing crisis plaguing vulnerable households is not new; in recent years, scholars in planning have shed light on the eviction crisis on low-income residents (Teresa & Howell, 2020). Another emerging body of work has considered public housing redevelopment in the United States, which has dramatically transformed low-income communities while also reducing the number of deeply affordable social housing units nationwide by roughly a quarter million (Goetz, 2013). Both the eviction crisis and public housing redevelopment disproportionately impact predominantly Black and Latinx communities, where the structural racism embedded in housing systems remains pervasive.

Missing from the literature is the crucial question of how residents, or more specifically—which residents—are impacted by public housing conversions. As the nation faces a potential flood of evictions as state and federal moratoriums expire following the pandemic and the privatization of public housing management continues in cities across the country, this paper addresses this gap through a critical quantitative assessment of tenancies of the federal Rental Assistance Demonstration (RAD) program. RAD is an Obama-era-program administered by the US Department of Housing and Urban Development (HUD) that converts traditional public housing to private management while alleging protections for existing residents. The conversion provides residents with a project-based Section 8 voucher to remain in their unit while allowing a private operator to take over management and access debt for repairs of existing housing that traditional public housing authorities cannot leverage.

Early scholarly work has evaluated the program in its nascent stages and considered the financial necessities that have prompted privatization in the first place (see Schwartz, 2017, for an overview). However, little research considers RAD with a focus on existing public housing residents. Drawing on evidence from the state of California, where public housing has the highest rates of conversions to private management in the United States, this paper asks: how do socio-demographic factors such as race, gender, income, disability status, and age of existing public housing residents impact the prevalence of conversions of public housing to private management, and how do tenancies change pre- and post-conversion? Using existing HUD data, I employ descriptive statistics and conduct a difference-in-differences analysis to compare tenancies in public housing that has remained in public operation versus housing that has been converted through the RAD program, accounting for the period pre- and post-conversion.

As journalistic accounts point to potential displacement risks from converted public housing, this paper asks how race and other demographic factors impact which communities are impacted by privatization processes. As opposed to measuring displacement from converted public housing from the offset, this study will instead depart from what Yiftachel (2020) has deemed as a necessary shift from singularly measuring displacement as it occurs to a critical consideration of “displaceability,” or the factors that make communities vulnerable to dispossession of various forms in the first place. By paying attention to socio-demographic characteristics as they intersect with the privatization of a public resource, this research contributes to a growing body of literature that considers the outsized impacts of racial capitalism on planning processes (Williams, 2020). The paper also ultimately paints a more comprehensive picture of an understudied federal policy tool that is dramatically changing the form and function of public housing across the country.

## COMMUNITY ASSESSMENTS OF ASSISTED MULTI-FAMILY HOUSING PROGRAMS IN SUN BELT CITIES BASED ON TRANSIT SHEDS

Abstract ID: 718

Individual Paper Submission

PARK, John [Rice University] [john.park@rice.edu](mailto:john.park@rice.edu), presenting author  
CHOI, Kwangyul [University of Oklahoma] [kchoi@ou.edu](mailto:kchoi@ou.edu), co-author

Sun Belt cities have substantial urban footprints with rapid population growth rates in urban areas and beyond their city limits. Some large cities like Houston, Dallas, and Oklahoma City have been accommodating growing immigrated populations, including the vulnerable, in their housing markets and expanding public transit. Nonetheless, the lack of convenient transit service in many growing Sun Belt cities has obstructed the equal accessibility of low-income families with limited personal vehicles. Particularly, many project-based affordable housing program tenants have a barrier in order to access urban amenities and essential places using the public transit system since the construction of public rental units is geographically limited.

Few studies have assessed the opportunity of the assisted multi-family housing program tenants in connection with the public transit system. This study focuses on renters in the assisted multi-family housing units and the tenants' opportunities within distances that transit service provides. In most cases, as these project-based affordable housing program tenants have limited income and vehicle ownership, public transit is a critical method to realize daily travel needs, such as jobs, education, grocery shopping, and other activities.

Some of the affordable housing programs that assist low-income populations in multi-family type properties have not been broadly assessed by previous housing scholars: Section 8 Project-Based Assistance, Section 202 Supportive Housing for the Elderly, and Section 811 Supportive Housing for Persons with Disabilities. This study focuses on the low-income and underserved tenants that live in these assisted multi-family properties in Houston, Dallas, and Oklahoma City.

With transit travel time, we evaluate neighborhood characteristics and demographic characteristics, such as job opportunity index, labor market engagement index, school proficiency index, environmental health hazard index, affordability factors, and other sociodemographic characteristics. Using the general transit feed specification (GTFS), which provides information regarding transit routes, stops, and schedules, transit sheds of assisted multi-family housing units are assessed in the three cities. Specifically, transit sheds of two travel time thresholds with 30 and 60 minutes are considered in our study.

We estimate current opportunities given to the tenants qualified for affordable housing programs and living in such units. We provide policy implications that help achieve social equity by drawing housing policymakers' attention to public housing residents' locational benefit when the connection with the transit system is considered. We further suggest recommendations for improved quality of publicly assisted housing programs in the sprawling urban development setting.

## THE STATE OF AFFORDABILITY ACROSS THE U.S. HIGH-TECH ZONES

Abstract ID: 729

Individual Paper Submission

ZANDIATASHBAR, Ahoura [San Jose State University] ahoura.zandiatashbar@sjsu.edu, presenting author

To date, a handful of theoretical studies addressed the possible negative consequences of the economic development strategies the highly focus on empowering high-tech clusters. Even so, there is critically a need for empirical studies confirming such theoretical discourses. Housing unaffordability (Voith & Wachter, 2009), gentrification (Florida, 2017) and displacement (Moulaert et al., 2001) are examples of the impacts that are discussed to be associated with tech clusters with tangible impact on local residents. As high-tech economy driven developments and policy actions gain in popularity, empirical studies should support planners in assessing the trade-offs. This research draws upon the location and sectoral types of high-tech zones identified by Zandiatashbar (2019) and literature gathered by Zandiatashbar & Kayanan (2020) to empirically find out that to what extent high-tech clusters are associated with housing unaffordability and gentrification in the region? How does it compare to other characteristics of a region? And how does high-tech zones' impact vary by the sectoral types and location of cluster? This analysis will be done in two parts. To assess housing affordability, this study presents three sets of analysis. First, by utilizing the Propensity Score Matching methodology, this study controls for the confounding factors and measure the housing premium variation across different sectoral types of high-tech clusters in the U.S. large regions. Second, this study will model the impact of tech clusters on the changes in affordable housing accounting for their sectoral differences in three time-brackets of 1990 -2000, 2000- 2013, and 2013-2018. Change in affordable housing is measured by the change in number of subsidized affordable rental units (e.g., section 8 vouchers or low-income housing tax credit (LIHTC) units) and overall affordable units. Lastly, this study opens up questions about possible gentrification happening across the tech zones. Using a widely applied set of criteria (used in Bates (2013), Chapple & Zuk (2020) and Freeman (2005)), this study identifies the gentrified neighborhoods (census tracts) within three time-brackets of (1990 -2000, 2000- 2013, and 2013-2018). These criteria first track a neighborhood's vulnerability to gentrification and second identify the gentrified ones among the vulnerable census tracts. Lastly, the gentrification model for these three time periods will measure to what degree different sectoral types of cluster could increase the likelihood of a neighborhood to be gentrified.

MYERS, Dowell [University of Southern California] [dowell@usc.edu](mailto:dowell@usc.edu), presenting author

Aging baby boomers and older homeowners are now building greater risk of heavy and prolonged sell-off, due to large numbers, as first identified in Myers and Ryu (2008). Although the exit rate of homeowners after age 75 was proportionally constant in decades since 1990 (Simmons and Myers 2018), replacements by younger home buyers are highly variable and influenced by economic conditions. The growing Latino population plays a crucial role.

Dynamics of turnover and replacement are considerably different in recession years than in expansion periods. Adverse impacts of the Great Recession were felt by homeowners in all age groups but were heavily concentrated in 30s and 40s where people were more likely to have recently purchased and little equity had been accrued. Premature exit from homeownership was disproportionately a problem among Latino homeowners.
