The advent of the Census Bureau’s American Community Survey (ACS) allows researchers to customize time frames to reflect the boom-bust conditions of the economic cycle. A systematic view on the generational turnover is made possible through the newly released three, “nonoverlapping” 5-year files from the ACS, covering 2005-09, 2010-14, and 2015-19. Lessons of recession and recovery from the last cycle may shed light on changes to follow after the COVID recession.

A new method, the “ACS cohort turnover” method, developed for use with these data in the case of Los Angeles (Myers and Rosas-Moctezuma 2021) bears application and comparison to Miami, which is the third largest Hispanic region in the nation after Los Angeles and New York (Stepler and Lopez 2016). An extension of the new method to cover nativity is especially warranted in the Miami case, which is over 50% foreign born, so we will disaggregate the contributions of replacement buyers between those who are recently arrived foreign-born, those who have resided in the U.S. since before 2000, and those who are U.S.-born.

What similarities and differences in these dynamics might be found by comparing White and Latino groups of residents in Miami-Dade County to those in Los Angeles County, and in the U.S.? These are the core counties of the two largest Latino and immigrant metropolises in the nation, other than New York, and they present many interesting contrasts. LA has a large Asian component that Miami does not, but both areas have smaller-sized African American populations as well as White minorities. Although LA has more expensive housing costs, both areas rank very high on their lack of affordability relative to income levels.

Overall, given the substantial differences in population make-up, what similarities of turnover and replacement may still exist? Does Miami have as great an illusion as found in LA of surging elderly homeowner growth—when estimated by simple age group growth, compared to the cohort turnover measures as cohorts grow progressively older? Does Miami demonstrate as massive an elderly decline as Los Angeles, in both recession and recovery? Have Miami homeowners rebounded more strongly from the Great Recession than those in Los Angeles and the United

States as a whole?

Research with the new method requires simple spreadsheet calculations and is readily paired with graphic formulations from Excel to create dramatic visualizations. Further, the narrative interpretations presented in this paper help planners to construct and communicate housing problems in a manner that emphasizes interconnections of the whole, specifically linking young and old age groups and different ethnoracial groups. The cohort turnover method also helps planners assert vision on changes to be expected in the next 5 or 10 years.

#### **BLACK HOMEBUYERS LOCATION DECISIONS**

Abstract ID: 734

Individual Paper Submission

HAN, Hye-Sung [University of Kansas] hshan@ku.edu, presenting author

MCCLURE, Kirk [University of Kansas] mcclure@ku.edu, co-author

The U.S. demographic landscape is rapidly changing. The racial composition of American suburbs began to shift after 1980. While suburbs are still overwhelmingly white, all racial groups are becoming more suburbanized (Massey & Tannen, 2018). The migration of black middle- and working-class people from predominantly black and deteriorating inner-city neighborhoods to suburbs, is one major driving force of the change.

This study has two primary objectives. First, this study examines the location decisions of black homebuyers of different income levels with particular interest in low-income groups. Where and what type of neighborhoods do black homebuyers of different income levels choose to relocate to? The study further reviews some of the key implications of their location decisions on the neighborhoods.

Second, this study aims to explore how increased access for blacks to suburbs contributes towards wealth creation. The purchase of a home is the most significant investment for most American families. Home equity is the largest family wealth component. Using the measure "home value per dollar of household income," this study explores the implications of suburbanization of black families on their ability to build assets.

This study analyzes all U.S. census tracts to answer the following research questions:

- 1) Where do black homebuyers, especially low-income black homebuyers, purchase homes?
- 2) Do black homebuyers, especially low-income black homebuyers, purchase homes so as to promote racial/ethnic integration?

- 3) Do low-income black homebuyers purchase homes where assisted housing or Housing Choice Voucher households are concentrated?
- 4) Do black homebuyers, especially low-income black homebuyers, purchase homes where home values are stable or rising and poverty is low?
- 5) Do the black homebuyers buy into a strong market? How does the wealth-creating potential of homeownership differ for black homebuyers in suburbs compared to black homebuyers within cities? How does it compare to white neighbors in the same neighborhood?

This study analyzes multiple sources of data: 2012 and 2019 Home Mortgage Disclosure Act (HMDA) data for home purchase loans originated for primary residence coded to 2010 census tracts; ACS data from 2012 and 2019 describing the demographic and housing characteristics of tracts nationwide; and the U.S. Department of Housing and Urban Development (HUD) Picture of Subsidized Households (PICTURES) describing the number of households or units of assisted housing in tracts nationwide.

## EVALUATING INCLUSIONARY HOUSING PRACTICES IN TORONTO

Abstract ID: 737

Individual Paper Submission

MAH, Julie [University of Toronto] julie.mah@mail.utoronto.ca, presenting author

With limited public sector funding available for subsidized housing production, there has been increasing reliance on the private sector to provide affordable housing. Historically, the neoliberal restructuring of Canada's welfare state in the 1990s resulted in the withdrawal of federal funding for many social and affordable housing programs and the downloading of responsibility for housing to the provinces. Ontario's provincial government then devolved responsibility for social housing to municipalities without concomitant funding tools.

The use of value capture tools, such as inclusionary zoning (IZ), has been adopted by a growing number of North American cities as a strategy to address housing affordability problems. Simply defined, IZ requires developers to set aside a percentage of their new housing units as affordable housing. In Toronto, inclusionary practices have been ad hoc, dependent on ward councillors' priorities, and largely facilitated through the use of Section 37 of the Planning Act (Mah & Hackworth, 2011). Section 37 enables municipalities to provide increases in density in exchange for community benefits. This approach has secured some affordable housing, though not enough to address the city's severe affordability problems. In 2018, legislative changes enabled Ontario municipalities to create and implement IZ, which could be used with Section 37. This research will examine the use and efficacy of value capture tools to produce affordable housing in Toronto. This study will also explore the implications of Bill 108 on Toronto's draft IZ framework. The new IZ approach is expected to produce more affordable housing as it will address the political

limitations and ad hoc nature of Section 37 practices. So, it is important to analyze Section 37 data and map where, how many, and what type of affordable units were produced under the previous affordable housing governance structure to create a baseline upon which a future approach could then be evaluated against. To inform current IZ policy debates, this research asks: How effective have value capture tools been in the development of new affordable housing in Toronto (2000-2018)? What are the implications of Bill 108 on the draft IZ framework?

There is a large literature discussing the structure of inclusionary housing programs (e.g. Calavita et al, 1997), the effectiveness of IZ (e.g. Mukhija et al, 2010), and the impacts of IZ on local housing markets (e.g. Schuetz et al, 2011). However, much of this literature is based on the U.S. experience, which represents a major gap in the literature (Mukhija et al, 2015). Very little peer-reviewed research has examined the Canadian experience. This study addresses this gap by evaluating Toronto's inclusionary housing practices. Moreover, given the increasing municipal reliance on the private market and value capture tools to produce much-needed affordable housing, it is important to assess the effectiveness of this governance approach. In other words, what has been the return of value for public sector support of these inclusionary developments?

To address these questions, I employ a mixed methods approach that involves: a spatio-temporal analysis of Section 37 data (2000-2018) from the City of Toronto; document analysis of council reports and by-laws; and qualitative interviews. I also investigate two large high-profile development cases in which affordable housing has been promised – Honest Ed's and the Galleria Mall redevelopments. These mini-case studies will be examined to better understand the planning negotiations and political circumstances and motivations that produced the affordable housing contributions.

#### **THE LATINX PARADOX AND HOMELESSNESS: THE INVISIBLE HOUSING PRECARIETY OF LATINX FAMILIES**

Abstract ID: 758

Individual Paper Submission

NEVAREZ MARTINEZ, Deyanira [University of California Irvine] nevarezd@uci.edu, presenting author

For decades researchers have suggested that Latinx communities are not as affected by their economic marginalization as they should be, they call this "The Hispanic Paradox" (Markides and Coreil, 1986). These studies initially focused on issues of life expectancy (Markides and Coreil, 1986; Palloni and Aria, 2004) but since then have also extended to teenage pregnancy (Gorry, 2019), asthma and other respiratory conditions (Cagney, Browning, and Wallace, 2006), and homelessness (Baker, 1996). This narrative is strong in our social imaginary and often obscures very real struggles within the community. This narrative adversely affects the public policy responses that are put in place to help this population.

Recently there has been some recognition of a surge in Latinx homelessness (Bermudez and Vives, 2017), however, there are still misunderstandings about what this looks like. This stems from issues such as language barriers, fear of deportation, and migratory labor patterns that often hide housing precarity in plain sight (Adams and Simonsen-Meehan, 2013). This also results in this population being less likely than other ethnic groups to be engaged by homeless outreach and accessing the services they need (Chinchilla, 2019). While the myth of the “Latinx paradox” in homelessness persists, there is evidence that homeless populations often reflect the racial and ethnic makeup of the communities in which they live. For example, the City of Los Angeles which has the largest Latinx population in the nation has historically had the largest number of Latinx individuals experiencing homelessness (Conroy & Heer 2003). Many times, homeless Latinx individuals get missed because they are not recognized by established count methodologies and survey methods as their housing precarity manifest itself as overcrowding, couch surfing, and living in vehicles.

This study seeks to examine how Latinx individuals and their families experience homelessness and how they navigate the homeless and housing services bureaucracy. As the housing crisis continues, it becomes increasingly important to identify how racial disparities affect housing precarity especially in an increasingly xenophobic political environment. This study will expand the knowledge we currently have about a population that largely resides in the shadows and are especially vulnerable due to an increased criminalization of homelessness and immigration. This project will examine the intersection of race and homelessness.

I will interview 30 Latinx individuals experiencing homelessness and an additional 13 front-line government and non-profit workers in Imperial County, CA and East Lansing, MI. Interviews will assess how Latinx individuals and families experience homelessness as well as how outreach is done and how services are delivered and received.

India has the second-largest urban population in the world. Yet, very little is known about its housing markets. In this paper, we use a panel instrumental variable framework to estimate the supply elasticity of temporary, permanent, and vacant residential housing units in urban India. We use two migration-inducing exogenous events - negative

rainfall shocks and a highway upgrade program - occurring in a distant state as demand shifters for local urban housing markets. We apply the Rosen-Roback spatial equilibrium setting to show that both the negative rainfall shocks and the highway upgrade program in a distant state increase inter-state migration. Increased inter-state migration leads to higher population and household growth, and therefore, higher demand for housing in local urban markets. Our findings are three-fold. First, similar to metropolitan areas in the United States, we estimate the supply elasticity of permanent housing in urban India to be 1.64. Second, we find that the supply elasticity of temporary housing to be -0.55. Negative supply elasticity of temporary housing is consistent with urban gentrification through the demolition of slums. And finally, we estimate the elasticity of vacant residential housing unit supply to be 2.63. We posit that a relatively higher vacant housing unit elasticity indicates speculative building by developers. The implications of floor area regulations for state-level housing supply are explored.

#### THE PHYSICAL LEGACY OF RACISM: HOW REDLINING CEMENTED THE MODERN BUILT ENVIRONMENT

Abstract ID: 786

Individual Paper Submission

RODNYANSKY, Seva [Occidental College] srodnyansky@oxy.edu, presenting author

AN, Brian [Georgia Institute of Technology] yan74@gatech.edu, co-author

ORLANDO, Anthony [California State Polytechnic University, Pomona] aworlando@cpp.edu, co-author

Land use choices, dating back over a century ago, still powerfully shape current development patterns. Through digitization advances, scholars have started studying the long-term effects of historic federal placed-based policies like "redlining". Designated by the Home Owners' Loan Corporation in the 1930s, redlining refers to maps that grade neighborhoods based on an appraisal the housing stock, population characteristics, proximity to industry in over 170 U.S. metropolitan areas (Jackson, 1980). The population composition component of these assessment methods overtly discriminated against all forms of minority populations of the time. The presence of any African Americans was labeled as an "undesirable element" and received lower grades; neighborhoods with concentrations of African Americans were given the lowest, or "D", grades (Hillier, 2003; Jackson, 1980). Similarly, neighborhoods with "infiltrations of Jews", concentrations of Catholics and foreign-born immigrants were graded lower (Jackson, 1980). These populations tended to live in crowded rental housing in many of the appraised cities.

The neighborhood grade guided whether loans were considered safe. "A"-graded neighborhoods were considered safe and received unconstrained credit access. In "D"-graded neighborhoods, it was nearly impossible to get a conventional mortgage and construction loans were difficult to obtain (Jackson, 1980). Redlining as a policy was reversed by the Fair Housing Act in 1968.

What longterm effects did redlining have on neighborhoods? Did effects last past 1968 when it was reversed? Previous work has shown that redlining maps had large causal impacts, with "D"-graded neighborhoods having

worse labor market outcomes, higher teenage pregnancy and divorce rate, and higher incarceration rates (Aaronson et al., 2021), reduced credit access and disinvestment (Aaronson et al., forthcoming), and reduced housing supply and population density (Krimmel, 2017). These changes persist after the policy was outlawed.

What mechanisms led these changes to persist? This paper explores one such mechanism – whether redlining has shaped neighborhoods’ housing markets by fixing the location of multifamily housing, even decades after it was outlawed. We argue that redlining has shaped the geography of housing segregation, not just that of racial segregation, by delineating the predominant location of singlefamily and multifamily stock. We then hypothesize that these built environment effects persist even while redlining-related racial segregation diminished over time. Specifically, we explore how and why “D”-graded multi-family neighborhoods became locked in a continued cycle of impoverishment, with continued under-resourced and under-invested housing stock. We test this idea for ten U.S. cities for which digitized maps and 1930-2010 census data are available. By instrumenting the geography of housing segregation through the redlining policy, we demonstrate the long-term connection between the built environment and contemporary neighborhood outcomes in local housing markets.

Our two-stage least-squares model findings reveal that home values, rents, and unit growth in poorly graded census tracts remain lower than high graded tracts even three or four decades after the policy was outlawed. This highlights that redlining policy from the 1930s cemented the delineation between multifamily and singlefamily neighborhoods, discriminating against multifamily neighborhoods along racial and socioeconomic characteristics. That wedge drives the differences in housing market outcomes through today.

#### **IMPACTS OF THE COVID-19 ON LOW-INCOME TENANTS AND PUBLIC INTEREST LAW ORGANIZATIONS IN LOS ANGELES CITY**

Abstract ID: 791

Individual Paper Submission

MEDINA HUARITA, Edith [University of California Irvine] emedinah@uci.edu, presenting author

The COVID-19 has exacerbated the longstanding housing crisis in Los Angeles. Many low-income renters, many of them who are Latinx and African Americans, have lost their employment income and have been unable to pay their rent for most of the year 2020. In addition, the complexity of landlord-tenant regulations in the city have been obstacles when navigating their housing concerns, especially when they have to grapple with rapid changes of landlord-tenant regulations. For some tenants, the pandemic has been an opportunity for them to learn about their housing rights for the first time as well as accessing resources available to them in their communities. For others, it has been an opportunity to mobilize and join a tenants’ union, such as the Los Angeles Tenants Union. At the same,

the public interest law organizations (PILOs), have had to grapple with the increasing demand of public needs and education of tenant's legal rights, especially when they have had to move their services to virtual platforms and phone calls. This study seeks to: a) understand how the COVID-19 has impacted low-income tenants in Los Angeles; b) explore the coping mechanisms and strategies tenants utilized to address their housing concerns; and, c) identify the types of resources and strategies PILOs utilized to inform tenants of resources available to them as well as educate on their legal rights. The study uses qualitative data from semi-structured interviews with tenants, representatives of PILOs, and landlords, as well as content analysis of newspaper articles. This study will provide insights to how tenants navigated their housing issues in the private rental sector in the midst of the pandemic.

### **DOES THE PRESENCE OF BLACK RESIDENTS VS. IMMIGRANT RESIDENTS IMPACT THE TRAJECTORY OF REDLINED NEIGHBORHOODS?**

Abstract ID: 795

Individual Paper Submission

SMITH, Rebecca [University of Southern California] rbsmith@usc.edu, presenting author

PAINTER, Gary [University of Southern California] gpainter@price.usc.edu, co-author

Research on the long-term effects of redlining has found significant impacts between grades as well as between graded and ungraded cities. Areas receiving a D grade have been shown to have lower homeownership rates and house values (Aaronson et al. 2020; Appel and Nickerson 2016) as well as essentially no growth in housing supply and declines in population density (Krimmel 2018). Findings on neighborhood level racial composition have been more mixed. Aaronson et al. (2020) find rising shares of black households on the lower graded side of C-D boundaries as well as on the lower graded side of B-C boundaries prior to 1970; however, studies including data from 1970 onwards, find no impacts of redlining on racial concentration (Appel and Nickerson 2016; Krimmel 2018). When focusing on metropolitan-wide segregation, Faber (2020) finds an overall increase in segregation for cities that were assessed by HOLC compared to cities that were not. Finally, Aaronson et al. (2021) show that the deleterious impacts of redlining persist for cohorts born as late as 1983, with individuals on the D side of a D-C boundary doing worse in outcomes measured by Chetty et al.'s Opportunity Atlas as well as having worse credit than those on the C side of the boundary.

While the long-term impacts of redlining have been established, there has been less focus on the heterogeneity of such impacts within areas receiving the same grade, and virtually no recognition of the different trajectory of immigrant, black American, and white American neighborhoods. We have utilized area description files, which accompany the HOLC maps and detail the rationale for each grade, in order to gather population-level information that goes beyond what can be found from census data at the time. Using this rich source of data allows us to identify neighborhoods that had white immigrant, black, and/or white American residents at the time of grading. In this way, we are able to move beyond the black/white dichotomy that characterizes the majority of redlining analysis in order to have a deeper understanding of the mechanisms at work in these areas over time.

Our study area includes cities from across the United States. Initial findings show that within D-graded areas, 34% of

neighborhoods mention only black residents as a reason for the designation. An additional 16% of neighborhoods can be identified as having only white immigrant populations at the time of grading. One quarter of neighborhoods mention both black and white immigrant populations, while 25% had neither. If we expand the definition of immigrant to include any mention of foreign populations (not explicitly identified as white), only 15% of neighborhoods receiving a D grade solely mention black residents living there. These results point to the importance of including immigrant groups in our understanding of the impacts of redlining.

Given the different social histories of immigrant and black American groups in the United States, identifying immigrant communities and analyzing their interaction with the practice of redlining gives us a better understanding of the heterogeneity of area trajectory over time. The next step in this study will be to assess the impact of the reason for a D-grade designation on the trajectories by investigating outcomes such as racial concentration and house values (Aaronson et al. 2020; Appel and Nickerson 2016). These results will inform future work on redlining and answer previously unanswered questions pertaining to the experience of immigrant groups with this particular federal policy. As such, it places greater emphasis on the question of intersectionality within the practice of redlining by analyzing the trajectory of areas inhabited by different racial and ethnic groups.

#### **DISPOSSESSION AND RESISTANCE: A CASE STUDY OF THE FINANCIALIZATION OF AFFORDABLE HOUSING IN TEXAS**

Abstract ID: 796

Individual Paper Submission

AZHAR, Awais [University of Texas at Austin] awais.azhar@utexas.edu, presenting author

Increasingly, the financialization of affordable rental housing is impacting tenants throughout the United States, requiring them to explore new strategies to resist unsafe and precarious housing conditions. Under financialization, private equity and hedge funds targeted formerly rent-restricted and regulated multifamily housing with the clear aim of purchasing cheaper developments and selling them at a higher price to generate profits (Aalbers, 2019; Fields & Uffer, 2016). More recently, as Wijburg, Aalbers and Heeg (2018) have argued, "housing units are no longer treated as purely speculative goods but rather as long-term investment objects for investment funds. Paradoxically, the long-term investment focus of these funds enables a short-term investment focus by buying and selling shares in these funds on the stock exchange" (p.1100). With this shift in strategy, predatory landlord practices tied to increasing the investment potential of properties have proliferated, such as unfavorable lease terms, the introduction of increased fee structures, unreasonable increases in rent, and frequent evictions (Alliance of Californians for Community Empowerment Institute, Americans for Financial Freedom, & Public Advocates, 2017; Chilton, Silverman, Chaudhry, & Wang, 2018). Though not as well understood, these models of investment are further adapting to changing financial and regulatory landscapes, with public private partnerships emerging as a

component of the financialization of affordable housing.

This paper highlights the mechanisms by which rental housing is being financialized in the United States, the impact this has on tenants, and the strategies by which tenants are resisting housing dispossession. Relying on the case study of two apartment complexes, this paper explores the impact on tenants of the partnership between Related Management Corporation out of New York City, New York, and the nonprofit public housing authority, Texas Housing Foundation, out of Marble Falls, Texas. In 2018, both entities purchased two Low Income Housing Tax Credit Properties in Austin, Texas: Fairway Village apartments and Oaks on Lamar apartments. Through this public private partnership, the foundation has expanded its affordable housing portfolio and the corporation has invested in properties where it does not have to pay property taxes. However, tenants in both properties have complained about poor maintenance and recurring safety issues. The financialization of affordable housing through corporate investment in this case has harmed tenants and made them more vulnerable. Through organizing and working with a local tenants' rights organization, tenants have negotiated agreements with their landlord, guaranteeing safer housing conditions. However, in a state that is hostile to tenants and offers them limited rights, tenants and advocates are particularly constrained in their ability to counter the violations to such rights. Housing rights movements in these cities are showing alternative paths to counter the threats of financialization and protect tenants' rights. Understanding both the ways in which affordable housing is being financialized in Texas and the ways in which tenants are resisting such changes is critical to countering housing dispossession and securing safe housing for tenants.

#### **DOES SUBSIDIZED HOUSING IMPROVE HOUSING CROWDING? AN EMPIRICAL STUDY OF LOS ANGELES**

Abstract ID: 799

Individual Paper Submission

ZHENG, Huixin [University of California Irvine] huixinz2@uci.edu, presenting author

Efforts to integrate an equity lens into in housing policy often seek to overcome patterns of racial discrimination and segregation in housing and improve access to opportunity for the poor and for people of color. Divergent strategies have emerged for promoting equitable housing development and have become the subject of much policy debate. In particular, there has long been tension between those advocating for deconcentrating poverty and fostering racially integrated communities and those advocating for enhancing housing choices and improving living conditions in neighborhoods of concentrated poverty and segregation (Goetz 2015; 2018). While the two categories of strategies need not to be at odds with each other, strategies prioritizing the pursuit of an integration objective often

seek to achieve a preferred spatial arrangement of households. Strategies such as those discouraging or limiting the development of subsidized housing in already high poverty, segregated neighborhoods to prevent further segregation, present potential conflicts with efforts to enhance housing choice and improve living conditions in these neighborhoods.

Further complicating this debate is the lack the empirical evidence supporting each type of these strategies. Existing studies have pointed to the importance of enhancing housing choices in high-poverty, segregated neighborhoods (Chapple and Goetz 2011; Goetz 2015, 2018). Mills et al. (2006) find that tenant-based assistance reduces housing crowding and doubling up. Nonetheless, little has been done to investigate whether increased housing supply, especially subsidized housing development, would contribute to increased living conditions such as reductions in crowded households.

This study assesses the linkage between living conditions and subsidized housing development. Because subsidized housing projects are generally intended for renters, I examine the relationship between neighborhood housing crowding and subsidized housing development among renter households in the City of Los Angeles, California. Specifically, this study asks whether subsidized housing reduces crowded rental units. I examine changes in the number of crowded renter households between 2010 and 2015 and compare these trends between tracts accessible to subsidized housing that were built/rehabilitated during 2011 and 2014 and tracts that were not accessible to such housing. To estimate the changes in crowding attributed to access to new/rehabilitated subsidized housing, the statistical analysis adjusts for confounding bias through the use of propensity score weighting. Two sets of weights are constructed and facilitate the estimation the effects of subsidized housing on (1) tracts where subsidized units are typically sited (and usually high-poverty and segregated) and (2) the rest of the city.

The results will contribute to the policy debate on ways to meaningfully incorporate equity in devising housing policy, such as guiding housing development to different types of locations. In particular, if the number of crowded renter households in disadvantaged neighborhoods are reduced through adding new or rehabilitated subsidized housing, policies seeking to promote an integrated living pattern through discouraging or limiting housing development in disadvantage communities may come at the expense of access to quality housing for the residents of these communities.

We examine the condition of tenants in Los Angeles in early months of the COVID-19 emergency. Drawing on both new Census data and two rounds of an original survey of renters, we find distress along multiple dimensions, almost all of them stemming from losses of work and income. We estimate that, within the first months of the COVID-19 crisis, about 1 in 5 Los Angeles tenants were unable to pay rent in full and/or on time, and that this difficulty resulted in tenants owing over \$850 million in rental debt. Our regressions suggest that nonpayment of rent is strongly associated with lost work and sickness. Tenants of smaller landlords are both more likely to have had problems making rent, and more likely—even controlling for nonpayment—to have eviction proceedings initiated against them. Many tenants who are current on rent, furthermore, are going into various forms of debt to be so. The crucial role that lost income in renter distress is reinforced by evidence suggesting that direct assistance to renters helps prevent nonpayment.

#### **TRACKING NEIGHBORHOOD CHANGE IN GEOGRAPHIES OF OPPORTUNITY FOR POST-DISASTER LEGACY CITIES: A CASE STUDY OF SAN JUAN, PUERTO RICO**

Abstract ID: 817

Individual Paper Submission

SANTIAGO-BARTOLOMEI, Raul [Center for a New Economy] raul@grupocne.org, presenting author  
LAMBIA-NIEVES, Deepak [Center for a New Economy] deepak@grupocne.org, co-author  
FIGUEROA, Enrique [Boston University] efig13@bu.edu, co-author

Underlying neighborhood conditions can be instrumental in enabling or hindering social mobility (Sampson et al., 2002), resulting in spatial inequities that lay out the geographies of opportunity (Galster & Killen, 1995). These spatial inequities translate to differing urban outcomes across neighborhoods (Lens, 2017). With the advent of climate change, specifically the devastating effects of natural disasters, underlying neighborhood inequities can be further exacerbated (Pais & Elliot, 2008; Wyczalkowski et al. 2019). In legacy cities, which have had a long struggle with deindustrialization, population loss, fiscal constraints and economic decay, many will likely need to address compounding stressors stemming from climate change, specifically the devastating effects of natural disasters. Using the San Juan Metropolitan Area (SJMA) as a case study, we provide key insights on how a post-disaster context can affect underlying tendencies in housing markets.

The SJMA has approximately one and a half million people, but it has been experiencing population loss for more than a decade, as well as a steep decline in manufacturing and other industrial activities. Suburbs and urban centers

in the SJMA have begun to hollow out, leading to a rise of vacant properties. To make matters worse, Puerto Rico was battered by Hurricane María in September of 2017. The storm caused severe damages to infrastructure and housing units, and recovery efforts have been painfully slow. In addition, post-disaster SJMA has also seen an influx of real estate investors, as well as an increase in short-term rentals throughout the main urban areas of the metro region. Moreover, the government of Puerto Rico has been aggressively proposing additional tax exemptions to potential investors as part of the federal government's Opportunity Zones program, created as part of the Tax Cuts and Jobs Act of 2017. All of these dynamics have raised concerns regarding gentrification and displacement among vulnerable populations in the region.

To determine pre- and post-disaster changes across geographies of opportunity, we performed regression analyses at the Census tract level to identify trends in socioeconomic segregation, urban decay and hollowing, housing affordability issues, and gentrification between 2016 and 2019. Results show the following overall trends regarding storm impacts and neighborhood change: (1) storm impacts are associated with higher real estate activity in certain areas; (2) they do not seem to be associated with increased socioeconomic segregation, although this could be a short-term effect that could change as real estate activity causes increased high-income concentration in some areas and poverty concentration in others; and (3) associated with increased vacancy rates.

#### **SUSTAINABILITY, WATER AND ENERGY USE IN INFORMAL COMMUNITIES IN THE DALLAS-FORT WORTH METROPLEX.**

Abstract ID: 839

Individual Paper Submission

REYES-SANCHEZ, Ariadna [University of Texas, Arlington] [ariadna.reyessanchez@uta.edu](mailto:ariadna.reyessanchez@uta.edu), presenting author  
HAFIZ, Mohammed [University of Texas at Arlington] [mohammedfouad.hafiz@mavs.uta.edu](mailto:mohammedfouad.hafiz@mavs.uta.edu), co-author

Although informal housing development has been considered a local problem of South Texas along the US-Mexico border (Durst and Ward 2014; Durst 2019), recent research found that informal housing is taking place on the fringes of most American cities (Durst 2019) beyond the borderlands. Informal housing development occurs in unincorporated districts that poorly enforce ordinances and indirectly allow developers to subdivide lots in unsuitable land for housing development (Ward, De Souza, and Giusti 2004). Impoverished families of color, particularly Latinx communities, purchase relatively cheap lots that often lack access to basic infrastructures, such as running water and electricity. Families face predatory land transactions that may endanger their patrimony and endure poor living conditions because they do not have easy access to essential utilities. After decades of informal housing occupation, planners know little (or nothing) about how families in US cities' informal communities consolidate their homes and use energy and water in their homes (Ward and Peters 2007).

The contribution of this research is threefold. First, this research systematically identifies informal communities,

known as colonias, in the Dallas Fort Worth Metroplex using spatial and census data on housing quality and ownership, the risk to floods, access to utilities, and families' income, race, and ethnicity. The systematic identification of informal communities helps document a typology of informal communities emerging in different locations throughout the Dallas Fort-Worth Metroplex, including inner-city, suburban, peri-urban, and rural areas. This spatial analysis will also help understand the characteristics of the people that reside in informal communities. Contrary to the assumption that Latinx immigrants mostly occupy colonias, families in these communities in the Dallas Fort-Worth metroplex may be more diverse.

Second, to understand the relationship between informal housing and sustainability, we will conduct field research in two representative communities: Sand Branch and Lilian, founded in the 1990s in the Dallas Fort Worth Metroplex's outskirts. Although these communities are spatially close to public infrastructures, such as the Dallas water treatment facility, families here lack access to running water, electricity, and sewage systems (Reynolds, Upshaw, and Larson 2019). These communities are also prone to flood risks because of low-lying topographic conditions and the absence of stormwater drainage systems. Field research in Sand Branch and Lilian will allow us to document the water and energy infrastructure characteristics, the variations of housing quality, such as the characteristics of the materials, and 3) technological innovations and strategies that families use in their homes to use water and energy. We will also gather life stories to develop an ethnographic understanding of water and energy use.

Third, field research will further examine the potential of technological innovations, such as solar panels and rainwater harvesting systems, to help families in informal communities to improve household economies while supporting sustainability (Elder and Gerlak 2019). More broadly, we will compare our sustainability, water, and energy use findings associated with informal communities in Dallas Fort-Worth Metroplex with previous research in Latin America (Collado and Wang 2020; Adegun 2017). This comparative analysis will reveal urban informality's role as a strategy for supporting sustainability and urban equity in low-income communities of color in the US cities.

#### THE IMPACT OF AN INVOLUNTARY MOVE ON JOB LOSS AMONG LOW- AND MODERATE-INCOME HOUSEHOLDS

Abstract ID: 855

Individual Paper Submission

NOLAN, Lauren [Rutgers, The State University of New Jersey] [lauren.e.nolan@rutgers.edu](mailto:lauren.e.nolan@rutgers.edu), presenting author

This paper examines the impact of forced moves on job loss among low- and moderate-income households. According to data from the Bureau of Labor Statistics, an average of 1.8 million workers were discharged each

month in 2019. Understanding what makes workers susceptible to job loss is important, as losing a job can result in financial hardship, poor physical and emotional wellbeing, and housing instability. Indeed, the impact of losing a job on one's ability to make rent or mortgage payments is clear. Yet, there is also emerging evidence of a reverse relationship—that housing instability impacts employment insecurity. Desmond and Gershenson (2019) describe the interrelationship between housing instability and job instability among the working poor as one of “double precarity.” Using data from a survey of low-income renters in Milwaukee, they found that workers who experienced a preceding eviction or forced move were more likely to be laid off from a job than observationally identical workers who did not. An eviction or foreclosure has been linked to poorer physical and mental health outcomes (Rohe & Lindblad, 2013; Vasquez-Vera et al., 2017), which, combined with stress and time away from work to address a move, are believed to adversely affect worker performance. Forced moves can also result in longer and more precarious commutes, increasing the likelihood of tardiness or missed workdays (Kruger, 1998; Loong et al., 2017).

Using a six-year panel survey of low- and moderate-income households, this paper examines whether a preceding involuntary move (defined as an eviction or foreclosure) increases the likelihood of job loss. It employs random-effects panel regression, controlling for relevant worker and household characteristics. It expands on Desmond and Gershenson's work in three ways: by using panel data; by using data from a wider geography; and by examining forced moves among both homeowners and renters. This paper's findings will contribute to the emerging discussion about the role of housing policy in promoting employment stability. Efforts to increase labor force opportunity have historically focused on human capital development and wage growth. Initiatives that increase housing stability among precariously employed workers may have positive impacts on employment stability, worker wellbeing, and wealth-building among vulnerable workers.

#### INNOVATIONS TO EXPAND ACCESS TO OPPORTUNITY NEIGHBORHOODS FOR LOW-INCOME FAMILIES IN GREATER BOSTON

Abstract ID: 860

Individual Paper Submission

KELLY, Nicholas [Boston Housing Authority] [nkelly@mit.edu](mailto:nkelly@mit.edu), presenting author

Despite strong evidence that neighborhoods matter for the long-term outcomes of low-income children, policymakers have largely failed to identify low-cost policies that can enable families to access opportunity neighborhoods at scale. I evaluate and compare three strategies of varying cost to increase access to opportunity for Housing Choice Voucher holders in Greater Boston: changes in rental payment subsidies set by ZIP Code instead

of by region through Small Area Fair Market Rents; a housing mobility counseling program; and a housing search tool that provides customized neighborhood information on schools, public safety, and public transportation. I study whether these three interventions encouraged more families to move to opportunity areas. I use data on the ZIP Codes of voucher holder moves and measures of opportunity as defined by the School-Violence-Poverty (SVP) Index. I employ a pre-post analysis of subsidy-changes, a randomized controlled trial of the housing mobility counseling program, and a randomized controlled trial of the housing search tool. First, I find that the introduction of rental payment subsidy changes by ZIP Code is correlated with an increase in school quality of the destination neighborhoods of voucher holders, and an increase in the percentage of families moving to areas with high performing schools and very low rates of violent crime and poverty. Second, I find that the housing counseling program had a statistically significant impact on families moving to lower crime areas. Third, I find that while the housing search tool did not affect moves for the full population, it had a large, statistically significant impact on destination neighborhoods' opportunity scores of those who indicated an interest in moving to a high-opportunity suburb. This research suggests that low-cost digital search tools can help facilitate moves for families already interested in high opportunity areas but have less impact on families without those preferences.

#### IDENTIFYING HOUSING VULNERABILITY IN COASTAL AREAS OF YUCATÁN, MEXICO

Abstract ID: 864

Individual Paper Submission

BILES, James [The City College of New York] [jbiles@ccny.cuny.edu](mailto:jbiles@ccny.cuny.edu), presenting author

More than 40 percent of the Earth's population lives in close proximity to the coast and, as the tragic consequences of Hurricane Maria (2017) reveal, coastal populations are increasingly vulnerable to the effects of natural hazards and global climate change. The more than 700 million people living in low-lying coastal communities face especially elevated risk. Beyond the threats to personal safety, coastal dwellers in vulnerable communities confront the potential loss of livelihoods and property. In the case of Mexico, with a coastline of more than 11,000 km, about 16 percent of the country's population lives in communities (municipios) directly on the coast. Some of the most vulnerable low-lying coastal areas in the country are located along the Gulf of Mexico and Caribbean; the Mexican government has classified nearly one-third of these locations as having high or very high levels of marginality based on educational outcomes, income, and quality of housing.

This study is part of a larger interdisciplinary project focusing on the living conditions, perceptions, experiences, and

adaptation strategies of households in seven coastal communities along the crown of Mexico's Yucatán Peninsula. Based on the results of a large household survey, this paper assesses the vulnerability of housing in study locations. Conceptualizing vulnerability as multifaceted and place-specific, this research identifies twelve relevant indicators, representing three discrete dimensions of housing vulnerability (structural, environmental/location, and socio-economic), which serve to create an index of housing vulnerability.

The index reveals that a relatively small share of households in coastal areas of Yucatán confronts inadequate housing conditions (structural vulnerability); however, socio-economic and environmental/location vulnerability are considerably more pervasive. Indeed, environmental and locational factors, including proximity to the coast and/or mangrove swamps, are an especially important component of vulnerability. Overall, the index indicates that more than 40 percent of households in the study area (more than 11,000 residents) face high or extreme vulnerability to natural disasters and global climate change. These results suggest that the extent of vulnerability among households in coastal areas of Yucatán is significantly greater than the levels of marginality found in official government reports.

Viable strategies to address vulnerability to global climate change and natural hazards are sorely lacking in Yucatán and other coastal communities, both in Mexico and elsewhere. Based on the insights gleaned from this study, potential interventions must wrestle with the multifaceted nature of vulnerability and the issue of place. Ultimately, the index of housing vulnerability described in this paper can serve as a useful tool and integral component of a more comprehensive strategy of coastal planning to promote greater resilience at household and community scales.

#### THE SOCIO-SPATIAL ECOLOGY OF POVERTY AND BEDBUGS IN SUBSIDIZED HOUSING

Abstract ID: 868

Individual Paper Submission

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] [agreen4@illinois.edu](mailto:agreen4@illinois.edu), presenting author  
BASNET, Vinisha [University of Illinois at Urbana-Champaign] [vasnet2@illinois.edu](mailto:vasnet2@illinois.edu), co-author  
SCHNEIDER, Daniel [University of Illinois at Urbana-Champaign] [ddws@illinois.edu](mailto:ddws@illinois.edu), co-author

Bed bug infestations are an emerging cause of health disparities in American cities, and a threat to housing security and affordability. Bed bugs, after almost 50 years of declining prevalence, began resurging across the world in the 1990's. Previous work on bed bug infestations in Chicago (Sutherland, Greenlee, and Schneider, 2020) and New York (McLafferty et al. 2020) has shown that bed bugs are not evenly distributed across the socio-economic landscape, but rather are concentrated in poorer neighborhoods. In Chicago, bed bug prevalence is higher in lower income neighborhoods with higher levels of household crowding, and eviction risk. Bed bugs appear to be a problem of

poverty (Eddy and Jones 2011), with major implications for the housing stability for low-income households.

Through ethnographic research with tenants, landlords and public housing authorities, we question how poverty and mobility are mutually reinforcing, entrenching bed bug infestations in poor neighborhoods. Because humans are the primary host of bed bugs, and housing units are the primary location of bed bug infestations, we treat the domestic environment as an integrated socio-environmental system (Liu et al 2007) in which bed bug ecology interacts with urban housing policy and landlord-tenant relationships. We focus on voucher-subsidized housing in Champaign County, Illinois administered locally by Housing Authority of Champaign County. We make use of the co-location of low-income voucher-subsidized households with higher income households to question the role of socioeconomic factors in determining the nature of prevalence of infestations, differentials in reporting, and differentials in treatment of infestations, as well as the nature of housing instability for low-income tenants. Using in-depth interviews with both voucher-subsidized and unsubsidized tenants in the same buildings, we observe the ways in which bed bug infestations alter relationships between landlords, tenants, and the state (code enforcement and housing authority officials) and examine differentials in reporting and treatment between these groups.

Understanding the relation between landlord and tenant behavior and infestation is necessary to inform best practices for policies establishing tenant and landlord rights and responsibilities for bed bug control (Schneider 2019). These relationships also point to the potential effects of housing regulation and code enforcement on overall infestation rates and their relation to poverty. Our results also inform administration of the Housing Choice Voucher Program. Given the observed precarity for low-income voucher-subsidized households, the unintended consequences of housing quality regulations and inspections may exacerbate residential instability, poverty and poor health outcomes as well as bed bug infestation risk.

#### **COMPARING THE FACTORS OF INTERURBAN RESIDENTIAL MOBILITY CONSIDERING HOUSEHOLD LIFE CYCLE STAGE IN THE SEOUL METROPOLITAN REGION: USING THE BIG DATA OF DOMESTIC POPULATION MOVEMENT STATISTICS BETWEEN 2001 AND 2020**

Abstract ID: 874

Individual Paper Submission

PARK, Hwan-Su [Kangwon National University] efleim@naver.com, presenting author

LEE, Jae-Su [Kangwon National University] jslee25@kangwon.ac.kr, primary author

The Seoul metropolitan region (SMR) encompassing Seoul, Incheon, and Gyeonggi Province has a population of about 26 million in 2019, exceeding 50 percent of the total population of Korea. Households living in the SMR have been very active in terms of residential mobility. From 2001 to 2019, 4.6 million households moved beyond Seoul to Gyeonggi Province, and 7.85 million households moved within Seoul. At the same time, 3.57 million families moved

to Seoul beyond Gyeonggi Province, and 6.23 million families moved between municipalities within Gyeonggi Province.

From a macro perspective, residential mobility is influenced by both spatial and socioeconomic factors. It is affected by geographical factors such as distance and location, as well as socioeconomic factors such as the number of households, housing prices and educational environments (Geist & McManus, 2008; Greenlee & Wilson, 2016). Furthermore, both the migration patterns and the factors influencing residential movement vary depending on the life cycle stage of the households. Households before marriage are mainly single-person households and economic factors such as job availability and accessibilities to transport and amenities have a significant impact on their residential mobility. For households with school-age children, housing market such as housing supply, and economic and educational factors become more important (Coulter & Scott, 2015).

Residential mobility of households is an important measure representing the change in time and space in a metropolitan area. From a macro perspective, it is significant to analyze the spatial patterns of residential movement to understand changes of a region. Residential mobility is influenced by various factors, and their importance varies depending on the life cycle stage of the household. However, prior studies have mainly focused on the attributes and factors of residential movement of individuals and households from a micro perspective. From a macro perspective, there is still a lack of studies comparing the factors affecting residential mobility according to the life cycle stage of the households living in a metropolitan region.

This study aims to compare the factors that affect the residential movement of households in the SMR from 2001 to 2020. This study breaks down the life cycle into six stages according to the formation, extension, contract, and dissolution phases of the household presented by Duvall (1988). They consist of single-person households in their 20s and 30s, couples in their 20s and 30s, households in their 30s and 40s with elementary school child, households in their 30s and 50s with middle or high school child, households in their 50s and 60s with adult dependent, and households aged 65 or older. Dependent variable is set to the number of households moved between localities by year. Explanatory variables are composed of the distance between origin and destination, the number of households in both origin and destination, housing market variables, economic factors, transportation accessibilities, amenity availability, and educational factors. Extended gravity models based on quasi-panel data are estimated using the dependent and explanatory variables from 2001 to 2020. This study is significant in that it makes analysis of spatio-temporal changing patterns of residential mobility between localities using public big data of domestic population movement statistics and geographic information system techniques in the SMR.

In the preliminary results, both single-person households and couples in their 20s and 30s are greatly influenced by job availability and accessibility measures of public transit and cultural facilities. Housing market variables and educational factors become more significant for both the households with elementary school child and those with middle or high school child. However, the households with adult offspring, and households aged 65 or older are affected by accessibilities to medical and shopping centers, and housing market variables such as housing price.

### **AFFIRMATIVELY FURTHERING FAIR HOUSING THROUGH CALIFORNIA'S HOUSING ELEMENT**

Abstract ID: 893

Individual Paper Submission

MONKKONEN, Paavo [University of California Los Angeles] paavo.monkkonen@ucla.edu, presenting author  
LENS, Michael [UCLA] mlens@ucla.edu, co-author

This paper outlines an approach to assessing whether the location of sites suitable for affordable housing in Housing Element updates in California are Affirmatively Furthering Fair Housing (AFFH), and compares twelve cities' draft housing plans accordingly. There are multiple components to AFFH, but in this case we focus narrowly on overcoming “patterns of segregation” through the planning for and production of new affordable housing. We argue that to ascertain progress in this specific arena, advocates and the state need benchmarks and objective measures. To reverse the legacy of segregation, jurisdictions must change how they regulate housing development, and redistribute capacity for low-income housing to higher-income neighborhoods. We propose a simple and more complex approach to measuring whether cities are identifying sites for affordable housing in this manner. This narrow focus on the location of sites also allows us to reflect on inter- and intra-municipal responsibilities in a metropolitan area, as well as the differing AFFH expectations for lower-income or majority minority municipalities.

### **COLLECTIVE HOUSING: A SOUTH/NORTH COMPARISON OF MODELS, MOTIVES, AND LITERATURES**

Abstract ID: 902

Individual Paper Submission

SHELBY, Hayden [University of Hawaii] hshelby@hawaii.edu, presenting author

Collective ownership of urban housing holds the potential to be and do many things. It can serve as a radical alternative private property, an urban commons (Huron 2015); it can be a site for empowering communities (Boonyabancha 2009; Galuszka 2021) or claiming community control (DeFilippis et al. 2019); and it can simply provide high quality affordable housing (Saegert and Benítez 2005). For all of these reasons, collective housing and land tenure have gradually gained popularity in cities throughout the world, albeit in different forms. In many countries in the Global South, governments and activists have created avenues for collective ownership through community mortgages, cooperatives, and community land title deeds, often as part and parcel of participatory slum upgrading programs. In North America and Europe, on the other hand, collective housing commonly takes the forms limited equity cooperatives, community land trusts, and cohousing. Though rich literatures exist on these different forms of collective housing independently, experiences from the Global South and Global North have rarely been put in conversation with one another. In this paper, I analyze the nature of this divide and ask what can be learned

by thinking across it with respect to the possibilities of collective housing. I look specifically at four different models of collective housing in two global regions. From the United States and Canada, I look to community land trusts and limited equity cooperatives. In Southeast Asia, I analyze the Community Mortgage Program in the Philippines and the Baan Mankong Program in Thailand. Through a critical review of policy documents and academic literature on these programs, I ask several related questions. First, what institutional forms do the different programs take? Second, how are their purposes portrayed in policy documents and reports? Finally, what theories and methodologies are commonly employed by scholars to understand the outcomes of these programs?

Conclusions suggest that although the larger-scale political and institutional contexts of the different programs vary greatly, meaningful commonalities exist that can be instructive for scholars and practitioners alike. Most importantly, though there is a general trend toward depoliticization and a focus on the pragmatic goal of affordable housing provision over time in all of these programs, their existence provides openings for more radical politics. However, taking advantage of these openings requires explicit organizing on the parts of community members and activists and cannot be thought to spring forth from the models themselves.

#### SPATIAL HETEROGENEITY IN THE DETERMINANTS OF NEIGHBORHOOD CHANGE

Abstract ID: 909

Individual Paper Submission

JUN, Hee-Jung [Sungkyunkwan University] [hjun@skku.edu](mailto:hjun@skku.edu), presenting author

Most neighborhood change studies posit spatial independence and spatial invariance of neighborhoods. Spatial independence implies that characteristics and outcomes within one neighborhood have no association with those in nearby neighborhoods. Spatial invariance implies that the associations between neighborhood characteristics and outcomes are constant across regions. Recently, a few studies (e.g., Jun 2017; Jun 2021) find that neighborhood change is spatially dependent, which means that neighborhood change is affected not only by the internal characteristics but also by change in surrounding neighborhoods. The area understudied is if the associations between neighborhood characteristics and outcomes are spatially variable. The political and socio-economic differences by region in the US are likely to lead to spatial variability in the determinants of neighborhood change. For example, based on the contact hypothesis (Allport 1954), presence of black people may be less influential for neighborhood decline because white people, the majority group, are more tolerant toward minority presence in

neighborhoods in the south where there is a larger share of minority people and thus more chance for whites to have contact with minority people. Additionally, given finding no consensus of the effect of presence of Asian, the effect of Asian on neighborhood change may differ by region.

This study employs geographically weighted regression (GWR) that allows examining differential effects of neighborhood characteristics on neighborhood change across regions. I analyze GeoLytics Neighborhood Change Database that includes decennial census data and use neighborhood housing value change as the dependent variable and housing, demographic, and socio-economic characteristics as independent variables. The empirical analysis shows that there is spatial variability in the determinants of neighborhood change. The findings suggest that policies for preventing neighborhood decline should not be based on the assumption of spatial homogeneity but spatial heterogeneity in the determinants of neighborhood change.

#### **WHEN NATIONAL HOUSING MANDATE MEETS LOCAL STRATEGIC COMPLIANCE: A SYSTEMATIC CONTENT ANALYSIS OF FORTY-TWO CHINESE CITIES DURING 2011-2015**

Abstract ID: 911

Individual Paper Submission

MA, Luyao [Tsinghua University] 1455606488@qq.com, presenting author  
LIU, Zhilin [Tsinghua University] zhilinliu@tsinghua.edu.cn, co-author

Countries of both developed and developing worlds have seen an increased shortage of affordable housing for the poor since the massive devolution of housing responsibilities from national to local governments in the 1980s. In recent years, national and subnational governments have attempted to use various forms of political or legal mandates to improve local affordable housing production (Liu, Ma, Goetz, 2021; Goetz & Wang, 2020; Karki, 2015). Existing literature has focused on the effects of these mandates on overcoming local constraints and increasing the overall stock of affordable housing. However, early observations also suggested a nuanced process in which localities adapted top-down housing mandates to local conditions, thereby leading to a diversity of compliance strategies adopted by local governments.

In China, similar affordable housing mandate was issued by the central government in 2011 to construct 36 million units of affordable housing for medium to low-income urban households within five years (2011-2015). A mass mobilization of fiscal and political resources had led to an improved level of affordable housing provision and eventual fulfillment of the five-year target by local cities. However, continuous observations of poor building quality, remote location, and inadequate accessibility related to affordable housing projects indicated an incomplete understanding of the effectiveness of the Mandate if simply concentrating on the quantity of affordable housing.

In this paper, we investigate how Chinese local governments have strategically complied with the national housing mandate, through balancing their actions among fulfilling the quantitative construction target (task fulfillment), ensuring quality and equitable distribution of affordable housing (policy outcome), and building local capacity for long-term housing solutions (capacity building). We selected 42 cities from 23 provinces that were considered best

performers in terms of annual construction targets (Liu, Ma, & Goetz, 2021), and collected all news reports related to affordable housing in local newspapers during 2011-2015. We conducted systematic content analysis of these news report to identify compliance actions adopted by each city government in three main areas: task fulfillment, policy outcome, and capacity building. We then calculated and compared the intensity and diversity of local compliance actions by year and across region, from which we developed a typology of compliance strategies of city governments adopted in the face of a top-down housing mandate. Our preliminary analysis found that there are four types of compliance strategies including low continuity- low wideness (passive compliance), low continuity – high wideness (comprehensive compliance), high continuity – low wideness (targeted compliance), high continuity- high wideness (sustainable compliance).

We believe this research contributes to the scholarly understanding of local government strategic behavior in affordable housing, and thereby enlightening future policy making toward improve local affordable housing policy performance.

Housing is a fundamental component of the physical environment of human communities, and in places dominated by rental housing of any kind, post-disaster stability requires that landlords remain solvent. The 2020 CARES Act rental moratorium and other similar policies enabled many struggling tenants to stay housed, while shifting the cost of housing stability to individual landlords. Despite popular conceptions of wealthy landlords with deep pockets, the majority of landlords in the US own properties with a value of \$200,000 or less and about 41 percent report having debt (Rental Housing Finance Survey, 2018). The pandemic forced many to manage revenue shortfalls while trying to fulfill a range of financial obligations including mortgage payments. Even landlords sympathetic to the plight of their tenants found themselves caught between a regulatory requirement to keep tenants in place and their need to ensure their own long-term financial stability.

This paper calls attention to the existing gap in the housing and planning literature regarding residential rental property owners and explains why we need to better understand landlords, both to address the challenges of COVID and to create more housing secure cities for the future. Using qualitative data from 80 interviews in four cities with landlords who self-manage their residential rental properties, this study asks the question, “How are landlords responding to the tension between regulatory restrictions and their financial obligations in the context of rental

moratoria?” Initial analysis identifies key outcomes, most notably a desire by small landlords to leave the market altogether. The findings raise the question of whether tenant-based assistance promotes or inhibits housing stability and suggest ways that urban rental housing systems may change as a result of the pandemic.

### **RESIDENTIAL MOBILITY OF SUBSIDIZED HOUSEHOLDS: EVIDENCE FROM THE GEOGRAPHY OF VOUCHER HOLDERS IN THE LONG TERM**

Abstract ID: 938

Individual Paper Submission

KIM, Woolack [University of Cincinnati] sgkimwl@gmail.com, presenting author

Housing Choice Voucher (HCV) program has served about 2.1 million low-income households with housing subsidy to promote residential mobility to solve the problem of concentration of poverty. The program aims to encourage low-income families to move to quality neighborhoods with lower poverty, good schools and services, lower crime, and better access to employment opportunities since they can choose where they live without additional housing rent burden (Varady & Walker, 2003). A large body of literature found that HCV recipients who relocated to neighborhoods with lower poverty rate have shown significant improvement in their mental health, crime, children's school performance and long-term effect on those children's income level (Sanbonmatsu et al., 2011, Chetty et al., 2016). These finding has led researchers to examine the relocation patterns of voucher holders and what factors influenced their decisions.

Geography of HCV recipients tells us that they live in neighborhoods with relatively lower poverty rate compared to control group with similar income level, although they are still living in high poverty areas compared to average families (McClure, 2013). Studies on Moving To Opportunity (MTO) program have addressed voucher recipients' long-term mobility patterns. Once MTO families relocated to quality neighborhoods, as the MTO program required participants to agree to move to low-poverty neighborhoods, researchers found that many of them move back to neighborhoods with higher poverty rate and the difference of poverty rates between experiment and control groups had been narrowed over time (Sanbonmatsu et al., 2011). These findings indicate that better neighborhood is not a sole determinant when they relocated with a voucher and there exist mixed factors which influence their decision.

However, less is known about individual HCV recipients' relocation patterns over time and whether they use the voucher to find a best location for them in the long term. This perspective views residential relocation of HCV recipients not as a one-time event. In response, this study explores the longitudinal trajectories of HCV households' relocation to examine where they move to with the voucher in long-term. The study uses data provided by the U.S Department of Housing and Urban Development (HUD) which allows to track all individual HCV households' residential locations as a panel data format over the 1995 to 2012 period in Cincinnati metropolitan area. Reviewing the longitudinal location data of 55,386 HCV recipients, this study examines the changes in neighborhood characteristics before and after relocation and addresses whether HCV program helps low-income families move to neighborhood of opportunity. This study aims to fill a gap in the literature regarding how have low-income families used HCV program to find a location which fits their needs in the long term and addressing different relocation

patterns between early and later phases of moving.

### **CHANGING NEIGHBORHOOD RACIAL DYNAMICS AND THE FLOW OF RESIDENTIAL MORTGAGE CAPITAL: EVIDENCE FROM 40 YEARS OF HMDA DATA**

Abstract ID: 974

Individual Paper Submission

LESTER, T. William [San Jose State University] [thomas.lester@sjsu.edu](mailto:thomas.lester@sjsu.edu), presenting author

Ever since the Home Owners Loan Corporation created their now infamous “redlining maps” in the late 1930s, access to residential mortgage credit has been shaped by the racial composition of neighborhoods and perceptions of neighborhood racial change. Throughout the mid-20<sup>th</sup> century, neighborhoods with higher proportions of minority residents and those with a small, but increasing share have been denied residential credit by lending institutions. This led to a process of dis-investment that disproportionately harmed the wealth building opportunities of African-Americans and other groups. While the Fair Housing Act of 1968 outlawed direct discrimination on the basis of race, redlining was still rampant, leading policymakers to enact the Community Reinvestment Act of 1977 and the Home Mortgage Disclosure Act (HMDA) in 1978 which forced every residential lending entity to indicate how they adjudicated each mortgage application and keep track of borrower’s race, income, and geographic location of the property. Despite the Federal legislation that aimed to undo the effects of redlining, race still plays a major role in determining who has access to mortgage financing (Avery and Buynak 1981, Munnell, Tootell et al. 1996). Recent evidence shows that African-Americans were more heavily impacted by the financial upheavals of the Great Recession as they were more likely to be offered sub-prime or predatory lending products which in turn resulted in a deeper impact of foreclosure (Raymond, Wang et al.).

Financial institutions claim that discrimination on the basis of race is minimal today, and that research using HMDA data to show disparate lending outcomes does not take into account borrowers credit worthiness (credit scores are not disclosed in HMDA) and also ignores the local market conditions (e.g. price trends) that bankers must evaluate in making loan decisions. This last factor—the dynamics of neighborhood change—is both under-researched in the mortgage discrimination literature as well as the key variable that lay at the heart of the HOLC map makers decisions. Specifically, this paper addresses how changes in neighborhood racial and income composition impact access to capital for minority borrowers.

This paper uses a dataset comprised of nearly 40 years of HMDA loan-level data to first describe and categorize all census tracts in the U.S. in terms of the racial balance of lending patterns and its change overtime. This descriptive analysis illustrates the connection between neighborhood racial change in lending mix and income dynamics (i.e. gentrification or disinvestment). Next, we test whether the rate of neighborhood racial change in the previous decade—as measured by the Modified Lillian Index (MLI) (Jaramillo and Lester 2020) affects the denial rate African-

Americans and Latinx homebuyers.

This analysis will test whether the traditional, ecological theories (Park and Burgess) of how neighborhood racial change impacts credit access is still occurring. In this scenario, as the proportion of minority residents increases banks may fear that property values will fall, as they expect, that white families with higher incomes will move away. This leads to a self-fulfilling cycle of disinvestment where even well qualified, borrowers are denied loans in neighborhoods that banks have deemed too risky. However, we also segment the analysis to focus on loan denial rates in areas which have undergone gentrification in the previous decade to test whether racial discrimination still persists, even in a context of increasing land values.

Preliminary results indicate that the proportion of tracts that maintained a stable balance of lending patterns to multiple racial/ethnic groups is low and remained so over the past three decades. Initial Results from a Probit model of denial rates in gentrifying areas indicate ongoing racial bias in access to mortgage capital for African Americans.

#### HOW FINANCIAL STRESS AFFECTS PROPERTY OWNER-TENANT RELATIONSHIPS: EVIDENCE FROM THE PANDEMIC.

Abstract ID: 990

Individual Paper Submission

KUHLMANN, Daniel [Iowa State University] dok@iastate.edu, presenting author

We examine how residential property owners responded to tenant stress during the Covid-19 pandemic using results from a survey we administered between November 2020 and January 2021. We find associations between property owner's flexibility with their tenants and their own financial stresses. We examine two types of property owner responses: tenant-favorable policies like providing free or reduced rent and business-oriented decisions like the use of evictions and allowing tenants who have missed rent payments to break leases. Property owners who have themselves experienced stress during the pandemic, such as a missed mortgage payments or who anticipate a decline in operating cash flows, were more likely to respond to tenant issues with business-oriented rather than tenant-favorable responses. Not only does our study help researchers and policymakers understand property owner stress during the pandemic and other disasters, but it helps improve our understanding of the constraints residential property owners face and the influence these constraints have on their decision-making.

STIPHANY, Kristine [Texas Tech University] [kristine.stiphany@ttu.edu](mailto:kristine.stiphany@ttu.edu), presenting author

The topic this paper explores is the role of heirs in the production of informal rental markets that, in recent years, have risen across informal settlements in Latin America (Baqai and Ward, 2020). The aim is to show how the involvement of heirs in homebuilding processes has changed and is changing dwelling development in São Paulo, Brazil. Prior research on informal housing inheritance has focused on varying dimensions of tenure and ownership, including a mismatch between investment (often involving a protracted period of sweat equity) and demand (Ward, 2012); the challenges and opportunities of property transfer across generations (Jiménez Huerta, Cruz Solis, Ubaldo-Velázquez, 2015); and dwelling subdivision among multiple heirs (Ward, Jiménez, and DiVirgilio, 2015). One important evidence gap is bequest amid housing markets that are secured by rental. The research question I am trying to answer is: What are the dimensions of housing inheritance that heirs are using to shape where new rental markets are being established and new investment opportunities are being created? In response, my study draws on ethnographic and survey based research about the impacts of urban redevelopment on informal settlements in São Paulo (Stiphany, Ward, and Perez, 2021), with a focus on how rental is changing tenure and ownership dynamics of informal dwellings. I use a range of data sources that were collected through a combined household and post-occupancy survey of individual dwellings in two large settlements, including follow up surveys with renters, and interviews with heirs of dwellings where rental exists. From these sources, I identify four dimensions for understanding the role of heirs in rental markets: value, the location, size, occupancy, and monetary value of all bequeathed and unbequeathed dwellings where rental exists; investment, the number of additional properties acquired; mobility, the heir's primary place of residence; and livelihood, or add on investments such as higher education. Similar to previous times, heirs carry forward a legacy of housing expansion and family land retention. Today, however, heirs are less likely to invest their labor to expand the dwelling that has been bequeathed, and their prospects for selling it to live elsewhere in the city are greater. Thus, increased land values have likely raised expectations among heirs about the investment options they can entertain, while broad trends toward rental may diminish dwelling preservation. These emergent dimensions have implications for heirs who are trading spaces in neighborhoods where the option to do so was formerly limited. Inheritance is often framed as a legal issue; vis-a-vis rental it also features implications for community character and housing revitalization.

## **FROM RACE TO RISK: UNPACKING THE AFFORDABLE HOUSING DEVELOPMENT FINANCE CHAIN**

Abstract ID: 1009

Individual Paper Submission

PROCHASKA, Natalie [University of Illinois at Urbana-Champaign] prochask@illinois.edu, presenting author

Building affordable rental housing is recession-proof because of over \$10 billion in public tax credit subsidies annually. Why, then, are we amidst a housing affordability crisis? This research targets the relationship between rental housing and socio-spatial inequality by explaining how community-based lenders evaluate housing loans. The most affordable non-subsidized housing stock for both owners and renters nationally are 2-49 unit buildings (Pendall, Theodos, & Hildner, 2016). Yet this is the least-studied housing sector. Community Development Financial Institutions (CDFIs) lend to those the mainstream banking sector deems 'too risky,' and evolved over the last 25 years into primary conduits of financing for 2-49 unit buildings. CDFIs exercise discretion in who gets access to financial resources in ways distinct from mainstream banks, and are understudied. Studying these successful lending institutions is important because by understanding their discretionary decision-making around risk, we can better understand how disparate impacts in mainstream lending continue to occur. In this research I ask: How do CDFIs decide who to lend to, and how do government policies impact lender risk calculations in low- and moderate-income (LMI) neighborhoods?

This qualitative multiple case study compares how four parallel Chicago CDFIs assess risk. Each case is a CDFI loan fund doing 2-49 unit housing lending. I evaluate how internal process and government policies affect lending decisions and how rating agency risk assessments affect CDFI access to capital. CDFI risk assessment procedure is evaluated through semi-structured interviews with (1) loan originators, underwriters, and portfolio managers across CDFIs, (2) analysts from national rating agencies, and (3) Chicago CDFI investors (philanthropic funds and banks). I triangulate interview data with publicly available archival documents including CDFI and investor IRS 990s, SEC 10Ks and 1Ks, municipal policy documents, loan agreements and loan committee meeting minutes from my CDFI participants, and rating methodologies and rating reports from my rating agency participants. I analyze interview transcripts, archival and participant documents using discourse and content analysis to interpret internal cultures around risk-based pricing. Using qualitative methods to understand how statistical value-at-risk (VaR) models are practically used inside financial institutions uniquely identifies the differences between 'real' risk as evaluated by lenders embedded in the communities they lend to, and the conventional 'perceived' risk that mainstream banks use in their automated underwriting models.

Emergent scholarship across information technology, computer science, planning and geography is investigating processes driving algorithmic violence, "the violence that an algorithm or automated decision-making system inflicts by preventing people from meeting their basic needs" (Safransky, 2019). Risk-based pricing is the practice of lenders charging a higher interest rate to borrowers they believe are more likely to default. Lenders calculate this from many metrics, including a borrower's credit rating. Technical systems of credit allocation constrict the production of affordable housing through limiting access to financing. I critically analyze borrower assessment metrics to identify what community benefit may be traded away in exchange for financial legibility and comparability for investors. As a specific form of algorithmic violence, this risk-based pricing research reveals how financiers limit affordable housing lending by requiring inclusion of equity and appraisal metrics with double jeopardy racial impacts in proprietary statistical models used to evaluate potential borrowers.

This research contributes to housing and policy scholarship by addressing extant gaps in urban spatial analysis

(Newman & Goetz, 2016) and “missing middle housing” literatures (An, Bostic, Jakabovics, Orlando, & Rodnyansky, 2019); as well as housing literatures that document household-level disparate impact in lending outcomes but cannot explain their upstream causes (Smith & Daniels, 2017). I explain lending practices that cannot be modeled quantitatively in order to help explain why disparate impact is reproduced despite myriad policy interventions.

#### **A MATTER OF VALUE: ASSESSING THE SCOPE AND EFFECTS OF TANZANIA’S NATIONAL HOUSING CORPORATION’S DEVELOPMENT STRATEGY ON DAR ES SALAAM’S URBAN NEIGHBORHOODS**

Abstract ID: 1023

Individual Paper Submission

IZAR, Priscila [Ardhi University] izarpris@vt.edu, presenting author

MTWANGI-LIMBUMBA, Tatu [Ardhi University] tatumtwangi@gmail.com, co-author

Since the 1990s, the Tanzanian public housing authority, the National Housing Corporation (NHC), has been changing its goal, from prioritizing delivery of affordable housing, to becoming a leading commercial and residential real estate developer. This happens against a backdrop of market-based reform and the state’s growing reliance on private markets to support urban development. In this paper, we look at the impact of NHC’s new approach and its effect on housing production and every day practice in Dar es Salaam. The analysis is based on a case study of two new NHC middle to high-income development projects and housing practice in the neighbourhoods surrounding these projects. Analysis is informed by semi-structured interviews, and project and site investigation. Findings indicate that currently, NHC operates like a private corporation, prioritizing market-rate developments over low-income housing projects, and promoting segregated developments based on land value criteria, while also lacking protocols regarding its trickling down approach. High input costs and declining state subsidies are some of the factors mentioned as a challenge towards meeting the housing needs of moderate to low-income households. The paper contributes to the international debate concerning the state’s adoption of business-like approaches to housing production and the affordability crisis.

## HOW IS COOPERATIVE HOUSING IN JAPAN BEING HANDED OVER TO THE NEXT GENERATION?

Abstract ID: 1037

Individual Paper Submission

MIYANO, Junko [Mukogawa women's university] miyano@thnk.jp, presenting author

### Research question(s):

Since there are no laws regarding the establishment of housing associations for Cooperative Housing in Japan, associations are only formed during the construction period, and the buildings become Condos after construction. An appeal of this is that members form a close-knit community as they become jointly involved in the construction. This is perceived as a form of Co-housing. However, it has been thought that these buildings become the same as Condos with the passing of time as a result of the community becoming distant with changes in ownership of the units.

However, as reported by the author in 2019, it was found that there are also examples of cooperative housing where the community does not become distant.

The Research Question of this paper is how next-generation residents who were not involved with the construction came to become actively engaged with the community.

### Research target -TOJUSO series

To this end, the TOJUSO series of cooperative housing, which is found mainly in the central city area was selected as the target of this research. There are 20 buildings, mainly in the central Osaka area. The buildings are 16 to 40 years old. The reason for selecting this series of buildings is because they were built around the same time and are of the same scale, making it easy to make comparisons.

### Approach and methodology:

Of the 86 next-generation residents who were given a questionnaire, 36 (42%) provided a response. Of these respondents, 13 were interviewed.

### Meaningful and new findings.

As a result of this research, it was found that most next-generation residents are in their 40s or 50s, putting them in the age group that would have non-adult children, regard being in an environment that is close to a city center as most important, select units based on their floor area, and have made renovations to the floor plan. These are the same as the choices that are made for general homes. With that said, the TOJUSO buildings have distinctive designs, and next-generation residents are also fond of the designs. Therefore, it was found that next-generation residents are not very interested in management when they move in but come to be actively involved in management as they recognize the importance of management through their involvement.

## **RELATIONSHIPS OF UNEMPLOYMENT INSURANCE AND STIMULUS CHECK WITH MORTGAGE PAYMENT OUTCOMES DURING THE COVID-19 PANDEMIC: IS THERE DISPARATE BENEFIT FOR PEOPLE OF COLOR IN THE U.S.?**

Abstract ID: 1065

Individual Paper Submission

PARK, Dongha [Gyeonggi Research Institute] dongha.park@snu.ac.kr, presenting author

PARK, JungHo [Chung-Ang University] untible@cau.ac.kr, primary author

The Coronavirus Disease 2019 (COVID-19) pandemic has exacerbated the state of housing insecurity in the U.S. through unprecedentedly high unemployment and household income losses, particularly among vulnerable mortgage borrowers. Previous COVID-19 research has primarily focused on somewhat extreme scenes such as foreclosure and upsurging prevalence of forbearance, which undeniably call for urgent policy responses. Yet how numerous American borrowers who experience financial hardships directly or indirectly due to the pandemic, even if neither foreclosed nor on forbearance plan, manage to pay their monthly mortgages and are concerned about impending payments are arguably as important but are less studied. Equally important but less examined is the role of Unemployment Insurance (UI) and stimulus check that have been with many jobless and disadvantaged borrowers since the beginning of the pandemic.

This study measures and examines mortgage hardship with focus on the relationships of UI benefits and stimulus check with mortgage payment outcomes among different demographic groups. COVID-19 mortgage payment outcomes are defined by two binary measures: i) retrospective measure of last month’s mortgage delay and ii) prospective measure of next month’s payment inconfidence.

The Household Pulse Survey (HPS), our primary data, is a nationally representative survey deployed by the U.S. Census Bureau jointly with the Department of Housing and Urban Development (HUD) and other federal agencies that measures housing and socioeconomic impacts of the COVID-19 pandemic on Americans. We use the entire survey weeks of HPS (April 23, 2020 to March 1, 2021) to examine the yearlong trend in mortgage hardships. This paper builds a pooled cross-sectional data that amount to a full sample of 754,749 adult (age 18+) Americans. Multilevel logistic regression models are estimated with a set of person- and household-level (level-1) variables, all derived from the HPS, and state-level (level-2) contextual variables supplemented from multiple sources including the Federal Housing Finance Agency (FHFA)’s National Mortgage Database (NMDb), CDC’s COVID Data Tracker, Bureau of Labor Statistics (BLS)’s unemployment rate, smartphone-based outdoor mobility, and 2019 American Community Survey (ACS).

Our preliminary results show that both UI and stimulus check are positively related with mortgage payment outcomes, controlling for individual- and state-level variables. Important demographic and socioeconomic predictors of COVID-19 mortgage hardships include middle age group, male, race/ethnicity other than non-Hispanic white (most acutely non-Hispanic black), unmarried status, children in the household, greater household size, lower education, and lower household income. A series of health and socioeconomic hardships due to the pandemic, such as employment income loss, food insufficiency, and mental health problem, are also associated with a greater

mortgage hardship. UI and stimulus check recipients are more likely to pay last month's mortgage in time and have a greater confidence on the next month's payment. The positive effects, however, are unequal across different racial and ethnic populations, with commonly reduced benefits to people of color. Particularly, non-Hispanic Blacks are more likely to report a substantially reduced benefit from UI and stimulus check than non-Hispanic whites.

Our preliminary findings suggest that changes to UI benefits and stimulus check provision are important policy levers for improving mortgage payment outcomes and longstanding racial inequalities in the mortgage market. Mortgage relief policies should be race-conscious and account for the systematic and long-standing vulnerabilities experienced by people of color.

#### ADMINISTRATIVE BURDENS IN EMERGENCY RENTAL ASSISTANCE PROGRAMS

Abstract ID: 1080

Individual Paper Submission

AIKEN, Claudia [University of Pennsylvania] claudf@upenn.edu, presenting author

REINA, Vincent [University of Pennsylvania] vreina@upenn.edu, co-author

ELLEN, Ingrid Gould [New York University] ingrid.ellen@nyu.edu, primary author

Since the onset of the COVID-19 pandemic, localities across the United States have been given unprecedented amounts of rental assistance funding for their residents and considerable flexibility in these funds' distribution. Emergency rental assistance (ERA) programs have varied widely in terms of how they conduct outreach, how tenants or landlords apply, the form the assistance takes, and to whom it is ultimately provided. The emergency nature of these programs—which are rendered urgent by the risk that unassisted tenants will be evicted during a pandemic—as well as the shallowness and temporary nature of the subsidy suggest that the administrative burden placed on participants should be lower than it is in typical housing programs such as the Housing Choice Voucher program. Yet ERA programs still face the “double take-up challenge” characteristic of programs designed to assist renters; they must engage both tenants and landlords. In addition, many ERA program regulators and administrators only have prior experience with non-emergency rental assistance, including vouchers, and may face challenges adjusting to a less burdensome model or accepting a higher risk of fraud.

This paper uses results from a national survey of over 200 ERA programs, as well as 15 case studies representing a broad cross section of ERA programs, to identify common sources of administrative burden for both tenants and landlords and to explore how these burdens relate to program outcomes, such as incomplete applications and landlord non-participation. The effects of federal funding guidelines and national and local eviction moratoria on the

allocation of administrative burden in ERA programs are considered. We then use Census and publicly available administrative data to examine whether variation in administrative burden across jurisdictions correlates with political context, racial segregation or composition, the presence of immigrants, and jurisdiction size and governmental capacity. We pay special attention to the relationship between tenant and landlord administrative burdens, and how increased burdens on one party may increase or decrease burdens for the other. Finally, drawing on case study interviews with program administrators, we discuss strategies to alleviate administrative burdens on tenants and landlords without unduly heightening the risk of fraud.

In studying the sources of ERA programs' administrative burden, its consequences, and its drivers, this paper provides information of immediate value to policymakers at the local and state levels as they continue to disburse federal rent relief funds. It also informs federal policymakers who must set parameters for future funding. More broadly, it takes advantage of a vast national experiment in the provision of rental assistance programs to shed light on how policymakers can increase equitable participation in housing programs by managing the burdens they place on both tenants and landlords.

#### EARLY PUBLIC HOUSING PROJECT SITING AND RACIAL SEGREGATION IN U.S. CITIES

Abstract ID: 1099

Individual Paper Submission

ALLEN, Ryan [University of Minnesota] allen650@umn.edu, presenting author  
VAN RIPER, David [University of Minnesota] vanriper@umn.edu, co-author  
MARSON, Corissa [University of Minnesota] marso056@umn.edu, co-author  
ANAMPA CASTRO, Catalina [University of Michigan] canampa@umich.edu, co-author

The U.S. Federal Government built and leased over 30,000 units of public housing in 71 developments in 46 cities spread across 22 states, Puerto Rico, and the U.S. Virgin Islands during the latter half the 1930s. Public housing was viewed as a mechanism to help the so-called "submerged middle class" rebound from economic distress, help inject capital into the construction industry, and clear so-called slum areas of inadequate housing (Friedman, 1966). While race was not explicitly discussed in the enabling legislation, it played a key role in early public housing. Policymakers designated most public housing developments for either White or Black residents, and existing research contends that the siting of these developments reinforced existing patterns of racial segregation (Radford, 1996). Yet, this claim remains untested outside of reviews of individual or small numbers of public housing projects (Fairbanks, 1988; Vale, 2000).

Thus, a key question related to the siting of public housing projects is the extent to which the placement of White, Black, and (the few) racially integrated public housing projects by local public housing authorities matched the racial distribution of residents in the surrounding neighborhood. This question arises because of guidance by the U.S. Housing Authority on siting public housing developments designated for a particular racial group that encouraged

local public housing authorities to exercise care in “selecting a site which will not do violence to the preferences and established habits of members of that race or to the community life of which they may be a part” (USHA, 1939: 7-8). The guidance elaborates by specifying that siting a white public housing project “in areas now occupied by Negroes [sic] or other minority racial groups is undesirable” (USHA, 1939: 8). While this guidance from the USHA did not carry the formal weight of policy, it makes clear that siting public housing should as a rule not upset existing racial segregation patterns nor displace households from a racial group not served by the new housing units.

We use a novel dataset containing data from the 1940 complete-count census on the characteristics of public housing residents and residents in neighborhoods where public housing projects had been built at the time of the census to assess how faithfully the siting of early public housing developments adhered to these guidelines. Results from spatial analysis and predictive statistical models indicate that local public housing authorities largely conformed to federal guidelines when it came to where they built public housing developments, placing projects designated for White residents in overwhelmingly White neighborhoods and projects designated for Black residents in overwhelmingly Black neighborhoods. At the same time, a number of White projects were built on the periphery of Black neighborhoods, confirming findings from previous research that suggested public housing projects were used to create a barrier to staunch a feared spread of Black, slum areas into White, middle class areas (Fairbanks, 1988). Finally, on rare occasions, the siting of a White public housing project appeared to be an attempt to displace Black households in order to jump start the reclamation of a formerly White neighborhood for White residents. Together, these research findings provide new insights into historic investments in public infrastructure by planners to reinforce patterns of racial segregation in American cities. In addition, the increasing focus on slum redevelopment as an ancillary goal of the fledgling public housing program helps to cast the public housing program as an early example of urban renewal that came to be adopted more pervasively and vigorously by urban planners in the 1950s.

#### DOES LIHTC FUND AFFORDABLE HOUSING IN LEGACY CITIES?

Abstract ID: 1114

Individual Paper Submission

NELSON, Katharine [Rutgers, The State University of New Jersey] [katharine.nelson@rutgers.edu](mailto:katharine.nelson@rutgers.edu), presenting author

The purpose of this study is to explore whether and how LIHTC serves the needs of legacy cities, and to identify differences across states in how LIHTC projects are sited in legacy cities. The LIHTC program is generally designed to produce new housing in cities with fast-growth and strong markets at an affordable price. It is an outstanding question how LIHTC may help legacy cities meet the affordability needs of residents. LIHTC is the largest affordable housing development program in the country. While the program is generally intended to promote new construction in areas of opportunity, LIHTC funds are also used for rehabilitation of older and dilapidated units,

which is an area of particular need for legacy cities.

Previous research shows that LIHTC projects are sited more often in less poor and suburban areas than other affordable housing programs, such as public housing (McClure, 2006). Research also points to the importance of state unique Qualified Action Plan (QAP) in the siting decisions for each state's LIHTC properties (Ellen & Horn, 2018).

In this study, I explore how LIHTC is used in legacy cities, defined as places that have suffered population loss and economic contraction since the mid-Twentieth Century. I'm particularly looking at the use of new construction versus preservation at the state and municipal level and how these vary across legacy cities. The research focuses on LIHTC projects in several states with legacy cities – New Jersey, Pennsylvania, Maryland, Ohio, and Michigan -- and uses a mapping and temporal approach to look at LIHTC projects in and around legacy cities, and how these have changed over time. Then, the study compares the QAPs across states, looking for how differences in QAP relate to differences on the ground, and how changes in individual state QAPs translate into changes in LIHTC siting.

## **POSTERS**

### **AUSTIN AI HOUSING ANALYSIS**

Abstract ID: 277

Poster

CONRAD, Josh [University of Texas at Austin] [josh.conrad@utexas.edu](mailto:josh.conrad@utexas.edu), presenting author

JIAO, Junfeng [University of Texas at Austin] [jjiao@austin.utexas.edu](mailto:jjiao@austin.utexas.edu), co-author

Supported by the University of Texas at Austin Good Systems Grand Challenge, this research project aims to develop a value-driven AI system that evaluates historical housing development in Austin and helps city planners and policymakers shape equitable, inclusive and sustainable plans and regulations. Using deep learning technology and an open data repository with development, transportation, energy, and demographic data, this system links and studies 30 years of Austin housing development metrics in an effort to help analyze the spatial and demographic relationship between affordability and housing, mobility and energy policy over the past three decades. Our goal is to build an AI-supported system that can help to test different regulatory scenarios and inform residential

development policies in Austin. The techniques and findings developed from this study can also be applied to many similar cities nationally and internationally.

This study is guided by four related research questions that aim to understand the history, current state, and possible future of housing affordability in Austin:

1. What are the most and least affordable types of residential developments in Austin today?
2. How has residential affordability changed in Austin since 1990?
3. What impact have housing policies had on residential affordability since 1990?
4. What new policies may have a greater equitable impact in the future?

From 2020 to 2021 we collected and analyzed 140 million records of open land parcel appraisal data from the Travis Central Appraisal Data in Austin, Travis County, Texas. These records estimate yearly market values per property and depict granular improvement-level changes in the built environment of Travis County over the past 30 years. With this basemap data, we spatially join construction permit data, home sales data, demographic data, and other urban metrics to develop a rich temporal and spatial model of Austin's built environment history up to the present.

To date, our analysis has found that from 2000 to 2020 Austin experienced an increase in the median single-family residential market value from under \$150,000 in 2000 to over \$350,000 in 2020, an average increase of 6.6% per year. Further we found that, since 2000, Austin has seen its largest residential growth in the creation of single-family condominium properties throughout Austin's central urban neighborhoods, developments which have both contributed to and removed affordable housing in different parts of the city.

Further we have conducted research into the performance of the City of Austin's Accessory Dwelling Unit/Secondary Apartment ordinances in supporting affordably-priced housing development in Austin since 2000. We found that these ordinances have resulted in a range of affordable and unaffordable open market single-family units in different parts of the city. These results suggest that City planners should work with different neighborhood communities to determine which combination of housing ordinances may work best for each area of the city. Further, our results show that these local planning collaborations can make important equity-based judgments and decisions with the help of open government data and AI analysis methods.

In 2021 we will continue to develop neighborhood-level analyses and historical inventories of affordable housing in relation to the application of several housing policies of interest to the City of Austin: Accessory Dwelling Units/Secondary Apartment ordinances, Local Historic District zoning designations, the Austin Energy Green Building certification program, and the Transit Oriented Development incentive program. We will track where the City has implemented these City policies and programs and evaluate whether or not these programs may be supporting affordable housing in each neighborhood.

Project results and analysis tools will be hosted on our project open data portal, hosted on ArcGIS Online at [ai-housing-ut-austin.opendata.arcgis.com](https://ai-housing-ut-austin.opendata.arcgis.com).

## **IMPACT OF DISASTER MITIGATION PROGRAMS ON LOW- AND MID-INCOME HOMEOWNERSHIP IN COASTAL REGIONS- CASE STUDY: NYC AFTER HURRICANE SANDY, 2012**

Abstract ID: 608

Poster

KHAJEHEI, Sayma [University of Utah] sayma.khajehei@utah.edu, presenting author  
CHANDRASEKHAR, Divya [University of Utah] CHANDRASEKHAR@arch.utah.edu, co-author

Disaster management contains four phases in its cycle, including mitigation, preparedness, response, and recovery. Among these four phases, mitigation aims to decrease the impact of hazards utilizing structural and non-structural measures. While post-disaster condition encompasses high demand and complex needs, recovery aims to reduce vulnerabilities toward future disasters. Therefore, the recovery efforts try to restore not only the pre-disaster routines but also to improve the resiliency of the community in terms of facing possible future disasters. But the concept of building back better does not work equally for the whole community.

Housing serves as a foundation for households and community resilience, both as a critical element of the built environment and a household's most significant financial investment. Housing recovery constitutes a large part of recovery efforts, and previous studies show that homeownership declines in the aftermath of disasters due to housing destructions. Some groups of the community remain displaced for a long time in the aftermath of disasters. While there are studies investigating housing issues and mitigation policies in the aftermath of disasters, few studies examine the role of recovery mitigation policies on long-term homeownership, specifically for low- and mid-income individuals.

New York City is a diverse community that has faced various disasters in its history. One of the major disasters that hit the city was Hurricane Sandy in 2012. Hence, the city has good experience in all phases of the disaster management cycle. Recently, the city shifted fundamentally to mitigation, the crucial step that can reduce the losses and break out the process of response, recovery, damages. The city has invested in many mitigation programs since 2014, and has completed 227 mitigation projects for various hazards until 2018, and has 473 existing projects. Using New York City as a case study, this research explores the impact of mitigation policies on the homeownership of low- and mid-income families in this city. This study uses secondary data from the American Community Survey (ACS- 5-year estimates) for 2014-2019, after the disaster, and Decennial Census data for 2000, before the disaster and mitigation projects conducted in the city using New York City Hazard Mitigation dataset. The study analyzes these data using a multi-level linear regression model. Level one is time observation (before and after the disaster), level two is census tract, and level three is the city where tracts are located. The analyses consider socioeconomic status using two sub-samples, including low-socioeconomic status areas and high socioeconomic status regions (based on the average values in the study area), in running the model. The model controls the results using mitigation efforts and people in-movers and out-movers data.

Study results show that areas with a low-socioeconomic status more vulnerable to significant post-disaster homeownership changes than high-socioeconomic status, and that homeownership of low- to moderate-income households has decreased in places where mitigation projects are being implemented. The study findings provide a greater understanding of how post-disaster homeownership changes are related to pre-disaster socioeconomic status and call into question whether the benefits of mitigation interventions are felt equitably.

## **MULTIFAMILY HOUSING DISASTER RECOVERY: A CONCEPTUAL FRAMEWORK FOR EXPANDING THE RESEARCH**

Abstract ID: 789

Poster

DAY, Wayne [Texas A&M University] waynecday@tamu.edu, presenting author

PEACOCK, Walt [Texas A&M University] peacock@tamu.edu, co-author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Multifamily housing has been documented as lagging in the recovery process compared to other housing types that are impacted. What we do know comes from a limited number of studies (e.g., Comerio, 1998; Hamideh, Peacock, & Van Zandt, 2021) and anecdotal evidence. How generalizable these findings are remains unknown. Multifamily housing is significant for the rental housing market with significant heterogeneity among property owners, renters, structural characteristics, and housing quality. Multifamily-renters (16.2 percent) comprise the second highest structure-tenure combination behind single-family owner-occupants (57.0 percent) according to 2019 American Housing Survey estimates.

Current U.S. disaster policy favors single-family owner-occupied housing, especially regarding recovery finance. With disasters occurring more frequently, and increasing population in dense urban environments (Been, Ellen, & Weselcouch, 2014), this housing type necessitates further investigation. This research puts forth a conceptual framework for investigating multifamily housing disaster impacts and recovery.

The disaster recovery environment has been characterized as a market-driven process favoring stakeholders with the most political and economic power and capacity to enact and manage their own recovery process (Comerio, 1998). Considering the separate property interests related to the ownership and use of the housing structure, we distinguish between the business interests, the structure, and renter-households as separate yet interrelated units of observation in the disaster context. Emphasis is particularly placed on the business interests as providers of this housing type.

Recovery for multifamily housing involves a complex group of stakeholders and is largely dependent on the owner-manager's investment objectives, motivation, and capacity. Owners residing in the impacted area may be dealing with the recovery of their household concurrently. Additionally, an impacted property is subject to lender conditions and other property interests such as governmental agencies and community residents with NIMBY attitudes towards multifamily housing. Renter status is an important determinant of social vulnerability and correlates with other social and physical vulnerability dimensions (Lee & Van Zandt, 2018). Given the multiple property interests, recovery for one actor does not necessarily mean recovery for another; failure or success at the business-level may

not equate to non-recovery or recovery for renter-households.

The proposed research framework draws on real estate and urban economic theories to characterize the real estate market, market segments, and actors with a focus on “normal” market functioning. The real estate market is comprised of asset, space, and capital markets--each with its own processes and actors (DiPasquale & Wheaton, 1996). Housing markets are also segmented by structural and quality characteristics and by demographics. Real estate submarkets and market segments interact with each other resulting in dynamic outcomes for users and investors. Outcomes in one market can reverberate throughout the entire real estate system. We also incorporate existing applied real estate research to identify vulnerabilities during “normal” times that signal potential vulnerabilities during disaster times--specifically, literature on investment and investor performance, mortgage performance, access to financing, and propensity for redevelopment and repositioning.

We then re-examine disaster literature on housing, household, business, and community recovery, and re-examine this body of research through the lens of the proposed framework to better understand existing findings. Our primary motivation with developing this framework is to identify areas for further investigation that will be accomplished in subsequent stages of this research. This framework and subsequent research findings should be relevant to urban planners involved in community recovery, researchers interested in disasters and a housing type that has been significantly understudied, and policy-makers crafting disaster recovery policy for a housing type that has significant implications for a diverse demographic base.

#### **TRANSNATIONAL HABITUS AND SPACE SYNTAX: A CASE STUDY OF AFFORDABLE HOUSING FOR IMMIGRANTS IN LOS ANGELES**

Abstract ID: 1100

Poster

MYUNG, Junyoung [University of Illinois at Urbana-Champaign] jymbright@gmail.com, presenting author  
LEE, Taegyu [Seoul National University] tegyu@naver.com, co-author

According to the 2010 U.S. Census Bureau, the number of foreign-born immigrants has reached a record population of nearly 40 million. Data show that continued growth will have an impact on housing markets. To better understand housing design and use of immigrants in Los Angeles affordable housing markets, this study examines the roles of transnational practices and cultural change in shaping spatial forms and use in residential spaces using Space Syntax. Space syntax seeks to answer how spatial configurations express social and cultural meanings and values (Hillier et al., 1984, 1996).

In the era of globalization and transnationalism, studies in immigrant transnationalism and the experiences of immigrants explore new trends in contemporary international migration and identify social relationships between

immigrants' places of origin and their societies of settlement (Basch et al., 1994). Moreover, the nature of a group's experience creates a group's identity. Thus, every group has its own experiences and collective memory, which are distinct from those of other groups (Halbwachs, 1980). In addition, to study everyday life experience and its contribution to the built environment, Amos Rapoport's theory (2000) suggests that the shape of the built environment can be examined specifically by analyzing an activity system and a corresponding system of settings. In this regard, housing use and the built environment are tangible manifestations of culture as a way of life, and the built environment changes because of its inextricable linkages with culture (Rapoport, 2000).

In this study, participants were asked to answer questions related to contextual themes such as historic, economic, social, and cultural values to assess residential settings, daily life patterns, residential experiences, and cultural identities of immigrants. This qualitative case study of affordable housing in Los Angeles, California, and immigrant homeowners investigates three research questions: 1) What is the nature of the relationships between transnational practices and cultures of immigrants, and the spatial forms and the use of residential spaces? 2) How are perceptions of past and present places embodied in residential spaces of immigrants? 3) How do they perceive and alter these spaces?

The findings provide insights into the nature and extent of transnational practices between immigrants' home countries and the US, the socio-spatial practices and cultural activities of immigrants, and the various ways in which these immigrants actually perceive and use residential spaces according to their lifestyles and experiences in everyday life. This study uses a variety of qualitative data to illustrate the cultural practices in relation to the spatial forms and use of space in affordable housing by immigrants and thereby broaden our perspective of immigrants in American society. This study also provides a conceptual framework for culture and housing studies by introducing different dimensions such as Space Syntax.

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### **7.95 PRE-ORGANIZED SESSION - EXPLORING THE CONNECTION BETWEEN HOUSING AND CLIMATE JUSTICE: A GLOBAL PERSPECTIVE**

Pre-Organized Session 95 - Summary

Session Includes 120, 477, 478, 479, 480

BALACHANDRAN, Balakrishnan [University of Illinois] bbalach2@illinois.edu, organizer

Globally, climate change will intensify vulnerability of communities living in precarious housing conditions, multiplying their displacement. Policies of resilience and adaptation that appropriate people's land also displace vulnerable communities. In such cases, the right to housing emerges as a crucial site of contention. In urban areas, systemic housing injustice forces low-income and historically disadvantaged communities to occupy risk-prone locations without municipal services and while they are coping and surviving, they face displacement pressures both ecological and policy-driven. Even when at-risk communities are relocated, they continue to be victims of housing injustice. This causal nexus between housing injustice and climate injustice and the resulting vicious cycle of housing precarity appears to be emerging as a serious global issue. In this pre-organized session, we bring together scholars researching the intersection of housing justice and climate justice in Asia, Latin America and the U.S.

Objectives:

- Explore the nexus between housing injustice and climate injustice
- Learn how policies are interconnected - housing policies and policies of adaptation to climate change
- Learn how communities respond to housing and climate injustice

### **MOVING TO "SAFETY": AN EXPLORATION OF THE IMPACTS OF RISK AND SAFETY FRAMING ON THE RELOCATION OF INFORMAL COMMUNITIES IN PUERTO RICO**

Abstract ID: 120

Abstract within Pre-Organized Session 95

CONTRERAS, Santina [University of Southern California] santinac@usc.edu, presenting author

LORENZO-PÉREZ, Monique [Ohio State University] lorenzo.32@buckeyemail.osu.edu, co-author

The Caribbean region is known to be particularly vulnerable to the effects of climate change and environmental hazards. To deal with the many risks impacting communities, retreat and relocation initiatives are frequently presented as potential adaptation strategies to use in mitigating the threats associated with living in these hazardous areas (Hino, Field, & Mach, 2017). However, despite the positive benefits of using these strategies to mitigate environmental threats, the relocation of communities can present additional issues. Studies note that risk exposure is not necessarily reduced by relocation and has at times been found to result in potential increases in community vulnerabilities (Nalau & Handmer, 2018). For instance, relatively higher ground areas could be considered safer than low-lying coastal lands, but as meteorological events intensify over time, they frequently become more vulnerable to tropical cyclone impacts like heavy rainfalls, wind damage, and in-land flooding. Factors such as these make it important to consider the diversity of risks impacting the decision-making process surrounding retreat and relocation initiatives.

When considering planning for informal settlements, additional challenges and concerns further complicate relocation efforts. In addition, to facing exclusion from formal planning and decision-making processes, informal communities are known to be frequently located in areas with high exposure to risk (Yarina, Mazereeuw, & Ovalles, 2019). As part of efforts towards addressing these dynamics, relocation is often presented as a planning strategy for risk management in informal communities. Relocation initiatives may be justified for a variety of reasons, including addressing inadequate housing and overcrowding, dealing with public health concerns, or as part of disaster induced displacement measures. These dynamics are well highlighted by exploring the relocation and resettlement of informal communities in Puerto Rico. Since as early as the 1970s, local municipalities in Puerto Rico have been actively involved in efforts to relocate informal communities across the island. These activities have been motivated by a variety of interests, including urban renewal, hazard exposure, public health concerns, and new development investments. Furthermore, devastation brought about by Hurricane María and more recent hurricanes have continued to highlight how climate and hazard issues impact informal areas, leading to renewed interests in advancing mitigation efforts. Thus, despite the potential benefits of this hazard mitigation approach, the relocation of these communities opens up questions surrounding the larger decision-making and resettlement process and broader risk exposure of informal communities.

In this study, we assess these dynamics through a qualitative assessment of the relocation and resettlement of informal communities in Puerto Rico. Our data collection efforts center on (1) in-depth semi-structured interviews with local public officials, planners, and other contextual experts; (2) focus groups with community leaders; and (3) hazard risk assessments. Our findings highlight the critical role risk and safety framings play in the decision-making surrounding relocation and retreat activities across the island. The results of this research aim to contribute to discussions surrounding the equitable implementation of hazard mitigation and planning efforts in informal and vulnerable communities.

#### **REFRAMING CLIMATE JUSTICE IN SANTIAGO DE CALI: A COMPARATIVE STUDY OF RESISTANCE TO CLIMATE RELOCATIONS IN AFRO-COLOMBIAN COMMUNITIES**

Abstract ID: 477

Abstract within Pre-Organized Session 95

SARMIENTO, Hugo [University of Illinois at Urbana-Champaign] hugos@illinois.edu, presenting author

In 2012 Colombia created the Fondo Adaptacion (Adaptation Fund in English) to finance climate adaptation projects including the reinforcement of protective infrastructure and the construction of new housing for communities vulnerable to climate-related floods and landslides. The Adaptation Fund has partnered with the City of Santiago de Cali to reinforce the city's flood protection system and to construct social housing for residents at risk of displacement caused by the increasingly frequent and intense flooding. This project, called Proyecto Plan Jarillon, involves the relocation of nearly 9,000 households who live in the informal settlements which line the banks of the Cauca River. Afro-Colombian residents, who constitute over 30% of the city's population and who have historically

been racially excluded and segregated from the formal housing market, are disproportionately represented in these informal settlements.

Based on three years of fieldwork in Colombia, this comparative study considers the counter-planning efforts of two Afro-Colombian communities, Brisas del Cuaca and Playa Renaciente, to resist state-led displacement and to negotiate their participation in the relocation project. The study finds these communities strategically mobilize their Afro-Colombian identity to make claims, namely to territorial sovereignty and the capacity to adapt to the river's changing flood patterns as a consequence of climate change. This social and cultural mobilization forms the basis for demanding larger housing subsidies and certain modes of relocation such as collective, community-based relocations to more centrally located parts of the city.

### THE LIVED EXPERIENCE OF RISK AND TRAJECTORIES OF CLIMATE-INDUCED DISPLACEMENTS AND RELOCATIONS

Abstract ID: 478

Abstract within Pre-Organized Session 95

BALACHANDRAN, Balakrishnan [University of Illinois at Urbana Champaign] bbalach2@illinois.edu, presenting author

Millions of people live in risk-prone locations and their exposure is increasing with climate change. Disasters displace such people (Esnard 2014). To reduce losses in future disasters, governments frame policies to disincentivize housing in at-risk areas, and to incentivize preemptive/post-disaster relocation to safer places. Studies in planning use technical and spatial analyses to assess land use policies and relocation as a means to reduce risk (Araki, Hokugo, and Masuda 2017; Correa 2011). However, policies favoring relocation often meet with resistance and fail to achieve their objective. Researchers in anthropology, sociology, and geography have shown how relocation disrupts communities' relationship to place (Oliver-Smith 1990; Jenkins, Stukes, and Phillips 2012). Despite these close links to place, despite resistance to policies favoring relocation, despite initiatives to build resilience and adapt to climate change, displacement and relocation are ongoing phenomena in many regions experiencing significant environmental change. To explain this seeming contradiction, my paper examines multiple forms of displacement – social, economic and physical – and charts out the complex trajectories of displacement that people experience. I show that these trajectories, involving several types of displacement, unfold in the intersection between housing (in)justice and environmental (in)justice.

I carried out qualitative research in coastal Louisiana, a region exposed to hurricanes, flooding, land subsidence and ecological destruction. Here, displacement and relocation result from land loss and decline in nature-based livelihoods, within a context of historical racial injustice and wealth disparity, fuelled by oil exploration and industrial development. Thousands have already been forced to relocate. People in many at-risk communities need to move but don't have the resources to move, a result of generations of wealth disparity. In contrast, several families on the Isle de Jean Charles have a fully funded opportunity to move but don't wish to move. The history of racial discrimination has also created a trust deficit that makes people look at government-driven programs with suspicion as to their true intent.

I interviewed members of vulnerable communities including a Native American tribe to understand their lived

experience of risk. I carried out participant observation, embedded in a planning team conducting community meetings and non-participant observation in the social life of the community. Through these interviews as well as formal and informal interactions, I tease out complex trajectories of social, economic and physical displacement.

My research shows that policies related to housing, land use planning and risk reduction complicate the decision processes of affected people in terms of their perception of options available to them. In some cases, it stops them from moving to safety, trapping them in their circumstances. In other cases, they hold out till they are finally, irrevocably displaced by disaster. In yet others, they take the option of moving, either for safety or to fulfill other aspirations. Those who make the move sometimes suffer other forms of displacement such as loss of livelihood, disruption in social networks a lowered sense of well-being.

Based on the findings from my research, I make a case for a more nuanced understanding of, and approach to, processes of housing and adaptation in at-risk communities. Housing policies as well as policies for building resilience and adapting to climate change need to be sensitive to the lived experience of risk and consider how the policy impacts people in various life situations. These policies need to respond to the multiple dimensions of displacement, not just physical relocation. My findings primarily inform planning practice, specifically in relation to policy formulation for resilience, adaptation and housing for low-income vulnerable communities in at-risk locations.

#### THE INFORMALITY OF CLIMATE IN A GLOBAL SOUTH CITY

Abstract ID: 479

Abstract within Pre-Organized Session 95

HUQ, Efadul [University of Illinois at Urbana-Champaign] [ehuq2@illinois.edu](mailto:ehuq2@illinois.edu), presenting author  
SHAFIQUE, Tanzil [University of Melbourne] [tanzil.arch@gmail.com](mailto:tanzil.arch@gmail.com), co-author

More than 2.2 million people, in the government's conservative estimates, endure persistent housing precarity in the informal settlements of Bangladesh (BBS, 2014). Climate-induced displacement, which has already displaced more than 6 million people in Bangladesh, will continue to push low-income communities to adapt-by-migrating to the expanding urbanizing centers where migrants make homes in hazardous and tenure-insecure settlements (Displacement Solutions, 2012). In these often low-lying settlements, low-income communities face other risks of

climate change—extreme heat or cold, and erratic rainfall leading to flooding. In the informal settlements, the demands of displaced climate "refugees" and informal settlement dwellers converge in their demand for the right to secure housing. But this converging demand is yet not recognized in the policies and governing practices that make informal settlement dwellers invisible. How do we explain this significant mismatch between urban and climate governance? The scholarly literature, to our knowledge, at the intersection of climate and housing justice is recently growing. Particularly in global south contexts, the climate/housing literature requires more in-depth engagement with urban informality in order to guide policy and interventions (Chu & Michael, 2019; Dodman, Archer & Satterthwaite, 2019). We join this conversation by building on our ongoing engaged research in the informal settlements of Dhaka, Bangladesh. Despite the Bangladeshi government's commitment to provide secure housing in the Sustainable Development Goals, informal settlement dwellers continue to face evictions. At the same time, the government has made national level plans for climate change adaptation and has taken a moral leadership in the international sphere. But the climate-displaced find little support or stability in their destination urban centers. We will argue that the same people—climate-displaced and living under regimes of evictions—fall through the cracks of policies and laws crafted at the national and urban scales. We see a gap between urban citizenship and national citizenship that is untenable on the ground, but which the government continues to leverage to abandon their responsibility towards the displaced and precariously-housed people. In Bangladesh, housing and climate injustices persist through maintaining an instrumental separation between urban and national scales across policies and legal approaches, where the state can ignore its responsibilities towards displaced climate migrants in the city while engaging in rural policies for climate adaptation and participating in an international moral discourse of sovereign victimhood. The findings of our research will propose just pathways for both climate adaptation plans as well as resettlement plans for the urban informal settlement dwellers.

#### **REBUILDING COMMUNITIES: TRENDS IN AFFORDABLE HOUSING PRODUCTION THROUGH MAINSTREAM HOUSING POLICY INTERVENTIONS IN THE GULF COAST.**

Abstract ID: 480

Abstract within Pre-Organized Session 95

BALACHANDRAN, Sowmya [University of Illinois at Urbana-Champaign] [sowmyab2@illinois.edu](mailto:sowmyab2@illinois.edu), presenting author

Low-income and racially marginalized community groups are disproportionately affected by displacements and exacerbated housing instability in the aftermath of natural disasters (Belkhir & Charlemaïne, 2007; Durant & Sultan, 2008). Neighborhood disinvestment and fragmented housing rehabilitation strategies along with repeated onslaught of disasters lead to declining community structures and extreme economic segregation (Billiot et al., 2019). Post-disaster recovery and rehabilitation processes have their own timelines, trade-offs and political limitations (Gotham, 2014). As a result, regions at risk of climate change impact in the United States have been grappling with an acute affordable housing crisis and the inevitable reproduction of class and structural inequalities (Gotham, 2014; Rodriguez, 2019). In response, post-disaster recovery can benefit from mainstream federal and state housing programs that encourage the supply of affordable housing, enabling choice and residential mobility

for households confronting multiple risks associated with poverty, racial marginalization, place stratification and climate change induced vulnerability (Morris & Diaz, 2020). The mainstream programs along with a supportive local housing policy environment can improve vulnerable communities' chances at recreating social capital, community life and long-term socio-economic recovery. However, there is little regional research on how production of housing stock through mainstream housing policy interventions have supported community rebuilding efforts over time. This paper seeks to address this gap our knowledge.

In this study I analyze trends in production and preservation of affordable housing stock in communities at risk of sea-level rise, storm surge and inundation in the Gulf Coast of the United States. I provide a regional assessment of changing diversity of housing typologies using publicly available datasets. Using the National Housing Preservation Database (NHPD), I describe temporal changes in the production of affordable housing through the Low-Income Housing Tax Credit (LIHTC) program and nine other federally subsidized rental housing programs in the coastal and adjoining in-land communities in the five states of Texas, Louisiana, Mississippi, Alabama and Florida. I assess loss and production of housing stock in the past three decades, focusing on variations across communities with differential Social Vulnerability (Cutter et al., 2003; Cutts et al., 2018). I substantiate these assessments with an analysis of locally adopted housing programs through a study of policy documents of jurisdictions in the region. The production of affordable housing through these programs and local policy adoption serve as useful proxies for determining interest and readiness in supporting housing access for vulnerable community groups. The findings of this research contribute to the ongoing efforts in community organizing, activism and lobbying for planning interventions in the pursuit of housing justice in at-risk and receiving communities of the Gulf Coast.

### 7.132 PRE-ORGANIZED SESSION - INFRASTRUCTURE PLANNING AND INTERNATIONAL FINANCING IN THE GLOBAL SOUTH

Pre-Organized Session 132 - Summary  
Session Includes 823, 824, 825

CRUXEN, Isadora [Massachusetts Institute of Technology] [cruxen@mit.edu](mailto:cruxen@mit.edu), organizer

This session explores the financing and governance of infrastructure development projects in the Global South. Scholarship on the relationship between infrastructure and spatial planning in the past decade has largely been framed around problematizing neoliberal urban policies and “sustainability” in the Global North. Instead, this panel

brings together a collection of papers that seek to: 1) shift away from the debates on neoliberal governance and the legacy of economic restructuring in the 1980-90s to gain insight into emerging models of international infrastructure financing and planning in the South; 2) examine distinct spatialities of infrastructure planning; 3) draw attention to the role of state and non-state actors—not simply financing instruments—in shaping the governance of infrastructure. Networks of actors influence the spatial geography of infrastructure, access to goods and services, and the distribution of risks and benefits across projects at different scales. Papers presented address how these rationales influence environmental governance, regional planning, the financialization of utility investments, and urban governance.

Objectives:

- Understand emerging forms of infrastructure financing and its impact on planning practices in the Global South

## **RESCALING THE PLAYING FIELD: FINANCIALIZATION AND THE GOVERNANCE OF PRIVATE INFRASTRUCTURE SERVICE DELIVERY**

Abstract ID: 823

Abstract within Pre-Organized Session 132

CRUXEN, Isadora [Massachusetts Institute of Technology] cruxen@mit.edu, presenting author

Political economy scholarship on the rise of finance, both in urban governance and in international development, typically casts financial capital as a beneficiary of the risk-mitigation, institution building, or entrepreneurial efforts of other actors, especially the state. In Western cities, local government strategies to raise capital and spur growth through debt security instruments or public-private partnerships have been described as forms of financialized urban development or municipal entrepreneurialism that are re-centering urban politics around “debt-machine dynamics.”[i] Within the realm of development, scholars have noted that multilateral development institutions are working with national and local governments to “derisk” development projects for investors[ii] as part of an emerging “Wall Street Consensus”[iii] that sees global finance as central to the achievement of the Sustainable Development Goals (SDGs). Under these lenses, finance appears as both a bystander and legatee, relatively removed from the on-the-ground politics of making financialization happen.

In this paper, by contrast, I propose that financial investors can be key agents of political and institutional change in the governance of urban infrastructure development and service delivery. Through a historical analysis of private participation in water and sanitation provision in Brazilian cities, I reveal a dynamic in which financialization is occurring not simply within but across cities through changes in business organization. Within the past two decades, a handful of holding firms took control of this market, together managing nearly 90% of service contracts with the private sector. While these companies used to share a common DNA—ownership and control by family-owned, domestic business groups specialized in construction—three of the largest holdings were recently acquired by financial investors such as private equity funds. I show that these shifts in business ownership have produced a new financialized political economy of service delivery centered on side-stepping local politics and advocating for the upward rescaling of contractual and regulatory arrangements.

Under the ownership of construction business groups, private providers were highly locally embedded: they maintained close ties to public officials and afforded their subsidiaries decision-making autonomy and flexibility. These strategies were deemed necessary for handling “the follies of the mayors”—a common, I observed, and jocose way in which professionals in the sector referred to the vacillating demands of local elected officials. Once financial investors stepped in, accompanied by stricter corporate governance rules, they sought to change the playing field. To alleviate local political risk and facilitate market growth, firms centralized organizational decision-making and successfully lobbied federal policy-makers for legal and regulatory changes that standardized regulatory norms at the national level and created incentives for the development of regional service provision arrangements

encompassing several municipalities.

My analysis builds on two years of fieldwork (including two months as an intern, in 2019, at a prominent private consultancy firm), more than eighty interviews, analysis of company documents and news media, and a novel dataset I constructed on public-private contractual relationships for water and sanitation provision in Brazil between 1994–2019. The paper contributes to a still incipient literature on the inner-workings and political effects of financialization for urban infrastructure development outside of traditional investment geographies in the Global North. It also underscores the importance of disaggregating monolithic treatments of private capital to explore the role of investor heterogeneity and business politics in the governance of service delivery.

#### **FROM INDUSTRIAL ESTATES TO SMART CITIES: REGIONAL PLANNING AND INFRASTRUCTURAL FINANCING ALONG THAILAND’S EASTERN SEABOARD**

Abstract ID: 824

Abstract within Pre-Organized Session 132

TANG, Dorothy [Massachusetts Institute of Technology] [dstang@mit.edu](mailto:dstang@mit.edu), presenting author

Global infrastructure-led development has garnered much scholarly and media attention since the financial crisis of 2008 (Dodson 2017) and the geopolitical tensions due to China’s increasing economic and political influence. The Belt and Road Initiative (BRI) is President Xi Jinping’s signature foreign policy approach and is loosely used as framework for bilateral cooperation through resource extraction and infrastructure financing. In conjunction with prior Chinese foreign policies since the early 2000s, analysts characterize the BRI as an effort to export excess capital and infrastructural capacity to maintain its own economic growth (Bach 2016). During this time, Chinese capital—in a variety of forms from state capital to private investments—have played a significant role in shaping infrastructure and urban development in Southeast Asia. However, this Chinese capital does not land on a blank slate for development and must negotiate with a long history of Japanese intervention in Southeast Asia. This paper compares two regional planning efforts along Thailand’s Eastern Seaboard: the Japanese financed Eastern Seaboard Development Plan from the 1980s and the more recent Eastern Economic Corridor Plan of 2018 which has attracted significant Chinese investments. Drawing from planning documents for the region produced by Thai and Japanese institutions since the 1970s and field observations of Chinese investments since 2019, this paper asks how competing geo-economic interests of Japan and China have influenced spatial planning efforts.

Since the 1970s, the Japanese International Cooperation Agency (JICA) has provided technical assistance and financing for the planning of Thailand’s industrial development and infrastructure with the express aim of exporting excess Japanese industrial capacity to Southeast Asia. The result of these efforts was a robust system of industrial estates and infrastructure projects throughout the country, culminating in the Eastern Seaboard Development Plan—a regional plan spanning three provinces along the Gulf of Thailand. The Eastern Seaboard Development Plan included major highways connected to Bangkok, two industrial ports, and major investments in the petrochemical industry and automobile industry. Industrial estates, both state-operated and private, are the nucleus for industrial clusters and urban development. In 2018, Thailand’s military government passed new national legislation for the

establishment of the Eastern Economic Corridor (EEC) to reinvigorate the aging industrial region. Public investment in the EEC include upgrades to a local airport, expansion of both industrial ports, highway upgrades, and the planning of various “smart city” hubs throughout the region over the course of 20 years. Chinese financing of critical infrastructure in the EEC, especially in port facilities and telecommunications, plays an important role in the future success for the region. However, my research finds that in contrast to media portrayals of geopolitical competition, Chinese financing is embedded in a larger international network of planning expertise and ambitions. Thai planners, Singaporean urban designers, Japanese Engineers and Chinese entrepreneurs all contribute to diverse and complex urban spaces and infrastructural plans for the EEC. Additionally, state and non-state Chinese actors actively collaborate with other agents, including institutions like JICA and the World Bank, to finance and implement infrastructural projects, complicating the simplistic narrative of Chinese hegemony in the region.

These findings suggest that the polarized political ideologies that produced cold-war era models of infrastructural development is no longer a viable framework to understand the geopolitics of contemporary infrastructure planning practices. By comparing the politics of the Eastern Seaboard Development Plan with the Eastern Economic Corridor in Thailand, I conclude that geopolitics is not a sufficient framework for analysis and one must consider additional agents and actors in infrastructural planning.

#### **PATTERNS IN CLIMATE FINANCE INFRASTRUCTURE PROJECTS, SAFEGUARDS, AND EMERGING MODELS OF PARTICIPATION**

Abstract ID: 825

Abstract within Pre-Organized Session 132

HARRINGTON, Elise [University of Minnesota] [eliseh@umn.edu](mailto:eliseh@umn.edu), presenting author

Since the 1990s, finance has been a critical outcome of international agreements (environmental and climate) to support environmental protection, infrastructure, and development goals. The Global Environment Facility started in 1994 with the United Nations Framework Convention on Climate Change, with subsequent funds established with Kyoto Protocol in 2001 (Special Climate Change Fund, Least Developed Countries Fund, and the Adaptation Fund), the Climate Investment Funds, and at the 2010 Conference of Parties (COP 16, Green Climate Fund). First, this paper examines distribution of climate funds to support infrastructure projects in sub-Saharan Africa using OECD DAC External Development Finance Statistics and project tracked by the Climate Funds Update. For example, the Global Environment Facility has a long history of investing in a wide range of infrastructure projects, including clean energy projects, and the newer Green Climate Fund investing in among other infrastructure projects, startups focused on new, distributed solar technologies (e.g., KawiSafi Ventures). Second, I trace what safeguards exist for environmental and social impacts associated with different financing mechanisms over time; what accountability mechanisms exist to support the implementation of funded infrastructure projects. Third, I examine the more recent approach of “devolved” climate finance that aims to incorporate more local planning and policy considerations in climate finance projects in East and West Africa. Broadly this paper examines the configuration of climate financed infrastructure projects and how effectively climate finance instruments are achieving safeguards

and promoting participation in tandem with infrastructure development.

Infrastructure provides an avenue for planning to engage in critical policy areas, such as energy, technology, and the interdependence between planning and infrastructure is a critical arena for exploring the impacts of technological change and innovation (Neuman and Smith 2010). Devolved climate finance has the potential to examine participation in climate finance infrastructure projects, aligned with conversations in the US about participation in green infrastructure policy (Goh 2020). The effort to promote devolved climate finance in the Global South has the potential to respond more effectively to local knowledge, community needs, and marginalized populations through community-based approaches (Hesse 2017) and extend infrastructure investment to not only address climate mitigation but adaptation and resilience.

NARANG SURI, Shipra [UN-Habitat] [shipra.narang-suri@un.org](mailto:shipra.narang-suri@un.org), participant

The adoption of the Sustainable Development Goals (SDGs) in 2015 and subsequent approval of the Paris Agreement, the New Urban Agenda, and the Addis Ababa Action Agenda signal a broad global commitment to sustainable development. Infrastructure is a major element for implementing many of the SDGs and for dealing with a range of pressing global agendas--climate change, energy shortages, food insecurity, and health crises (including the COVID-19 pandemic), among others. Deficiencies in infrastructure coverage and quality are particularly severe in low- and middle-income countries.]The role of urban governments and their options to secure and manage development finance has not received the level of attention it deserves, including among urban planners engaged in prioritizing infrastructure investments

The role of urban governments as key players in sustainable development and urban infrastructure and services was a primary focus of Habitat III and the New Urban Agenda. Many wealthier countries rely on cities for managing major public functions and investments to a much greater extent than middle- and low-income countries. Subnational government investment as a share of total public investment (in a sample of 99 countries across the

income spectrum) averages 36.6%, ranging from 43% in high-income countries to only 12.9% in low-income countries. Demands for infrastructure will only intensify in the coming decades as global population growth--from around 7 to more than 9 billion by 2050--will be largely absorbed in urban areas, with urbanization rates expected to approach 85% in industrialized and 64% in developing countries.

Addressing infrastructure gaps in poorer countries will require enormous planning and investment in the coming decades, much of it in sectors for which urban governments do or could bear substantial responsibility. Urban governments need to be key players in formulating and executing integrated development plans that meet the specific infrastructure and service delivery needs of their constituents and to do this in a way that promotes more inclusive decision-making and more equitable outcomes. These efforts require careful consideration of how to finance both the infrastructure investment and the operation and maintenance expenses of completed facilities.

Despite the recognized value of a stronger urban role in public investment in developing countries, progress has been slow. The challenges are well known, especially in low-income countries. Public finances, including development aid, are inadequate and volatile, and financial markets are still maturing and remain inaccessible to many urban governments. Equally important, despite official decentralization in many lower-income countries, poor linkages between planning and budgeting, underdeveloped intergovernmental fiscal systems, and governance and accountability weaknesses pose daunting challenges. Not enough cities have adopted measures they might take independently even given constraints imposed by national policies. Further, international financial institutions have no mandate to lend to local governments. Political economy realities underlie many of these weaknesses, so that careful analysis of their nature and effects is needed to determine how reform-minded actors might deal with them.

This roundtable will consider the following questions:

What is the status of efforts to better link urban planning to finance so as to support building infrastructure that supports sustainable development?

What specific types of reforms and innovations are being pursued or piloted—by international organizations, national governments and urban governments--to increase access to development finance in often challenging environments?

How can planning academics and practitioners contribute to the research and action needed to improve development finance for more effective urban planning and sustainable development?

This panel brings together planning academics and practitioners from government and major development organizations who have been working on these issues to share their ideas, findings and experiences. Brief comments from the panelists will be used to generate a robust discussion among the roundtable participants.

## **INDIVIDUAL PAPER SUBMISSIONS**

### **THE ISSUE OF AFFORDABILITY IN HOUSING AND IMPLICATIONS FOR THE REGIONAL PLANNING OF DRAINAGE INFRASTRUCTURE: A CASE OF AFFORDABILITY AS PART OF INCLUSIVE DECISION MAKING**

Abstract ID: 39

Individual Paper Submission

GYAN, KWADWO [University of Texas at Arlington] kag9275@mavs.uta.edu, presenting author

Cities are growing at unprecedented levels. Meanwhile, governments in the Global South are already overwhelmed by this growth and are unable to provide infrastructure proactively as expected. As a result, urban residents resort to providing their own infrastructure such as drainage systems as part of self-built housing development. Their small-scale incremental housing practices, which often represent formation of dense and diverse housing types, styles and ages, have been identified to affect planning of drainage systems at the regional-scale. Such developments reflect the varied affordable responses as part of a collective effort to curb regional problems, specifically flooding in this case. However, while some are included in this collective action, others are excluded as they are unable to afford to be included. This phenomenon, in addition to the formation of new autonomous localities, has led to challenges in mitigating flooding and has affected resilience to climate change.

Using a qualitative approach, this paper explores how the mismatch between housing development which occurs at an individual scale and drainage infrastructure which is provided at a regional scale, affects a regional effort to mitigate flooding in Tema, Ghana. It seeks to explore and reveal a relationship between affordability and inclusiveness.

### **PLANNING PRACTICE IN MEXICO: ARE THERE SIMILARITIES WITH OTHER PLANNING SYSTEMS?**

Abstract ID: 51

Individual Paper Submission

PEÑA, SERGIO [El Colegio de la Frontera Norte] spena@colef.mx, presenting author

This study addresses two basic questions: What Mexican planners do? Is planning practice in Mexico different from other planning systems? The questions are relevant not only from a perspective of understanding planning practice in other context, but also from a comparative perspective. It is important to know whether there are commonalities in the planning practice across systems.

This comparison and reflection on planning practice has important theoretical implications. Understanding professional practice is a way not only to test theories, but also being able to assess the kind of knowledges, skills, and abilities (KSA) that the profession demands. The objective of this article is precisely to study professional practice or the demand side of planning to learn what type of KSA are more relevant, valued, and used more often. The grand debate currently in planning theory is whether communicative planning has consolidated and replaced rational planning. This article demonstrates that rational-technical or “knowledge in action” is still relevant in the Mexican case; however, “communicative work” appears to become relevant, particularly, among directors or senior planners (Healey. 1992). The planning profession valued higher general planning knowledge instead of very specialized skills. Finally, the study show that ethics, values, and social justice are dimensions of planning practice that are overlooked by Mexican planners.

The analysis of planning practice in this article is based on a survey of 141 planning practitioners in Mexico. The survey design and questions employed were based on the dimensions of what the planning profession is according to the American Institute of Certified Planners (AICP) and the Planning Accreditation Board (PAB) of the American Collegiate Schools of Planning (ACSP). These instruments provide a general and comprehensive guide of knowledge, skills, and values that define the profession and planning practice that can be used as benchmark to study other contexts. The dimensions of practice taken into consideration deal with plan making and implementation, functional areas of practice, knowledge and abilities, and ethics and values.

This study is based on a quantitative methodology using a standardized questionnaire. The questionnaire was organized into nine sections. The first section focused on gather information about the professional background and credentials of the respondent. The second section capture the work history and experience as a planner of the person. From the third to sixth section the respondent was inquired regarding the knowledge, skills, values and the field or planning specialization that practice. The last sections were more focused on evaluating the role actors or stakeholders, that in the view of the respondent, have the more influence in the elaboration and implementation of the plan; also, those whose knowledge have more input in the elaboration e implementation of the plan.

This study shows that when assessing planning practice, it is important to differentiate and understand that roles and functions vary according to the rank or position in the organization. The findings showed that when analyzing KSA between planners in a directive position versus the rest of the planning staff we obtain completely different stories. As a matter of fact, the findings demonstrated that directors or senior planners are more engaged in “communicative work” rather than “knowledge in action” functions dealing with data gathering and analysis, plan review, norms, etcetera (Healey, 1992). In other words, what planners do is dependent upon their position in the organization that determines some of the role and function that they performed; planning organizations at the end of the day are still being bureaucracies that respond to the Weberian logic of hierarchical organizations with differentiated functions among their members.

## ACHIEVING CLIMATE JUSTICE WITH FLOODPROOF DESIGN POLICIES

Abstract ID: 73

Individual Paper Submission

GELDIN, Samuel [University of Pennsylvania] sgeldin@upenn.edu, presenting author

As urban areas face a notable rise in flood-related casualties and economic losses due to climate change, academics and practitioners increasingly advocate applying the strategy of managed retreat. In the Global North, retreat programs typically involve the relocation of structures to areas of lower flood risk, often through buyouts, land use and zoning changes, as well as design-based techniques. However, in the Global South, national governments, development banks, and other knowledge brokers overwhelmingly employ retreat to relocate people to ostensibly lower-risk areas, which disproportionately affects informal settlers lacking legal land tenure. Over the last three decades, these relocation efforts targeted at least 1.3 million residents worldwide, often employing coercive tactics through eviction and demolition, de-prioritizing economic security, offering inadequate safeguards for resettlement, and in fact heightening the flood risks borne by the most vulnerable groups. My study therefore investigates why governments in the Global South – particularly the Philippines – favor the relocation approach to retreat, rather than a floodproof design approach.

To uncover the dominant beliefs and practices of actors involved in key state-supported relocation and community upgrade programs in the Philippines, I employ text analysis and multi-stakeholder interviews. By examining local and national agency eviction records, in addition to planning documents for approved and rejected upgrade projects, I select two project sites situated in different Metro Manila locales as case studies for examining how the retreat process plays out on the ground. I conduct roughly 30 semi-structured, virtual interviews between April and August 2021 to discuss considerations and challenges for both upgrading and relocation at selected project sites. Informants, selected through snowball sample, include: state and local planners, contracted consultants, public and private engineers and architects, community organizations, homeowner associations, and project financiers. I will also analyze text from official flood and housing project documents, land use plans, building code regulations, and media reports to inform my lines of inquiry and corroborate informant claims.

My study's initial results suggest that state and non-state institutional protocols and tools feature pro-relocation assumptions, which reinforce two dominant stakeholder views - that informally settled land should be used differently and that resettlement practices will undoubtedly improve the safety of settlers. As such, these results begin to detail the key factors and processes enabling the state to conduct mass evictions in the name of flood protection. However, the stakeholders engaged in state-supported retreat projects – who I interviewed – would likely support the adoption of land use and design-based strategies for retreat if they had more demonstrated evidence of feasibility, clearer guidance, and more targeted funding. These prerequisite elements would support strategies such as: setting back or realigning land claims, elevating structures off the ground, adding more floors, arranging rooms to accept occasional flows of water, using more durable building materials, and making vegetative landscape improvements. Planning scholars and practitioners can therefore use this study to selectively facilitate more diverse, indigenously-sourced floodproof designs as a more climate-just alternative to relocation approaches. Rather than approaching retreat as an exercise for relocating people, stakeholders throughout the Global South should consider incorporating more land use and design considerations – when feasible – to ensure that residents can safely stay-in-place as long as possible while they plan future movements.

## EVALUATING THE INDUSTRIAL AND SPATIAL INTERDEPENDENCE IN CHINA'S GREATER BAY AREA

Abstract ID: 126

Individual Paper Submission

YU, Meng [The Ohio State University] yu.3066@osu.edu, presenting author

CHEN, Zhenhua [The Ohio State University] chen.7172@osu.edu, primary author

WANG, Yafei [Beijing Normal University] ywang@bnu.edu.cn, co-author

Although it is generally understood that industrial agglomeration has a linkage with regional economic growth, little attention was paid to the understanding of the industrial and spatial interdependence, especially measured at the city-level in a context of a megaregion that involves complex supply chains (intra-industry and inter-industry) covering both domestic and cross-border trade flows. To address this issue, this study evaluates the cross-border and intercity trade relations using the Guangdong-Hong Kong-Macau Greater Bay Area (GBA) in China as an example. The objective is to examine what are the key industrial linkages across cities and to what extent they may influence regional economic growth.

The question was investigated using a multi-regional input-output model (MRIO), which was developed based on city-level data for the year 2012 from the Eora26 database (Wang et al., 2017). The model was also expanded based on Cooper's method (Cooper, 2000), which allows us to examine the relative importance of value-added trade chains in GBA. Compared with previous studies (Polenske and Hewings, 2004; Wixted and Cooper, 2007), our analysis has the following two research highlights. First, the model helps us to identify the relative importance of various trade chains in GBA based on indirect value-added metrics. Second, given that the different relationships, such as the cross-border and intra- and inter-industrial dependency, were captured in the analytical framework, the model enables us to have a clear understanding of the impact of the GBA development strategy on industrial development disparity both within and among cities. Through the examination of the level of specialization in the indirect value-added flows of each city, our assessment reveals that during the early stage of GBA's development, cities such as Zhongshan presented a significant trade dependence with Macau and other GBA cities primarily in the first and secondary industries. Hong Kong was found to have the closest industrial connection with cities such as Foshan, Macau and Guangzhou, particularly in wholesale, retail trade, agriculture and manufacture sectors. In contrast, the industrial dependence of Shenzhen on other GBA cities was found to be relatively low, which suggests that the economic growth in Shenzhen tends to be dependent on external trade outside of the GBA. Such an outcome also confirms that Shenzhen, as the innovation and high-tech oriented city, presents a distinctive industrial feature than that of other GBA cities, which is consistent with Saxenian (2007)'s early observation on southern China.

Overall, the developed modeling framework provides an important tool for researchers to evaluate the effect of industrial and spatial interdependence on regional economic growth. It offers new insights to decision-makers to develop sound planning and policy strategies to achieve a coordinated regional development through the understanding of the potential disparity of industrial fragmentation and dependency.

## FROM THE MIDDLE-CLASS POINT OF VIEW AFTER FIVE YEARS: A FOCUS GROUP ANALYSIS OF THE URBAN LEGACY OF THE RIO DE JANEIRO 2016 OLYMPIC GAMES

Abstract ID: 252

Individual Paper Submission

GOHARIPOUR, Hamed [The College of Wooster] hgoharipour@wooster.edu, presenting author

ISKIN, Amanda [The College of Wooster] aiskin24@wooster.edu, co-author

CARTER, Mei [The College of Wooster] mcarter22@wooster.edu, co-author

Since the turn of the twenty-first century, sport mega-events' legacy has become an interesting topic among tourism and sport management scholars, sociologists, political scientists, and environmentalists. Beginning with the Japan/South Korea 2002 FIFA World Cup when the hosts took advantage of the most-watched sporting event to renovate urban infrastructure and rebrand themselves as the new competitors of European/American cities, various legacies of sport mega-events have become the main reason why developing countries bid to host the Olympics Games and the FIFA World Cup. Despite the increasing importance and impacts of sport mega-events on cities and urban residents, urban planners have not paid warranted attention to the mid-and long-term legacy outcomes of the games on cities, especially in developing countries.

"Um Mundo Novo" (A New World) was the slogan of the 2016 Rio de Janeiro Olympic Games, representing a promising image of Rio to the world. While developers and business owners, authorities, and mainstream media spread an inspiring and celebratory portrait of achievements for the whole city, country, and even the continent, critics, especially journalists, political and environmental activists, and researchers have heavily questioned the utopian representation of this mega-event. Focusing on the dark consequences of the government's physical and economic interventions, namely the displacement of the poor, the critics have mostly depicted a dystopian vision of the Rio Olympic Games' tangible and intangible legacies, like those of the 2010 FIFA World Cup in South Africa.

Acknowledging the findings of several studies on the negative impacts of the 2016 Olympics on the residents of favelas and other low-income inhabitants of Rio de Janeiro, this paper aims at filling the research gap between their pessimistic narratives and the hopeful prospects represented by the authorities. Following a qualitative approach, this study interprets the arguments and discussions resulting from several focus groups that consist of the middle-class residents of Rio de Janeiro who shape most of the city's population. Moreover, while most publications are conducted before, during, and immediately after the Games, this paper opens a new perspective toward a better understanding of the urban impacts of the 2016 Olympic Games after five years. This five-year evaluation of sectoral legacies, including employment, social inequalities, urban mobility, etc., also constitutes a subjective context for a

purposeful analysis of city-event transactions in incoming mega-events like the 2022 Qatar World Cup and even the 2026 FIFA World Cup in the USA, Mexico, and Canada.

There are two alternative hypotheses for this research, each of which could demand a distinct approach toward hosting the Games in different cities. The high or acceptable level of satisfaction of the middle-class with the Games indicates that hosting sport mega-events is still a positive step toward improving the urban environment and providing advantages for most residents. However, the discrimination of the poor's right to the city remains a significant challenge that must be eliminated through inclusive strategies and urban policies. The low level of satisfaction of Rio's middle-class after five years, on the other hand, demonstrates that sporting mega-events at their current scale and apparatus are only in favor of the political interests of a few and economic goals of a limited number of international and national organizations and companies. In this case, to justify the hosting of competitions by developing and even developed cities, it is necessary to restore the existential and inherent value of these events and reconstruct their twentieth-century form when building a peaceful and better world for all was the primary goal.

#### **'WE MUST REMAIN THE PEDESTRIAN SPACE FOR THE PEOPLE TO PASS THROUGH!' URBAN DESIGN IN A SELF-HELP FASHION**

Abstract ID: 289

Individual Paper Submission

WANG, Hsi-Chuan [Washington University in St. Louis] andrewwang@wustl.edu, presenting author

Urban design deals with the production of public spaces, traditionally conceived as a top-down intervention tool. Its practices are often tricky and impeded in urban informal settlements, places lacking equal social rights such as essential public services and amenities due to demographical, environmental, and political instability. Nevertheless, informal settlers are also resilient and tend to stabilize the surrounding physical settings despite different challenges. In many circumstances, the migrants, who come to the cities to earn a living, have to work multiple shifts, endure culture shock, and study political climate to eventually sustain their staying or better mobilize themselves to move up in the social hierarchy. In and between such journeys, different actors formulate and polish the public spaces through their everyday activities. These interactions practically socialize these spaces into urban commons accommodating various social networks. As a result, urban design in informal settlements can be perceived through a bottom-up self-help lens, explicitly showing how public spaces have been planned, constructed, maintained, and even re-planned by the dwellers. This social movement has become the central force of urban shaping within challenging environments across the Global South settlements. We want to know more about the "internal logic" with which the settlements' landscapes have become what they are today.

Here, I ask how the spreading self-help practices along a drainage waterfront have coincided with the accumulative social norms expressed in place. Accordingly, what are the potential ways to categorize the self-help urban design exercises? What types of social norms can be thematically elaborated? How have these dimensions coordinately responded to informal urbanization achieving settlement stabilization and community enhancement? Through field observation and in-depth interviews, I study the self-help cases from an informal settlement in Accra, Ghana, to contextualize how urban design in a self-help fashion has manifested within the settlers' daily public spaces and spontaneously strengthened local social norms. My findings indicate that despite the opportunities of consolidating accessible public areas (open space, playground, and pedestrian) are random and unpredictable, the residents who have been "transformed" via different contingencies are the essential actors sustaining and enhancing the functionalities of these public spaces. The thriving settlements are featured with self-help cases of shaping, maintaining, and reshaping while displaying the divergent social norms of indifference, carefulness, and determinacy. In this vein, I argue that these environments' stabilization needs to first search for ways to ground the people, followed by establishing many small urban spaces that uphold rules, obligations, and operations. More specifically, humanizing the settlements with identity recognition and residence permit is equally essential as delivering physical interventions, including infrastructure and services provision, to provide meaningful settlement planning.

#### NEOLIBERAL PLANNING AND OVERBUILDING IN CHINA: THE ROLE OF THE DETAILED DEVELOPMENT CONTROL PLAN

Abstract ID: 294

Individual Paper Submission

SU, Xing [University of Waterloo] xingsu0529@gmail.com, presenting author

QIAN, Zhu [University of Waterloo] z3qian@uwaterloo.ca, co-author

Neoliberal Planning may be a critical contributor to overbuilding in both China (e.g. Su & Qian, 2020) and beyond (e.g. Kitchin et al., 2012). In China, a wide array of planning practices have been identified in promoting overbuilding, such as master plans, preferential policies, land governance, and public-private partnerships (e.g. Li, 2017; Su & Qian, 2020). Nonetheless, as an essential planning tool that shapes China's land development, the Detailed Development Control Plan (DDCP) has received inadequate attention regarding its interactions with the overbuilding phenomenon in China. Initiated by Chinese local governments, the DDCP stipulates land use types, intensity and spatial relations through detailed control indexes (e.g., building height and density, plot ratio, greening ratio, etc.) and ordinances; thus, the DDCP is a prerequisite for land leasing and significantly affects real estate development outcomes (Wu, 2015). The insufficient studies on the interactions between the DDCP and overbuilding hinder our understanding of the role of planning in shaping overbuilding and the interactions between planning and changing real estate development trajectories in the Chinese context.

This study aims to shed light on this issue. Under the conceptual framework of neoliberal planning, this study explores the interactions between the DDCP and overbuilding in Ordos City, China. Although Ordos's overbuilding and real estate boom-bust cycle have attracted tremendous attention (e.g. Woodworth, 2015), and that planning has been identified as a crucial facilitator of Ordos's overbuilding (Su & Qian, 2020), inadequate attention has been paid to the interactions between the DDCP and overbuilding in Ordos.

By employing qualitative research methods including semi-structured interviews and document analysis, this study reveals several key findings. First, the DDCP, both on macro (metropolitan) and micro (parcel) levels, has been actively promoted and deregulated by the Ordos local government to facilitate unfettered real estate development, which eventually led to overbuilding. Second, while the pro-growth and deregulated DDCP significantly promoted the real estate boom in Ordos, the real estate boom has in turn stimulated the DDCP to be more expansionist, flexible and deregulated. Moreover, the burst of the real estate bubble has stimulated more transparent and regulated practices of the DDCP. These findings suggest that the DDCP and overbuilding are mutually interactive processes.

This study also offers several theoretical implications. To begin with, it highlights the mutually reinforcing mechanism between neoliberal planning and real estate booms, and the mutually interactive mechanism between neoliberal planning and real estate boom-bust cycles. In addition, this study reveals the versatile techniques of the strong state, including a combination of proactive state intervention and strategic deregulation, to promote neoliberal planning and expeditious real estate development. Moreover, it indicates the importance of state-market relations and interactions in shaping the mechanisms and practices of neoliberal planning. Finally, this study shows that strong state intervention and rigorous regulation can also help tackle neoliberal planning. It suggests that strong state intervention may be a double-edged sword in promoting and restraining neoliberal planning.

#### MIGRANT MOBILITY AND THE POLITICS OF SELF-RELIANCE DURING INDIA'S COVID-19 LOCKDOWN

Abstract ID: 323

Individual Paper Submission

GOLDSTEIN, Shoshana [Princeton University] shoshanarg@gmail.com, presenting author

This paper presents empirical findings on the physical and social mobility of domestic migrants in India during the Covid-19 pandemic. Specifically, I focus on the politics of self-reliance and the web of non-government intermediaries who have worked to address the precarious existence of migrant laborers in cities for decades. In March of 2020 India went into lockdown. This sudden disruption had profound implications for India's low-income migrant workers in cities. India's urban migrant labor force is one of the largest in the world, working in service, transportation, construction, and manufacturing sectors. While the right to move freely within India's borders is

guaranteed to its citizens in the constitution, for these populations, the process of crossing state, regional, and urban geographies is fraught with barriers to inclusive or permanent resettlement (Abbas 2016).

In the cities of Gurugram and Pune, where this study is based, thousands of migrants have opted to live dual lives for much of their working life. The lives of “middle migrants” are distinct from cyclical or seasonal migrant workers (Gidwani and Ramamurthy 2018). Their realities involve earning income and raising families in the city while travelling hundreds of miles to vote, give birth, find a spouse, or access entitlement programs in one’s ancestral village. The cost of preserving ties to home is invisibility, living without local political representation or benefits in cities, sometimes for decades at a time.

India’s lockdown had devastating effects on this way of life, with millions of workers suddenly unable to earn a living. Many were held in captivity by their employers. Others decided to walk home to the same rural villages they had once left in search of economic opportunity (Balakrishnan 2020). This paper discusses the invisibility of migrants and the challenges of India’s “enumeration gap” (Naik 2020), contextualizing how the pandemic shed light on the plight of migrants and their means of survival. As central government unveiled new policies aimed at national “self-reliance”, individual migrant households were often left to rely on their own networks and informal strategies for survival without income or the means to return home. Preliminary findings from the field explore the travails of women workers, who were the first to be let go from manufacturing jobs, as well as the role of NGOs and private actors in providing emergency services, including ration kits and rent relief, in lieu of government action. The paper is informed by content analysis of news media, and interviews conducted remotely with NGO workers and migrants over the past year.

This paper contextualizes these findings within the history of India’s planning and policy debates around providing benefits to workers straddling multiple places. These debates have endured since independence, but most recently focused on the portability of rights and benefits across state and urban-rural boundaries. These approaches have tended to be people-centric but have done little to address infrastructural deficiencies in destination cities. Finally, the paper offers recommendations to planners and policy makers for future action based on the experiences of NGOs engaged in emergency response to the migrant crisis.

#### **STUDYING PEDESTRIANIZATION PROMOTING SPATIAL PLANNING EFFORTS IN MEXICAN CITY CENTERS: INTERACTION EFFECTS BETWEEN WALKABILITY AND PUBLIC SPACE DESIGN**

Abstract ID: 354

Individual Paper Submission

FRANCO GARZA, Daniel [University of Illinois at Chicago] [dfranc29@uic.edu](mailto:dfranc29@uic.edu), presenting author

Pedestrianization consists in a transformation of the urban space, through the conversion or adaptation of the vehicular road into a space of pedestrian privilege. It represents an equity and social justice urban intervention, and, spatially, main goal of this action centers in promoting an accessible, quality and walkable public space, fostering spaces for people and public life. In recent decades, design policies and spatial planning interventions promoting pedestrianization have become recurrent and key components of revitalization plans in Mexican city centers. This way, several cities have employed such approach to revitalize central cores, supporting the retail activity, as well as more pleasing commercial/historical and environmentally healthier zones, highly dominated by the automobile otherwise. But having great impact transforming the urban space and public realm of deteriorated, yet symbolic, areas of cities, only a few outcome studies of these planning and design efforts exist, and not a robust body of knowledge addressing the topic of pedestrianization has been built, especially from perspectives based on theories of urban design.

Therefore, my research studies the spatial planning and design impacts of pedestrianization in Mexican city centers, via an outcome-oriented assessment, through select case studies where such scheme has been implemented in different ways. My research targets the built environment, involving an examination of the spatial features, physical configuration and design elements that act on the outcomes of walkability and quality of public space (both physically and as promoter of social life), by asking: What combination of plan-making approaches and physical design ideas helped create successful pedestrian zones in Mexican city centers? My work aims to build a body of scholarly knowledge and design guidelines, allowing planners and decision-makers develop better and more successful pedestrianization schemes. It will contribute to the literature in the spatial/physical planning and urban design field, with well-founded and practical criteria for the conception, planning and implementation of effective pedestrianization projects, which successfully accomplish quality spaces that contribute to improve important areas' public realm, environment and circulation zones.

From an early stage of my research, I present the progress of my work, showing the results of a first preliminary field study where I carried out an extensive observation exercise in one of my three case studies: "Morelos Pedestrian Corridor", in the city of Monterrey, Nuevo Leon, Mexico. I aimed to detect the spots or areas of special concentration of activity –whether pedestrian or stationary– within the walkways of the pedestrianized zone, as well as those where the opposite happened, to perceive and document their physical/spatial characteristics, and be able to elaborate preliminary descriptions and judgements. My work consisted in walking and observing the pedestrianized zone, at different times of the day, at different days (week and weekend days), ranging from early morning to late night. This way, I was able to register the times and thus the areas of special concentration of activity, and the lesser intensity ones. From there, I focused on observing and perceiving the physical/spatial distinctive of such areas. Results clearly show certain spatial features exist in the areas of highest concentration or different type of activity. Information obtained will help me for further and more formal evaluations, once I have built a methodological tool for that end, employing relevant urban design theories and planning insights, from a qualitative approach, to capture the essence of elements that effect walkability and public space quality.

## **VULNERABILITY, RESISTANCE, AND COLLECTIVITY IN BRAZILIAN FAVELAS: SURVIVING THE THREATS OF THE COVID-19 PANDEMIC AND THE STATE'S NECROPOLITICS**

Abstract ID: 365

Individual Paper Submission

BASILE, Patricia [University of New Mexico] arqpatriciabasile@gmail.com, presenting author

The COVID-19 pandemic has deepened existing inequities and injustices in Brazil, seen in the disproportionately detrimental impacts on favelas. State policy responses to the pandemic have disregarded favela residents' experiences. Recommendations such as "shelter-in-place" ignore the reality of over 11.4 million favela residents who cannot work from home or afford to stop working, nor practice social distancing from others. Historically, policy and investment in favelas have been absent or deficient, resulting in significant urban and social inequities that aggravate the impact of the virus for favela residents. These circumstances reveal the urgent need for planning and implementation of policies that embody the unique urban and social territory of favelas aligned with existing local efforts, especially during a pandemic.

This study investigates the discourse of community organizations in favelas as they respond to the threats of the COVID-19 pandemic and the state's necropolitics. Community organizations in favelas have taken action to protect their residents from the virus, unemployment, and hunger. I assess organizations' (a) motivations to act as a collective in their communities, and (b) stances about the government's responses to the crisis. Through content analysis of social media, websites, and media appearances of eight favela organizations and collectives in São Paulo and Rio de Janeiro, this study finds three main frames through which organizations make sense of their actions: vulnerability, resistance to the state's necropolitics, and collectivity and care. More than survival strategies, the actions of favela organizations are counter-political acts as they oppose the decrepit necropolitics of the state by collectively enduring in the Brazilian context of the pandemic. Understanding favela organizations' actions in response to the pandemic is fundamental, as it gives insight into the impact of public health emergencies in the lives of informal settlements' residents, and about the governance of public health emergencies in these communities. Ultimately, this study brings favela residents' perspectives, knowledges, and experiences to the center of discussions about the realities of the current public health emergency while reflecting about the governance of the pandemic in informal settlements.

## **ENABLING LEGAL ENVIRONMENT FOR MEETING THE RATIONAL NEXUS PRINCIPLE: INSIGHTS FROM THE USE OF DEVELOPMENT CHARGES IN INDIA**

MATHUR, Shishir [San Jose State University] shishir.mathur@sjsu.edu, presenting author

#### Central theme

Governments at all levels—national to local—are fiscally constrained, especially in the developing countries of the Global South. The local and state governments, in particular, are in a fiscal bind in this region because among others: a) a large proportion of tax and fee revenue typically accrues to national governments and b) local and state governments have very little authority to levy new taxes. In such a scenario, these countries urgently need additional revenue sources to fund urban development projects, especially due to their rapid rate of urbanization. Development charges are a potential revenue source.

Among all the countries in the world, India is projected to increase its urban population the most—404 million between 2014 and 2050. In India, property developers typically pay development charges when seeking government approval to change/institute the use of their land parcels and/or to improve them. The revenues from these charges are used to develop the infrastructure/services needed to service the proposed development. From a legal standpoint, these charges are considered a fee, not a tax. Accordingly, like those in the US, the courts in India require these charges to meet the “nexus” and “rough proportionality” principles. The nexus principle stipulates that there should be a connection between the charges and the impacts caused by the charge-paying development. The rough proportionality principle calls for the charges to be in proportion to the cost of mitigating the impacts of the charge-paying development. Combined, these two principles constitute the “rational nexus” principle.

As India seeks to increase development charges or levy them, there is an urgent need to investigate how these charges can meet the rational nexus principle; otherwise, they can be successfully challenged in court. Indeed, the rational nexus principle was cited to legally challenge the state of Tamil Nadu’s Infrastructure and Amenity Fee. This paper seeks to begin to fill this research gap by reviewing several pieces of state-level enabling legislation to a) show how the legislation hinders or promotes the rational nexus principle and b) identify major insights that can help India and potentially other developing countries craft or amend legislation that can withstand legal challenges.

#### Approach and methodology

Using a recently published report by the Government of India, this study identifies development charge-related state-level legislation for 22 states. Next, using the strategies to promote the rational nexus principle identified in Mathur (2016), this study examines whether/how these pieces of legislation hinder or support this principle. Finally, the study findings are synthesized to highlight how legislation can support or hinder the rational nexus principle.

#### Findings and relevance of work

Through a summary and synthesis of India’s development charge-enabling state legislation, this research advances the strand of applied research that examines ways to make development charges legally defensible by showing how these charges can be designed to meet the rational nexus principle. The extant research in this line of inquiry has mainly been US-focused and calls for data-intensive studies as inputs for designing the charges. However, conducting such studies is often not feasible in many developing countries. Therefore, this study uses India as an example to examine whether: a) context-sensitive exemplars of how enabling legislation is promoting or could promote the rational nexus principle in a developing country already exist, and b) what are some of the ways these pieces of legislation hinder the rational nexus principle and how the hindrances can be removed. Finally, the study provides several key insights that jurisdictions in India and potentially in other Global South countries can use as they adopt/amend development charge-enabling legislation.

## WHO DRIVES CHANGE? AN EVOLUTIONARY PERSPECTIVE ON THE DISCURSIVE SHIFTS ON CLIMATE GOVERNANCE IN INDIAN CITIES

Abstract ID: 421

Individual Paper Submission

PARIDA, Debadutta [University of Alberta] dparida@ualberta.ca, presenting author

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author

Cities are at the forefront of climate governance, action, and innovation in the global south (Bhardwaj & Khosla, 2020; Singh et al 2021). Climate risk in cities is mediated through discourses addressed through forms of governance. Yet, climate initiatives embedded within city-scaled governance frameworks remain underexplored in many geographical contexts, particularly in Indian cities. In this paper, we examine how climate governance discourses and narratives have evolved (and co-evolved) in the past decade in Indian cities, and understand their implications on future pathways for equitable climate action.

We use Evolutionary Governance Theory, or EGT (Beunen, Assche, & Duineveld, 2015) as the key theoretical lens in this paper. EGT considers co-evolution as the central feature of governance configurations. Features of governance are actors and institutions (formal and informal), power and knowledge, and discourses that constantly evolve over time and always relative to other changes within constantly evolving governance configurations.

We employ a qualitative methodological approach, based on the single case study method (we take the case of Bhubaneswar city, India). We draw on participant observation, semi-structured interviews of state and non-state actors, and relevant document analysis (of plans, policy documents, legislation, media articles, and memos) as the techniques for data collection. We use Critical Narrative Analysis (we combine Critical Discourse Analysis by Jäger & Maier, 2009, and narrative analysis) to map the wider discourses as well as local narratives on climate governance issues in Bhubaneswar city (Souto-Manning, 2014).

Our findings are three-fold. First, climate governance discourses are shifting from a centralized, bureaucratic, and hydro-meteorological risk management approach towards a hybrid model of governance that attempts to balance international commitments (adaptation focus) and local development priorities (mitigation), through institutional changes, public-private partnerships, and increased space for individual responsibility. Second, narratives around climate governance continue to be based on disaster risk discourses (disasters are ‘natural’ events, therefore to be dealt with immediately as opposed to examining systemic governance failures); and experiences of environmental marginality (of vulnerable groups such as slum dwellers). Third, climate plans are gradually incorporating issues of gender and equity through incremental change. While being a positive shift, these advances remain rhetorical for now, without significant materialization.

We contend that climate governance frameworks in southern cities suffer from problems of framing (climate

change as ‘natural’, or ‘socio-political’ issue); lack of coordination between different actors that are involved in complex interplays and interdependencies; policy integration (is limited, and causes further problems); and lack of specificity and context (ignores the role of informality). We conclude by highlighting that climate change in Indian cities remains a low priority for action, and key aspects of equity, justice, and the socio-spatial distribution of vulnerability remain ignored in the discourse. Changing the discourse around framing climate issues can help challenge historically evolved governance approaches in southern cities.

### **LEVERAGING MIGRANT-FRIENDLY AND CLIMATE-RESILIENT CITIES TO PROMOTE AND DECENTRALIZE ECONOMIC GROWTH IN BANGLADESH**

Abstract ID: 467

Individual Paper Submission

MAHID, Yousuf [Cornell University] [ym527@cornell.edu](mailto:ym527@cornell.edu), presenting author

CARRUTHERS, John [Cornell University] [john.carruthers@cornell.edu](mailto:john.carruthers@cornell.edu), co-author

There has been a growing concern about a potential number of climate-induced migrants flying into the already overcrowded metropolitan cities in response to the adverse impacts of climate change in the low-lying areas of developing countries. Despite the negative connotation about migration from rural to urban areas (Amrevurayire & Ojeh, 2016), experts have started to recognize this spatial movement as an adaptation strategy against climate change and an opportunity to thrive the economic growth of a country, particularly in the developing world. This study intends to articulate this opportunity of people’s movement associated with the tremendous prospects of growth by adopting migrant-friendly and climate-resilient city concept in Bangladesh; the country with a vision to become an upper-middle-income country by 2031 by thriving economic prosperity of the nation. The study recognizes the urgency of territorial development, especially, in the secondary cities and towns of the country to reduce the pressure from the capital city, Dhaka that has been a center of almost all economic and political activities of the nation and also a reservoir of 10.3 million population with a density of 41,000 inhabitants per square kilometer (World Bank Group, 2018).

The under-construction Padma bridge has opened the discussion about decentralizing the investment to formulate the development framework of the country in an inclusive manner and to leverage the economic growth of the country. Padma bridge shows a gateway towards attaining the goals of decentralization by creating economic

opportunity in other parts of the country and extends an opportunity to make Dhaka city a livable place for everyone by reducing the ever-increasing population stress. Despite the growing prospect of the Padma bridge regarding the economic growth in Bangladesh, it also offers some new challenges including accommodating the newly migrated people in different cities of the country other than Dhaka (Alam et al., 2018) and managing the natural resources (Mukul et al., 2020) to achieve sustainability. The study, therefore, aims to conceptualize migrant-friendly and climate-resilient cities in the context of Bangladesh. The study is also proposing to develop a set policy guideline to operationalize the concept on the ground. The study will integrate migration theories with theories of political ecology, political economy, resilience, power dynamics, and social-ecological system and will contextualize the integration with a view to providing a robust foundation to the conceptual framework. To do so, the study will adopt the Integrative Review technique (Snyder, 2019) and perform it in a systematic fashion focusing on the grounded question- “what are the underlying principles in conceptualizing migrant-friendly and climate-resilient cities in Bangladesh?”. The study outcome will certainly offer a conceptual framework that constitutes the principles of understanding migrant-friendly and climate-resilient cities. The intend of the development of this framework is to provide guidelines to the policymakers in adopting migrant-friendly and climate-resilient cities concept in their sustainable policy agenda to accelerate the economic development trajectory in a more comprehensive manner.

#### **PLANNING AND ECONOMIC DEVELOPMENT IN THE GLOBAL NORTH AND SOUTH: INSTITUTIONAL AND TRANSACTION COST PERSPECTIVES**

Abstract ID: 540

Individual Paper Submission

PRASETYAWATI, Dian [University of Washington Seattle] dianp@uw.edu, presenting author

WHITTINGTON, Jan [University of Washington Seattle] janwhit@uw.edu, co-author

SUN, Feiyang [University of Washington Seattle] fs377@uw.edu, co-author

Research in planning commonly borrows from economic theory to explain urban growth and its connection with the allocation of infrastructure development in a given region with studies that compare planning and development between the Global North and the Global South borrow ideas from development economics. Development economics treats planning as mainly a centralized government role, aiming to support an industrious-oriented urban development, despite variations in planning practice across differing socio-economic conditions and geographies. Comparative studies in planning and infrastructure development are in need of a shift in theory and methodology.

This study builds on a meta-analysis of papers examining planning and infrastructure development in the Global North and South. The analysis consists of 263 articles systematically collected from the Web of Science with queries of ‘comparative study’ and ‘infrastructure’, ‘planning’, ‘economics’, and ‘development studies’ from the last five

years. This paper asks: 1) What are the theoretical assumptions in studies of planning and economic development? 2) How do the economic theory link with planning theory? 3) How do scholars investigate and control the effects of different institutional arrangements in the Global North and Global South? The publications were then grouped into two categories: one examining cross-country economic differences and macroeconomic conditions with respect to the state of infrastructure development and another consisting of in-country case studies focused on physical output indicators to generalize the claim of a regional typology of growth and development.

Only a handful of studies compare planning differences between countries in the Global South and Global North in ways that link to the history of colonialism, evidence of government failure, or market failure. Both groups rely on the neoclassical economic assumption that infrastructure services are a prerequisite to growth. However, the in-country case studies argue in favor of shifting attention from meta-analysis of macroeconomic indicators (e.g. GDP) towards measuring basic needs (e.g. minimum wage, poverty index) with mixed-methods approaches, to better capture the role of formal and informal institutions in managing infrastructure services. Most studies on institutions are in the Global North with limited attention to the South, where the economic history of development and associated institutions are vastly different. This suggests that the application of development economic theory in the Global South is limited and improved with economic perspectives indicative of institutional economics. It explains how institutional economic theory could be used in comparative research to analyze the state of infrastructure planning and development across the Global North and South.

The pivot from neoclassical to institutional economic theory to explain economic development has specific implications for the design of research comparing the planning and development of infrastructure. Existing studies have demonstrated the use of transaction cost economics as the theoretical complement of institutional economics for the empirical study of infrastructure planning and markets. A transaction cost economics approach explains the peculiarity of infrastructure development by comparing the associated costs needed for planning, change orders, and oversights across 'alternative governance structures' within the hierarchical contractual market models, and provides empirical observation of the micro-economic effects of institutional arrangements as they differ from one country to the next. The evidence of a mixture of formal and informal institutions in the Global South matters for understanding the role of infrastructure in economic development, and in particular the direction of institutional change needed from planning in theory and practice. A transaction cost economics approach opens the possibility of assessing the state of infrastructure development by measuring actual transaction cost differences of planning activities at the ex post stage of contractual agreements where the variable of costs are proxies for the effectiveness of institutional arrangements.

**BEING THERE WITHOUT BEING THERE: DECOLONIZING INTERNATIONAL DEVELOPMENT PRACTICE DURING COVID-19**

CAROLINI, Gabriella [Massachusetts Institute of Technology] carolini@mit.edu, presenting author

WILLIAMS, Sarah [Massachusetts Institute of Technology] sew@mit.edu, primary author

GULIAD, Sofia [Massachusetts Institute of Technology] gulaid@mit.edu, co-author

REGE, Sarah [Massachusetts Institute of Technology] srege@mit.edu, co-author

International development projects are deeply ensconced in debates about power, intentions, and imaginaries of progress that are today also stirring discussions about what it means to decolonize international relations and projects that nominally aim for poverty reduction and improvements to the well-being of peoples living across diverse low-income countries. The notion of expertise, the criticality of contextual knowledge, the manner in which projects are evaluated, and the power dynamics of partnerships involved are all central elements of these pronounced tensions between the practice of international development and critical scholarship and local perspectives around it. In this project, we test a process for international development that is centered on community co-design, which we believe will ensure the project is community built, owned, and maintained long after the project is complete. Living Data Hubs a small-scale ICT/data community-based international development project in the informal settlement of Kibera in Nairobi, Kenya through which we explored not only how international partnerships can produce material benefits but also how they can put forward a pathway for decolonizing power relations and knowledge production.

Over the course of 2020 and into 2021, the project saw the installation of a community-based wireless internet infrastructure powered by solar panels, creating a wireless network across five public space sites. In addition, the wireless network infrastructure involved establishing a capacity to use sensors and an internet portal to ask questions and collect data that community-based organizations themselves determined were critical to their work and the well-being of neighbors and residents. The network also provides community-based organizations and their support organization the capacity to manage and direct their own data's integration and use in data centers and research networks targeting the build-up of data on informal communities like Kibera, institutionalizing data ownership at the most local level.

The project's success in the pandemic challenges the long-held notion that international partners in development projects themselves need to spend time on the ground to ascertain the viability of projects, leading and setting the terms of assessments of project progress and the address of challenges therein. The paper further describes how the travel restrictions imposed during the COVID-19 pandemic highlighted the importance of grounded partnerships in international development work, and de-emphasized the need for high-income country partners to travel internationally and spend time "on the ground" getting to know contexts at the project site themselves. Instead, by design, the project centered the ownership and leadership of local partners in Kibera in the co-production of a community wireless network and data management platform. Context matters, but we show that—in keeping with discourses around decolonizing development—contextual knowledge already exists with local partners, whose own assessments and direction need acknowledgement and power in international cooperation. What is most critical to a project's success is not the specific contextual knowledge of international partners, nor their physical presence, but the trust and dedication of project partners in a shared process of knowledge co-production and project management. In conclusion, we suggest that this project forwards a rethinking of project roles and advances decolonized power relations in development projects by correcting for the presumed hierarchical leadership of partners from the global North in the implementation of community-based improvements.

## **FIGHT OVER RATIONALITY: LEGITIMIZING “RED ZONES” IN POST-DISASTER RECOVERY PLANNING IN INDONESIA**

Abstract ID: 635

Individual Paper Submission

KOBAYASHI, Hisako [Oriental Consultants Global] hisakook@gmail.com, presenting author

Relocation is the most significant and controversial issue in post-disaster recovery planning. After devastating disasters, such as tsunami, high risk areas are designated as “red zones” to restrict residential use, with residents of such areas relocated to safer areas. This paper explored how different types of rationalities are used by diverse stakeholders to legitimize “red zones” based on a case study of post-disaster recovery planning in Palu and the surrounding areas, Central Sulawesi, Indonesia.

In planning theory, communicative rationality has attracted researchers’ interest over the last few decades, placing increasing importance on participation in the planning process. However, idealistic assumptions of authentic communication create barriers for achieving communicative rationality in planning practices, where power differences and political decisions often prevail. Moreover, the characteristics of post-disaster recovery processes, “time compression” (Olshansky, Hopkins and Johnson, 2012) hinder communicative and collaborative rationality, despite the benefits of community participation for the recovery planning process. From a scientific approach derived from disaster science and engineering, which was once abandoned in planning theory, red zones are identified in a hazard map and relocation is suggested to reduce disaster risk and ensure the safety of the community. However, decisions regarding land use regulations, particularly relocation, are never made solely based on scientific rationality.

In the post-disaster spatial planning process in Central Sulawesi, the central government, local governments, and a bilateral donor proposed a delineation of various “red zones” based on their own perspectives and rationalities derived from value systems, organizational obligations, and political culture. In particular, the hazard map including land use policies and building regulations suggested based on the level of disaster risk, which was created and approved by the Indonesian Government, became a battleground of discussions. Stakeholders disagreed regarding how disaster risks should be understood and interpreted into land use regulations, particularly on the topic of relocation in “red zones.”

This study attempted to reveal obstacles to make collaborative rationality work in a planning practice, including significant conflicts of interests, such as relocation decision during the post-disaster recovery process. This study was based on reconstruction project activities conducted by the Government of Japan in 2019. The interdisciplinary nature of post-disaster planning and the peculiar circumstances of the aftermath of disaster place high stakes on the relocation decision and create significant barriers to stakeholders compromising to reach more acceptable and consensual decisions on land use regulations and relocation. This study revealed the role of the hazard map as a boundary object that could be used to highlight different perspectives, assumptions, and implications derived from various technical and scientific disciplines, rather than seeking collective agreement. This study poses a question of how conflicting rationalities and weak communicative and collaborative rationality affect resilience and recovery in post-disaster regions.

## **PLAY BEFORE THE RULES CHANGE (OR YOUR FRIEND LEAVES): BUILDING PERMIT ISSUANCE AND ADMINISTRATIVE TRANSITIONS IN MUNICIPALITIES IN METROPOLITAN GUADALAJARA**

Abstract ID: 660

Individual Paper Submission

BAIRD-ZARS, Bernadette [Columbia University] bvb2108@columbia.edu, presenting author

Anecdotally, the risk of starting a new formal construction project in Mexico and beyond responds to the stability of municipal land governance practices, but the nature and effect of the relationship has proven hard to quantify. Mexico's land governance decentralization and patterns of wholesale municipal staff turnover every three years provide an opportunity to tease apart the connection between daily land governance practices and construction activity. The "vertiginous" turnover of local officials local in Mexico is endemic and results in deep institutional "volatility and fragility" (Hernández 2013; Cabrero Mendoza 2003, 30) with clear consequences for projects and programs (Herrera 2017). Formal regulations, plans, and subsidies for urbanization, however, last longer and are not timed to coincide with administrative transitions.

Using an original database that assembles over 100,000 building permits (*licencias de construcción*) from four municipalities over multiple transitions in the metropolitan area of Guadalajara, Mexico, this project uses a regression discontinuity approach to examine building permits in the months before and after the transition of municipal officials, defined in Mexico by law as October 1<sup>st</sup>, following elections that occur the first Sunday in July every three years, for the period between 2004-2020. In line with qualitative findings, the initial analysis suggests that permits increased sharply in the months before a transition, dropped dramatically in the first month after the transition, and gradually increased over the months following. How to chart and navigate "patterning" of practices over transitions is critical for planners hoping to change outcomes in cities (Healey 2007), now more than ever (Campbell 2021). Building on the findings and fieldwork findings, the article will discuss three possible institutions mediating the permit shifts: patron-client relationships, macro-level turnover in other departments, funding or programs, and the presumed ruptures in the informal rules, or "gray institutions" governing practice that are generated and sustained by teams of municipal officials.

## URBAN PLANNING AND GOVERNANCE IN MIDSIZED MEXICAN CITIES: A HEURISTIC TOOL.

Abstract ID: 689

Individual Paper Submission

GIOTTONINI BADILLA, M. Paloma [CSUN] mpgiotto@ucla.edu, presenting author

GONZALEZ, Dinorah [UCLA] dinorahgo@g.ucla.edu, co-author

Urban planning in Mexico has evolved from being a predominantly centralized and state-controlled instrument (Garza, 2003) to one forced to include a greater diversity of actors and, therefore, different visions and interests about the urban environment. This has made understanding, analyzing, and evaluating urban planning processes and its results a more complex task for which no analytical framework exists. This is a particular challenge for mid-sized Mexican cities, not only because they face increasing growth pressures, but they generally have weak institutions and limited autonomy to guide their growth (Peña, 2012). Furthermore, most of the existing research focuses on the country's largest metropolitan regions; thus, little knowledge has been generated around mid-sized cities' planning processes. These two factors motivated the creation of a heuristic tool to analyze and evaluate planning processes and practices in mid-sized cities within a context of democratic access to decision-making, which we present in this study.

We base the theoretical framework on the normative principles of governance (Graham, Plumptre & Amos, 2003; Pierre, 2011) and the right to the city (Lefebvre, 1996; Marcuse, 2009). We operationalize and apply these principles to the urban planning process, and analyze them through a mixed methods approach to understand how different actors (government, markets, and civil society) influence urban growth (whether expansive or intra-urban) through the establishment of land uses and the provision of infrastructure.

We conducted a pilot test on two cities in northern Mexico: Hermosillo, Sonora, and Tijuana, Baja California. Both cities are characterized by its rapid urban growth in the last two decades, their close interaction with the international border region, and the introduction of urban planning institutions that incorporate the public and private sectors and the participation from society at large. We use official data obtained from government sources and structured interviews with key informants, such as government officials, developers, and community representatives. We systematize the data to account for the presence or absence of legitimacy and voice, strategic vision, effectiveness and efficiency, accountability, and justice and equity.

The application of this tool has allowed us to identify the processes through which the different actors influence or favor different ends and, consequently, direct urban growth. The pilot reveals that many interests merge in planning processes, and that not all actors have the same weight. On the one hand, markets tend to impose themselves on the public sector to obtain economic ends relevant to their interests, and on the other, there is a more impoverished and only partially organized social sector whose political influence is weaker.

The tool we present here allows for the analysis of the dynamic processes that lead to different urban outcomes,

moving away from an analysis of urban planning results as static ends. The tool helps to understand the aspects that may limit or favor urban governance, and how spatial planning reflects the objectives of different interests (government, market, and the social sector). The tool also helps to verify if formal or informal mechanisms exist for society to exercise a counterweight to government and market actions. This tool will be useful for urban planners, practitioners, and academics to better guide the development of midsized cities.

#### **SPATIAL PLANNING: AN INTERPRETIVE REVIEW**

Abstract ID: 706

Individual Paper Submission

MALKAWI, Fuad [World Bank] fmalkawi@worldbank.org, presenting author

MASON, David [World Bank] damson@worldbank.org, co-author

1. Central theme or planning issue to be addressed: In many countries, sectoral investment planning and land use planning approaches are separate and undertaken at different scales by different levels of government. They are often disconnected, and many times are in conflict. As a result, public investments may not be located where they can provide the greatest impact for human or economic development outcomes (among others). Spatial planning is used by local and national governments to better align sectoral policies, strategies and investment plans in ways that are sensitive to location and place.

Recent initiatives by multilateral advocacy and donor organizations have highlighted the potential for spatial planning to improve both the efficiency of public investments and their responsiveness to local needs. However, the definition of spatial planning remains debated and differs by country and by planning system. In addition, the potential benefits and pitfalls of the different spatial planning approaches are unclear to decision makers, and even professional planners, in many countries.

The main objective of the paper is to illustrate the significance of spatial planning in the investment planning process. Through case studies, the paper will present different interpretations of spatial planning. It will focus on the conditions and tools needed for both effective “plan-making” as well as “plan-implementation” based on lessons learnt from the analysis of spatial planning initiatives in selected cities and regions.

2. Approach and methodology: The paper draws from a literature review and analysis of case studies drawn from countries in Europe, Asia and Africa. Based on a review of these case studies and other literature, it will develop a conceptual framework to identify the common features of spatial planning in terms of

planning objectives, institutional structures for implementation and the links between prioritization and financing mechanisms.

3. Meaningful and new findings: The paper will have three main contributions: First it articulates a general definition of spatial planning and the differences between sectoral, master, land use and other planning approaches. Second it details the potential benefits or costs for adopting spatial planning approaches in contrast to traditional sectoral-led public investment planning approaches. This includes the more efficient allocation of public funds to complementary investments across sectors (such as transportation and housing, or water resource management and flood risk mitigation and so forth). Third and finally, it will identify gaps in, and outline key questions for the future research agenda on the enabling conditions for successful spatial planning practices.
4. Relevance and implications to planning scholarship, practice and or education

The paper will have direct relevance to planning practice and scholarship. It responds to a growing interest in development organizations (such as UN-Habitat and the World Bank) in improving the planning and coordinated implementation of public investments from sectoral to spatially informed through applying a spatial lens to investment prioritization and decision making. The paper will provide guidance to policy makers on the objectives and fundamental dimensions of spatial planning and its tradeoffs based on case examples from the literature. It will also contribute to scholarship by identifying gaps and avenues for future research on the topic.

## **GENERATING CHANGE: MULTI-SCALAR DIMENSIONS OF LAND ACQUISITION FOR RENEWABLE ENERGY DEVELOPMENT IN SOUTHEAST ASIA**

Abstract ID: 726

Individual Paper Submission

KENNEDY, Sean [University of Illinois at Urbana-Champaign] seankenn@illinois.edu, presenting author  
QAYYUM, Faizaan [University of Illinois at Urbana-Champaign] qayyum2@illinois.edu, co-author

In recent years, the combined challenges of energy access, energy security, and energy-related greenhouse gas emissions have led to growing support for expanding renewable energy (RE) generation across Southeast Asia. Much of this growth has occurred in the form of large-scale solar and wind facilities with extensive land requirements (Kennedy 2018). The acquisition of contiguous land for large RE projects poses significant challenges in a region with a long history of colonial intervention and land-related conflict (Hall, Hirsch, and Li 2011). While the region aims to quadruple installed RE capacity by 2025, complex permitting processes, informal tenure arrangements, and opposition due to conflicts with existing land uses have hindered land procurement and RE project development.

To accelerate RE development, national governments across Southeast Asia have sought to address land acquisition

barriers by streamlining licensing and permits and reducing land acquisition costs (Department of Energy 2017; Guild 2019). Simultaneously, multilateral institutions such as the Asia Development Bank – which provide significant financial support for RE development – have increasingly sought to standardize land acquisition practices to minimize the economic, social, and environmental risks associated with large-scale infrastructure projects, including RE (Skinner and Haas 2014). While advocates of rapid RE development view these measures as necessary to meet national and regional RE targets, the articulation between these efforts and existing land use policies and livelihood strategies remains largely unexplored, particularly from a planning perspective.

This qualitative comparative case study draws on national and regional RE policies, targets, and social and environmental assessments to analyze the multi-scalar processes and potential outcomes of land acquisition for RE development in Indonesia and the Philippines. We find that despite ADB's efforts to minimize social and environmental impacts through safeguards and standardized land acquisition practices, local land use planning and policy continue to exert considerable influence over project design and its related social and environmental impacts. While ADB safeguards have reduced reported incidences of involuntary physical displacement among existing land users, the ways in which RE development may create more subtle forms of social and economic vulnerability remain closely tied to the political economy of local land use planning and policy. These findings point to the need for greater emphasis on land use policy and planning as critical levers in mediating the social and environmental impacts associated with the continued expansion of RE infrastructure across the global South. In doing so, this work highlights land use policy as a crucial node for directing multi-scalar processes of climate transformation in ways that address rather than exacerbate existing forms of climate-related inequity and injustice.

#### **COVID-19 THROUGH THE ETHICS OF CARE: COMMUNITY SOLIDARITY ACTION IN SQUATTER SETTLEMENTS OF RIO DE JANEIRO, BRAZIL**

Abstract ID: 736

Individual Paper Submission

COUTINHO-SILVA, Rachel [Pontifical Catholic University of Rio de Janeiro] [rachelcms@puc-rio.br](mailto:rachelcms@puc-rio.br), presenting author  
COMELLI, Thaisa [Federal University of Rio de Janeiro] [thaisacomelli@ufrj.br](mailto:thaisacomelli@ufrj.br), co-author

This paper explores how the urban poor are taking relief actions during the COVID-19 pandemic in five squatter settlements (favelas) of Rio de Janeiro. It analyses strategic and discursive changes of grassroots groups in order to provide short-term responses to the outbreak of the pandemic in their communities. In these new strategies, neighborhood and city-wide solidarity networks are formed to deliver emergency aid in the face of the precariousness of the built environment and the vulnerable conditions of many households. Here, we examine different formats of solidarity action: prevention measures, co-produced sanitation infrastructure, psychological

support, income relief and the distribution of basic food and hygiene items. The objective of the paper is to explore different ways in which marginalized residents organize themselves to support and care for each other. Our analysis recognizes the mobilization capacity of these groups in the face of little state action. It also adds to other existing efforts to better understand the effects of the pandemic (e.g., Duque Franco et al., 2020). Drawing on the case of five informal settlements, this article produces both theoretical and empirical contributions to planning studies. Such contributions are underpinned by normative assumptions about ethics and social justice. At the theoretical section, we approach the topic of grassroots planning through the lenses of care from women's studies (Gilligan, 1977). At the empirical section, we analyze COVID-19 responses through mixed methods. First, we map solidarity actions and networks in these territories. Our preliminary results identify dozens of initiatives that articulate with the state and civil society at different scales. Then, we introduce a qualitative analysis of the narratives attached to these actions. The choice of methods is aligned with the ethical principle of avoiding harm to both researchers and communities - hence, the choice for remote mapping and digital ethnography. This includes data collected from social networks, community-managed websites, local and mainstream media, along with other online platforms. The analysis also draws on previous ethnographic data gathered in these communities before the COVID-19 outbreak. Because this is an ongoing research, there are no definitive results and conclusions yet. However, the paper draws a few reflections which contribute to inform planning theory and practices concerned with informality. The first concerns the rapid, organized and effective relief response of communities to the crisis in light of state's neglect and disarray. This reinforces a long-standing argument that informal planners are major producers of valuable knowledge and action (McFarlane, 2009). Second, we highlight the urban poor's ability to engage in fluid and multi-scalar networks, which contributes to build a "deep democracy [and solidarity] from below" (Appadurai, 2001). Finally, we argue that the COVID-19 crisis is an entry point for looking at cities from the perspective of care, particularly in southern contexts. All the above points contribute to a broader argument: that studying and engaging with informality requires a recognition of the different ethics, rationalities and strategies that underlie urban planning and management.

#### URBANIZATION THROUGH CIRCULATION: THE CASE OF MUZAFFARPUR, INDIA

Abstract ID: 750

Individual Paper Submission

RANDOLPH, Gregory [University of Southern California] grandolp@usc.edu, presenting author

Scholars generally imagine the urban transition as a massive population movement from rural areas to cities—a "depopulation of the countryside" (Davis & Golden, 1954). However, the Indian context complicates this simple model as scholars claim that the country's urbanization involves "morphing places" more than "moving people" (Mukhopadhyay et al., 2020). Throughout India's countryside, new towns are proliferating in once-rural

geographies, part of a surge in the number of small urban settlements throughout the Global South (Randolph & Deuskar, 2020). Research demonstrates that some dense agrarian regions in the country are attaining urban densities and even experiencing structural transformation in their local economies (Pradhan, 2013)—despite witnessing negative net migration (Randolph, 2021). These urban transformations in the countryside, however, may indeed be tied to people’s movements, as urbanizing rural locations seasonally “export” their surplus labor to prosperous metropolitan regions for short-term, informal casual work—leading to the concept of “urbanization through circulation” (Randolph, 2021). Not only does this phenomenon complicate the image of urbanization through mass migration to cities; it also raises questions about what it means to plan for these emergent urban environments, whose underlying conditions of growth differ markedly from the metropolitan areas where planning research and practice are concentrated.

This paper studies “urbanization through circulation” using a case study: the district of Muzaffarpur in the northern state of Bihar. Since 1990, the district has witnessed rapid growth in the share of its population living in dense agglomerations (with greater than 1500 people/km<sup>2</sup>) and a dramatic agrarian exit, with the share of workers in non-agricultural employment more than doubling to about 40 percent. These changes occurred even as the district attracted virtually no non-native migrants—its urban transformation driven entirely by natural population growth. I first examine the structural conditions that undergird Muzaffarpur’s emergent urbanization, including its historical demography and densification and the social, economic and policy factors that limit the scale of permanent out-migration. Next, I study the multi-sited livelihood strategies that individuals and households adopt in response to these structural conditions—helping to explain both the local growth in urban (non-farm) occupations and the district’s high rates of temporary out-migration. Finally, I consider the implications of this form of urbanization for planning, especially relevant as the Indian government has designated Muzaffarpur a “smart city” under its national urban infrastructure policy.

#### ***ASPIRING FOR JUSTICE AND EQUALITY IN CLIMATE CHANGE ADAPTATION PLANNING: CONFLICT AND CREATIVITY IN PANORAMA, COLOMBIA.***

Abstract ID: 768

Individual Paper Submission

Lajoie, Steffen [Universite de Montreal] [steffen.lajoie@umontreal.ca](mailto:steffen.lajoie@umontreal.ca), presenting author

As planning increases its focus on the climate crisis, it is important not to lose sight of complementary fields of study and research already benefiting from decades of experience in this pressing issue. This paper takes theoretical lessons from a political ecology critique of “adaptation to climate change planning” and links them to practical learning in community-led planning, development, and adaptation. Both fields have a strong and explicit focus on

social justice and equality and challenge traditional ways of approaching planning responses to climate change-related risks (Ziervogel et al. 2017; Dodman and Mitlin 2013). This paper relies on a case study of a marginalized urban environment in the Global South, namely in Panorama, Colombia. The planning context in Colombian cities weaves a clientelist network in and out of legal and formal definitions layered over a history of colonization, civil war, and social and ethnic inequality. Recent years have seen innovative urban planning practices emerge from Colombia, and in Panorama, residents work to access the territorial plan, regularization process, relocation strategies, risk reduction and climate change adaptation plans.

The case study used an ethnographic approach, centered on semi-structured interviews and observation, to follow three groups of local actors engaged in improving the conditions for their community. The research reveals a plethora of approaches, strategies, and priorities as well as multi-actor initiatives that are at once creative, collaborative, and conflicting. The case study is not a best case example of how to plan for “climate change adaptation”, but rather, offers real-time lessons on how a diverse community struggles internally and externally where access and influence over political and natural resources are limited, manipulated and competitive. The case reveals how local leaders and urban practitioners navigate these complexities to find space for inclusion, participation, and development. It highlights the creative as much as the contested spaces central to urban production, risk reduction and community planning. Further, it shows how local inhabitants weave climate risks into other existing problematics and priorities to struggle for improvements to their environment through land tenure security, housing occupations and environmental and nature-based strategies.

Accessing and learning from these spaces—formal, informal (or both)—provides opportunity for the planner to better understand, mobilize, and integrate local knowledge in their work. The paper supports efforts to address three key challenges in local, community-led adaptation planning specifically: diversity, power and the articulation of scale (Dodman and Mitlin 2013). The research then offers insights into how these approaches can inform mainstream planning practice (Davoudi and Porter 2012) engaged in climate change adaptation on how to integrate climate change risks in places where there is already an important development deficit; how to avoid sweeping cookie-cutter solutions that benefit some and not others; how to access and support local initiatives and articulate them with broader planning strategies. These interconnected approaches are central to addressing the difficult questions linked to climate change risk, vulnerability, power, and diversity and to integrating a just and equitable planning practice.

#### PLANNING IN THE MUD: MAKING AND UNMAKING RESILIENCE IN MEXICO CITY

Abstract ID: 784

Individual Paper Submission

MCCELVAIN, Beki [University of California Berkeley] [bmcelvain@berkeley.edu](mailto:bmcelvain@berkeley.edu), presenting author

While cities can anticipate an increasing frequency and severity of climate related disasters, political uncertainty and global pandemic fallout are producing crises of public capacity and accountability in state and local economies. This

convergence of crises exposes a ‘muddy politics’ that upends implicit assumptions about the existence of a functioning state and its role in addressing climate risk. In this paper, I explore how this muddiness came to the surface in Mexico City, where a recent political regime shift and pandemic pressures resulted in deep austerity measures, which have dismantled Mexico’s complex infrastructure of bonds and trusts used for disaster recovery and climate adaptation in the capital. Given Mexico City’s high disaster risk and with the clock still ticking on climate change, interest in financing adaptation persists among an emerging constellation of private actors and development finance institutions. Yet it is unclear what is motivating private interests—or what forms these new interventions might take without state support—and what the implications are for equity. Characterizing Mexico City as a case of ‘planning in the mud’ that is becoming steadily pervasive globally, this paper traces adaptation finance to explore how urban resilience is made and unmade in increasingly uncertain times.

## IS SMART ALSO GREEN? THE ENVIRONMENTAL IMPLICATIONS OF THE SMART CITY MOVEMENT IN ASIA

Abstract ID: 793

Individual Paper Submission

SILVER, Christopher [University of Florida] [silver2@ufl.edu](mailto:silver2@ufl.edu), presenting author

The Smart City movement is underway with full force throughout Asia, instigated by national governments intent upon driving economic growth through greater utilization of information and communication technologies. India, Indonesia, Thailand, Korea, and Vietnam all have launched nationwide Smart City efforts over the past decade typically under the umbrella of 100 Smart Cities. India’s Prime Minister Narendra Modi committed US 14 billion to underwrite the first phase of its nationwide initiative in 2015. The Indonesia government launched its own 100 Smart Cities initiative in 2017 beginning with its three largest cities, Jakarta, Bandung and Surabaya. By the end of 2019, according to an Indonesian government report, the initial three Smart Cities had grown to 97 encompassing urban place of varying sizes throughout the archipelago. In the case of Viet Nam, the Smart City initiative started with the Vietnam Sustainable Smart City Development project approved by its prime minister in 2017. They started with the four target cities of Ho Chi Minh City, Hanoi, Da Nang and Can Tho to spearhead their nationwide effort. Besides national government funds, donor agencies such as the Asian Development Bank and the World Bank developed trust funds to help fund these Smart City initiatives throughout the region.

As Joo and Tan observe, the pro-growth emphasis of national Smart City initiatives in Asia is consistent with Harvey’s (1989) neoliberal urban entrepreneurship, albeit wrapped in the rhetoric of urban sustainability. The incorporation of the sustainability rhetoric implies that bringing advanced technologies to the management of its rapidly growing cities can provide the means to enhance their livability, including attention to longstanding environmental deficits. In the case of Ahmedabad, one of the initial participants in India’s 100 Smart City initiative, the city applied

technology to improve its waste collection system and to assist in developing a long overdue city-wide recycling program, Smart cities built from the ground up, such as Songdo in the outskirts of Seoul, incorporate a pneumatic waste disposal system into its basic infrastructure. In the case of Songdo, a product of the pro-growth strategy of the national government conceived under National Strategy for Green Growth enacted in 2008, green growth was intended as the “entrepreneurial strategy” for all future development in the country.

It is at the local level where Smart City concepts are actualized and where efforts to address environmental deficits and promote sustainable development can be assessed. This is particularly relevant in the case of Indonesian cities where the most visible uses of smart technology has been to support newly implemented public transportation systems, to manage traffic, and to enhance responsiveness by government to select community needs. There has been no analysis of how these Smart Cities have applied technology to longstanding environmental deficiencies, particularly in waste management, water quality and pollution control, hazard mitigation, and energy consumption. Focusing on the three pioneering Smart Cities in Indonesia (Jakarta, Bandung, and Surabaya) but also seeking examples from the remaining 94 “self-proclaimed” Smart Cities, this paper offers a much-needed assessment of the priority given to environmental upgrading within the Smart City framework. The degree to which environmental deficiencies are addressed at the local level suggests how Smart City interventions in Indonesia affect the masses of urban residents who deal with environmental deficits on a daily basis, and whose lives are impacted directly by the environmental condition in its cities. The research for this paper extends previous published work on Indonesian urbanization including *Planning the Megacity: Jakarta in the Twentieth Century* (Routledge, 2008 and 2011) and the forthcoming *Urban Flood Risk Management: Looking at Indonesia* (Routledge 2021).

#### **TOWARDS A NEW RESEARCH AGENDA IN URBAN DEVELOPMENT AND PLANNING RESEARCH IN THE GLOBAL SOUTH: GOING BEYOND THE “CRITICAL CONSENSUS VIEW.”**

Abstract ID: 794

Individual Paper Submission

SIDDIQI, Faizan Jawed [Massachusetts Institute of Technology] [fjawed@mit.edu](mailto:fjawed@mit.edu), presenting author

The purpose of this paper is to make progress in crafting an appropriate research agenda for studying urban development and planning in the Global South. A consensus seems to have emerged from the work of scholars of urban development and planning in the Global South. In this view, which I will call the “critical consensus view,” (CCV) planning interventions are seen as primarily serving the interests of those in power. In the context of the last three decades, this has meant that planning interventions have supported the consolidation of neoliberal capitalism since that is the ideology espoused by economic elites. Scholars such as Ananya Roy (2009) have mounted an existential challenge to the very profession of planning in the Global South, arguing that informality is encoded in

the DNA of the state in a postcolonial country like India, which makes planning logically impossible. Given that planning interventions in countries of the Global South are viewed as either anti-people (Watson 2009, Bhan 2009) or a logical impossibility, how does progressive change happen as per the CCV? Enter “insurgents”—organizations of members of marginalized communities who push for meaningful change from the ground-up. In other words, CCV takes neoliberal capitalism as a universal, whose exclusionary effects are primarily counteracted from the bottom-up.

What do we miss if we follow the CCV? While CCV scholarship is valuable for highlighting inequality in urban regions, it suffers from three major blind spots: 1) It forecloses the possibility of desirable change resulting from state planning interventions, 2) It misses any meaningful engagement with organizational aspects of planning, and 3) there is little emphasis on developing comparative understanding of the varieties of planning outcomes in countries encountering the “neoliberal” script. In short, the CCV seldom asks questions such as: why, alongside a number of planning failures, also exist numerous of planning successes? CCV also does not engage with the question of why some insurgent groups are successful in realizing their demands but others are not.

In reality, nations of the Global South have taken markedly different paths to capitalist development. For instance, the notion of private property – an integral part of the neoliberal script – and land governance have had significantly different trajectories in developing countries. India repealed urban land ceiling laws in early 2000s and now allows private ownership of large parcels. In China, the law does not allow private property but for the last three decades, the government has allowed de facto private possession of land. Rwanda has created property rights from scratch in the last two decades. The Chinese state directly builds affordable housing while India has moved to relying on market-based incentives to spur construction of affordable housing. All three countries have also made significant progress in pulling millions of citizens out of extreme poverty. Why are these different trajectories and outcomes not a subject of serious research and academic debate?

I argue that if scholars of urban development and planning in the Global South have an interest in helping realize progressive change, we need to broaden our horizons and go beyond macro-structural critiques of capitalism. Comparative examination of planning processes and outcomes is a task with dual significance. Studying the transformation of property in comparative perspective, for instance, will not only demonstrate that transformation of property rights in the Global South, is not one thing, that is either good or bad, but also will take us from making catholic generalizations (e.g. neoliberalism perpetuates inequality) to a more nuanced understanding of how normatively desirable outcomes can indeed be realized through planning interventions involving both state actors as well as insurgents, among others.

#### **FROM PEOPLE-CENTERED TO LIFE-AFFIRMING: THEORETICAL REFLECTIONS ON COMMUNITY DEVELOPMENT GROUNDED IN TWO CASE STUDIES FROM MEXICO CITY**

Abstract ID: 808

## Individual Paper Submission

PEREZ-QUINONES, Katherine [The University of Texas at Austin] kathyperezq@utexas.edu, presenting author

In his *Twenty theses on politics*, Enrique Dussel lays out his politics of liberation, a framework where he states that all political structure should be oriented towards the promotion, reproduction and enhancement of all life in community (2008). As an inherently political field, which in theory is increasingly concerned with building equitable and just futures, I extend this framework to planning. The main question guiding this paper is, what can we gain as planners if we shift the lens through which we approach community development from a people-centered to a life-affirming one?

To answer these questions, I draw from two case studies done in Mexico City in 2017. These two instances of community organizing explored how inhabitants were defending their place in the city, the place of particular ecosystems, as well as their own visions for public spaces. The first case looks at a group of neighbors who were organizing against attempts to “renovate” a plaza. Not only did the neighbors organized around a lack of consultation, but they also assumed an ethical position that was centered around the wildlife that already existed in the plaza, over the increasing neoliberalization of public spaces in the city.

The second case is local community space Huerto Roma Verde, a grassroots initiative, which is a multipurpose community space that operates through ideas of well-being, of just exchange, solidarity and self-organizing dynamics. While it has an explicit philosophy guiding the project, these ideas are not preached or discussed on a daily basis and are rather embodied through daily practice.

With these two cases, I examine planning and community development in two different lights. The first, as an institutional practice, often times, disconnected from people’s understanding of place, and later in Huerto Roma, as the type of community development that is possible, and which should be uplifted, acknowledged, and supported in the planning field and beyond.

The paper engages with the concepts of authors such as Enrique Dussel (life-affirming politics, Alterity) and Davina Cooper (prefigurative politics, conceptual force) to offer a theoretical discussion grounded in these cases.

The paper also suggests that, while the idea of sustainability, is in theory very close to this life-affirming politics, the discourse has diffused too much and lives somewhat comfortably under the neoliberal city. While life-affirming might be broad, this emphasis in the word life, offers less room for oppressive and extractive planning practices hiding behind incomplete ideas of sustainability. I suggest that moving from people-centered to life-affirming puts us in a better position to understand people’s relation to their environment, but also goes a step further as it asks more from planners. A life-affirming lens will likely put planners at odds with the state and the logic of the market they usually work under. The paper concludes by reading these community efforts as important windows through which alternative political horizons are being imagined and brought into being; they are opportunities for the planning field to reflect on who and what does it want to affirm.

The disproportionate impact of the COVID-19 pandemic on low-income communities has been evident worldwide. The resulting government response, especially the imposition of lockdowns lasting weeks and sometimes months, has negatively affected people's livelihoods and survival, especially when they lack job security or social safety nets (Gaynor, 2020). This impact was especially problematic in India. On March 25, 2020, the Prime Minister of India announced a complete lockdown across the country to interrupt and reduce the spread of COVID 19. As a result, millions of impoverished, internal migrants found themselves unable to stay in place. Entire families, including the elderly, young children, pregnant women, started walking, using carts, bicycles, and rickshaws – were dragging themselves across thousands of kilometers in the extreme heat of the Indian summer. Approximately 100 million migrants had been directly affected, and at least 20 million of these workers were reduced to extreme desperation (Bhowmick & Khandelwal, 2020).

Alarmed by this desperate situation, a group of civil society workers, indigenous networks, and grassroots activists in the state of Jharkhand, India, worked with the state government to set up a helpline to direct aid. In the space of a week, this helpline evolved into a hybrid institution that brought together participants from the state, civil society, traditional networks (Mundari and Ho tribe), and academia (International Institute of Information Technology-Bangalore). In the first six months, this alliance had registered and directly aided more than a million migrant workers from Jharkhand and was hailed as an effective model by the local and national media.

The emergence of this unique hybrid governance arrangement, which came to be called the Jharkhand State Control Room (JSCR), leads me to ask: *How can hybrid institutions leverage networks, technology, and resources to plan for and address disasters? What do these unique arrangements tell us about the ways that planning institutions in the Global South could transform to effectively plan for – and with – indigenous populations?*

This paper will present the insights gained from a six month long participant observation (from March to September 2020), fifty semi-structured interviews with various stakeholders, and results from an impact assessment survey designed and conducted by the author. It closely looks at the plural institutions and organizations working in this hybrid institution (Sorensen & Torfing, 2009), its effect on managing an effective disaster response, and the challenges and barriers this institution faced. It also looks at the individual testimonials of the migrant workers to unpack the embedded structures of precarity that affect the everyday lives of the migrants and that exacerbated the effect of the pandemic and economic lockdown in these populations.

This paper argues that pluriversal hybrid institutions can leverage multiple worldviews, resources, and networks and create collaborative solutions (Escobar 2018). It contends that a trust-based, hybrid disaster response system leads to deeper penetration among their constituents and examines whether hybridity can negotiate embedded distrust and long-term structural conflict. This paper seeks to contribute to the emerging procedural planning literature on planning pluralism, institutional hybridity, and indigenous planning.

## URBAN DESIGN, METROPOLITAN GOVERNANCE AND THE NOCTURNALIZATION OF WORK

Abstract ID: 967

Individual Paper Submission

STERN, Justin [Yale-NUS College] justindstern@gmail.com, presenting author

Today, cities are no longer constrained by local time zones. For millions of people in the Philippines, the work day now happens at night, due to changing patterns of labor caused by globalization. What are the local, socio-spatial implications of this nocturnalization of work?

In recent years, the urban night has received renewed attention in planning scholarship. This includes the emergence of 'night mayors' as a new form of urban governance (Seijas & Gelders, 2021), the temporal expansion of urban life under conditions of late capitalism and 'planetary urbanization' (Shaw, 2018) and the presumed conflicts between the 'twenty-four hour city' and urban social order (Roberts & Eldridge, 2009). Much of this work expands on previous scholarship on earlier historical moments which coincided with the expansion of the nighttime economy due to changing economic conditions and technological innovations (Melbin, 1978). This paper builds off of this growing body of scholarship to look specifically at the nocturnalization of work in 'white-collar' employment.

I focus in particular on the expansion of the Business Process Outsourcing (BPO) industry in the Philippines. BPO refers to the subcontracting of different aspects of business operations to a third party. This includes accounting, advertising, animation, health insurance claims processing, human resources, and, in particular, customer service contact centers or "call centers." Over the previous decade, the Philippines has emerged as a global hub for the BPO sector. Today, the industry is estimated to directly employ over 1.3 million people across the country, the vast majority of whom work throughout the evening to service clients located in Europe and North America. In business districts throughout the Philippines, the socio-temporal, spatial and regulatory climate of the night have been altered to accommodate the needs of American corporations and consumers. In Metropolitan Manila in particular, entire urban mega projects now function primarily on a North American time zone.

The paper draws on over one year of field research conducted in the Philippines. I focus in particular on the experience of one megacity, Metro Manila, and two mid-sized cities, Bacolod and Iloilo. I adopt a mixed methods approach, which includes spatial analysis, observational analysis, industry analysis and semi-structured interviews with business leaders, politicians, urban planners and night-time office worker.

Through this analysis, I draw attention to how the nocturnalization of work has led to unique planning challenges, ranging from increased petty crime to the need to provide affordable and reliable public transportation during the evening and early morning hours. I also show how the expansion of nighttime employment in central business districts is driving a new type of urban agglomeration, one in which issues of time – and the specific time zone(s) served – shape the organization of physical space, and influence urban design and planning practices. The paper concludes with a more generalizable discussion on the nocturnalization of work and its urban implications in a global context.

## **RURAL HERITAGE PRESERVATION UNDER THE LOGIC OF COLLECTIVE ACTION—A COMPARISON OF THE HETEROGENEOUS DEVELOPMENT OF THREE TRADITIONAL VILLAGES IN CHINA**

Abstract ID: 978

Individual Paper Submission

KOU, HUAIYUN [Tongji University] khy@tongji.edu.cn, presenting author

The conservation and research of rural heritage has become a popular topic among the international heritage community. In China, in the context of its national strategy on cultural revival and rural revitalization, various policies alongside with funds have been developed and injected into those underdeveloped villages where the traditional ways of production and lifestyle have been relatively well preserved, aiming to safeguard rural heritage as well as to promote local economic development. These conservation actions generally as the interventions for public good and interests, however, ended up in very different ways. Some have achieved the goals of preserving heritage and benefiting the local community; some are dealt with purely as token gestures and formalities; some are even interrupted and suspended upon the resistance of local communities.

The study attempts to explain the intrinsic reasons for different results of the practices from the perspective of the action logic of the villagers. Through analyzing the relationship and conflicts between the interests of the individual, collective and public, the authors explore the possible conditions under which individual rationality is consistent with collective rationality, so as to provide new ideas and methods for effective conservation.

The article employed the "Logic of Collective Action" theory to analyze villagers' response to the interventions of historic preservation. The theory, deduced by the famous American economist Mancur Olson, demonstrates that individual rationality is not a sufficient premise for collective rationality. The reason is that Individuals who are rational and seeking self-interest will not take action to realize their common or group interests, but tend to be free-riding. Based on this theory, the study establishes a conceptual framework of rural heritage conservation to explain the internal logic of villagers' actions in the process of rural heritage preservation (regarded as some sort of public goods in this case), as well as the different results under different prerequisites.

The study introduces the cases of three adjacent traditional villages in the same underdeveloped area in China. All these three villages were inscribed into the list of National Traditional Villages in 2012, whose current development status however, are quite different: Village A is well-preserved with its tourism development in full swing; Village B has some converted a few of its traditional houses, following a preservation route of Ecological Museum; Village C has undergone a major change in its landscape with more than 90% of the traditional houses demolished and reconstructed. The three cases, which shared the same policy background and location conditions while going towards totally different directions, are approached and explained in this study with the application of the theoretical framework to comparison of the logic of villagers' actions.

The study finds that heritage conservation is collective rationality of the whole society, and the village collectively assumes the obligation and responsibility of heritage conservation as a consideration for public payment; in underdeveloped areas, the "rational" individuals are more inclined to the improvement of living conditions; while certain conditions can be made to enable the convergence of the individual rationality and collective rationality. The

research suggests that decision-making and planning should fully consider the inconsistency between individual rationality and collective rationality, and utilize individual compensation mechanisms to promote the consistency. Therefore, the research is an inspiration for the development of rural heritage conservation mechanism.

### **SLUM GROWTH IN TIER 2 CITIES: A CASE STUDY FROM GAYA, INDIA**

Abstract ID: 997

Individual Paper Submission

ALAKSHENDRA, Abhinav [University of Florida] alakshendra@ufl.edu, presenting author  
KUMAR, Abodh [Central University of South Bihar] abodhkumar@gmail.com, primary author

In India, more than 70 million people live in urban slums. Most of the 53-urban agglomeration in India with a population of million or more are experiencing a rapid growth of slums (GOI). The unplanned urbanization has contributed significantly to this large expansion of slums in Indian cities. The slums population has been constantly rising since 2001, though the rate of increase has slowed down due to aggressive push by the national and the state governments to rehabilitate slum dwellers (Li et al., 2021).

However, governments at every level have been struggling in keeping up with influx of poor people in cities. The urban service delivery has taken a massive hit. At the same time, housing shortages and housing unaffordability has been increasing in most of the cities in India (Ahluwalia, 2016).

In the last 6 years, the national government has launched 6 major development projects targeting urban poor with the projected cost of more than \$200 billion. There is no doubt that this major policy push has helped slum dwellers, however, most of the impact we see has been limited to Tier 1 cities. This research focuses on the slums in Tier 2 cities, most of the previous research on slums has focused on Tier 1 cities with little or no discussion on small and medium cities.

The study aims to answer two questions: (a) Why do slums persist? and (b) How can we transform slums into better living space? The study identifies the continued persistence of slum attributes as defined by UN-HABITAT. Small city slums have been largely overlooked in the existing literature on urbanization (Marx et al., 2018). The study utilizes primary data collected from 184 households and focus group discussions conducted in nine different slums of Gaya, a tier 2 city of Bihar in India. Econometric results reveal that perceived legal ownership, prolonged stay at the same location, improved housing, income and education facilitate the dissolution of slum characteristics. Our results also suggest that while, patronage associated with corruption within the local formal governance enables reduction of slum characteristics, whereas discriminatory allocation of public resources contributes to their persistence. The paper suggests that strengthening of security of land tenure, improvement in local governance and adoption of income and human capital augmenting measures can act as a potential catalyst towards the endeavor to de-slum a city.

Understanding the effectiveness of policies aimed at informal settlements will help planners, policy makers, and civil society to formulate and implement appropriate policies for urban poor to achieve more inclusive and sustainable cities. This paper also emphasizes the importance of differentiation planning strategies. The policy aimed at Tier 1 cities are likely not to succeed in Tier 2 cities.

#### **MAKING THE AFFORDABLE MORE LIVABLE: BETTER HOUSING BY DESIGN**

Abstract ID: 998

Individual Paper Submission

DAS, Ashok [University of Hawaii] [ashokdas@hawaii.edu](mailto:ashokdas@hawaii.edu), presenting author

While affordable housing remains a daunting challenge, globally, recent years have also witnessed an uptick in creative solutions and public sector commitment towards expanding the supply of affordable housing in the Global South. Innovations ranging from land assembly to tenurial arrangements to financing mechanisms have emerged and have been spreading, boosted by the involvement of civil society, private sector, and other non-state actors. In addition to shelter interventions such as in situ slum upgrading (King et al., 2017) and ways to enable incremental development (Mukhija, 2014, Owens et al., 2018), there is also a growing recognition and push for scaling up the supply of mass housing (Woetzel et al., 2014; World Economic Forum, 2019) in emerging economies. Influenced by the broader contexts of decentralization and neoliberal policies since the 1990s, the changing dynamics of affordable housing supply in the Global South are privileging the objectives of supply expansion and efficiency over those of housing effectiveness and equity (Das, 2018), particularly from the standpoint of livability. Towards meeting the objectives of effectiveness and equity in affordable housing projects, by creating more livable environments, this paper calls for enlarging the emphasis on “design” aspects. Likely boosted by recent Pritzker prizes recognizing architecture’s contribution to social housing, as well as concerns raised by the COVID-19 pandemic, in both the North and South there is a noticeable resurgence in valuing the role of design for affordable housing (Hoyt & Schuetz, 2020). Design, here, refers to multiple considerations—including, the siting of projects, site-planning and designing of units and buildings, materials and construction techniques, institutional actors and their arrangements, as well as regulations and standards. The paper underscores the role of design by: 1) describing and analyzing the development of rusunawa projects (walk-up rental flats, Indonesia’s popular public housing product) in the city of Surabaya, spread over a period of three decades; and b) discussing effective, contextually relevant, affordable housing solutions from elsewhere in Asia that highlight exemplary design. The research involves multiple qualitative methods: semi-structured interviews with planners and architects, including designers of rusunawa projects; analyzing secondary literature and other sources; and evaluating site plans and design of structures and spaces—from drawings, site-visits, and conversations with residents. The paper finds that despite decentralization having made planning activities in Surabaya more localized, transparent, and inclusive, the process of planning and designing rusunawa has become less local and participatory than before, thereby adversely impacting livability—in terms of the spatial, sociocultural, and economic relevance of these designed spaces to their occupants. Based on the findings, this paper recommends, for Surabaya and elsewhere, that: 1) although centralization of public housing programs might be necessary for scaling-up, decentralization of individual projects is essential for effective design

inputs; 2) housing design at the local level should be decentralized further to allow multiple institutions (universities, civil society organizations, community groups) to collaborate in participatory design processes; and 3) land use regulations and building bylaws and standards need to be more flexible to allow for creative and effective solutions through incremental development and modifications of space.

#### THE INCLUSIVENESS OF URBAN PUBLIC SPACES IN A GLOBAL SOUTH CITY: EVIDENCE FROM BANGKOK STREET PLAZAS

Abstract ID: 1008

Individual Paper Submission

MANSURY, Yuri [Illinois Institute of Technology] ymansury@iit.edu, presenting author  
CHIVAKIDAKARN, Yanin [Chulalongkorn University] yanin.h@sdgmove.com, co-author  
ANANTSUKSOMSRI, Sutee [Chulalongkorn University] sutee.a@chula.ac.th, primary author  
TONTISIRIN, Nij [Thammasat University] nij@ap.tu.ac.th, co-author

Planners actively endeavor to promote more inclusive urban spaces that meet the public health, recreational and social needs of an increasingly diverse urban population (Gehl, 2013). While public spaces ideally provide opportunities to socialize and interact, making all residents from a multitude of socioeconomic backgrounds feel welcome remains a planning challenge particularly in global cities of the south. This study seeks to (i) explore the measurement operationalization of inclusiveness and (ii) identify the causal relationships that exist between perceived inclusiveness and patterns of public space utilization in Bangkok, Thailand. Many of the existing studies measure the inclusiveness of public spaces using the researcher's observations (Mehta & Mahato, 2020). The role of perceived inclusiveness in the users' propensity to use public spaces, however, is not yet well understood in the context of the Global South. While there is an established literature for the developed world (see, e.g., Németh & Schmidt), the inclusiveness of urban public spaces in emerging economies remains an underexplored research area. Bangkok, in particular, is home to over 10 million people, but available urban public spaces currently fell short of the demand of its growing population. Because of such limited availability, inclusiveness is one of the top policy concerns in efforts to advance quality of life through improved utilization of public spaces.

This research aims to assess the inclusiveness of urban public spaces in Bangkok as a representative city in the Global South, focusing on users' perception of inclusiveness with the central business district as the primary study area. We collected data from over 600 respondents to a survey of users' perception of the Bangkok premier street plazas. Central to the survey are instruments designed to measure how users feel about the degree to which the street plazas they frequented were inclusive. The dimensions of their perception are the user assessments of pedestrian comfort reflected in the thermal environment, passageway condition, walking obstacles, available

shading, and physical accessibility. A methodological contribution of our study is the structural equation model that we developed to articulate the causal linkages between the latent inclusiveness and patterns of public space utilization in Bangkok. The latent variable approach is designed to incorporate distinct measures of users' perception capturing the shared meaning of inclusiveness in a theoretically-consistent framework. Structural path analyses suggest that the effect of perceived inclusion on the frequency of visits to street plazas is both direct and mediated by accessibility and thermal comfort. How often users visit public space in Bangkok thus is shaped by subjective assessment of accessibility, which in turn is influenced by perception of inclusiveness. At the same time, duration of visits is only indirectly affected by perceived inclusiveness and turns out to be significantly longer for residents with college education, suggesting a pattern of utilization that benefits the educated users of Bangkok street plazas. We also found evidence of a positive impact of street plazas on social capital through the indirect effect of perceived inclusiveness on the likelihood of a chance encounter with the user's neighbors. In parallel, users sought ease of access through plaza entrances because of its role in promoting spontaneous interactions with other community members. The results suggest the role of inclusiveness-friendly planning in promoting a public-space-friendly lifestyle that cultivates social capital and nurtures physical and mental health in the Global South.

#### **TRADE AND EVERYDAY LIFE IN EAST AFRICAN COASTAL CITIES: THE EVOLUTION OF TWO URBAN MARKETS AND THEIR SURROUNDING COMMUNITIES IN DAR ES SALAAM, TANZANIA**

Abstract ID: 1024

Individual Paper Submission

IZAR, Priscila [Ardhi University] izarpris@vt.edu, presenting author

MBUYA ELIAS, Mejah Frederick [African Leadership University] mejaah@gmail.com, co-author

Open street markets (urban markets) are a quintessential feature of East African coastal cities. These sites at once represent, trade and business centres, sources of entry-level jobs for low skilled labour, and places where an array of formal and informal social, economic and spatial relationships and structures are formed and transformed. However, research has seldom focused on urban street markets as a way to understand everyday urban production and transformation in East African cities. This paper addresses this gap through a comparative analysis of the evolution of two urban markets and their surrounding territories in the fast-growing city of Dar es Salaam, Tanzania. Standing three kilometres away from each other, in the municipality of Kinondoni, near to the city centre, Tandale and Makumbusho are, respectively, the city's second largest food market and regional hub for the trade of second-hand goods, and a planned market built in 2001 that has struggled to maintain its commercial activities. The paper explores the interconnections between the two markets and the neighborhoods adjacent to them, and the relationships between development and transformation of the markets, the neighborhoods and the broader territory. Drawing from ethnographic and action research methods, the paper combines research data from informal interviews and archival analysis with on the ground knowledge of the Swahili communities in which the markets are inserted, acquired through years of social tourism and heritage preservation activities that the researchers have conducted in the area.

## PROLONGED WATER WOES OF MUMBAI'S URBAN DRAINS: WHAT ARE DECISION-MAKERS MISSING?

Abstract ID: 1039

Individual Paper Submission

VUPPULURI, Richa [University of Virginia] richa.vup@gmail.com, presenting author

BASSETT, Ellen [University of Virginia] emb7d@virginia.edu, co-author

The three urban rivers of Mumbai – Dahisar, Oshiwara, and Mithi – are breathing lungs of the city by regulating its urban drainage through the wet and dry seasons of the year and particularly during the extreme monsoon spells. All, while navigating through densely populated suburban development, ultimately emptying into the Arabian sea. The Mithi river was the primary cause of the intense flooding and life-loss in the city in the July 2005 deluge, while the Dahisar and Oshiwara rivers also majorly flooded, breaking down all possible urban systems. In response, for the past fifteen-plus years, the public authorities have focused on the river widening and cleanup mainly through the displacement of informal settlements along the riverbeds called “encroachment.” However, a critical look into the environmental history will reveal that other pro-development projects also contributed to the river pollution. Like the extensive land reclamation since the 1970s for the present-day financial district of Bandra Kurla Complex and the Mithi river diversion to accommodate an airport runway creating a significant choke point. There have been no mechanisms to address these developments that may seem more permanent, ultimately targeting the already vulnerable urban poor. Myriad of interventions are incessantly underway to “save,” “revive,” “restore,” “reimagine” these urban rivers, but there has not been much improvement. Most of the responses fall under the realm of either displacement or large-scale design and hard-engineering solutions. This study also aims to look at how decision-makers can go beyond these big engineering approaches to perhaps more human-centric incremental approaches like behavior in restoring these urban drains.

Like many developing cities of the global South, the challenging state of Mumbai's rivers is a barometer of an urban crisis, and a vast implementation gap becomes evident while analyzing multiple failed interventions over the years. So, what are we missing here? This study essentially aims to investigate the environmental history of Mumbai's urban rivers, identifying sites of multiple failures, and evaluate the efforts that have gone into managing and improving their conditions. Furthermore, explore behavioral opportunities and interventions by engaging a diverse range of decision-makers. Such as incentivizing positive behavior of communities, businesses, or institutions, establishing a social support network to reinforce pro-environmental behavior, recruiting change agents or role models within our communities. If recognized and scaled appropriately, these approaches could be instrumental in crafting environmental policies, programs, and significant infrastructure projects.

Along these lines, the primary research question is two-fold: (1) What does an urban environmental history of these rivers reveal regarding factors responsible for river pollution, how does it align with current pollution abatement and restoration efforts? (2) How can decision-makers and professionals in urban water management practices adopt

behavioral interventions?

This study's fundamental implication is incorporating a behavioral approach with urban environmental planning. An essential part of this research is defining this decision-making community, guided by critical frames of equity, representation, and agency. Its entities include leaders at various levels of agencies, professionals, representatives from public, private, non-profit, and residential welfare associations (RWAs), groups with specific interests, voluntary or providing expert services. This study's data is mainly from secondary sources and preliminary field visits from 2018 and early 2019.

The theoretical framework and case study analysis of the context is modeled after Ostrom's Socio-Ecological Systems approach on Governing the Commons, to understand the institutional dynamics and multitude of decision-makers in an urban setting. Additionally, while exploring behavior change as a critical tool in urban water management, the research will also build upon the Pro-environment Behavior framework, which aids in the sustainability of the natural environment, harms the environment as little as possible, and potentially benefits the environment.

#### INFORMAL WORK AND SUSTAINABLE CITIES: FROM FORMALIZATION TO REPARATION

Abstract ID: 1047

Individual Paper Submission

TUCKER, Jennifer [University of New Mexico] [jennifertucker@unm.edu](mailto:jennifertucker@unm.edu), presenting author

ANANTHARAMAN, Manisha [Saint Mary's] [ma20@stmarys-ca.edu](mailto:ma20@stmarys-ca.edu), co-author

Building just and sustainable cities requires reexamining how the informal is conceptualized and acted upon by mainstream development actors. Epitomizing a powerful economic commonsense, the Sustainable Development Goals (SDGs) assert that formalizing the informal economy is the route to decent work and economic growth (see also ILO 2019). Admirably, the 2015 SDGs seek to decouple decent work from ecological extraction, promoting both livelihoods and sustainability. Yet assessments like the SDGs often underestimate the economic, environmental and social value informal workers produce for cities. These assessments also elide how growth-oriented economies reproduce job scarcity, income inequality and poverty, the very conditions that impel many to informal work (Tucker and Anantharaman 2020).

While planning has a rich legacy of engaging informality in housing and human settlements, these insights have not been systematically applied to informal work. This paper draws on extended ethnographic research in Paraguay and India with street vendors and wastepickers. Based in our own research, critical informality studies and community-

produced knowledge about informal work, we argue for new ways of thinking about and engaging informal work. We challenge the persistent tendency to devalue informal work. Grassroots recyclers provide essential urban-environmental services, diverting waste from landfills and enabling recycling (Dias 2016) while street vendors support food security as they bring life, vibrancy and protection to urban spaces (Bromely 2000). Even further, formal economies rely on and appropriate this value. The deficit-based frame of informal work, we argue, is rooted in a pernicious antipoor epistemology. To counter this, we argue that thinking spatially, relationally and historically clarifies the essential role of informal work in subsidizing urban economies and ecologies.

Urban planners, policy-makers and city officials often invest formalization with supercharged powers to reduce poverty, increase productivity, clean and order urban space and produce self-reliant economic subjects. Yet, deficit-based frames of informal work tend to prescribe disempowering forms of formalization, which can dispossess workers, reduce their collective power and undercut the social and environmental value their work generates.

We propose decentering formalization as a primary goal of urban planning and initiatives like the SDGs. For formalization to address social and environmental inequities it must redistribute resources and power to informal workers and grassroots social movements. Indebted to the Black radical tradition, we argue this can be realized through an ethic and practice of reparation, which seeks to reimagine and recreate socio-ecological relations from a full acknowledgement of the injustices of the past as they live into the present (Robinson 2000). We advocate reparation over justice because dominant, liberal notions of justice center the individual, foreclose consideration of histories of harm and deny the need for collective redress.

Both skilled and unskilled laborers are migrating across different Asian countries in search of job opportunities and income. It is estimated that more than 15 million non-national workers are working in the United Arab Emirates, Saudi Arabia, Qatar, Oman, Kuwait, and Bahrain. Most of them are from the Indian subcontinent or South East Asia (Kronfol, Saleh, and Al-Ghafry, 2014). From Nepal, more than 4.3 million youths are staying outside of their country for employment. The majority of previous research has focused on the cost and benefits of labor export. Still, results are ambiguous and primarily targeted to the economic impacts, including contribution to the national economies, communities, and households (Goss and Lindquist, 1998). Previous studies have identified research gaps in labor migration's social, political, and cultural dimensions (Asis and Piper, 2008). These migrant workers face different challenges in destination countries, including poor living conditions, lack of health services, social discrimination, and

psychological problems. With the Novel Coronavirus outbreak (COVID-19), social and psychological issues became severe among these migrant workers. Previous research has shown that the global pandemic has become the leading cause of chronic psychological problems like anxiety, panic disorder, depression, and psychosomatic manifestations among migrant workers (Tandon, 2020). To develop a better understanding of challenges faced by migrant workers, this study examines how COVID-19 took a toll among returning Nepali workers in their social, economic, and psychological lives.

An online survey was developed focusing on the social, economic, and psychological challenges of COVID-19 among returning Nepali migrant workers. It was distributed through personal and professional networks in all 77 districts of seven provinces of Nepal. It was administered from May 10 to July 30, 2020, when the highest number of Nepali migrant workers returned to their country due to job loss or outbreak of COVID-19 in their work locations. A total of 1,107 responses were received. Using content analysis and statistical methods (Chi-square and logistic regression models), the research finds that these migrant workers faced economic, social, and psychological challenges in their own country. The majority of these workers lost job permanently. About half of the returning migrant workers faced discrimination in their village, including exclusion from social activities, ignorance from their own families, and deprivation of essential services. The research identified a greater need for immediate actions from Central, Provincial and Local Governments of Nepal to address these workers' employment needs. It also noticed an urgent need for counseling, training, and awareness campaigns to control the dogma against returning migrant workers about the COVID-19 spread.

# Track 8 – Land Use Policy & Governance

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### **8.23 PRE-ORGANIZED SESSION - LOCATING THE SOCIAL VALUE OF LAND: THE PLANNERS' ROLE IN LAND VALUE CAPTURE - SESSION 1**

Pre-Organized Session 23 - Summary

Session Includes 127, 128, 129, 130, 131

SHIH, Mi [Rutgers, The State University of New Jersey] mi.shih@ejb.rutgers.edu, organizer

Recent scholarship on land and financialization has argued that many land value capture mechanisms have led to an urban world that is both planned and inflationary. While this body of work is analytically insightful, it leaves little direction of action and good solution to planners, a key agent in the urban landed property development. This paper session focuses on the planners' role, the social value of land and the conditions for materializing it. We have three goals: 1) Diversify the scope of discussion by bringing in international use of land value capture, 2) Examine how social value of land is framed, strategized, politicized, inserted, and materialized in planners' engagement of land-based financial tools. We recognize that planners have agency and we are interested in how planners help construct the urban world in which they practice, 3) Juxtapose a set of dissimilar cases as a method of comparison to further advance the discussion of the conditions under which the social value thrives or stagnates in land value capture. The session contributes to the planning scholarship by advancing and expanding the epistemologies of land, value, and urban development.

Objectives:

- To learn about the mechanisms, practices, processes, and politics of land value capture

### **THE GOVERNMENTALIZATION OF SPECULATION**

Abstract ID: 127

Abstract within Pre-Organized Session 23

WEBER, Rachel [University of Illinois at Chicago] rachelw@uic.edu, presenting author

Land value capture strategies (LVC; often called "value uplift" or "planning gain" in countries outside the United States) require local governments to hitch their wagons to future land values to pay for public goods in the present. Those governments have assumed debt to pay for infrastructure and to subsidize private developers to invest in targeted areas. If land values in the area do not go up, the cash flows local governments have committed to repay debt are threatened and the complicated deals between public and private sectors may collapse.

Dependent on land value surpluses, LVC strategies turn local governments into and co-rent seekers and partners in speculation. Speculation is "future-oriented social action aimed at directing capital" and involves ideas about what time should be used for, "formal knowledges used to anticipate patterns in time so as to harness and direct capital," and "tools used to arrange action in time and to link its flow to capital generation and accumulation" (Bear 2020).

What kinds of ideas, knowledges, and tools are deployed in these partnerships? Does having a similar end goal (land value inflation) reconcile their respective interests or smooth over the potentially divergent means of getting there? Do municipal planners accept private predictions of land inflation at face value? Or do they push back against those predictions? How do planners and their private partners engage with the future as both an imaginary and material process of unfolding, projecting and extrapolating, as both temporal and spatial? What are the effects of this "governmentalization of speculation" (Birla 2015)?

I draw on my many years of participating in and observing publicly subsidized LVC projects in Illinois and Wisconsin from 2010-2020. In several cases, I was brought into these deals to provide advice by journalist or municipality, and so had access to the formative documents and discussions enabling them. I was interested in how professionals involved in these deals anticipated the behavior of uncertain property markets in order to extract rents from them in the present. I interviewed planners, developers, and consultants and asked them to "show me their models." This paper explores other compromises municipalities make when they enter into these Faustian bargains (i.e., private land value surpluses to pay for public goods).

Value capture schemes, and any tax- and land-based debt, rest on a foundation of expectancy and speculative future-thinking. Partners to the LVC deal must attest to the rate of land value appreciation; indeed that prediction is what gets monetized and used as security in subsequent phases of the project's financial life cycle. How parties agree to use the expected value increment is, to some extent, open to negotiation and political contestation (Wolf Powers 2020).

And yet the ability of the public and private sector to realize their speculations on the future are also unequally distributed (Szolucha 2018). Specifically, it has been argued, financial capital owns and controls the means of prediction. Indeed my previous research demonstrates how and explains why the public sector adopts "financialized" time value of money assumptions (Weber 2020). If this is the case, is it possible for municipalities (or other interest groups) to advance their future interests, and ensure that their private partners do not anticipate, colonize, or control every projection or future imaginary on which plans are based? Or is the final product of the negotiations always weighted toward private interests because their models and assumptions are designed into the process? I return to my interview and participant observation data, updated by recent developments in the projects I was tracking, to attempt to answer these questions.

#### PLANNERS' PREFERENCES FOR EMBEDDED SOCIAL VALUE IN THE ENGLISH LAND VALUE CAPTURE EXPERIENCE

Abstract ID: 128

Abstract within Pre-Organized Session 23

DUNNING, Richard [University of Liverpool] R.J.Dunning@liverpool.ac.uk, presenting author

The relationship between the land that value is captured from and the location of expenditure of that value is fraught with ethical, equity and political considerations. Some political economies resolve this tension by strictly prohibiting the removal of value from the spatial context it is generated in, whilst others permit its extraction to fund public goods separate from the site. In this paper, I explore the perspectives of planners involved in the

negotiation of developer contributions in England and their role in determining whether values are embedded within or outwith the site of extraction.

In England, the value of developer contributions is widely variable between local planning authorities, in part this is a result of different path dependent development patterns, which are partly explained by local economic conditions (Lord et al., 2019). However, different local planner behaviours and planning cultures also result in diverse negotiations with developers and differences in the value of planning gain extracted (Dunning et al., 2019).

When the Community Infrastructure Levy (a flat charge on developments to fund infrastructure anywhere in the local authority) was introduced in 2011 it changed the role of negotiations between planners and developers over contributions. The rational nexus, that any contribution required by the local authority should be clearly caused by the development, was revitalised as the guiding principle for negotiations (Crook and Whitehead, 2019). Yet, this still left some room for planners to pursue their visions of what social value should be created through the development and where.

In this paper, I will explore evidence of planners' perceptions from across studies in England conducted between 2007/08 and 2018/19. The paper will show how planners' perceptions and behaviours have engaged with concepts of spatial justice and equity, adding some nuance from diverse development contexts to Fainstein's (2012) argument for land value capture and justice. It will explore the variation in their positions and explanations of relating concepts of equity to broader social needs and the specific site of development. The findings from this research will prove fruitful in training planners in alternative approaches to negotiation in the planning process for social goals.

#### **EMBRACING VALUE CAPTURE FOR INCLUSIONARY HOUSING ORDINANCES: ANALYZING THE ATTITUDES AND PERCEPTIONS OF LOCAL PLANNING PRACTITIONERS IN FLORIDA**

Abstract ID: 129

Abstract within Pre-Organized Session 23

KIM, Minjee [Florida State University] m.kim@fsu.edu, presenting author

In 2019, the Florida Legislature passed House Bill 7103, adding a new statutory mandate that requires local governments to “fully offset all cost” borne by the developers complying with local Inclusionary Housing Ordinances (IHO). The Bill has had a chilling effect on local IHO practices. One county, Sarasota, went as far as to partially repeal its existing IHO to avoid potential legal challenges.

Value capture offers a particularly useful conceptual framework for securing inclusionary housing in Florida's legal context, but if and how the local governments of Florida will embrace value capture for inclusionary housing will

depend on a multitude of political, cultural, and economic factors. One such factor is the local planning culture (Dunning et al., 2019). If value capture finds no support among the local planning and economic development staff, it is unlikely that the localities will establish new IHOs in light of the statutory mandate. Some localities may even repeal existing IHOs, as Sarasota County did.

This research project aims to understand how and why some local governments might be more receptive to using value capture for affordable housing than others and for those that are reluctant, why. The efficacy and outcomes of value capture practices are known to depend on the strength of the real estate market (Kim, 2020; Crook et al., 2016), the level of practitioner expertise (McAllister et al., 2016), and the perceptions and attitudes of local government actors (Weber, 2020; Dunning et al., 2019). These explanatory frameworks serve as useful lenses to examine a locality's openness towards embracing the concept of value capture, in this case for inclusionary housing.

I will first present findings from a survey of how Florida's planning practitioners understand the new statutory mandate and if and how their locality has responded to the new mandate. I will then present the findings from investigations of the local planning culture based on interviews with planning and economic development practitioners working at local governments. I will use the existing explanatory frameworks to explain the variations that might be found in practitioner attitudes and perceptions. The findings from this research will yield valuable lessons for fostering local planning cultures that can be more receptive and bolder in harnessing the value capture concept to secure public benefits.

## **INTENSIFICATION, DEVELOPMENT REGULATION, AND LAND VALUE CAPTURE: CONFLICT OVER THE RULES OF THE GAME IN TORONTO**

Abstract ID: 130

Abstract within Pre-Organized Session 23

SORENSEN, Andre [University of Toronto] andre.sorensen@utoronto.ca, presenting author

This paper examines the emergence and operation of the Toronto intensification planning regime, focusing on approaches to development regulation, land value capture, and infrastructure finance, through two case studies of land development control and planning policies in areas that have seen large-scale, high-rise redevelopment in the last two decades, City Place on the edge of the downtown core, and Humber Bay Shores on the Lake Ontario shoreline. Toronto has for 70 years been one of the fastest growing city-regions in North America, and over the last two decades in particular has seen a boom of high-rise development (Filion, Leanage et al. 2020). The Toronto case is valuable, as a distinctive value-capture system has emerged, conflict over both the rules of the game and their application is intense and continuous, and detailed documentation of regulatory processes and outcomes is

available.

The sets of institutions regulating capital investment in urban property are increasingly important today, as urban property development has become the world's largest industry, most cities struggle to finance infrastructure demands related to intensification, and cities are key actors in attempts to achieve more sustainable development and better living environments. Debates and policies designed to capture a share of increases in urban property value for public benefits are longstanding, but have become more pressing in recent years as demands for and costs of necessary infrastructure grow and other sources of revenue have shrunk (Ingram and Hong 2012, Kim 2020).

In theory, as every property in a city requires a wide range of public infrastructure and services to be able to function, each should contribute its share of these costs. Further, as public actions such as development regulation and infrastructure provision are responsible for a significant share of any land value increases associated with intensification, it is widely argued that the public owns a share of the uplift of property value. The challenge is to achieve this in practice.

This paper quantifies the scale of value capture in Toronto, and details the nature of public benefits that have been realized, showing that in practice, while most municipal operating and maintenance costs are paid for with annual property taxes and user fees, capital costs are mostly paid for with levies on new development following the principle that 'growth pays for growth' (Biggar and Siemiatycki 2020, Found 2019).

But these policies have been vigorously contested. Conflict occurs in two main arenas: in the provincial legislature, where planning laws and policies have been repeatedly revised to modify value-capture mechanisms; and at the micro scale of each development where zoning, permitted height and density, infrastructure assessments, and permission fees are negotiated and contested, often through appeals to the Ontario Municipal Board (OMB), a quasi-judicial appeal body. These conflicts are revealing of the operation of the rules of the game regulating development, of key actors' positions, and of processes and mechanisms of institutional change. While Toronto has seen some success in achieving planning goals and land value capture, it is clear that the city has become increasingly reliant on exactions for density bonuses, development charges, and park land dedications as sources of infrastructure finance, and big questions remain about the legitimacy and effectiveness of current approaches, particularly as housing has become increasingly unaffordable.

#### **BUILDING SOCIAL HOUSING ON RISING LAND PRICES: TAIWAN'S TECHNOCRATIC-DEVELOPMENTAL APPROACH TO URBAN DENSITY AND LAND POLITICS**

Abstract ID: 131

SHIH, Mi [Rutgers University] mi.shih@ejb.rutgers.edu, presenting author  
CHIANG, Ying-hui [National Chengchi University] yinghui@nccu.edu.tw, co-author

Planners and land officials in Taiwan have a long history of facilitating real estate market growth by creating and changing technical rules for density use. From mundane, inconspicuous building codes exempting certain residential spaces, such as balconies, from official calculation of floor area; to regulatory experiments with transferable air rights for boosting buildable density; to a growing list of development acts deemed worthy of density bonuses, such as large-site or speedy development, Taiwan's ever expanding and increasingly complex technical intervention into density reflects the closeness of the real estate sector's financial interests, political influence, and market power to planners' regulatory minds (Chen, 2020; Shih et al, 2018). Globally, density as a form of land rent has become a popular method through which planners turn land into monetary value or capture land value (Haila, 2016; Pérez, 2020). In recent years, there is a distinct new trend in density bonusing in Taiwan: that is, fulfilling social needs or purposes, such as social housing or energy-saving building construction, through real estate property development by rewarding private developers with density rent. Taiwan's density regime is such a large collection of rules of density remission, incentives, and credits that it is a common phenomenon that one single real estate development project "stacks up" its building height from several different sources of density bonuses.

In this article, we examine how Taiwanese planners' use of density is rooted in a technocratic and development intervention to land, density, and urban politics. We argue that when planners use the same technical manner of density bonusing to address social housing as they do to boost real estate market interests, it deepens the acquisitive and speculative logic of real estate capital and ultimately worsens the problem of housing affordability. Analyzing 18 real estate development projects, we estimate the lifting effects of density bonusing on land prices. We aim to quantify the answer to the question of how much more daring developers are in their bidding for land at present in anticipation of more salable units in the future. We use the residual valuation method (also called the cost approach) that is the standard practice among real estate professionals in Taiwan and is also the basis of the financial viability test for land value capture in England (McAllister, 2017). The findings show that even after accounting for a net profit of 20% of total sale, a figure we heard consistently in our interviews with real estate agents, density bonusing still has a great potential of driving land prices up.

Our findings show that privately built social housing units are gained under the conditions of an accelerated capital switch to land acquisition, luxury property development, and rising land prices. This is an irony in which a hyper acquisitive real estate market worsens housing affordability while contributing to the stock of social housing units in the city. We conclude the article by discussing the larger implications of how such a technocratic-developmental approach to density bonusing allows planning to reproduce a symbiotic state-market relationship.

### **LAND VALUE AND JUSTICE: INSISTING ON DECOMMODIFICATION VS. ASSENTING TO HYPER-COMMODIFICATION**

Abstract ID: 132

Abstract within Pre-Organized Session 26

WOLF-POWERS, Anna Laura [Hunter College, City University of New York] [aw2416@hunter.cuny.edu](mailto:aw2416@hunter.cuny.edu), presenting author

A rich vein of relatively recent scholarship contends that planners are complicit in the financialization of land. In relying increasingly on tools such as tax increment financing, density bonusing, and transfer of development rights (TDR) to fund public infrastructure and promote development, it is argued, planners participate in processes that inflate land prices, enable rent-seeking, and contribute to destructive property market bubbles. Advocates for reparative planning and economic justice have responded to these dynamics with calls for decommodification. Rather than reinforcing extractive logics, they argue, planners should work to remove land from the speculative marketplace using instruments of public, non-profit and cooperative ownership. An opposing impulse, however, is to repurpose land value capture tools to achieve redistributive and reparative ends. This approach implicitly assents to the construction of urban space as a commodity but strives to recover the proceeds of this process to fund disinvested public goods and reduce deeply inequitable access to urban amenities and opportunities.

This paper draws on the case of land politics in New York City in the second decade of the 21<sup>st</sup> century to examine the tension between these two approaches. Early in the decade, planners in the city used transfer of development rights and density bonusing in multiple situations to stimulate market-rate housing and Class A office and retail development, as well as pioneering density increases in conjunction with an inclusionary housing mandate. However, the housing crisis worsened as luxury development displaced working class households and as units created under the inclusionary mandate did not address the deepest need, in large part because expectations about up-zoning inflated property prices in low-income areas. Concomitantly, a boom in the "tech" industry that was deeply imbricated with the increased valuation of industrial and commercial real estate priced out industrial businesses, working artists, and low-rent commercial enterprises. Decrying the complicity of the "real estate state" in these dynamics, advocates mobilized around policies that would have the effect of decommodifying land.

Community land trusts proliferated in the city during this period, as did advocacy for reinvestment in public housing. Interest in mission-driven industrial and commercial development grew, and in 2019, an activist state legislature succeeded in shoring up residential rent regulation in the city. In the current electoral cycle, some candidates for citywide office have pledged to use city policy to put more land in social and non-profit ownership.

While decommodification efforts show promise, they have remained marginal in the policy landscape. In the meantime, advocates have seen opportunities to tap into real estate market hypertrophy, bending value capture practices, particularly air rights transfer, to redistributive purposes. In the 2019 report *Public Action, Public Value: Investing in a just and equitable Gowanus Rezoning*, the Pratt Center for Community Development and the Fifth Avenue Committee proposed to raise revenue for direly needed renovations in public housing by instituting a transferable development rights (TDR) regime in conjunction with the up-zoning of the Gowanus neighborhood in Brooklyn. Similarly, advocates for religious congregations and cultural institutions facing aging buildings and dwindling membership have proposed that the city change its zoning code so that non-profit institutions can transfer air rights more flexibly, raising funds for the mission-related work these groups do. This second approach, rather than challenge the financialization of land, seeks to capture and redistribute its gains more evenly.

Because they co-opt dominant practices and discourses, strategies to capture value within the hyper-commodification paradigm might be expected to have greater political traction. But city government has resisted efforts to use value capture for justice, perhaps demonstrating the necessity of a wholesale paradigm shift.

#### **LAND VALUE CAPTURE: WHAT AND HOW CAN WE LEARN FROM OTHER COUNTRIES?**

Abstract ID: 133

Abstract within Pre-Organized Session 26

CROOK, Tony [University of Sheffield] [a.crook@sheffield.ac.uk](mailto:a.crook@sheffield.ac.uk), presenting author

Capturing development value to help fund new affordable housing and infrastructure has a long history in the UK both through (less successful) taxation approaches and (more successfully) through developer contributions. There has been a similarly long history in many European, North American and other countries. This paper will consider what lessons if any, nations can learn from policies and practices in other countries including examining the success of land value capture policy in England. The paper draws on the author's long standing empirical and conceptual work in this area including most recently for UK governments and including comparative analysis. The papers will also draw on concepts related to policy transfer and to different approaches to the legal underpinning of planning especially contrasting common law with rules based legal systems. It will consider the extent to which notionally successful policies in specific countries can take root and flourish within other countries.

Key Words: land value capture

## NEGOTIATING AIR RIGHTS TRADING AND THE SOCIAL FUTURES

Abstract ID: 134

Abstract within Pre-Organized Session 26

CHEN, Hung-Ying [Durham University] hung-ying.chen@durham.ac.uk, presenting author

This paper analyses urban policy instruments which attempt to capture land values through three forms of air rights trading, including air rights as bonus credit (i.e. density bonus), offset credits (i.e. TDR), and saleable permits (see also (Gandhi and Phatak 2016; Liong et al. 2020; Shih and Shieh 2020). Here, air rights trading is broadly identified as policy instruments that permit the uplift of buildable volumes of a land parcel upon exchanges between air rights and (non-)monetary values. In this study, I draw the links between works of literature on the land value capture scholarship and geographical critiques of urban commons and commoning (Brinkley 2020; Eidelman and Safransky 2020) and ask three interrelated questions: How do current urban policies invest in the valorization of urban air rights? How are different urban actors capturing the value from this process? Taken together, how are the social futures of ownership and control between individual property and urban commons/commoning being understood, perceived, negotiated, and practiced? Building upon four spells of fieldwork in Taipei City and New Taipei City between 2015 and 2021, this study uses comparative legal analysis, in-depth interviews with policymakers, government review committee members, planners in government, and civil society sectors, appraisers, and developers. By reviewing the air rights trading and its modes of land value capture mechanisms, this paper explores the symbiotic relationship across different urban actors. It highlights the monetary and non-monetary exchanges in different phases of negotiation processes for (mega-)urban development projects. It concludes by proposing three themes that help to identify lines between the use and abuse of air rights in the existing land value mechanisms: valuations, ownership and control, and socio-ecological futures.

## **WHAT IS LAND? TRANSFER OF DEVELOPMENT RIGHTS (TDRS) AND THE NEW ENCLOSURES OF THE VERTICAL CITY**

Abstract ID: 135

Abstract within Pre-Organized Session 26

BALAKRISHNAN, Sai [University of California Berkeley] sbalakrishnan@berkeley.edu, presenting author

This paper interrogates the growing popularity of a new land-use planning instrument, the transfer of development rights (TDR). Public officials in varied contexts, from New York and Boston to Mumbai to Taipei, are turning to TDR as a flexible, market-oriented instrument for regulating urban space and urban resources. The TDR program is a form of "land-based financing," where land and its appurtenant development rights becomes key sources of public finance. The TDR program is a special form of "land-based financing" because it is not the increment or surplus from terra-firma land that is in question, but the surplus from development rights which are linked to land via floor area ratios (FAR). In Mumbai, the rise of vertiginous new skyscrapers is enabled by the TDR program which allows developers to separate development rights from a specific plot of land, to transfer these development rights (or air rights) across space, and then to stack them onto different plots of land. It is this separation logic of TDR that is the crucial focus of this paper (cf. Balakrishnan and Van Maasakkers, n.d). The paper has two main aims. First, the TDR is enabled by the mundane and often-naturalized land-use instrument of the Floor Area Ratio (FAR), which became a favored mobile policy in the 1960s (traveling, for instance, from New York to Mumbai / then Bombay). What were the forces that led to urban density being codified in the form of a monetizable instrument like the FAR, which then became the basis for hyper-speculative vertical urbanization in various cities around the world? Second, how can the proliferation of TDR in varied contexts open new windows into fiscal austerity in the post-1980s era of globalization? In answering this question, I'm particularly interested in why two ideologically opposed political parties, the right-wing Shiv Sena in Mumbai and the workers-party of the PT in Sao Paulo, introduced the same land-use instrument for financing urban public services at more or less the same time? Third, how do instruments like the TDR with their logics of separation produce a-priori narrow understandings of land that disembody air / development rights from the particularities of the site? How does this foreclosure of the varied meanings of land trap planners within processes that reinforce existing urban power relations, leaving them with little or no recourse at embedding land within its social-ecological and place-based meanings.

## **8.37 PRE-ORGANIZED SESSION - THE PRACTICE OF USING PLANS: ENGAGING THE FUTURE NOW**

Pre-Organized Session 37 - Summary

Session Includes 245, 246, 247, 248

HOPKINS, Lewis D. [University of Illinois at Urbana-Champaign] ldhopkins@sbcglobal.net, organizer

Plans should be useful, usable, and used. Assessing plan quality, recognizing that plans function within an ecosystem of plans, representing uncertainty in plans, and accounting for climate change adaptation will make plans more useful. Tools that support the many actors who can benefit from easier access to the ecosystem of plans and associated regulations that apply to a particular place will make plans more usable and more impactful. These papers present initial evidence that useful plans, supported by usability tools, are being used by a wide range of participants to achieve diverse interests.

Objectives:

- Innovations in making and using useful plans
- New tools for working with the many plans that apply to a place

### **DERIVING AND REPRESENTING ROBUST AND CONTINGENT PLANS**

Abstract ID: 245

Abstract within Pre-Organized Session 37

AVIN, Uri [University of Maryland] uavin@umd.edu, presenting author

One of the oft-repeated benefits of scenario planning is its potential to produce actions, strategies and even plans that can work both for specific scenarios (contingent) as well as across all scenarios (robust) (Chakraborty et al 2011). There is, however, extremely little evidence of such bona fide products (Avin and Goodspeed 2020) and those which have been developed appear overly generic (when robust) or overly granular (when contingent), limiting their utility in both cases. Moreover, their products typically exist as words rather than embedded or embodied in plans and maps, further limiting their utility. Recent additions to the scenario literature (Goodspeed 2020, Stapleton 2020) do not much change this conclusion. This presentation seeks to present advances in the practice of deriving viable robust and contingent scenarios and in their useful representation in plans.

The vehicles for demonstrating these advances are a quick survey of several current examples of such scenario planning efforts and their products with the primary focus on a scenario planning effort for updating the famous new town of Columbia, Maryland. This effort was part of a 2020 academic studio for the Columbia Association as the “client”, who were concurrently updating their own “vision”. It also occurred in parallel with a separate comprehensive plan update for the new town’s host, Howard County, using a scenario-based process. Columbia is an unincorporated entity and even though it contains 1/3 of the people and jobs in this affluent, suburban County, the Columbia Association has had a very limited say in the future of the County. This scenario-planning exercise thus also raises other interesting and obvious institutional, political and substantive questions about the use and impacts of scenario planning. Some of these questions will be addressed in the presentation.

## IMPROVING THE QUALITY OF INDIVIDUAL PLANS AND COORDINATION OF NETWORKS OF PLANS: AN APPLICATION TO A LOW-CAPACITY COMMUNITY VULNERABLE TO DISASTERS AND CLIMATE CHANGE

Abstract ID: 246

Abstract within Pre-Organized Session 37

PHILIP, Berke [University of North Carolina at Chapel Hill] pberke@email.unc.edu, presenting author

MASTERTSON, Jaimie [Texas A&M University] jmasterson@arch.tamu.edu, co-author

MALECHA, Matt [Johns Hopkins University] malecha915@tamu.edu, co-author

YU, Siyu [Texas A&M University] yusiyu\_1989@tamu.edu, co-author

A major barrier to achieving more resilient and equitable development is the lack of knowledge about the interactions between the quality of individual plans and coordination among plans. The benefits of a high-quality comprehensive plan may be compromised if the plan is poorly coordinated with other plans. For example, a high-quality comprehensive plan proposes avoidance of new construction in areas exposed to sea level rise, but a city may face pressures to create a transportation plan that supports new development in the same area. In turn, plans that are well-coordinated in the integration of climate resilience and equity policies, can be compromised if they have weak fact bases and poorly conceived implementation elements.

Against this backdrop, there is significant gap in knowledge about the interactions between the quality of individual plans and how well integrated any individual plan is with a network of plans. There is a great need to develop new innovations that can help communities both improve plan quality of individual plans and ensure coordination of a network of plans. Planning researchers only partially responded to this challenge by developing separate theories and methods for plan quality evaluation (Lyles and Stevens 2014, Masterson et al. 2015) and plan Integration (Berke et al. 2015, and Malecha et al. 2019). A critical next step is to connect these perspectives and test applications that attempt to translate them to planning practice.

In this study, we use participatory action research (PAR) to apply to urban planning practice in the context of a community's efforts to create a high-quality comprehensive plan that is coordinated with a network of local and regional plans. We engaged planning practitioners to chronicle the process and document the impacts of the application of plan quality evaluation and plan integration tools to guide the recovery of a relatively poor, low-capacity case community devastated by Hurricane Harvey that is increasingly vulnerable to floods and the effects of climate change on flooding. The case involves a cooperative partnership between the community and university experts to co-produce knowledge that improves the quality of individual plans, and identifies conflicts among plans and reveal hidden opportunities for improving coordination and implementation of plans.

We address two research questions. Can the tools be used in actual planning practice to build local capacity to improve the quality and coordination among plans and produce outcomes (e.g., changes in land use and development regulations, and public investments) that are directed toward more resilient and more equitable places? If yes, can recommendations be developed to serve as guidelines for applying the tools aimed at higher levels of government that incentive or require local planning, and local communities that most directly deal with resilience and equity issues? These questions are subject to empirical inquiry, and they guide the design, data collection, and analysis of this study.

We find that the application process enabled a team of local plan evaluators to learn about the diverse values, priorities and rules of different city agencies, and the scope and purpose of the network of plans. Plan evaluators found that local plans are not fully consistent and do not always address the geographic areas and population groups most vulnerable; moreover, some plans actually increase vulnerability to floods and sea level rise. The partnership demonstrated that planners can use the tools to generate information to inform changes in plans, regulations, and public investments to support more equitable, healthy and less vulnerable cities.

## **PARIT: WHAT PLANS AND REGULATIONS APPLY TO THIS PLACE?**

Abstract ID: 247

Abstract within Pre-Organized Session 37

CHIMENTO, Cyrus [University of Maryland] [cchiment@terpmail.umd.edu](mailto:cchiment@terpmail.umd.edu), presenting author

HOPKINS, Lewis D. [University of Illinois at Urbana-Champaign] [ldhopkins@sbcglobal.net](mailto:ldhopkins@sbcglobal.net), primary author

FINIO, Nicholas [University of Maryland] [nfinio@umd.edu](mailto:nfinio@umd.edu), co-author

KNAAP, Gerrit-Jan [University of Maryland] [gknaap@umd.edu](mailto:gknaap@umd.edu), co-author

The Plans and Regulations Information Tool (PaRIT) is a computing interface that enables spatial queries to identify and access the many plans and regulations that apply to a given place. These plans and regulations are created by various government, intergovernmental, and non-governmental organizations and are created at different times with different functional, spatial, and temporal scopes. As argued elsewhere (Hopkins & Knaap, 2016), we should neither expect these plans to be consistent nor try to make them consistent. PaRIT accesses multiple plans and regulations to give decision-makers emergent information in support of several plan using tasks: plan commission staff report, affordable housing location opportunities, developer location opportunities, aggregating ideas across plans for advocacy such as bikeways or affordable housing (National Center for Smart Growth, 2019), neighborhood group advocacy/opposition, looking for consistency or contradictions related to particular goals such as hazards or climate change mitigation (Berke, Malecha, Yu, Lee, & Masterson, 2019).

We demonstrate the capabilities of PaRIT in applications to the Purple Line light rail transit project in Montgomery and Prince George’s Counties, Maryland, north of Washington, DC. This tool operationalizes concepts for creating Information Systems of Plans (Finn, Hopkins, & Wempe, 2007; Kaza & Hopkins, 2012), structured databases for collecting, indexing, and querying the many plans that typically apply and relating these plans to regulations. The tool relies on an extensive database of geo-spatially defined plans that express intentions or visions of important organizations in both counties. These plans range from traditional neighborhood level land-use plans to county-wide general plans but also include educational facility master plans and bicycle and pedestrian plans. Regulations included in the tool include legally binding rights, incentives or constraints on land development in the corridor such as zoning, impact fees, and economic development incentive zones.

Spatial queries can be defined in several ways: by street address; by drawing a point, line, or polygon; by uploading shapefiles; by allowing access to your location; by choosing a feature on the map; and a buffer can be added to any of these queries. Queries can use filters to focus on particular types of plans or regulations. Query results present important attributes of each plan or regulation that applies to that location and include links to PDFs and websites for the complete documents. A summary report can be formatted in printable format or exported as spreadsheets

or shapefiles.

#### **CAN ONE ORGANIZATION PLAN FOR EVERYTHING? A COMPARISON OF THE NEW YORK REDC'S REGIONAL ECONOMIC DEVELOPMENT STRATEGIES AND CLEANER, GREENER COMMUNITIES PLANS**

Abstract ID: 248

Abstract within Pre-Organized Session 37

GREEN, Tim [Clemson University] [tgreen8@clemson.edu](mailto:tgreen8@clemson.edu), presenting author

FINN, Donovan [Stony Brook University] [donovan.finn@stonybrook.edu](mailto:donovan.finn@stonybrook.edu), co-author

The goals of economic development planners and sustainability planners, which have often been in conflict, have begun to overlap to considerable degree (Campbell 1996; Gibbs and Linz 2016). The well-being of present and future communities cannot be considered independent of the relationships among economic development, environmental degradation, and global climate change. Furthermore, shifts toward carbon-neutral production offer the prospect of industrial growth and development. Despite this evolution in thinking, planning practice commonly retains disciplinary and institutional boundaries between the fields of environmental/sustainability planning and economic development. While many communities engage in comprehensive planning that nominally addresses both goals, the degree of meaningful integration in such plans often remains low even as the case for broader planning grows stronger (Oseland 2019). At the regional scale in the U.S., economic development and sustainability planning (if they exist at all) are often completely separate processes and are commonly carried out at different times by completely separate organizations.

Since 2011, New York State's ten Regional Economic Development Councils (REDCs) have overseen the creation of multiple regional plans in their respective jurisdictions. Two of these planning efforts – the 2011 Regional Economic Development Strategies and the 2012 Cleaner, Greener Communities initiative – were carried out within the nominally distinct policy areas of economic development and sustainability with each of the ten REDCs developing one plan of each kind for their respective regions (Green and Finn 2020). Unlike prior episodes of regional planning in the U.S. that often attempted to influence land use in smaller jurisdictions directly, these plans seem to function more like agendas for future action (Hopkins 2001).

This flurry of regional planning creates an ideal opportunity to observe how these two types of plans are produced and used as well as the relationship (if any) between them. The research begins with a content analysis of the resulting 20 plans to determine what sorts of information they contain. This is followed by a set of case studies of

two regions where the document review is supplemented with key informant interviews to determine how the plans have been used since they were produced.

The research addresses four related questions about the ways that regional economic development planning and regional sustainability planning are related in practice:

1. Given the growing understanding of the relatedness of their goals, how similar are regional economic development plans and regional sustainability plans?
2. To what degree and in what ways do plans of one type explicitly acknowledge the existence and importance of the other?
3. To what degree and in what ways were the two planning processes in each region related, if at all?
4. How have the plans been used over the last decade, if at all, in their regions and constituent municipalities?

The results will help us to assess the degree to which the overlapping goals of economic development and sustainability are reflected in current planning practice and will highlight specific ways in which regional planning institutions support or hinder the integration of these historically distinct areas of planning.

## **ROUNDTABLES**

### **8.831 ROUNDTABLE - TWENTY YEARS OF SMART GROWTH: PROGRESS AND FUTURE**

Abstract ID: 831

LEWIS, Rebecca [University of Oregon] rlewis9@uoregon.edu, organizer, moderator  
KNAAP, Gerrit-Jan [University of Maryland] gknaap@umd.edu, participant  
CHAKRABORTY, Arnab [University of Illinois] arnab@illinois.edu, participant

Although its precise birth date remains uncertain, “smart growth” is now more than 20 years old. In this roundtable, we look back at the origins of the smart growth movement, examine the successes and failures of smart growth policies and practices, and envision what smart growth will -- and should-- look like going forward. Our roundtable summarizes our Handbook on Smart Growth which will be published by Edward Elgar in 2022.

Although definitions vary, the EPA defines smart growth as “development that serves the economy, the community, and the environment and changes the terms of the development debate away from the traditional growth/no growth question to how and where should new development be accommodated” (Smart Growth Network 2004). Before the 1990s, state and local efforts to combat sprawl and manage development were called “growth control” and “growth management” and primarily focused on slowing the rate of urban growth and regulating how growth happened. In the early 1990s, a new growth management movement emerged, focused on policies to control suburban sprawl. The smart growth movement focused on how government investments and incentives could facilitate smarter development on a regional level. This new approach aimed to change the focus from stopping or slowing growth to assuring that growth was “smarter” in location, intensity, and form.

The Smart Growth Network – a national alliance of more than thirty private sector, public sector, and non-governmental organizations – continues to advance the following ten principles, which constitute the predominant paradigm in land use planning for the last two decades:

Mix land uses

Take advantage of compact building design

Create a wide range of housing opportunities and choices

Create walkable neighborhoods

Foster distinctive, attractive communities with a strong sense of place

Preserve open space, farmland, natural beauty, and critical environmental areas

Strengthen and direct development toward existing communities

Provide a variety of transportation choices

Make development decisions predictable, fair, and cost effective

Encourage community and stakeholder collaboration in development decisions

More recently, however, smart growth advocates have begun to address contemporary challenges such as climate change and social equity. The popularity of the term “smart growth” has faded in favor of the terms “sustainable development” and “urban resilience.” These new vocabularies connote many of the principles of smart growth, but they also represent a change in focus and a recognition of new challenges, raising questions around the validity of the 10 principles; whether smart growth achieved goals; failures and omissions from smart growth; updated principles; and the future of smart growth.

The roundtable will describe the key findings of the book, including an overview of the history of smart growth & role of smart growth. Then, we address the original principles of smart growth such as mixing land uses, promoting walkability, providing housing opportunities, providing transportation alternatives, and more. Finally, we examine issues that were not addressed in the original smart growth principles but have ostensibly been added to the smart growth agenda. These include climate change, social equity, public health, workforce development, smart cities, and more. Then we offer remarks about how smart growth has succeeded or fallen short, and what smart growth version 2.0 might look like going forward. We consider a smart growth policy agenda for addressing social equity and climate change through the smart growth principles.

## **INDIVIDUAL PAPER SUBMISSIONS**

### **GOVERNMENT A LA CARTE, “FEND-FOR-YOURSELF” FEDERALISM, OR LOCAL CONTROL? INTERROGATING SPECIAL DISTRICTS IN COLORADO**

Abstract ID: 9

Individual Paper Submission

NORGAARD, Stefan [Columbia University] spn2121@columbia.edu, presenting author

Special districts are territorially defined public or quasi-public entities that provide public services to residents on an à la carte basis. Metropolitan (metro) districts are a type of special district that provide at least two special-district services and act as developer-initiated residential associations, functioning as de facto ghost governments. There are over 3,000 special districts in Colorado and 1,520 metropolitan districts, compared with around 270 municipalities in the state. Indeed, according to the Colorado Futures Center, Colorado ranks first per capita of all U.S. States in its sheer number of public-service entities. The largest metro district in the state, Highlands Ranch, CO, is home to 96,500 people.

In this inquiry, I ask: what are the social characteristics of metro districts in the U.S. State of Colorado compared with municipalities? What are the legal, political, and normative consequences of each jurisdictional regime? I consider the first question drawing on geospatial methods joining jurisdictional boundaries with racial and income data from the U.S. Census, and couple this inquiry with an analysis of home values and property taxes paid in one pilot Colorado County. I find that special districts are whiter and wealthier than municipalities, though the scope and practical significance of my findings depend on assumptions made with regard to GIS’ Modifiable Areal Unit Problem (MAUP). Accordingly, I complement these findings with quantitative regressions that control for county and settlement size. I consider the second question through three possible normative imaginaries explaining the presence of special districts in the state, informed by theoretical literature on local government from historical, legal, and urban theory fields: (1) communities of common interest (McKenzie, 1994; Young, 1990); (2) urban entrepreneurship (Harvey, 1989; Brenner, 2004); and (3) racial capitalism through implicit fortification and fear of the ‘other’ (Caldeira and Holston, 2000; Hutson et al., 2012). Planners and the planning practice should be concerned that metro districts in particular may serve as more than a mechanism for “local control”: they further spatial exclusion, uneven development, and what Tilly (1998) calls “opportunity hoarding.” One promising policy solution may lie in “strong regionalism” (Frug, 2002), with public-service delivery more equitably shared across fragmented jurisdictional regimes.

## HOUSING TORONTO: EXAMINING THE DETERMINANTS OF SOFT DENSIFICATION EFFORTS IN TORONTO, CANADA

Abstract ID: 28

Individual Paper Submission

DAVIS, Jenna [Columbia University] jmd2218@columbia.edu, presenting author

In recent years, planners and policymakers have touted the benefits of “soft densification,” or the process in which private actors, such as small-scale developers or property owners, incrementally densify their properties through parcel or housing subdivision, home extensions, or residential additions (Dunning, Hickman & While 2020). Soft densification projects tend to take place in low-rise, single-family neighborhoods and to occur in housing markets with rising real estate values (Touati-Morel 2015). In the past few decades, an increasing number of municipalities in Europe and North America have adopted “soft densification” as an explicit policy objective, touting soft densification as an approach that can help address a host of urban challenges, but that does not dramatically alter the existing urban form (Charmes & Keil 2015). For example, cities have reasoned that soft densification will help encourage more environmental forms of urbanization, increase the housing supply in housing-scarce cities (e.g. through the addition of secondary units), and encourage greater buy-in for residential densification in areas where larger-scale upzonings are politically unpalatable (Meijer & Jonkman 2020). Although previous research has found that incremental densification can make a substantial contribution to the overall housing supply, minimal empirical research to date has examined the determinants of soft densification, including parcel, neighborhood, or regulatory characteristics that influence the likelihood that a given parcel experiences soft densification (Bibby, Henneberry & Halleux 2020).

This gap in the literature matters for several reasons. First, since private actors tend to drive soft densification efforts, additional research is needed to identify factors that motivate property owners to engage in soft densification efforts. As municipalities across the United States consider eliminating single-family zoning to allow for denser development, planners and policymakers that wish to encourage densification need additional information about factors that might motivate private actors to densify their properties. Second, previous research has found that property owners “who engage in soft densification receive higher returns on selling their land” (Touati-Morel 2015, p. 606) and that households located in higher-income areas tend to be more likely to engage in incremental property improvements, particularly if doing so requires a zoning variance (Fischer, Stahl & Baird-Zars 2018). Thus, if it is the case that more advantaged households enjoy the economic benefits of soft densification, planners and policymakers interested in incentivizing densification in less advantaged neighborhoods will need additional information about the conditions under which soft densification tends to be feasible and successful.

Aiming to help fill this gap in the literature, this research examines factors that encourage soft densification practices in Toronto, Canada, asking: “What are the factors that influence the likelihood that a property owner will seek zoning relief for incremental densification in Toronto?”. Toronto is an ideal setting to study soft densification efforts since Canada has encouraged high-density development in its suburban periphery since the 1960s and has more recently encouraged soft densification in single-family neighborhoods within Toronto (Charmes and Keil 2015; Searle and Filion 2010). In the past several years, planners and policymakers have expressed increasing interest in the city’s so-called “yellowbelt,” or the nearly 70 percent of residential areas zoned for detached and semi-detached housing (Kalinowski 2019). In order to answer this research question, I leverage data from the City of Toronto to construct a unique database reporting on the parcel, neighborhood-level, and regulatory characteristics of properties that have undergone soft densification since the early 2000s. Next, I conduct a regression analysis to understand factors associated with a higher probability of lots densifying during the time period. Findings from this research will be relevant to planners aiming to better understand the dynamics behind urban densification and identify densification priority areas.

## EXAMINING THE MOTIVATIONS FOR THE WILLINGNESS TO OWN AUTONOMOUS VEHICLES IN THE TWIN CITIES

Abstract ID: 77

Individual Paper Submission

TAO, Tao [University of Minnesota] taotao@umn.edu, presenting author

CAO, Jason [University of Minnesota] cao@umn.edu, co-author

Governments regard the advent of autonomous vehicles (AVs) as an important opportunity for citizens and businesses. It is widely believed that AVs will greatly improve traffic safety. However, their impacts on urban form, vehicle miles traveled, and the environment are ambiguous. Understanding the spatial correlates of people's acceptance of AVs helps policymakers know where AVs emerge firstly, predict the spatial patterns of AV trips, and better understand their environmental impacts. Previous studies have explored how built environment attributes and demographics influence people's acceptance of AVs (Jiang et al., 2020; Nodjomian and Kockelman, 2019). However, the literature has two major limitations. First, these studies seldomly examine the relative contribution of various motivations for the acceptance of AVs from a theoretical perspective. Second, few studies focus on the potential nonlinear and threshold effects of the built environment on people's acceptance of AVs. Addressing these gaps helps better understand how people are motivated to accept AVs in their daily travel and provides planning guidance for areas where AVs arise in advance.

Using the 2018 regional travel survey data in the Twin Cities, this study applies the gradient boosting decision tree approach to explore individuals' motivations for willingness to own AVs and the nonlinear effects of built environment attributes. Specifically, it tests hypotheses pertinent to three motivations (efficiency, diffusion of innovation, and transit substitution) and examines their relative importance to AV acceptance. The efficiency hypothesis posits that people who drive more and usually live far away from the city center prefer to own AVs because they would like to enjoy the efficiency provided by AVs (Nodjomian and Kockelman, 2019). The innovation-diffusion hypothesis posits that people living in urban areas are among the first group of people to accept new technologies like AVs because they tend to be better educated, more affluent, and more technology savvy (Talebian and Mishra, 2018). The hypothesis of transit substitution postulates that people treat AVs as a substitute for transit, taxi, or shared mobility because they do not need to operate AVs manually (Haboucha et al., 2017).

Our results show that the built environment attributes and demographics serving as proxies for diffusion of innovation (e.g., population density, income, education) have a total relative importance of 32.8%, larger than those related to efficiency (e.g., distance to downtown, land use mix, 18.1%) and transit substitution (e.g., transit stop density, TNC frequency, 17.4%). In addition, built environment variables collectively have a relative importance of 31.9%, with land use entropy, population density, and intersection density among the largest ones. Finally, there are salient nonlinear and threshold relationships between built environment attributes and people's willingness to own AVs.

This study contributes twofold to the literature. First, we conclude that the influences of built environment attributes and demographics on people's willingness to own AVs reflect more on diffusion of innovation, followed by efficiency and transit substitution. Second, the nonlinear and threshold effects of the built environment on the willingness suggest the locations where AVs may emerge firstly, for example, the areas with land use entropy smaller than 0.3, population density smaller than 20 per acre, and intersection density less than 80 per acre. Planners can give priority to these areas to promote AV acceptance in the long-range transportation plan. They can also use the results to predict the future travel demand of AVs and make policies to address the potential issue of congestion, especially in those already-congested areas.

#### PEERING INTO MEGA-EVENT IMPACT CRATERS

Abstract ID: 79

Individual Paper Submission

MINNER, Jennifer [Cornell University] [jm2359@cornell.edu](mailto:jm2359@cornell.edu), presenting author

ZHOU, Grace Yixian [China Youthology] [gyxzhou@hotmail.com](mailto:gyxzhou@hotmail.com), co-author

TOY, Brian [Cornell University] [bjt92@cornell.edu](mailto:bjt92@cornell.edu), co-author

Mega-events such as World Expos and the Olympic Games, have been employed by a host of actors to reshape cities around the world (Monclús, 2009; Roche, 2017). Through time and space these events have left substantial urban footprints in host cities (Mataruna-dos-Santos & Pena, 2017). National, state and local governments, and civic and business leaders have used mega-events to achieve intangible goals such as the reshaping of urban imaginaries through “urban image construction” (Abbott & Minner, 2021; Broudehoux, 2007). The International Olympic Committee (IOC) and the Bureau of International Expositions (BIE) both require prospective local hosts to prove their ability to deliver on “legacy,” touted as a loose amalgam of intangibles and economic impacts (Cohen, 2016). Mega-events are also used by local hosts to restructure urban land and create new civic centers and public spaces, transforming the uses and users of the land (Chan and Li, 2017). Over time, mega-events have marked the shifting tides of nation-building to city-making ambitions and urban redevelopment (Monclús, 2009; Roche, 2017).

In this paper, we approach former mega-event sites, specifically International Exhibitions or World Expos, with the “meteor impact crater,” as a conceptual metaphor evocative of spatial transformation through large-scale redevelopment. The “impact crater” occurs in large-scale astro-geological events in which an object hits the land with enough velocity to create a depression. This metaphor is indicative of the ways in which an expo as a temporary event leaves a lasting physical, as well as social or cultural, impacts (Minner et al., 2021). In the case of

mega-events, these impact craters can be observed in the process of large-scale demolitions of existing urban fabric and the carving out of space for the event. After the expo, a space is created that may be repurposed as parklands, for a convention center, for urban mixed use development, or any number of new uses. Mega-events may also leave abandoned buildings and vacant lands for short to extended periods of time. Similar to the way in which geologists use stratigraphy to understand physical impacts, systematic observations of spatial and land use layers can be observed in both the physical fabric and archival record to understand the impact of mega-events like expos over time.

The civic and business elites involved in organizing expos use these events to shape the nature of public and private investments in order to achieve urban development goals (Poynter et al., 2016). Expo development can be very similar to, or incorporated as a part of, redevelopment schemes that transform downtowns and waterfronts (Abbott, 2005; Hackworth, 2007; Ribeiro & Santos Junior, 2017) and produce suburban research hubs and science parks. These goals are often proposed for attainment immediately after an expo, but change at former expo sites may be uneven and the actual uses and social and spatial impacts of expos may differ substantially from the urban development aspirations of mega-event organizers. Our primary research question centers on methods of comparing urban development in and around world expos many years after an event. We ask: How can scholars compare their social and spatial impacts and evolution of the sites over time?

We review existing scholarship on mega-events as tools of urban development and the extant literature pertaining to their longitudinal study and comparison globally. Next, we describe methods that involved geospatial tracing of the “impact craters” of 20 expo sites and means of understanding patterns in relation to each other, to change over time, and to paradigms of urban redevelopment. We conclude with recommendations for scholars and international bodies overseeing mega-events for the construction of a framework for in-depth comparisons between expo sites over time.

#### IS THERE SUCH A THING CALLED “EQUITABLE ZONING BYLAW?”

Abstract ID: 138

Individual Paper Submission

Zoning prescribes the uses of land and the locations, types and sizes of buildings within a municipality. Since the early 20th century, zoning has been used to address conflicts between land uses, such as residential and industrial, but has also been used to control and segregate people. Zoning thus has a dual legacy: one of promoting public good, but also discrimination and exclusion.

Recognizing that planning too often places unfair burdens on certain segments of the population through zoning, planners are increasingly seeking to incorporate equity -- the "just and fair inclusion into a society in which all can participate, prosper and reach their full potential" (APA, 2019, p.3)' -- into all aspects of planning practice. Many intersectional factors, such as race, socioeconomic status, gender, religion, and ability, have an impact on equity.

Applying the relatively broad concept of equity to a legal and regulatory tool like zoning, however, is challenging. Hence, taking "a human rights perspective can provide a universal frame of reference for identifying inequitable conditions" in a regulatory environment (Braveman & Gruskin, 2003, p.540). "Substantive equality" in the Canadian jurisprudence on human rights encapsulates the idea of equity. A human rights perspective forces issues of equity into the same legal realm in which land use regulation lies (Agrawal, 2014, 2020).

To this, we added distributional, recognitional and procedural equities as three additional dimensions of equity (Krumholz, 1990; Schlosberg 2004, 2007; Bulkeley et al 2014; Meerow et al 2019) as our framework to analyze the zoning bylaw. This research uses currently ongoing Edmonton's Zoning Bylaw Renewal Initiative as a case study to examine equity considerations in zoning.

The study addresses a series of related questions: how can we apply and promote equity and substantive equality considerations in a zoning bylaw? How can we identify the inequities created by land use regulations generally, and specifically in the case of Edmonton? What human rights and equity issues should be considered when drafting land use regulations? What compromises may be necessary when addressing equity using such tools?

We have conducted a thorough review of academic literature, best practices, and relevant case law to explore the intersections of equity, human rights, and land use regulation. We interviewed key actors -- local stakeholders both within and outside of the City bureaucracy -- to gain insight into how equity can be embedded into municipal regulations. We also analyzed close to twenty years of minor and major variances, zoning amendments, and appeals to the City's Subdivision and Development Appeals Board to ascertain how zoning tools have caused or helped improve inequity within the city in the past.

Our research develops an equity test that cities could use to gauge how equitable their zoning bylaws are. Our research results not only guide how the City of Edmonton can best apply equity and human rights considerations in its new zoning bylaw but are also useful for planners and policymakers across Canada and beyond seeking equity and human rights considerations in land use regulations.

## **AGING PLANNING BEYOND THE BRICK-AND-MORTAR: THE EVOLUTION OF AGING POLICY AND GOVERNANCE IN SINGAPORE**

Abstract ID: 197

Individual Paper Submission

KHOO, Louisa-May [University of British Columbia] louisamayk@gmail.com, presenting author

Planning for aging is a foremost policy concern given that one in four Singaporeans will be aged 65 years and above by 2030. Through archival work, interviews and a discourse analysis of secondary material, I chronicle Singapore's aging policy infrastructure since the 1980s, highlighting the paradigm shifts in policymaking as Singapore adapts to evolving demographic needs, social practices and governance considerations.

The paper examines the interventions in the built environment, housing and ageing-in-place policies Singapore has undertaken over the years, excavating the governance rationalities that have undergirded policies through the decades. In doing so, I highlight the challenges faced, and the nimbleness required to tweak policies and build institutional capacities to meet the desires and diversity of the aging populace. In particular, I suggest that the recent initiative by the Housing and Development Board (HDB) and the Ministry of Health (MOH) to jointly develop a public housing concept of Assisted Living piloted in February 2021, signals a turn from the neoliberal market-driven direction that had previously marked senior housing developments in Singapore towards public-sector efforts with the government taking the lead to provide affordable senior housing options across the eldercare needs spectrum. Concomitantly, the paper also attends to the growing concerns on the mental well-being and stresses of aging in global city Singapore. I emphasize how Singapore's aging policies have sought to but will increasingly need to be attentive to strategies that move beyond the immediacy of physicalist and design-centric measures to a more comprehensive place-based ethics of care approach that forges capacities of 'heartware' to complement the hardware measures already in place towards aging well.

In providing an overview of Singapore's aging planning and policy experience, I offer a perspective outside the Euro-American canon that can bring helpful takeaways for cities everywhere enabling possibilities for better planning and making of age-friendly cities.

## **ARE WE THERE YET? REVISITING "PLANNING FOR SUSTAINABLE DEVELOPMENT" 20 YEARS LATER**

Abstract ID: 199

Individual Paper Submission

CONROY, Maria [The Ohio State University] conroy.36@osu.edu, presenting author

WILSON, Jessica [The Ohio State University] wilson.3499@osu.edu, co-author

More than 20 years ago, Berke and Conroy (2000) set out to answer whether planning practice had responded to the UNECD Rio Conference directive to plan for sustainable development. The authors established six sustainability principles (livable built environment, harmony with nature, place-based economy, equity, polluters pay, and responsible regionalism) and used those principles to evaluate plan policies of 30 high quality and sustainability-focused plans across the United States. The overall findings set forth that plans intending to promote sustainability and those that were otherwise noted as high quality were not significantly different in how well they promoted the principles. Both sets of plans did promote one principle (livable built environment) significantly more than the other five, establishing a very unbalanced promotion of the concept for practice (Berke and Conroy, 2000).

Planning for sustainable development remains an active and promoted paradigm in the planning literature. Not only does the Berke and Conroy (2000) article have over 800 citations, most coming since 2010, searching via Academic Search Complete for “planning” and “sustainable development” (limiting to planning related journals) reveals hundreds of citations for articles published since 2015. The paradigm serves as the foundation for “best practices for comprehensive plans” (Godschalk and Rouse, 2015). However, in light of the increased attention to specialty plans addressing, for example, climate change, ecosystem services, and resilience, the planning community remains generally unaware of the integration of fundamental principles into community comprehensive plans.

Berke and Conroy (2000) did not measure plan quality itself. Instead, the work evaluated the strength with which plan policies promoted sustainability principles. However, it remains a component of the plan evaluation literature (Berke and Godschalk, 2009). That literature has developed in the intervening years to capture communicative processes (Norton, 2008), detailed internal and external plan characteristics for best practices (Berke and Godschalk, 2009), as well as “anticipatory governance” (Berke, et al., 2014). Given these progressions both on the evaluative and topic foci, planning is again challenged to understand how well practice is translating sustainability considerations into primary planning documents, notably the community comprehensive plan.

This paper examines three research questions based on the original work. First, do the sustainability principles used for evaluation remain valid when considering the evolution of the sustainability paradigm to issues including, for example, resilience? Second, do the updated plans for each of the original communities promote sustainability principles more strongly and/or more balanced than their initial sustainability score? Third, do new high quality plans promote principles of sustainability similarly (strength and balance) to the updated original plans?

We examine the questions by first establishing the essential considerations of the current plan evaluation literature, including the target plans of those evaluations. Then we evaluate the ability of the Berke and Conroy (2000) framework to capture the topical and methodological evolution. Based on that assessment, we return to the 30 community comprehensive plans from the 2000 study and evaluate how well they promote sustainability principles. Finally, we then examine award winning comprehensive plans from the past decade to compare how well they promote those same principles. This study will assess the relevance of the Berke and Conroy (2000) principles in light of the literature progression and provides needed insight regarding the state of practice in promoting sustainable development.

## **DO STAKEHOLDERS DIFFER IN THEIR PERCEPTIONS OF EMPOWERMENT IN SUCCESSFUL BROWNFIELD REDEVELOPMENT? A CASE STUDY OF THREE PROJECTS IN BIRMINGHAM, ALABAMA.**

Abstract ID: 210

Individual Paper Submission

CUTTS, Sandra [University of Alabama Birmingham] scutts16@uab.edu, presenting author  
FRICANO, Russell [Minnesota State University, Mankato] russell.fricano@mnsu.edu, co-author  
PETERS, Robert [University of Alabama Birmingham] rwpeters@uab.edu, co-author

This research uses Arnstein's ladder to evaluate differences in stakeholder perceptions of empowerment in the brownfield redevelopment process. While environmental legislation promotes citizen participation in brownfield redevelopment, limited work exists on implementation and evaluation of stakeholder participation in these activities. We define meaningful participation in brownfield redevelopments as a process where public participation educates citizens, interacts with them, and incorporates their ideas and comments to enhance the quality of project outcomes (Rowe and Frewer, 2005). However, research has indicated that public participation in brownfield redevelopment typically occurs at lower (less than strong) levels of participation (Solitare, 2005); it is often reduced to holding workshops and disseminating information (Chess and Purcell, 1999). A successful redevelopment project may not indicate the ultimate satisfaction of all stakeholders with collaborative decision-making and the ultimate project outcome.

This work explores this issue by utilizing Arnstein's ladder as an evaluative technique that measures the extent stakeholders feel empowered in the decision-making process (Arnstein, 1969). More recently, Contreras (2019) modified and adapted Arnstein's model to research community participation in organizational post-disaster cleanup and recovery work in Haiti. Contreras' work highlighted the practicality and statistical application of Arnstein's ladder of participation as a framework to address the extent of citizen participation and to guide different applications of participation. In this manner, Contreras' approach is more relevant and useful to assess participation in brownfield redevelopment at the local scale.

A case study using a mixed methods approach evaluated participatory activities of three successful brownfield redevelopments located in Birmingham, Alabama. Stakeholders included citizens, public officials, and developers. Semi-structured interviews and surveys incorporated levels of Arnstein's ladder of participation to measure stakeholders' perspectives of empowerment in participatory processes. Stakeholders were also asked to rate their satisfaction with the outcome of the redevelopment projects. It was presumed that a high level of satisfaction would be commensurate with similar perceptions of empowerment among the stakeholder groups.

Most citizen stakeholders were highly satisfied with the redevelopment outcome. Two-tailed t-Tests and Wilcoxon tests were performed to measure significant differences in perception of empowerment in paired stakeholder categories. The perceptions of empowerment were significantly different between citizen and public officials' perceptions with  $p=0.04$ ; however, perceptions amongst citizens and developers ( $p=0.12$ ) and public officials and developers ( $p\sim 1.0$ ) were not significant. Research findings suggest that perceived meaningful decision-making amongst stakeholders can vary depending upon their roles and relationships in the redevelopment process. As these tests provided a general indication of significant differences, this research recommends further studies that examine how stakeholder categories specifically rate levels of participation, and qualitative analysis of open-ended responses.

## THE RELATIONSHIP BETWEEN HISTORIC REDLINING AND MODERN ZONING IN MAJOR US CITIES

Abstract ID: 321

Individual Paper Submission

QUATTRO, Christine [University of Pennsylvania] [cmquat@upenn.edu](mailto:cmquat@upenn.edu), presenting author

At the beginning of the 20<sup>th</sup> century, two important spatial designations took place that have become foundational for current planning and zoning. Due to the historical context of these decisions, racism and bias were implicit in their creation. In recent years, interdisciplinary investigations on the lasting impacts of both the HOLC (Homeowner's Loan Corporation) maps of the 1930s and zoning regulation have risen in significance and number. Academics across fields have turned their attention to the historic maps -termed "redlining maps" - and asked questions regarding its relationship to the modern distribution of important characteristics of US cities. Similarly, questions regarding the efficacy and longevity of zoning, also largely adopted in the 1920s and 1930s, have percolated many fields.

This paper joins these two important conversations by using quantitative measurements to extrapolate on the relationship between HOLC grades and modern Euclidean zoning and social demographics. Cities in all regions of the country were subject to racially motivated HOLC and zoning categorizations during the same period. The longevity of zoning designations and their relationships to those grades nearly 100 years later may continue to inform the questions regarding the long-term impacts of both redlining and zoning.

This paper presents findings on 18 case cities distributed across the country that experienced both redlining and zoning prior to WWII. The findings include important conclusions regarding differences in city size, age, and demographics and what these factors mean for the modern distributions of zoning. These conclusions could help inform the future for comprehensive planning and land development regulation decisions as planners consider equitable solutions to longstanding concerns.

## BEYOND GLARE AND NUISANCE? EXPLORING HOW EIGHT US CITIES REGULATE LIGHT POLLUTION

Abstract ID: 338

Individual Paper Submission

POTHUKUCHI, Kami [Wayne State University] [k.pothukuchi@wayne.edu](mailto:k.pothukuchi@wayne.edu), presenting author

A growing scourge in metropolitan areas, excessive artificial outdoor light at night adversely impacts the health of humans and of nature and wildlife, threatens views of the sky, and constitutes nuisance in other ways. Sources of excessive light, or light pollution (LP), include parking lots and sports arenas, digital billboards, and entertainment districts, increasingly featuring light-emitting diode or LED technology.

Understandably, municipal policies tend to emphasize the positive functions of lighting, such as access, safety, and neighborhood quality. Related regulations typically seek to minimize glare and off-site spillover. As night-time lighting exceeds functional thresholds, planners need to educate themselves about LP and the possibilities and limits of LED technology for LP mitigation.

This exploratory study reviews zoning codes in eight US cities selected from each of the four major ecological zones. Cities were selected for expected diversity of activities enabled by outdoor light at night and capacity to enact and enforce policies to achieve desired values, including minimizing LP. Codes were analyzed using keywords such as lighting, glare, LED, and other terms commonly associated with lighting and signage. Additionally, I reviewed model ordinances developed by advocacy organizations.

The study's findings include:

1. Codes typically enumerate positive values such as public safety, access, promotion of business and entertainment, and neighborhood character; thus they tend to stipulate minimum lighting levels for streets, sidewalks, parking lots, and other public spaces.
2. All codes identify two undesirable impacts of artificial light: glare and spillover of light into residential properties or public rights-of-way. Fewer codes stipulate maximum levels or night time curfews for streetlights or other common uses.
3. Advertising signage is a growing LP threat, with some evidence of associated regulation among cities studied. Codes typically balance business-visibility with glare and spillover via standards that include distance from residential uses, directionality, and curfews. New York City's code is exceptional for its signage-related standards in special entertainment districts where lighting that LP opponents may consider excessive is encouraged.
4. No city code discusses LP's adverse public or ecological health impacts. Model ordinances, by contrast, include both rationales and standards that planners may consider adopting.
5. Beyond the zoning code, codes governing buildings, energy, ecological conservation, and sustainability also need to be addressed for LP mitigation.
6. Addressing the cumulative impact of LP originating from many diverse activities will require attention to overall lighting and spectral density as well as curfews, an approach that transcends zoning and other typical regulations.

Ultimately, LP mitigation is a political issue, with disparate, conflicting interests and unequal power. Addressing LP will require involving diverse stakeholders, and public education, dialogue, and participation. As planners build sustainable responses to climate change and associated challenges of biodiversity, public health, and energy

efficiency, we will need to understand the ways in which LP is implicated in the challenges. It is possible to minimize LP to promote human and ecological health while also permitting safe, effective urban nights.

#### REVISITING SMART GROWTH POLICIES IN THE COVID ERA

Abstract ID: 340

Individual Paper Submission

ALI, Amal K. [Salisbury University] [akali@salisbury.edu](mailto:akali@salisbury.edu), presenting author

Since it started in the late 2019, the COVID pandemic has changed our life dramatically. Fears of disease spread have necessitated physical distancing, and raised serious questions about current land use and transportation policies. Thus, debates over the applicability of Smart Growth policies in the COVID era have emerged. Scholars began to rethink policies promoting compact development, mixed land uses, and public transportation that have been applied for decades.

The Organization for Economic Co-operation and Development (2020) argued that “Life after COVID-19” will be “life with COVID-19”, and suggested changing the focus of current planning policies from “mobility” to “accessibility to basic amenities and services.” Batty (2020) predicted a possible policy shift away from compact development and public transit. On the other hand, Hamidi and others (2020) recommended adopting dense development because of its environmental and economic benefits, and the low death rates resulting from COVID and other infectious diseases. Sharifi and Khavarian-Garmsir (2020) called for creating more pedestrian areas and open spaces within compact cities.

This research paper contributes to scholars’ efforts to explore best planning responses to recent health challenges. It investigates two major questions: what are Smart Growth policies that would address current health concerns effectively? and which Smart Growth policies would be irrelevant in the COVID era? I surveyed state, county, and city planners in the State of Maryland to investigate how COVID-19 has changed land use planning procedures, which smart growth policies helped us adapt to current health concerns and restrictions, and which smart growth policies would be irrelevant or should change to enable “Life with COVID” and other infectious diseases.

The survey findings provide important implications for policy makers and urban planners. They help improve our understanding of current planning challenges and best practices, and point to needs to adjust our land use and transportation policies to create smart growth addressing current and future health challenges.

## SCENARIO PLANNING ENHANCEMENTS FOR SMALL- AND MID-SIZE LEGACY CITIES: A TRANSIT CORRIDOR CASE STUDY IN YOUNGSTOWN, OHIO

Abstract ID: 345

Individual Paper Submission

HILDE, Thomas [Cleveland State University] [t.hilde@csuohio.edu](mailto:t.hilde@csuohio.edu), presenting author

MORRISON, Hunter [Cleveland State University] [h.morrison55@csuohio.edu](mailto:h.morrison55@csuohio.edu), co-author

Scenario planning has traditionally been applied in growing cities and regions to assess the sustainability implications of alternative land use plans and policies (Berke & Kaiser, 2006). These processes often use a normative framework at the metropolitan scale to build consensus around a preferred long-term vision, aided by analytical tools and metrics that measure the outcomes of alternative paths forward (Holway et al., 2012). Recently, scholars and practitioners have turned to scenario planning as a method for addressing uncertainty, in cases such as climate change or disaster resilience planning where exogenous variables demand robust or contingent planning strategies for the future (e.g., Chakraborty et al., 2011; Goodspeed, 2020). However, applications of exploratory approaches are less researched in U.S. legacy cities, where demographic and economic uncertainties present fiscal and social justice challenges in the context of postindustrial population decline or limited growth (Mallach & Brachman, 2013). This paper addresses the question of how scenario planning frameworks and tools – largely designed for contexts of regional growth – can be adapted for enhanced land use planning in small- and mid-size legacy cities such as Youngstown, Ohio.

We partnered with the City of Youngstown to engage with stakeholders and model parcel-level redevelopment scenarios in two embedded transit corridor study areas. To address demographic uncertainty and related planning challenges found in this context, we tested the utility of (1) a novel exploratory scenario planning framework and (2) an integrated use of two leading scenario planning tools (Urban Footprint and Envision Tomorrow). As part of the latter task, we developed and beta-tested new building typologies calibrated to the Youngstown context to measure their impact on the analysis results. Semi-structured interviews were then conducted with local stakeholders to collect their feedback on the strengths and weaknesses of the scenario-based approach and analysis results for informing corridor planning in Youngstown.

Our findings report on the scenario-based analysis results. Based on these results and subsequent interview responses, we discuss the integrated tool capabilities that are well-suited to inform planning efforts in Youngstown and other small- and mid-size legacy cities. We also offer recommendations for enhancing the use of scenario planning and supporting analysis tools in contexts of decline, limited growth, and demographic uncertainty. These

recommendations include the use of frameworks that include normative and exploratory components, the ability to model alternatives at multiple planning scales ranging from corridor to detailed site-level projects, and the need for enhanced fiscal and equity analysis.

This research offers implications for planning research and practice in legacy cities throughout the Midwest and Northeast regions of the U.S., nearly half of which have less than 100,000 people (City College of New York, 2015; Hollingsworth & Goebel, 2017). Our paper offers opportunities for further scholarship to investigate enhanced planning methods for addressing demographic uncertainty in contexts of decline and limited growth, an underdeveloped area of the planning literature. Our findings and recommendations also provide guidance that can help broaden the adoption of scenario planning practice in legacy cities.

## TIEBOUT SORTING, ZONING, AND PROPERTY TAX RATES

Abstract ID: 352

Individual Paper Submission

BOURASSA, Steven [Florida Atlantic University] sbourassa@fau.edu, presenting author  
WU, Wen-Chieh [National Chengchi University] jackwu@nccu.edu.tw, co-author

This paper examines certain implications from the literature on Tiebout's model of local government service provision, particularly Hamilton's extension of the model to include local control of land use and property taxation. Our empirical analysis focuses on the use of fiscal zoning to lower property tax rates, a topic that has not been addressed in the extensive Tiebout literature. Using data for over 100 municipalities in the Miami, Florida, metropolitan area, we specify property tax rates as a function of fiscal zoning measures, other municipal characteristics, and tax mimicking. We conclude that single-family zoning is by far the most important variable explaining municipal property tax rates.

## THE RURAL-URBAN INTERFACE AS A SOCIAL FIELD OF CONTESTING MULTIPLE VALUES OF FARMLAND: NEGOTIATED TENANCY ARRANGEMENTS IN THE JAPANESE SUBURBAN CONTEXT

Abstract ID: 372

Individual Paper Submission

NISHI, Maiko [United Nations University Institute for the Advanced Study of Sustainability (UNU-IAS)]  
nmaiko@hotmail.com, presenting author

Controlling land use at urban fringes is a challenge given the inherent dynamics and ambiguities of a rural-urban interface with a wide variety of manifestations, contestations and competitions (Amirinejad, Donehue, and Baker 2018). Consequently, a fragmentation of agricultural landscapes progresses through a diversification of land use not only due to uncontrolled urban development but also resulting from failures of planning legislation and land governance (Gallent and Shaw 2007). The transitional characters of urban fringes require an appropriate and flexible coordination among different planning instruments and regulations across sectors and scales (Spyra et al. 2020). However, legislation for landscape protection often congeals certain patterns of use and falls behind faster real-world changes, leading to discontinued and disintegrated farmland use (Gant, Robinson, and Fazal 2011).

This paper explores how farmland owners as primary decision makers have interacted with other stakeholders to determine land use at urban fringes in the context of farmland liquidation policy in Japan. From multi-level perspectives, it aims to better understand what values held by owners interplay in the process of decision making on tenancy arrangements for farmland use at the rural-urban interface. Japan's farmland liquidation policy began in the 1960s, and more recently has been accelerated to generate economies of scale through larger-scale farming against agricultural abandonment. It has been promoting tenancy arrangements particularly since the mid-1970s, by which owners can secure land tenure while leasing their farmland to other farmers. In 2013, it further made new legislation that in general allows farmland banks as regional semipublic intermediary organizations to accommodate technically and economically capable tenants without the owners' consent (Act No. 101 of 2013).

The study focuses on a suburban community existing in the space between the urban planning and agricultural promotion controls to examine multiple values of farmland assigned by owners and other stakeholders. The community is located as part of the major rice producing region of Japan, exhibiting typical land-extensive, flat agricultural landscapes. A total of 28 farming and non-farming landowners in the community were interviewed in a semi-structured form. The questions to the farmers were concerned with 1) their roles and responsibilities for farmland management, 2) their engagement in tenancy arrangements, and 3) their value perspectives on farmland. Furthermore, similar semi-structured interviews were undertaken with other stakeholders at local, regional and national levels to delve into the processes and mechanisms of governing farmland and their value perspectives on farmland. The analysis of the value perspectives draws on the conceptual framework of three classes of values to nature, including instrumental, intrinsic and relational values (Himes and Muraca 2018).

Within the community, tenancy arrangements have been made progressively over half a century and been largely indifferent to the new legislation that allows for anonymous tenancy. At the same time, however, substantial amount of farmland has been abandoned even within the area designated for agricultural promotion. The findings illustrate that owners have negotiated their multiple values of farmland at the individual, family, communal and governmental levels essentially to secure their livelihoods and wellbeing through tenancy arrangements. Along with

the increased agricultural abandonment, the remaining active farmers have struggled to find alternatives to economic values of farmland and have thus become more attentive to the spiritual, aesthetic, social and constitutional aspects of farmland. The paper explicates the roles of farmers as active social agents to find meanings of land and continuously seek for workable solutions. It suggests that planning legislation could create a room for more innovation and experimentation by farmers keenly sensitive to diverse values of farmland.

#### ADDRESSING BARRIERS TO THE USE OF VALUE CAPTURE TO FUND TRANSIT-ORIENTED DEVELOPMENTS IN THE US

Abstract ID: 375

Individual Paper Submission

MATHUR, Shishir [San Jose State University] shishir.mathur@sjsu.edu, presenting author

#### Central Theme

Transit-oriented developments (TODs) are being developed globally to provide mode choice, increase transit ridership, reduce vehicle miles traveled, and promote sustainable development. However, governments worldwide and at all levels—from federal to local—have limited financial capacity to provide or upgrade infrastructure around transit stations and incentivize real estate developers to build TODs. Therefore, any new funding mechanism, such as value capture (VC), is welcome.

The VC tools capture land value increases resulting from public improvements and actions such as the provision of infrastructure and up- or re-zoning. These tools include sale/joint development of land in or around the transit stations, lease/sale of air rights above the transit stations, special assessments, impact fees, land value taxation, and tax increment financing (TIF).

While empirical studies find that public transit and TODs are positively associated with increases in surrounding property values and VC tools have been used extensively to fund transit systems, including the metro rail systems in Japan, China, Hong Kong, and India, their use to fund TODs has been sporadic. It is primarily limited to New York City and Washington DC metropolitan area in the US and select countries such as Brazil, China, Hong Kong, Japan, and United Kingdom internationally.

#### *Research questions:*

- a) What are the major VC-related barriers to the construction of TODs in the US; and
- b) What major strategies could be used to address these barriers?

#### Methodology

First, academic and professional literature was reviewed to identify the various types of VC-related barriers to TODs and the strategies employed or those that could be used to address these barriers.

Second, two national surveys—one of the transit agencies and another of the local/city governments—were conducted. The Federal Transit Administration’s National Transit Database was used to identify the top-101 transit agencies in the US. The US Census data were used to identify the largest cities in each of these transit agencies’ service areas. The surveys identified the VC-related barriers the public agencies face in implementing TODs and how these agencies have or are planning to overcome these barriers.

Third, six in-depth case studies of recently-developed TODs were conducted to identify the VC-related barriers faced and overcome while constructing the TODs.

Finally, information obtained from all three sources—literature, surveys, and case studies—was synthesized to identify the major findings concerning the types of barriers faced and the strategies that might be used to overcome them.

#### Findings

The synthesis of the literature review, surveys, and case studies leads to several insights and recommendations, such as the need to a) consider land use, zoning, and VC in an integrated manner because many of the barriers to the use of VC are closely tied to land use and zoning; b) judiciously use eminent domain and land assembly to facilitate TODs; c) encourage transit agencies and local governments to use VC to implement TODs; d) enhance public agencies’ ability to use TIF and other VC tools; and e) transparently, systematically, and comprehensively assess land value increase.

#### Relevance of the Work

This research has great relevance and implications to planning scholarship, practice, and education because it provides updated information about the steps taken by the two public agencies at the frontline of developing TODs in the US—local governments and transit agencies—to mitigate VC-related barriers. Moreover, by synthesizing the insights from the existing research, surveys and case studies, it links planning scholarship with practice. Furthermore, educators can use this research in their planning courses on topics such as land use, zoning, public finance, sustainability, and transportation planning. Finally, planning and public transit professionals could use this research to facilitate TODs in their jurisdictions.

## **A CASE OF (DECREASING) AMERICAN EXCEPTIONALISM: SINGLE-FAMILY ZONING IN THE US, AUSTRALIA, AND CANADA**

Abstract ID: 438

Individual Paper Submission

WHITEMORE, Andrew [University of North Carolina at Chapel Hill] [awhittem@email.unc.edu](mailto:awhittem@email.unc.edu), presenting author  
CURRAN-GROOME, William [University of North Carolina at Chapel Hill] [wcggcw@live.unc.edu](mailto:wcggcw@live.unc.edu), co-author

The United States (US) has not always stood alone among high-wealth countries in its copious use of exclusive zoning for single-family detached homes (SFZ). This paper examines why, despite the US, Australia, and Canada all sharing similar planning and built environment histories, SFZ has persisted to a greater extent in the US. The paper provides an illustration of the current state of residential zoning across ten large cities in each of the three countries, and seeks an explanation for the countries' divergence in a comparative history of SFZ. The paper argues that the historical racial and ethnic diversity of the US came to distinguish American residential zoning practice from that in more homogeneous Australia and Canada during the 1970s. As Australian and Canadian governments began to explore alternatives to SFZ, American planners faced suburban revanchism in the wake of civil rights gains and white flight. The persistent ability and frequent desire of US local governments to exclude impedes not only access to opportunity for those excluded, but progress on any number of fronts, including environmental and fiscal sustainability. Separating housing types and setting aside the bulk of urban land for the lowest-density type, as American zoning often does, is clearly inequitable, and more equitable land use regulation is therefore the foundation upon which more sustainable American cities can be built.

In recent years, there have been an increasing number of state efforts to intercede in local land use and planning activities to foster the production of affordable housing (Infranca 2019). However, housing affordability is influenced by a number of disparate issues, including the ability of household to borrow money, variations in the cost of labor and material, and individual choices about spending on housing compared to other goods (Quigley and Raphael 2004). Local planning regulations like zoning, minimum lot sizes and building materials regulations have the potential to impact housing affordability by influencing the distribution of housing prices and quality in a community (Wegman 2020, Whittemore 2020, Glaeser and Gyourko 2003).

In 2019 the Texas legislature passed two bills that preempted local building regulations and plan review processes with the stated intent of increasing affordable housing. HB2439 prohibits local governments from regulating building materials for new construction, maintenance and renovations while HB3167, imposes a 30-day approval window for development plans to expedite local plan review process. Both pieces of legislation went into effect in September 2019, a few months before the COVID pandemic. This paper presents results from a focus group and a state-wide survey of municipal planning officials evaluating local responses to state preemption in Texas. The research also documents local perspectives on the impact of COVID-19 on planning processes and development activity to assess the confounding impact of a public health crisis on local planning activities.

Our preliminary findings highlight four major themes in local government response to state preemption: (1) The impact of deregulation has greater impact on medium size suburban communities than it does on central cities; (2) Local governments are relying on development agreements to enforce building materials standards that cannot regulate directly; (3) Other are encouraging local residents to use the deed restrictions (CCR; HOA) to regulate building material standards and (4) the state professional planning organization has shifted its role from a purely technical and professional development toward advocacy work. We explore these themes in more detail and provide a discussion of how these findings influence our understanding of intergovernmental policy making and state preemption in the field of urban planning.

#### WHY ARE US METROS CONSUMING LESS LAND? A SOCIAL-ECOLOGICAL ANALYSIS OF URBAN EXPANSION

Abstract ID: 490

Individual Paper Submission

RICHTER, Steven [University of Texas at Austin] [steven.richter@utexas.edu](mailto:steven.richter@utexas.edu), presenting author

Few topics unite cities and natural landscapes as concretely as the conversion of undeveloped landscapes into urbanized land uses. This process, also called urban expansion, has become increasingly relevant to global biodiversity and carbon storage (Seto et al., 2012). It comes with myriad local and regional impacts such as diminished water quality, altered hydrology, urban heat island, reduced food production, etc. Yet, our understanding of the determinants of expansion remains limited. Richter (2020) demonstrates how several models

projecting expansion all grossly overestimated consumption of land in the United States. Instead, the per capita rate of expansion dropped by 60% from 2001 to 2016. Such non-linear outcomes reinforce the need for theorization of urban regions as complex social-ecological systems, not as predictable economic entities.

Despite their limitations, past attempts to model expansion provide insight into some of the determinants. Alig et al. (2004) combine econometric modelling of population and economic growth with regional dummy variables that begin to incorporate some social-ecological context. But the model is limited and fails in two regards. First, the emergence of millennials that act as amplifiers of urban concentration (Myers, 2016) is not considered in the model. Second, physical variables need to be more precise than a regional dummy variable. For example, Saiz (2010) models the availability of developable land for all US metros using land cover and topographic data, finding a significant relationship to housing prices.

The next generation of expansion models needs to build off these works to adaptively incorporate temporally and spatially relevant social and ecological data. Toward this end, this paper analyzes expansion, as identified in the 2001 to 2016 National Land Cover Database, against a wide range of demographic, economic, real estate, regional planning, and physical data. First, exploratory OLS of two time periods – 2001 to 2011 and 2011 to 2016 – examines how correlations and significance of independent variables shift over time. Next, panel regression is performed to more formally assess the longitudinal shifts in expansion determinants.

The results from this analysis highlight several important drivers for expansion. Some, like the presence of populations age 18 to 34, household size, or increases in manufacturing GDP, are consistently significant throughout the study period. Others, like population age 55 and above, the proportion of those living in high density dwelling, car usage, or the percent of those working from home, are only significant for parts of the study period, reflecting a less durable relationship with expansion trends.

This work contributes to a growing body of literature on urban social-ecological systems much needed in a world of rapid urbanization and ecological crisis. Expansion is a dynamic, rapidly changing process, one which this research provides new insight into by leveraging a variety of social and ecological data. It also attempts to be receptive to non-linear change by evaluating statistical relationships across time. Empirical findings suggest that urban expansion needs to be understood as responsive to shifting demographic trends, not just as an outcome of economic and population growth. In the United States, this means the peak and maturation of the millennial age cohort (Myers, 2016) may lead to increasing expansion trends across the United States, especially given the potential impact of COVID-19 and increased telecommuting. But region-specific physical context, such as physiographic containment, appear to have a greater impact, leading to large regional disparities in land consumption. Therefore, the findings of this study need to be interpreted in light of regional and place-based considerations such as historic and cultural landscapes, housing affordability, and regional ecosystem services.

## **BETWEEN PROMOTING AND BANNING: STATE PREEMPTIONS ON INCLUSIONARY HOUSING POLICIES**

Abstract ID: 495

Individual Paper Submission

SANGA, Naganika [University of Michigan] nsanga@umich.edu, presenting author

States play an important role when it comes to influencing local policy in the US federal system [1]. Within inclusionary housing policy literature, where studies on state policies exist, they focus on states like California, New Jersey, and Massachusetts that have explicit mandates for inclusionary housing policies [2]. Together these three states constitute about 90% of approximately 900 inclusionary housing policy jurisdictions in the country – a clear indication of the importance of state-level promotion of housing policies for successful local adoption [3]. However, state policies through explicit legislative restrictions, called ‘state preemptions,’ can also negatively impact local policy implementation. But there is very little information on what state-level policy environments look like in states that are politically and ideologically opposed to inclusionary housing policies. Currently, five US states have preemptions against city inclusionary housing policies, and several other states are deliberating similar action [4]. My paper focuses on three states that had or currently have state preemptions that restrict local inclusionary housing policies, Texas, Oregon, and Tennessee. I seek answers to the following questions: Where states are generally restrictive of inclusionary housing policies, what were the reasons for the state-level restriction of inclusionary housing? What mechanisms did the states use to impose restrictions on inclusionary housing? How did inclusionary housing proponents rally against preemptions at the state level? Did the state agree to any compromise?

I used extensive document analysis of government policies, legislative hearings, memos, and press releases in addition to 54 semi-structured interviews. I conducted interviews with policymakers, the civic sector, developers, housing advocacy organizations, and officials at the state and local levels to map critical junctures in policymaking. My findings reveal varying degrees of opposition to inclusionary housing policies, even in the states with preemptions against inclusionary housing policy. These variations depend on the state’s policy position on related issues such as rent control, land use planning, dominant state political ideologies, the seriousness of the state-wide affordable housing crisis, and the strategizing and lobbying capacity of various institutions and actors at the state-level. The work of these actors - state government agencies, municipal league, homebuilder’s association, chamber of commerce, housing advocacy groups, prominent city governments, inter-city networks, and diverse coalitions can together negotiate and manipulate state position to create conditions for local policy success. While the combined sum of these forces swung in favor of overthrowing the state ban on inclusionary housing policies in Oregon, it tightened the restrictions in Tennessee. In Texas, the push and pull of these forces created microcosms of policy exceptions for specific city contexts.

Therefore, this study argues that state inclusionary housing policy positions are on a continuum between promoting and banning rather than a binary choice. These state positions can be adapted and manipulated to favor city initiatives with sufficient motivation and effort over time. The detailed cases in my study can provide guidance to housing activists and progressive local governments battling preemptions in their state contexts.

## TEMPORARY USES OF VACANT URBAN LAND: PANACEA OR PLACEBO? A COMPARATIVE STUDY ON THE NEIGHBORHOODS IN CHICAGO AND COLUMBUS

Abstract ID: 517

Individual Paper Submission

CHEN, Liang [Ohio State University] [chen.7584@osu.edu](mailto:chen.7584@osu.edu), presenting author

Vacant urban parcels, especially large numbers of concentrated vacant parcels and abandoned structures, are widely considered the signals and fuels of urban decline and distress, leading to unsustainable neighborhoods (p.2, Bowman & Pagano, 2004). Repurposing vacant urban land is often considered an effective prescription to address vacant land problems and further enhance neighborhood sustainability. Vacant land is not immutable, and vacancy is a temporary condition (p.145, Németh & Langhorst, 2014; p.143, Newman et al., 2016). Vacant parcels can be turned into new residential, commercial, or industrial land uses through traditional real estate development processes. Alternatively, vacant parcels can be transformed into green infrastructure, civic facilities, or public spaces serving local communities with no permanent structural changes. The latter approach is known as the temporary urbanism approach and has gained popularity among scholars and policymakers due to its low cost and high flexibility. The supporters noted that these very short-term uses and occupations of vacant parcels could create immediate and intermediate benefits to the neighborhoods, support an incremental process of urban transformation, and improve economic and time efficiency (p.145, Németh & Langhorst, 2014; pp.1-2, Kremer & Hamstead, 2015). Although a handful of studies have shown that the temporary uses of vacant parcels could reduce the negative impacts of vacant parcels in some specific aspects (e.g., neighborhood security, environmental quality, property value, etc.), it is still not clear whether this approach can enhance neighborhood sustainability comprehensively. Moreover, the temporary uses of vacant parcels can take many forms, and whether different forms have different impacts on neighborhood sustainability remains unclear. Therefore, the main research question for this work is how the temporary uses of vacant parcels affect neighborhood sustainability. To be more specific, this research examines how the temporary uses of vacant parcels impact measures of neighborhood sustainability across the three dimensions (environment, society, and economy) and further compares the effects of different temporary use types.

The research sample is the neighborhoods in the city of Chicago, IL and the city of Columbus, OH. Both cities are in the Midwest, where urban vacancy poses a problem to sustainable urban development. Vacant land is measured by vacant land ratio (the proportion of vacant land to neighborhood territorial size). Aerial imagery and street view imagery are used to identify whether a vacant parcel is temporarily used and what type of actual use a parcel is. Neighborhood sustainability is measured by NSA (Neighborhood Sustainability Assessment) indicators, which are developed from the cross-referencing between selected NSA tools and relevant literature. A cross-sectional data analysis model is used to examine the relationship between vacant land ratio and critical sustainability indicators at the census tract scale. This model further tests whether temporary uses and the types of temporary uses influence vacant land's impacts.

The significance of this research is threefold. First, the findings can contribute to our understanding of the relationship between vacant urban land and neighborhood sustainability. More specifically, the findings of this research not only can tell whether temporary uses of vacant parcels contribute to neighborhood sustainability significantly but also can suggest which forms of temporary uses are more effective. Second, the primary outcomes

can help policymakers to develop effective strategies to address the vacant land problem. Third, governments and residents can take advantage of the conclusions and turn vacant parcels into neighborhood assets, making neighborhoods sustainable.

## UNDERSTANDING THE GEOGRAPHIC CONCENTRATION AND CIRCULATION OF LAND USE POLICIES

Abstract ID: 557

Individual Paper Submission

KIM, Jae Hong [University of California Irvine] jaehk6@uci.edu, presenting author

WON, Jongho [University of California Irvine] jonghw1@uci.edu, co-author

The prevalence of restrictive local land use regulations has increasingly been seen as one of the most significant barriers to making housing more affordable and creating inclusive communities in the United States. Over the last several decades, however, there have been considerable changes in the way land use is regulated by localities (Pendall et al., 2018). Inclusionary zoning ordinances have been adopted by a growing number of municipalities to expand the supply of affordable housing units, although their effectiveness (when implemented in a mandatory or voluntary form) remains unclear. More recently, efforts have also been made to destabilize traditional R1-oriented zoning practice across the nation.

In parallel, there has been considerable development of analytical frameworks that could enable one to better understand the underlying mechanisms of this complex process. The adoption of local growth control has been examined in the light of strategic interaction among local governments (Brueckner, 1998) and spatial regression models have been employed to empirically test the significance of spatial interdependence (or interjurisdictional competition). The policy transfer literature has also been expanded beyond disciplinary boundaries, offering new ways to explore the policy mobilities and dynamics at multiple scales (Benson and Jordan, 2011; McCann and Ward, 2012).

This study examines the changing geography of land use control with particular attention to the various centrifugal and centripetal forces that shape the geographic concentration (or dispersion) of land use policies. An investigation is made using data from two comprehensive nation-wide surveys: the National Longitudinal Land Use Survey (Pendall et al., 2018) and the Wharton Residential Land Use Regulation Index dataset (Gyourko et al., 2019). The analysis shows some evidence of the persistence of geographic concentration, but these patterns do not necessarily correspond to the view that often treats a region as a highly regulated (or laissez-faire) environment without consideration of internal heterogeneity.

## **SELF-FINANCING MECHANISM FOR THE PROTECTION OF WATER RECHARGE ZONES**

Abstract ID: 609

Individual Paper Submission

ZHININ, Fanny [Municipality] zhininchimbofanny91@gmail.com, presenting author

GUAMAN, Victor [Municipality] vihguaman@gmail.com, co-author

It has been observed that the effective protection of water recharge areas involves monetary compensation to the owners or the purchase of land in favor of the state (Avendaño-Leadem et al., 2020). However, the government does not have the resources for acquisition. In this sense, it is essential to explore alternative sources of financing that provide an outlet for the state budget deficit, for example, through the mobilization of private resources.

Generating alternative resources for financing would be possible through the implementation of land use policies, which allows getting resources as a result of compensation for additional urban benefits (better building conditions and subdivision) (Borrero & Morales, 2007), for example, the density bonds in USA or CEPAC's in Brazil (Smolka & Mullahy, 2007).

In the Ecuadorian case, municipalities have exclusive competence to regulate the use of urban and rural land. However, there are state agencies that allow violating the municipal land use regulation. For example, in the municipality of Cañar, the Subsecretaría de Tierras (a dependency of the central state) has sponsored rural parcelling without authorization from the municipal government, which generated an atomization of agricultural productive units and a budgetary burden on the local government to the provision of infrastructures for dispersed dwellings derived from the subdivision.

This out of land use regulation phenomenon suppresses the potential participation of the municipality in the benefits derived from the rural subdivision of the land and building. In this sense, since the subdivision and rural occupation in Cañar, a phenomenon impossible to counteract and since there is a budget deficit for the protection of the water recharge zones, it is pertinent to explore mechanisms to make the urban regulation more flexible in the affected areas. by parcelling through land use regulation tools, so that they can mobilize private resources to finance protection (Jouravlev, 2003).

In this sense, it is worth asking whether: Are there instruments in the Ecuadorian legal framework that allow the mobilization of private resources to finance the conservation of fragile ecosystems? and Does the mobilization of private resources make the transfer of land ownership in water recharge zones economically viable in favor of the state as a protection measure?

Methodology

The Ecuadorian urban legal framework allows the mobilization of private resources to cover social charges resulting from intensive urbanization, through the participation of surpluses or extraordinary gains from real estate development in favor of the local government. However, the legislative tools have an applicability orientation towards urban land, in this sense, the first part of the research is based on establishing a legal basis for the transition of these tools to rural land, allowing the municipality to participate in the resources generated by the intensive fractionation of the rural area.

The second part of the research focuses on quantifying the potential resources of the intensive rural subdivision, in contrast to those required for the acquisition of the parcels of moorlands that provide water resources to the specific areas that the tool would apply. For which the behavior of the land market, the administrative costs of the subdivision and the costs of infrastructure provision are investigated.

#### Preliminary results

Legal instruments have been identified that allow the application of tools provided in rural areas, as well as preliminary results show that the application of the tools would allow the acquisition of 16.3 hectares for the 2008 period, since there were 97 fractionation processes, which would have generated a value of \$ 32,200.

The research aims to provide inputs to improve municipal management in response to climate change and add to the academic experience.

NEAL, Sue [West Chester University] [sneal@wcupa.edu](mailto:sneal@wcupa.edu), co-author

In 2000, Pennsylvania adopted Growing Smarter, its smart growth agenda that included a comprehensive set of initiatives to encourage sound land use planning locally. State legislation was amended to, among other things: enable tools such as locally designated growth areas, rural resources areas, and mixed-use zoning; strengthen the use of transferable development rights and impact fees, and; authorize communities to enter into intergovernmental cooperative agreements to enable multi-municipal planning and zoning. The legislation also required state agencies to consider local land use ordinances and comprehensive plans in making infrastructure permit and funding decisions. This research investigates the sustained impact of this smart growth initiative over a 20-year period, with particular attention to different impacts across urban and rural areas across the Commonwealth. Specific research questions include: Did the legislation result in an increased use of land use planning tools? Are there spatial differences in the use of tools? Has the perceived effectiveness of planning changed at the local level?

The research is based on a comprehensive survey of the 67 county planning departments and 2,510 local governments in Pennsylvania, conducted in 2020. County Planning Directors and Local Government Officials were asked to identify land use planning tools used, how plans influence decision-making, the perceived effectiveness of tools in achieving local planning goals, and obstacles to their use. The separate county and local government surveys achieved a response rate of 85% and 38%, respectively. Follow-up key person interviews were completed for a selection of rural municipalities. A similar state-wide survey was completed in 1999, with findings published in 2000. Comparison of the findings across surveys provides a basis to assess differences before and after the adoption of the state-level legislation.

Early analysis of the survey data indicates that there was been a significant increase in the use of some planning tools, including comprehensive plans, capital improvement plans, and mixed-use zoning, however other tools, such as transportation impact fees, have failed to take hold. There has also been an increase in intergovernmental planning, including multi-municipal plans and cooperative planning across county and local governments. But while the use of plans has increased, there has not been a parallel increase in zoning ordinances and other implementing tools. Other early findings suggest a shift in planning focus driven by a rising concern regarding disaster planning, hazard mitigation, and economic development. Of special interest to the funder of this research is the experience of planning in rural areas of Pennsylvania. The findings provide an interesting contrast between the nature, extent, perceived effectiveness, and barriers to planning in rural communities, compared to urban communities, in Pennsylvania.

This research contributes to the body of planning scholarship that investigates the design, implementation and effectiveness of state-level land use legislation and on-the-ground impacts of land use policies. With growing attention to climate planning and the rise of state mandates and programs for climate action, the findings can help inform best practices for effective state-level policy and regulatory design. This research also contributes to the body of scholarship on the special challenges of planning in rural communities, and the role of the state in addressing unique rural land use challenges.

## NEIGHBORHOOD CHANGE AFTER FLOODPLAIN BUYOUTS: FINDINGS FROM HARRIS COUNTY, TEXAS

Abstract ID: 708

Individual Paper Submission

SEONG, Kijin [Texas A&M University] kjzziccu@gmail.com, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Post-disaster property acquisition programs (e.g., buyouts) have increased in recent decades to expedite residents' relocation from hazardous areas to safer ground as well as minimize future disaster risks. Despite the growing interest in floodplain buyouts – also known as a voluntary program to mitigate flood damage by relocating residents and structures out of harm's way– limited research has focused on the long-term neighborhood change in affected areas after buyouts. Many existing studies have examined individual-level factors of residential mobility decisions after disaster events (Binder, Baker, & Barile, 2015; Cong, Nejat, Liang, Pei, & Javid, 2017), but research on buyout impacts at the community-level is scarce.

This research explores the long-term impacts of floodplain buyouts on neighborhood change. Focusing on changes from 1990 to 2015 in 2,144 block groups in Harris County, TX, we seek to examine how single-family home buyouts implemented between 2001 and 2010 have altered neighborhoods over time, especially in racial composition. Harris County was chosen as the study area due to the long historical and frequent relationship with catastrophic flooding since its major urban center, Houston, was founded in 1836. Indeed, Harris County experienced 16 major flooding events during its first 100 years. Thus, Harris County/Houston represents an excellent case for this study in that the area is perhaps the largest, most diverse, and heavily flood-exposed city in the United States.

The authors focus on buyout projects carried out by Harris County Flood Control District (HCFCD) for homeowners living in flood-prone areas. The buyout data was combined with the decennial Census data, Harris County parcel data, FEMA floodplain maps, and secondary data from the municipality to investigate the relationship between the floodplain buyouts and neighborhood change at a block group level. A mixed-method approach was used, including longitudinal multilevel analysis for the quantitative study and a phenomenological approach for the qualitative study to conduct this inquiry. Specifically, a piecewise discontinuity model was developed using STATA and compared trajectories of neighborhood change between the pre-and post-buyout phases. Questions derived from the statistical results were posed to ten buyout participants and the remaining residents through in-depth interviews. The findings support that white flight occurred in the buyout neighborhoods, shifting the white population to the Hispanic population. Also, its impact has been greater in the wealthier buyout neighborhoods.

By reviewing the local buyout practice over the long-term and analyzing its consequences in neighborhoods, this study sheds light on the neglected long-term impacts of floodplain buyouts on the remaining communities. Transcending cost-effective approaches, this study provides planning practitioners an expanded and more comprehensive view of disaster-related home buyouts in the neighborhood context. The study also suggest a better-designed floodplain buyout program to promote hazard mitigation and community resilience.

## **LAND-USE REGULATION AND MOBILE HOME PARK EXCLUSION IN THE HOUSTON METROPOLITAN REGION: AN ANALYSIS OF 132 LOCAL GOVERNMENTS**

Abstract ID: 744

Individual Paper Submission

RUMBACH, Andrew [Texas A&M University] rumbach@tamu.edu, presenting author  
 MAKAREWICZ, Carrie [University of Colorado Denver] carrie.makarewicz@ucdenver.edu, co-author  
 SULLIVAN, Esther [University of Colorado Denver] esther.sullivan@ucdenver.edu, co-author  
 MCMULLEN, Shelley [University of Colorado Denver] shelly.mcmullen@ucdenver.edu, co-author

Land-use policies and regulations contribute to regional housing segregation in the United States. Metropolitan regions are composed of local jurisdictions with the legal authority to regulate land-use and have grown increasingly segregated by income and race, in-part because of land-use measures that effectively exclude or limit certain housing types and tenure arrangements. Single-family zoning, which limits residential housing development to single-family, detached homes, has been at the center of recent debates about land use planning and housing affordability. Other land-use tools – like permitted densities and infrastructure requirements – have also been used by local jurisdictions to shape and manage growth and development. The fractured landscape of land-use planning within metropolitan regions is an important consideration for policy debates about regional development and equity as they can contribute to substantial inequalities of access to housing, infrastructure and services, transportation, job opportunities and natural amenities, and exposure to environmental hazards across population groups.

Mobile home parks are an important source of housing for households with low- and moderate-incomes in the United States. Mobile homes are housing units that are built in a factory and transported to a site for installation. Mobile homes are especially common in the U.S., although they can be found in other countries as well. Approximately 7 million households in the U.S. live in mobile homes generally, and a third of those in mobile home parks. Mobile home parks are privately-owned businesses that rent parcels of land for mobile homes. Mobile home parks range in-size from a handful of rented “lots” to hundreds. A combination of factors – like their density and unique tenure arrangements – make mobile home parks a uniquely affordable housing option in the U.S.

Ethnographic and case-based studies suggest that mobile home parks have become so-called ‘locally unwanted land-uses’ in many communities. Communities, in-turn, have used their land-use regulating authority to limit, or exclude altogether, the development, expansion and/or improvement of mobile home parks. The exclusion of mobile home parks under local land-use policy has potentially important equity implications, as mobile home park households will be constrained in their geographic choices and relative access to resources. Despite a surge of recent scholarly interest in mobile home parks, there are relatively few studies that have examined their location and function within metropolitan housing markets, however, or the patterns of regulatory exclusion that mobile home parks face. What kinds of communities are most likely to limit or exclude mobile home parks within their jurisdictions and what potential impacts do such regulations have on regional equity?

We explore these questions by documenting the regulation of mobile home parks across a large metropolitan region – the Houston Metropolitan Statistical Area (MSA). We collect planning documents from the 132 jurisdictions in the Houston MSA and analyze their treatment of mobile home parks using a multi-cycle coding approach. We then describe how jurisdictions that are more tolerant of mobile home parks vary from those that are less tolerant, across a range of factors that are relevant to regional equity discussions. We conclude by describing the policy implications for Houston and large urban regions across the Western United States.

## **AMBIVALENT PLAYER IN THE REAL ESTATE GAME: MUNICIPAL LAND USE PLANNING IN A HOUSING CRISIS**

Abstract ID: 761

Individual Paper Submission

KRAMER, Anna [McGill University] anna.kramer@mcgill.ca, presenting author

The policy and process of re-zoning and development approval in Toronto and Vancouver open a view into the internal contradictions of an un-monolithic state. The municipal land use planner is ambivalently positioned vis a vis the 'real estate game' (Encampment Support Network, n.d.), where state and economy together bet on the financialization of housing (Stein, 2019). Zoning has emerged as a locus of negotiation to manage the contradictions of the resulting housing crisis, as development permissions are leveraged for public goods including affordable housing. As real estate has increasingly shifted to a primary circuit of capital, planning is enrolled in the commodification of housing. This commitment to land value extraction through boundary-drawing and the management of property space (Blomley, 2020) recalls planning's role in the post-contact non-consensual taking of land for property and segregating labor in the settler colonial, racial capitalist city (Dorries et al., 2019).

From interviews and a spatial policy analysis, planners seek to leverage planning permissions and density bonuses to provide underfunded public goods, including parks, infrastructure renewal, public space improvements, community centers and schools, and even affordable housing. Value capture has become the way to address fiscal gaps and the downloading of responsibility for social, life-sustaining infrastructures facing municipal governments. This bundle of goods in turn makes the continued value of neighborhood and urban amenity that is necessary for profit-making.

Even as the scope of planning has been narrowed through the neoliberal era, its remaining tools are tasked with managing multiple urban crises. Uneven re-development through upzoning mobilizes the rent gap as a force of production (Brenner & Theodore, 2002). The restructuring of urban space unfolds through local land use policy, over the existing palimpsest of exclusionary and hierarchical zoning. Accumulation is made possible with a new spatial fix of condo towers pre-sold to investors in post-industrial downtowns and in commercial centres along major arterial roads, creating new un-neighborhoods while protecting increasing property value in low-density residential zones. Rather than a compromise between the growth machine and the home voter, these interests co-constitute the production of scarcity of decommodified housing.

Planners salaries are dependent on development, in Toronto directly through rezoning application fees. Attempts to introduce democratic and progressive urban regulation of housing development are often stalled in bureaucratic loops involving multiple rounds of community consultation, legal limbo, or political opposition. Assumptions of minimum profit margins for land owners and developers are built into the analysis of inclusionary zoning, making the goal of achieving affordability through value capture Sisyphean. Even as the horizon of possibility for policy is

limited, the work for planners has increased, with development review processes expanding and intensifying with extra requirements and layers as they are rushed through multiple tokenistic consultations. Despite this, planners expressed understandable reluctance to give up the leverage of rezoning, and continued to attempt to anticipate speculation and capture land value uplift in upzoned areas towards public infrastructures.

This ambivalence of municipal land use policy vis a vis land and housing shapes an uneven distribution of vulnerability (Blomley, 2020). In contrast, the clarity of housing activism calls for a different speculative project on how to remake the state for more livable futures. If housing is the current zone of extraction, and planning permissions are required to access it, then planning holds the possibility of a generative refusal towards a life-sustaining infrastructure of decommodified housing.

## A COMPARATIVE PERSPECTIVE ON LAND USE REGULATIONS AND HOUSING OUTCOMES

Abstract ID: 774

Individual Paper Submission

HEIKKILA, Eric [University of Southern California] [heikkila@usc.edu](mailto:heikkila@usc.edu), presenting author  
GOYTIA, Cynthia [UTDT] [cynthia.goytia@utdt.edu](mailto:cynthia.goytia@utdt.edu), co-author

This paper examines the relationship between land use regulations and housing outcomes, especially housing affordability and informality. Using a unique and important database of 191 metropolitan areas from all regions of the world, it assesses whether there are consistent emergent patterns from a global perspective that may in turn be useful for informing policy on land use regulations in specific locales and contexts. The empirical results point to a number of striking conclusions. Empirical evidence from across the globe underlines the dynamic nature of the interaction between land use regulations and informality. In the long run, the evidence strongly suggests that more restrictive land use regulations lead to more rapid growth in informal settlements. This result conforms with prior literature that emphasizes the exclusionary effects of land use regulations. As more restrictive regulations are applied, households find themselves with fewer options outside the informal sector. This phenomenon is accentuated during periods of rapid urbanization. But from a static perspective, the situation looks quite different over the short run, since cities with more stringent land use regulations tend to have fewer informal settlements, and this finding is strengthened further when those land use regulations are coupled with active enforcement.

## **CODIFIED PARTICULARITY: ZONING FOR DIFFERENCE IN AN ULTRA-ORTHODOX JEWISH ETHNOBURB**

Abstract ID: 782

Individual Paper Submission

HUENNEKENS, Joseph [Columbia University, GSAPP] jsh2228@columbia.edu, presenting author

Suburban land use authorities generally work to exclude non-normative built forms and people (Fischel, 2004; Hirt, 2014; Dantzler, 2016). However, this dynamic is more complicated in “ethnoburbs.” In emerging ethnoburbs, municipal governments may control or restrict the construction of ethnic “landscapes of difference” (Lung Amam, 2017). Yet, in more established ethnoburbs, organized ethnic groups can build enough political power to force a municipality to accommodate significant changes to the built environment (Li, 2009). This paper uses content analysis to document a historical case where a municipal government acceded to claims for a landscape of difference. Through an examination of newspaper articles, I show how advocates in Monsey, New York successfully argued that ultra-Orthodox Jewish households had a unique propensity for higher density living that made them especially suited to multifamily zoning. I find that these arguments were so compelling that they ended up being incorporated into the zoning text itself. This “codified particularity” was a victory for the ultra-Orthodox community, but I argue that the theoretical implications are double-edged. The practice of codified particularity signals a willingness on the part of municipalities to engage with difference, but it may also be a strategic way to contain beneficial land use changes (like multifamily zoning) within a designated ethnic area.

## **ROLE OF THE LAND TRUST IN DEFINING LAND USE AND PREVENTING SPRAWL: DO LAND TRUSTS INTERFERE WITH GOVERNMENT PLANNING PROCESSES?**

Abstract ID: 788

Individual Paper Submission

OVERBY, Anna [Clemson University] atreado@clemson.edu, presenting author

Many interacting factors influence patterns of land development. In the United States (U.S.), low-density, non-contiguous development, termed sprawl, has long been a widespread concern. Since the 1970s, rural residential sprawl, or exurban sprawl, has grown faster in area than any other development pattern. Exurban sprawl voraciously consumes land and has implications for biological conservation, natural resource management, and agriculture. Local and regional governments have implemented growth management policies to prevent sprawl, with various levels of effectiveness. Similarly, non-profit land trusts (LTs) have proliferated and have acquired large land acreages under fee-simple ownership or conservation easements (CEs), with various conservation purposes. The degree to which these two endeavors, one of the state and one of non-governmental organizations, are related and influenced by one another is unclear and understudied (Gerber, 2012). Some scholars question the processes LTs use when placing CEs, namely the lack of public oversight in land use decisions that are contractually perpetual (Owley, 2011). Governments, in contrast, have mandated public input when implementing growth management strategies. Olmsted (2011) suggested that the LTs' CE use can interfere with government planning processes but did not present empirical evidence supporting or refuting this assertion.

The question as to whether LTs have a legitimate claim to influence land use hits at the heart of a paradigm shift in urban planning. As early as the mid-1950s, attacks on the dominant paradigm in planning, the rational planning model, began, criticizing whether decision-making processes described by the rational model were achievable in practice. Simon's critique held that no decision-making process could satisfy the requirements of normative rationality, such as complete information and the ability to consider all possible alternatives simultaneously. Furthermore, Banfield demonstrated how much the political context affects decisions. New planning approaches see planning as dialogical and reliant on consensus building, that knowledge is contextual, contingent, and fallible, that planning's scope is incremental and strategic, and the agent of change is civic society. Mirroring the paradigm shift in planning, Fairfax and Guenzler (2001) identify a "New Era" in land and resource conservation. New conservation organizations are working in partnership with or in place of government agencies. The LT movement has been described as a bottom-up, grassroots movement (McLaughlin, 2002). LTs decide what land to protect based partially on the accumulated wisdom of local inhabitants and their connections to the land, which suggests that land use decisions are made at the level closest to the people in the communities in which they operate. (McLaughlin, 2002).

To explore these ideas, this paper focuses on the perceptions of local governments and LTs about their respective roles in preventing sprawl and greenfield development, as well as their respective views on the effectiveness of government growth management policies and CEs. We completed interviews of 20 LTs in rapidly growing, exurban counties across the U.S., which informed a survey instrument that we administered to government planners and administrators in 556 incorporated places within the same counties, as well as their surrounding urban, suburban, exurban, or rural counties. The interview results provide much-needed insight into LT views on government growth management policies and the ways in which LT and government roles coincide, inter-relate, and differ in shaping future land use. The survey responds with local government viewpoints on their relationships with LTs and whether local government's view LTs and CEs as complementary or interfering with local planning. Additionally, we report upon LTs and local government's view on combating sprawl and the need to balance multiple planning objectives.

STEWART, William [University of Illinois at Urbana-Champaign] [wstewart@illinois.edu](mailto:wstewart@illinois.edu), co-author

Land vacancy is a growing concern in many post-industrial cities. High vacancy often results from government subsidies to suburbanization, systemic racism, and decade-long deindustrialization processes (Nassauer & Raskin, 2014). Issues associated with land vacancy include high maintenance costs for local governments, a low tax base, a high crime rate, and adverse health effects for residents. Specifically, marginalized groups like Black communities, over-represented in high vacancy neighborhoods, are at the receiving end of these issues (Ganning & Tighe, 2015).

In recent times, urban planners have created programs to green or repurpose vacant lots in several cities (e.g., Philadelphia, Baltimore, Chicago) to combat the issues associated with high vacancy and help re-establish neighborhood vibrancy (Crauderueff et al., 2012; Schilling & Logan, 2008). Most of the studies on these programs focus on lots that are improved and maintained by public agencies. Yet some initiatives, such as Chicago's Large Lot Program, transfer city-owned vacant lots to nearby property owners for a small fee, as low as one dollar (Crauderueff et al., 2012). Studies on such initiatives are few, including limited work on the visual condition of lots and crime reduction (Stern & Lester, 2021). There is a lack of research that compares the condition of vacant lots before and after they are sold to private owners with those that remained owned by cities. Moreover, limited work has investigated the meaning of vacant lot ownership for the racially and ethnically minoritized groups who experience the impacts of systemic racism.

Focusing on Chicago's Large Program, we ask two research questions that start to address these literature gaps: Do vacant lots sold through the Large Lot Program see greater improvements in condition-care over time compared to city-owned vacant lots? What are the personal and social meanings of ownership for new Large Lot owners?

We used a mixed-methods design including two steps. First, we used a difference-in-differences (DID) technique to compare changes in condition-care between 198 repurposed lots (sold to nearby property owners) and 594 series of control lots (city-owned) located in the Greater Englewood area of Chicago. We used a combination of field observations, photos, and Google Street View images to rate vacant lot condition-care in 2014 (before the sale), 2015 (after the sale), 2016, and 2018. Second, we drew from three focus groups with 25 Large Lot owners and conducted a content analysis of the focus group transcripts. Specifically, we purposefully looked for content that illuminated the meanings of vacant lot ownership for individuals and the community.

Our results of the DID analysis show that ownership matters. Condition-care for sold Large Lots significantly increased after the sale (2015) and continued to grow through 2018, whereas condition-care for the control lots slightly decreased in the same period. We also found that condition-care for the sold Large Lots did not differ based on whether their owner lived on the same block. Our focus group interviews demonstrated that vacant lot ownership through the Large Lot Program helped empower residents by reducing illicit and dangerous behaviors (owners had more control over their lots), fostering an ethic of care for their neighborhood (many lots hosted

community spaces), and reinstating a legacy of land tenure for Black residents.

The results of this study have at least two sets of planning implications. First, we demonstrate that vacant lot greening programs that transfer land to private owners help improve condition-care, and that such improvement does not depend on whether owners live nearby. Second, our focus group results suggest that vacant lot greening initiatives could be embedded into broader equitable development planning initiatives that empower marginalized residents.

#### **GATEWAY COMMUNITIES AND ZOOM TOWNS: PLANNING CHALLENGES AND THE MIGRATION IMPACTS OF THE COVID-19 PANDEMIC.**

Abstract ID: 879

Individual Paper Submission

STOKER, Philip [University of Arizona] philipstoker@arizona.edu, presenting author  
RUMORE, Danya [University of Utah] danya.rumore@law.utah.edu, co-author  
LEVINE, Zacharia [University of Utah] levine.z@gmail.com, co-author

Small towns and cities outside of national parks, forests, rivers, ski resorts, and other natural amenities throughout the western U.S. are known to experience a range of unique planning and development challenges. However, the COVID 19 pandemic worsened these challenges because it caused a surge of migration to these “gateway communities” or “zoom towns”, as reported widely in popular media (see for example Levine 2020 or Sen 2020). When lockdowns in major cities across the country were enacted to stop the spread of the virus, many Americans decided to move to rural areas and work remotely if they could. This surge in migration likely contributed to the fact that rural communities had the highest prevalence of cumulative COVID-19 cases in the U.S. (USDA 2021) while having access to fewer medical facilities and services than larger urban areas (Peters 2020).

We present a baseline assessment of the planning and development challenges that were experienced by these communities prior to the COVID 19 pandemic. This assessment is based on a national questionnaire and in-depth interviews with practicing planners and public officials working in over 250 gateway communities (Stoker et al. 2019). Providing affordable housing, infrastructure maintenance, and a loss of community character were the most commonly reported challenges before the pandemic. This baseline assessment provides clear indication of how the pandemic will continue to impact these communities and accelerate what were previously slow trends related to a

lack of affordable housing and changing community character. We draw upon analysis of the Origin-Destination Employment Statistics database (LODES), which indicates that as many as 70% of a gateway community's workforce resides outside of the city and commutes to work in the community. This is driven by a lack of workforce housing and high population growth rates. It is clear to see how this new influx of COVID-19 migrants from urban areas, who tend to have higher incomes, will significantly alter housing markets and transportation patterns in these regions. We present strategies that are currently being implemented in gateway communities as reported in a series of webinars, organized by the Gateway and Natural Amenity Resource Initiative ([https://www.usu.edu/gnar/gnar\\_network](https://www.usu.edu/gnar/gnar_network)). These include regional affordable housing strategies, permitting of accessory dwelling units, and peer-to-peer learning networks. Our presentation seeks to inform the ACSP community of immediate research needs to better help these communities plan and adapt to the long-term impacts of the COVID-19 pandemic.

#### IT'S THE REFINERIES: EMPHASIZING INDUSTRIAL LAND WHEN UNDERSTANDING HOUSTON'S LAND GOVERNANCE

Abstract ID: 957

Individual Paper Submission

SHERMAN, Stephen [Rice University] [sas26@rice.edu](mailto:sas26@rice.edu), presenting author

Houston's "free market" approach to land governance is famous, yet Houston's urban development is not a free-for-all. While having many other land development controls, Houston specifically lacks the type of land-use zoning that restricts specific uses. It is the only major city in the U.S. without this. Planning scholarship on the outcomes of Houston's (lack of) zoning centers largely on housing and urban growth (Gray & Millsap, 2020; Ryberg-Webster, 2019; Qian, 2011).

This leads to one major oversight: industrial land. Unlike older U.S. metros, industry and manufacturing land uses (and their pollutants) never left Houston. Houston has the largest petrochemical manufacturing complex in the Western Hemisphere. Almost half of the entire country's petrochemical capacity goes through this complex, which contains not only refineries but plastics manufacturers, fertilizer plants, and the second biggest port in the United States. Industrial land and its externalities are ignored in planning scholarship on the city's land regulation practices, despite such land covering a large chunk of the city's eastern half.

This project addresses this oversight by performing two different analyses. I use a critical political economy lens to evaluate the role of the petrochemical industry in shaping the city's land governance practices, and also measure Houston's current industrial land uses.

First, using primary and secondary materials (Siegen, 1972; Feagin, 1988; Mixon 2010), I do historical research on the attempts to change Houston's land governance practices, centering on the 1962 and 1993 failed referenda to implement land-use zoning. I show that local land use governance does not reflect the recommendations of "rational" plans; rather, it reflects highly localized struggles which prioritize landowners' needs. In most cities this leads to frequent exemptions (Valverde, 2011); in Houston--where 40% of the economic base belongs to the petrochemical industry--these struggles led to a defeat of Euclidean zoning. I examine Houston Chronicle archives for the three months prior to each vote, examining news stories, editorials, and ads about the referenda. This helps identify the agents who influenced the referenda and the discourses they employ, centering largely on the public positions taken by the manufacturing and petrochemical sectors.

While the first phase of analysis examines how Houston developed its current land governance regime, the second phase examines its effects. Using Harris County Assessor District data (HCAD), I map the extent of industrial and residential land uses within Houston (while Houston does not have land-use zoning, the county assessor does record land uses for its records). Prior research does not consider the extent of industrial land within Houston, and in particular how in Houston industrial land uses can exist near homes. This descriptive analysis shows how land-use zoning has allowed industry to locate in unusual proximity to residential uses. I conduct a descriptive analysis on demographic, health, and socio-economic status of census tracts with predominately industrial land uses.

This research contributes to land-use planning scholarship in three ways. First, it offers a corrective to prior scholarship on a particularly famous location, emphasizing the role of the local political economy in Houston's land regulation. Second, it places the famous case in historical context, emphasizing the specific agents who shaped Houston's land regulation practices rather than using "free market ideology" as an explanatory factor. Third, it points towards new ways of assessing the impact of Houston's land regulation regime. While the dependent variables in prior research on Houston's land regulation measure the (lack of) zoning's impact on housing costs, gentrification, or urban sprawl, this project suggests newer objects of analysis, particularly cancer rates and life expectancy.

#### **WHAT IS LOST AND WHAT IS GAINED? A PARCEL-LEVEL ANALYSIS OF HOUSTON'S INFILL TOWNHOUSE BOOM BEFORE VERSUS AFTER REDEVELOPMENT, 2005-2020.**

Abstract ID: 989

Individual Paper Submission

WEGMANN, Jacob [University of Texas at Austin] jagw@utexas.edu, presenting author

Suddenly, the repeal of single-family zoning and its replacement with medium-density friendly updates appears to be transitioning from a distant pipe dream to a real policy being actively pursued in specific US cities (Manville, Monkkonen, & Lens, 2020). Ironically, this gathering trend of questioning the most common form of zoning is heightening interest in the experience of Houston, famously the only large US city that never adopted zoning (Siegan, 1972). Houston's experience is relevant to that of zoned cities precisely because its reputation as an unregulated Wild West is, if not wholly unfounded, at least somewhat exaggerated (Lewyn, 2004). In the late 1990s, a full two decades before the current move away from single-family zoning became apparent across the United States, Houston acted decisively to reduce minimum lot sizes, and thus paved the way for the development of tens of thousands of "townhouses," or tall, narrow houses, sometimes attached, sometimes narrowly separated, on small lots in or near the urban core (Wegmann, 2020). To a likely greater extent than in any other large US city, many of these townhouses were developed on formerly "residential" lots, or parcels occupied by single-family houses on large lots. Houston thus experienced a more thoroughgoing and spatially widespread transformation of its everyday built fabric than perhaps any other city in the US.

A notable recent study from Gray & Millsap (2020) quantifies and maps the extent of Houston's townhouse boom, and characterizes the neighborhoods in which most of the development has taken place—generally middle-income areas with high enough land values to be attractive for development, but modest enough to be left uncovered by private landowner covenants that restrict development. In this study, I build on Gray & Millsap's efforts to reveal what got built in Houston's townhouse boom by asking what the townhouses replaced. To what extent were they built on previously residential parcels, versus commercial or industrial property? What was the net gain in housing units in cases where housing was demolished to make way for their construction? How much additional property tax revenue is being accrued as a result of the redevelopment of previously developed parcels into townhouses? How do the property values of the new townhouses compare to what they replaced? And to what extent do the racial/ethnic identities of the new townhouse homeowners differ from those of the previous homeowners that sold their homes to the developers that built them?

Taking advantage of how the Harris County Assessment District (HCAD) property tax data is organized, in which current parcels are linked to previously platted parcels that occupied the same land, this study deploys a novel method of comparing parcels before-versus-after redevelopment into townhouses completed between 2005 and 2020. Ethnic/racial identities of homeowners before-versus-after redevelopment are compared using surname analysis of names that appear in HCAD records. These analyses offer a window into what other cities contemplating reforms to single-family only zoning may expect not only in terms of the housing stock that may be gained, but existing housing stock that will be lost as redevelopment proceeds.

#### PROXIMITY AND VIEW PREMIUM OF WATERBODIES ON HOME VALUES -- A META-ANALYSIS

Abstract ID: 1026  
Individual Paper Submission

MITTAL, Jay [Auburn University] jzm0029@auburn.edu, presenting author  
SAGINOR, Jesse [Florida Atlantic University] jsaginor@fau.edu, co-author

This paper uses meta-analysis to analyze proximity and views related to water as an amenity in the United States (Simon and Saginor 2006). This research utilizes peer-reviewed literature from multiple disciplines with single-family residential real estate as the property of analysis. “Proximity to” in its simplest form is the distance from a house to the amenity. Past studies present that homes located close to a desirable environmental amenity frequently sell at a premium price. Similarly, “view of” in its simplest form, embodies the scenic nature of an amenity and studies show that homes with scenic views command premium prices. Past peer-reviewed studies presented varying values of premiums as capitalized in home values due to the view and proximity of water. The value premiums have varied from study to study by geographic region; general economic conditions, the type of water (river, lake, ocean) studied; the distance from the water, view of the water, a statistical method used in the research, whether the study occurred in an urban, suburban, or rural location; and other related variables (Mittal and Byahut 2016).

This study summarizes a literature review of over 20 peer-reviewed journal articles to create a dataset of observations. This includes variable such as the positive or negative impact on single-family residential real estate (the dependent variable), with the independent variables including but not limited to the statistical method used in the research, the distance from the water, the type of water (river, lake, ocean); whether the study occurred in an urban, suburban, or rural location; geographic region; general economic conditions, and other related variables. Ordinary least squares regression is used to determine the overall impact of water on residential property values. Several variables were found to be statistically significant, providing insight regarding current water-based residential development. Additionally, this research may lead to predictive impacts regarding the future development and/or redevelopment using water amenities to maximize residential property values.

#### **IT TAKES A VILLAGE TO MAKE URBAN VILLAGES WORK: EFFECTS OF ZONING AND LAND USE POLICIES ON LAND VALUE AND DENSIFICATION IN THE CITY OF SEATTLE**

Abstract ID: 1050  
Individual Paper Submission

BAE, Christine [University of Washington] cbae@uw.edu, presenting author  
SA, Boyang [University of Washington] boyangsa@uw.edu, co-author  
GUIDA, Eric [University of Washington] eguida@uw.edu, co-author  
YUE, Haoyu [University of Washington] yohaoyu@uw.edu, co-author

The City of Seattle experienced an unprecedented economic expansion in recent years. Since 2015 Seattle has been one of the top 5 fastest growing cities in the US. Most of the growth has been spurred by the high-tech, biotech, health care industries led by well-known businesses such as Amazon, Google, and Facebook. The central tenet of Seattle's growth management strategies is to pursue mixed-use urban development with varying density and transit-oriented development via designated 5 Urban Centers and 20 Urban Village areas. The policy was adopted in the 1994 Seattle Comprehensive Plan, which was developed to meet the Washington State Growth Management Act (1990) requirement to reduce urban sprawl/auto-dependency and protect residents' quality-of-life and environment, among other goals. The results are astonishing growth: Seattle, for the first time since WWII, experienced a population of over 700,000 (563,374 in 2020 to 753,700 in 2019). Some say the dark side of the growth is the increasing difficulties of housing affordability.

Did the Urban Village policies stand up to the expected densification and increased housing quantity? The City changed several land-use policies, such as zone changes, upzoning, and light-rail station area designations to accommodate the growth. It means that a substantial degree of intense land conversion occurred, which results in the increased housing stock in the Urban Village areas. However, there is no research on how successful the Urban Village policies to achieve the planning goals and how it affected housing affordability with increased housing supply.

Gabb et al. examined the impact of the 2011 urban villages designation in San Jose, CA. After investigating transactions and assessing the parcels' values, large-scale development projects, residential and commercial permits, the authors found almost no effect. This outcome could result from several factors, such as sparse zone changes, complicated requirements, diversion from the real estate market conditions.

The paper examines the impact of Seattle's Urban Village strategies on densification and property values, including land values and housing values, between 2000 and 2019. We compare the land value and improvement value changes of the properties converted from single-family housing (SFH) to multi-family housing (MFH) or higher density residential developments inside the Urban Village/Urban Centers. We compare how these changes occurred in Urban Villages vs. the rest of Seattle during the two decades of the time stream. We conducted a spatial analysis using the historic property value data and performed a time-series statistical analysis of property value change on top of land use and zoning policymaking, as well as the demographic characteristics of different neighborhoods within the city.

The preliminary results show that (1) the initial land values were increased after the passage of GMA, (2) Higher land value changes occurred because of the conversion of SFH to MFH, (3) the land value changes are much more significant than the improvement value changes during the growth period; (4) mixed result of the light-rail station area (half mile buffer) property value changes; (4) densification occurred faster than outside Urban Village areas. These results could provide evidence-based syntheses of the policy implications of urban village and growth management, which local governments and planners could use to better serve the public interest.

## **PARKING BENEFIT DISTRICTS IN RESIDENTIAL NEIGHBORHOODS**

Abstract ID: 1096

Individual Paper Submission

SHOUP, Donald [University of California, Los Angeles] shoup@ucla.edu, presenting author

Free curb parking in a crowded city presents a classic commons problem: no one owns curb parking spaces and anyone can use them. As a result, drivers often cruise around searching for an open curb space, and this cruising adds to traffic congestion, air pollution, and carbon emissions. In 1954, William Vickrey proposed solving the cruising problem by charging prices for curb parking to “keep the amount of parking down sufficiently so that there will almost always be space available for those willing to pay the fee.” Cities can charge the lowest price that will leave one or two open spaces on every block, so no one will have to cruise for parking. Drivers oppose paying for parking, but some cities have built political support for demand-priced curb parking by establishing Parking Benefit Districts that spend the meter revenue to pay for added public services on the metered streets. Demand-based prices manage the curb, and the new public services show the benefits of metering curb parking. Everyone who lives, works, or owns property in a PBD can see the meter money at work repairing sidewalks, planting street trees, or providing free Wi-Fi. Cities have established PBDs mainly in commercial districts, but will they also work in residential neighborhoods? As one example, the Upper West Side of Manhattan has one curb space for every 20 residents, so no more than 5% of residents can park a car at the curb. If the curb spaces earn the same revenue as adjacent off-street spaces, the Upper West Side’s curb spaces could earn at least \$300 per resident per year for added public services. Cities that manage curb parking as valuable real estate can provide better public services and stop subsidizing congestion, pollution, and carbon emissions.

## **COASTAL PLANNING AND TANGLED LINES: A LEGAL EXAMINATION OF CONFLICTS AND CHALLENGES IN MASSACHUSETTS ASSOCIATED WITH INDETERMINATE SEAWARD BOUNDARIES OR OVERLAPPING JURISDICTION.**

Abstract ID: 1105

Individual Paper Submission

DUFF, John [University of Massachusetts, Boston] john.duff@umb.edu, presenting author

The landside boundaries of municipalities in Massachusetts are well-defined and have been well documented over centuries. The seaward boundaries of Bay State municipalities are another matter.

Indeterminate and/or overlapping jurisdictional lines lead to conflicts. Examples abound along our coast:

Does one town’s efforts to facilitate aquaculture interfere with another’s interests in navigation?

Can a coastal municipality tax property miles away on a rocky ledge in Boston Harbor? Do a town's laws and regulations attach themselves to a national wildlife refuge when a stretch of town beach breaks away from the mainland and attaches to the island refuge? Some of these issues may resolve amicably, others may be contested in courts for years. The common thread among them is an incomplete understanding of the location and extent of the boundary lines and the important legal and economic interests associated with them.

As cities and towns strive to maintain, protect, and enhance healthy and productive coastal communities and the ecosystems upon which they depend, disputes related to water-borne boundaries threaten to hamper effective governance and impede productive use and stewardship. Indeterminate jurisdictional boundaries along with hierarchical legal regimes (e.g., local, state, and federal rules governing wetlands and waterways) increase murkiness at a time when stakeholders seek clarity.

This research examines gaps in understanding regarding Massachusetts' seaward boundary lines along with issues related to overlapping local/state/federal jurisdiction, and to develop and disseminate knowledge to stakeholders and policymakers eager to engage in informed coastal management. Municipalities charged with managing coastal resources, along with other stakeholders whose lives and livelihood are intricately linked to coastal ecosystems, require clear comprehensive information to guide their decisions, develop plans and implement practices and policies.

This project employs well-established methods of legal and public policy research and analysis. We examine judicial opinions, statutes, and bylaws to determine how coastal and ocean boundaries in Massachusetts have evolved and identify gaps and conflicts regarding the characterization of those boundaries. We also identify and assess coastal management issues that are subject to multiple levels (local/state/federal) of law and policy to identify existing and potential conflicts within the hierarchy of applicable law. For example, whether and how the federal Clean Water Act prohibition regarding filling wetlands or waterways might accommodate municipal or state level efforts to fashion green infrastructure (living shorelines) designed to protect coastal communities while restoring or maintaining coastal ecosystem functions.

The research is designed to provide policymakers, resource managers, nongovernmental organizations, and private stakeholders with an enhanced understanding of the rules that set the stage for claims of jurisdiction, governance, and planning..

### **A STUDY ON THE SPATIAL STRUCTURE AND IDENTIFICATION OF URBAN CENTERS IN THE CAPITAL REGION OF SOUTH KOREA**

Abstract ID: 311

Poster

SHIN, Hakcheol [University of Seoul] nextlord30@naver.com, presenting author

WOO, Myungje [University of Seoul] wksw1927@naver.com, co-author

Due to advanced technologies in transportation and telecommunications, trans-bordering commuting has increasingly taken place and mutual exchanges in freight and information among suburban cities have increased in the Seoul metropolitan area. This means that both physical and functional metropolitanization phenomena occur in the region. On the one hand, the concentration of higher value urban functions on Seoul, which is the central city of the region, generates spatial mismatch in commuting, causing a long-distance commuting problem. To combat with this problem, the long-range regional plan in the capital region and existing studies suggested the multi-center spatial structure through identifying urban centers in terms of the concentration of commuting and employment.

However, those urban centers in the plan and existing studies failed to take economies of scope into account in the process of identifying them. The economies of scope as well as the economies of scale are key characteristics of urban centers to minimize spatial mismatch. Since communities are characterized by diverse residents in terms of income and jobs with a number of industry sectors, the functions of urban centers need to be diverse as well in order to absorb nearby commuters. The economies of scope helps this commuting patterns.

In this line, the purpose of this study is to identify metropolitan centers in consideration of both economies of scale and economies of scope using non-hierarchical cluster analysis. The results show that a number of urban centers were identified throughout the region. Those centers in the southern area of Gyeonggi, which is a large administrative district outside Seoul, are characterized by high-industries, high employment density, and convenient transportation, while there is no striking urban centers in the northern part of the region, while major centers in Seoul carry out producer service businesses. This implies that policies should focus on the diverse urban functions in urban centers in suburban areas of the region to reduce spatial mismatch in commuting and foster several urban centers in the northern suburban area of the region for balanced development.

#### **AN EXAMINATION OF MUNICIPAL EFFORTS TO MANAGE BROWNFIELDS REDEVELOPMENT IN ONTARIO, CANADA.**

Abstract ID: 483

Poster

DE SOUSA, Christopher [Ryerson University] [chris.desousa@ryerson.ca](mailto:chris.desousa@ryerson.ca), presenting author

Abstract: Since the 1990's, the reuse of brownfield sites for urban intensification has emerged as a core strategy in government efforts aimed at remediating pollution and prioritizing renewal, regeneration, and retrofitting. While upper levels of government in Canada engaged in early efforts to devise policies, programs, and funding strategies to support redevelopment, the job of overseeing it has fallen mainly to local government. This research project investigates the role of municipalities in Ontario, Canada's most populous and industrialized province, in managing and facilitating brownfields redevelopment via a so-called Community Improvement Planning (CIP) approach.

Online surveys of municipal brownfield specialists, site visitations, and data provided by the province are used to answer the following questions:

What role are Ontario municipalities playing in managing and facilitating brownfields assessment, remediation, and redevelopment activity in regulatory, financial, technical, and other relevant terms?

What barriers continue to inhibit the redevelopment of brownfields?

What redevelopment outcomes and impacts have been evidenced by municipalities?

What is the municipal relationship with other public, private, and nonprofit sector stakeholders?

Results reveal that there has been moderate growth in the number of municipalities of different sizes using CIPs and offering incentives to support brownfield redevelopment throughout the province. The CIP approach also helps standardize how municipalities perceive their role and the role of brownfields in planning for growth and urban economic development. But, while objectives and perceived roles may be common, the research reveals that municipal capacity to deliver on those objectives and roles is extremely diverse. Indeed, three groups of municipalities have emerged, with one group very experienced in how to apply a CIP and the financial tools therein, another group muddling through as opportunities and interests arise, and a group with brownfields goals and plans but little capacity to move them forward. As such, the development barriers that continue to inhibit brownfields redevelopment in Ontario are not only related to development costs, risks, and complex procedures, but are further complicated by the need to maintain and improve municipal capacity to engage in and support brownfield activities and partnerships.

Overall, the province's hope of empowering municipalities with the ability to both plan and facilitate brownfields redevelopment locally via the CIP approach seems to support a common vision, but realities are fragmented on the ground. While this may be fine for some, it doesn't provide hope for those keen on seeing brownfields achieve more to advance renewal, regeneration, and retrofitting. The research is of relevance to urban planners and policymakers interested in this domain of urban revitalization and redevelopment, as well as the strong cohort of planning scholars who have made significant contributions to this field of research over the last two decades.

# Track 9 – Food Systems, Community Health & Safety

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### **9.33 PRE-ORGANIZED SESSION - GROWING FOOD POLICY FROM THE GROUND UP**

Pre-Organized Session 33 - Summary

Session Includes 449, 450, 451, 452

RAMOS-GERENA, Carol [University at Buffalo] carolram@buffalo.edu, organizer

Cities are highly vulnerable to disruptions in food supply chains. Strengthening urban food systems (and urban agriculture) has drawn attention as a means of shortening the food supply chain between urban growers and consumers as well as providing the ancillary benefits of increasing access to healthy foods, reducing transportation emissions, mitigating urban heat island effects, greening urban space, and promoting public health. Leading transformational change in urban food systems are often community networks and advocates, many of whom are urban growers. However, community-driven innovation to rebuild urban food systems occurs in the face of a number of constraints, many of which are exacerbated by the ‘food-blind’ nature of local government public policy. To rebuild and foster resilient urban food systems, improved policy awareness and new models of community-driven change in urban food systems are needed. This session will bring together a transdisciplinary team of researchers and community partners who will share findings from a multi-year, participatory action research project, "Growing Food Policy from the Ground Up."

Objectives:

- Discuss (dis)connects between local government policy and urban food system networks
- Examine relationships between social networks, households’ foodsheds, and community health
- Understand ways by which systemic transformation happens in urban food systems

### **GROWING FOOD POLICY FROM THE GROUND UP IN MINNEAPOLIS: HOW ARE BIPOC AND IMMIGRANT URBAN GROWER NETWORKS ADAPTING TO DISRUPTION AND PROMOTING RACIAL JUSTICE?**

Abstract ID: 449

Abstract within Pre-Organized Session 33

BURGA, Fernando [University of Minnesota] hfburga@umn.edu, presenting author

Background:

Through a collaboration with Appetite for Change, a food advocacy nonprofit in Minneapolis MN, this paper interrogates how food systems policies in Minneapolis and urban growers adapt to a dynamic environment where existing food policies encounter the disruptions of the COVID 19 pandemic and the racial upheaval set in motion by the killing of George Floyd.

Objective(s):

This analysis examines how existing food policies concerning urban growers address racial disparities and how BIPOC and immigrant urban growers mobilize their social networks to enact policy change based on racial disparities. Local Government policies have a deep impact on the development of policies that affect urban growers (Raja, 2018; Neuner, Kelly, & Raja, 2011; Dilleuth & Hodgson, 2016; Clark et al, 2017). We interrogate how food policies address race to promote the growing practices of BIPOC and immigrant urban growers and consider how the social

networks of urban growers apply food policies during this dynamic period to promote racial justice.

#### Setting:

Over the past two decades the City of Minneapolis has heralded a robust food system policy regime focused on alleviating historical disparities disproportionately affecting BIPOC and immigrant residents. While food policies focused on urban planning scopes are emergent they remain symbolic in their approaches (Burga & Stoschcheck 2017). More recently the killing of George Floyd and the onset of the COVID 19 Pandemic continue to underline the structural disenfranchisements that affect BIPOC and immigrant residents throughout the state of Minnesota.

#### Methods:

By developing an NVIVO coding analysis of food policies focused the practices of urban growers (including formal plans, laws, regulations, programs, and fiscal incentives). And carrying out 10 interviews with food policy makers and urban growers, we identify the gaps between policy implementation and the actual practices of urban growers. We explore the challenges that urban growers face in fostering and maintaining social networks to achieve food access during the current this period of disruption.

#### Results:

We hypothesize that Minneapolis' food policy regime relied on local and state-wide networks to bring food policy innovation to the forefront. However, both formal and informal networks have been deeply impacted by the disruption brought forth by the pandemic shifting the ways in which people develop social networks to build capacity, foster policy change, carry out strategic planning and enact racial justice in the food system. The reconfiguration of these networks has dramatically impacted the inclusion of BIPOC and immigrant growers in the promotion of anti-racist food policies in the future.

#### Implications for planning practice:

Outcomes of this study will inform policy solutions to improve anti-racist food policies. As local governments consider strategies to rebuild resilient food systems, findings from this research aim to draw attention to how planners can support community-driven innovations for food security by focusing in residents who are BIPOC and immigrant residents in the city of Minneapolis.

RAJA, Samina [University at Buffalo] sraja@buffalo.edu, co-author

Public policy adopted by local governments forms the backdrop for urban food system activities in cities and regions across the United States. A great deal of literature in the last decade has addressed the crucial role of both community advocates and local government policy in urban food systems (Raja, 2018; Neuner, Kelly, & Raja, 2011; Dilleuth & Hodgson, 2016; Clark et al, 2017). A smaller body of literature focuses on the explicit ways in which municipal policy has responded to the aspirations of, and engaged, growers of color. Scholars have argued that the failure to create inclusive planning processes has led to inequitable outcomes in the food system especially for growers of color (Clark et al, 2017).

Building on past work, this paper examines how community-led processes change/influence municipal policy discourse around urban agriculture in Buffalo, NY, especially as led by growers of color. We ask what impedes or enables community engagement in policy processes. In the case of Buffalo, NY, there is already a history of community and organization-led pressure on government policy makers for stronger food policy (Raja et al, 2013). While municipal policy has shown a gradual increase in impact within the food system, the effects are felt disproportionately throughout the city. Buffalo remains one of the most racially and economically segregated cities in the country, which impacts the extent to which food policy benefits are experienced by people and growers of color.

Empirical work for the paper relies on mixed methods. Data on policy formation processes and outcomes will be gathered through qualitative interviews of city policy officials and urban growers of color to document the extent and nature of policy tools, including formal plans, laws, regulations, programs, and fiscal incentives, available to urban growers. Additionally, policy documents will be analyzed (documents have already been searched using web and existing databases). Qualitative data--from policy officials and policy texts--will be coded using a set of a priori and emergent themes using NVivo. A comparison of qualitative interview data from policy officials with that of urban growers will yield a 'map the gap' analysis between the needs/perspectives of growers of color and the policy supports offered by local government policies.

We anticipate that, while most cities in the U.S. are not actively engaged in creating an enabling local government policy and regulatory landscape, Buffalo's steady improvement from 'food blind' to 'cautious engagement with the food system' has continued to progress as community leaders and organizations continue to apply pressure to policy makers to better support the local food system and, more specifically, urban agriculture. These results put forward an opportunity to leverage community partnerships to better address the current barriers to and challenges within urban food systems. Outcomes of this study will inform how policy makers can collaborate with community partners to identify and bridge gaps between the aspirations and needs of growers of color. The resulting paper will highlight how policy processes led by growers of color can better inform the design of equitable urban food systems.

## **SOCIO-SPATIAL FOODSHEDS: A LOOK AT THE IMPLICATIONS OF SOCIAL NETWORKS AND FOOD SPACES ON COMMUNITY HEALTH**

Abstract ID: 451

Abstract within Pre-Organized Session 33

MUI, Yeeli [Johns Hopkins Bloomberg School of Public Health] ymui1@jhu.edu, presenting author  
 HEADRICK, Gabby [Johns Hopkins Bloomberg School of Public Health] gheadri1@jhmi.edu, co-author  
 DEHONNEY, Allison [Urban Fruits & Veggies LLC] dehonn@outlook.com, co-author  
 RAJA, Samina [University at Buffalo] sraja@buffalo.edu, co-author

Background: The United States faces an unprecedented food security crisis, with low-income households and communities of color experiencing the sharpest rate of food insecurity. Increasing social and community support is one of the five main domains of the social determinants of health. Thus, rebuilding resilient community food systems in the wake of the COVID-19 pandemic calls for food system policies and practices to reflect local communities' values, resources, experiences, and priorities. Yet, there is limited empirical evidence of how local, community-driven food supports meet families' needs; where current local, state, and federal programs fall short; and the ways in which community members are leveraging their social networks to ensure families' food security and well-being.

Objective(s): This analysis examines the relationships between households' social and spatial foodsheds (i.e., the geographic scope of food acquisition) by visualizing families' social network patterns and how they affect households' overall health and access to food over space.

Setting: This study is nested within "Growing Food Policy from the Ground Up," a participatory action research project in East Buffalo, NY, where structural racism in housing, education, and economic opportunities have had lasting impacts on families' access to key resources, including nutritious food. In spite of these systemic challenges, community leaders are generating local innovations and utilizing a variety of food supports to ensure households' food security.

Methods: Using data from a cross-sectional household survey that will be administered this spring through summer 2021, we will employ geospatial and social network analysis tools to link geospatial data of households' foodsheds and social networks with other built environment variables (e.g., street length, housing density, food source density). Respondents will comprise households' main food shopper. Food security will be measured using the 18-item USDA Household Food Security Survey Module. Food procurement will be measured through recall of the past 30 days, asking about the types and locations of food sources from which food was collected (food retail, farmers markets, personal growing sites, community-based organizations, emergency sources, etc.) as well as mode of transportation used to procure food from each identified source. Socio-demographic data will be collected, including household size and composition, income level, race/ethnicity, employment status, and level of education. Using socio-spatial analyses, we will explore the extent to which low-income households' foodsheds can be explained by their social networks. We will also assess how households' foodsheds relate to overall health and well-being, and whether these relationships vary between urban grower and non-grower households.

Results: We hypothesize that more geographically clustered social networks will be associated with greater household food security, controlling for the built environment. More expansive foodsheds are also hypothesized to be associated with health and well-being; this relationship may vary between urban grower and non-grower households.

Implications for planning practice: This study will inform policy solutions to improve social determinants of health. Outcomes from this research aim to draw attention to how local government can support community-driven innovations for food security. For example, planners may consider transportation and economic development strategies to rebuild resilient food systems. Partnerships between planners and public health practitioners are also likely to advance healthy, equitable, and sustainable communities.

#### CO-DESIGNING CHANGE IN URBAN FOOD SYSTEMS

Abstract ID: 452

Abstract within Pre-Organized Session 33

BOHM, Martha [University at Buffalo, The State University of New York] [marthabo@buffalo.edu](mailto:marthabo@buffalo.edu), presenting author

The objective of this paper is to present a framework for co-created design work which can contribute to community engagement around urban food systems. The nature of the work discussed includes co-created graphic design and digital/web design underpinning community-facing communication on a multi-year, participatory action research project, "Growing Food Policy from the Ground Up (GFPGU)."

These co-produced design processes shift the role of the designer from the traditional one as actor in service of a monied patron's agenda to one in which the designer acts to initiate or advocate on behalf of a community group (Bohm, Hwang, and Printz, 2015). This further positions the practice of art and design as a means of community engagement (Miessen, 2006). This transdisciplinary team has disciplinary breadth including public health communication, art, graphic design, and architecture. The co-designing process does not give primacy to research as the only way to understand complex issues; it aspires to discover a 'third way' where designers and community partners are in dialogue to understand and visualize complex issues.

Reflecting on the co-produced process of design production, the paper explores the possibilities and limits of such

processes in serving food systems planning. Empirical content of the paper draws on an analysis of design team meeting notes, stakeholder interviews, and archival records of the planning process. The design processes discussed in this paper supports the GFPUGU project's overall capacity building work to accelerate residents' engagement in urban agriculture (UA), growers' engagement in UA policy, and ultimately, stronger, more equitable urban food systems (UFS). The first process discussed is the iterative, participatory development of a graphic identity and project name with strong resonance for community partners and participants. The second process discussed is for a digital platform of community engagement and information dissemination. These two efforts aim to create a graphic identity and digital presence that allow community participants to perceive themselves as part of the urban food systems network in their community; their co-authorship in the visual and web identity of the project facilitates this identification.

This work will have implications for the future work within this project, as well as on the education of both architecture and art / design students in seeing their work as a means for community engagement and activism in food systems planning. Lessons learned from the graphic and digital co-design processes will be applied and expanded upon in the subsequent phase of the project, which includes small scale built projects (e.g. community garden planter box, tool shed, or water collection device) situated in the community in service of community network formation. Small scale design intervention is a tool through which human action can shape the experience and physical structure of the city (Borasi and Zardini, 2008).

### **9.57 PRE-ORGANIZED SESSION - BEYOND SILOS: COLLABORATING ACROSS FIELDS TO DISMANTLE STRUCTURAL RACISM AND ACHIEVE COMMUNITY HEALTH**

Pre-Organized Session 57 - Summary  
Session Includes 261, 262, 264, 265

ANGST, Sean [University of Southern California] angst@usc.edu, organizer

Throughout history, planning and public health have sought to promote healthy communities and public good within the context of white supremacist ideologies and practices. Given the foundational nature of racism to the development of the United States, systemic racism—specifically tied to the superiority of whiteness and inferiority of Blackness—was central to each field and deeply infiltrated their policy decision making processes. As a tool for the Nation-state, planning formalizes the spatial order that produces and reproduces disparate health outcomes across different racial/ethnic groups through plans, policies, and practices. While public health has tried to address inequities in the distribution of these health outcomes, the field's gutted infrastructure has often focused on individual level outcomes that, intentionally or unintentionally, pathologize behaviors of marginalized racial/ethnic groups. As a paradigm shift towards reparative praxis emerges in both professions, in this panel, we ask how can planners and public health professionals learn from each other and work together to achieve the goals of healthy communities?

Objectives:

- Understand the relationship between planning, public health, and structural racism
- Gain strategies for addressing racial disparities in community health outcomes
- Learn across disciplines to make planning and public health interventions more effective

## **WHO WILL SURVIVE IN LOS ANGELES? PRECARIOUS HOUSING AND MECHANISMS OF STRESS, TRAUMA, AND COMMUNITY WELL-BEING**

Abstract ID: 261

Abstract within Pre-Organized Session 57

ANGST, Sean [University of Southern California] angst@usc.edu, presenting author

In the field of public health, socio-economic status is considered the ‘fundamental cause’ of health inequities because of its role in shaping social, environmental, and behavioral determinants of wellbeing (Link & Phelan, 1995). While the mechanisms that produce health inequities change across time and space, socio-economic inequality remains their underlying cause. Inequality—produced through the mutually constituted relationship between racism and capitalism—not only influences distribution of opportunity and access to care, but also determines exposure to harms and stressors (Seamster, 2018). Thus, policy aimed at improving the quality of life and health of residents must address the structures reproducing inequality as well as the new mechanisms that arise to uphold those conditions.

The on-going affordable housing crisis offers a useful entry point to study these factors given the large proportion of monthly income devoted to rent and the essential role of home in human development (Swope & Hernandez, 2019). Precarious employment and rising housing costs are compounded by development pressures that disproportionately affect communities previously targeted with disinvestment and devaluation. These conditions have translated into fewer resources, scarcer housing options, and heightened uncertainty for residents. As a result, tenants—especially those within the Black and Latinx communities—must increasingly go without essentials and grapple with consistent stress, fear, and anxiety in their attempt to find stable housing. The human body is well-designed to deal with concerns that arise throughout life. Being in a state of constant stress, though, causes long-term damage to overall wellbeing (Turner, 2013).

Using South Los Angeles as a case study, this research seeks to answer:

1. What mechanisms of stress and trauma are created by the affordable housing crisis?
2. How do these mechanisms contribute to disparate living and working conditions?
3. What types of social supports are available to buffer against the impacts of housing instability?

The study was composed of three interrelated phases. First, 17 focus group conversations were facilitated with residents consisting of a 20 minute survey followed by a 75 minute conversation. Second, a door-to-door survey was administered to 400 households using stratified randomization at the census block group level as a semi-structured interview taking roughly 45 minutes. Third, 75 hours of participant observation was conducted by walking the study neighborhoods and attending community meetings.

Results suggest that tenants employ a variety of survival tactics to maintain stability. This ranges from cramming into overcrowded homes, working around the clock, going without needed medicine, decreasing their quality of housing, enduring harassment, and moving farther from work and friends. These tactics—while life-preserving in the short-term—wear residents down over time and have the potential to impact their lives long after the initial adjustments are made (Geronimus, et al., 2006). Because adjustments do not remain contained as one-time stressors or necessarily resolve themselves quickly, they have the potential to change the way renters live and allow for the effects of the crisis to accumulate over time as conditions persist. Families, in particular, are subject to magnified

effects due to higher expenses, greater demand for space, and sensitive timing in psycho-social development. Nonetheless, residents have formed dense systems of support and resistance to remain in place. Residents' resilience offers new ways to think about interventions that are grounded in community control and local assets.

#### **"TO LIVE AND DIE IN [SOUTH CENTRAL] LA": EXPLORING PLANNING IN PRODUCING TRAUMA IMAGINARIES?**

Abstract ID: 262

Abstract within Pre-Organized Session 57

POE, Jocelyn [University of Southern California] poej@usc.edu, presenting author

Since Hippocrates identified "sunny, breezy hillsides" as healthy places and "swamps" as unhealthy places in his foundational text, place has been instrumental in achieving good health (Frumkin 2003, 1415). But who gets access to healthy places? Scholars have found that "population [trends] of good and bad health mirror population distributions of deprivation and privilege" (Krieger 2001, 668). Hence power structures regulate access to healthy places. In the United States, access is systematically distributed along racial lines, and race is always spatialized. As a spatial process and practice, planning contributes to these health inequalities through policies and plans that uphold racialized distributions.

Many scholars have thoughtfully examined planning's contribution to health inequalities through a physical, political, and economic lens. These approaches are essential in understanding planning's complicated histories and creating greater access to healthy places. I contribute to these works by offering a psycho-socio-cultural approach. My work as a practicing planner led me to explore communal trauma, a multilayered, place-centric trauma expressed through trauma imaginaries— spatial imaginaries that carry the hallmarks of trauma. In this paper, I ask how do planning processes impact trauma imaginaries in South Central Los Angeles (SCLA)?

To analyze trauma imaginaries in SCLA, I center spatial consciousness. Spatial consciousness allows people to understand the centrality of space and place in their biographies (Harvey 2005). This work cultivates a method for exploring spatial consciousness— a method for traversing the intricate relationship between time, place, and being. Exploring this method calls for a transdisciplinary approach to knowing, so I integrate interviewing, participant observation, autoethnography, artmaking, and instinctual "street" ways of knowing methodologies (Isoke, 2018). Because spatial imaginaries are the collective consciousness of a group (Davoudi 2009), I cross-reference this spatial consciousness work with a discursive and content analysis of spatial imaginaries present in SCLA's literature and news media. In doing so, I find that communal trauma is essential to understanding the relationship between place, power (planning), and health. Examining trauma imaginaries can lead to a reparative planning praxis that aims to

redress the impacts of communal trauma.

#### **DISSED/PLACED: PARTICIPATORY PLACE-HEALTH RESEARCH AS PLACE(RE)MAKING, SOCIOSPATIAL COUNTERNARRATIVE, AND RESISTANCE**

Abstract ID: 264

Abstract within Pre-Organized Session 57

PETTEWAY, Ryan [OHSU-PSU School of Public Health] petteway@pdx.edu, presenting author

Understanding “place” (e.g. “neighborhoods”) and health is a core focus of public health research and practice (Arcaya et al., 2016). And increasingly, many scholars and practitioners are rediscovering and revisiting historic connections between planning and public health, especially in relation to housing, built environments, and notions of “placemaking.” Much work to date, however, tends to de-place place-health relationships by not explicitly engaging local/regional social, political, and economic practices/processes that fundamentally shape (socio)spatial distributions of health opportunities/risks. That is, this work frequently ignores the manners and mechanisms through which place is actively made, unmade, and remade over time—placemaking as literal and material, as well as symbolic and social. Here, I contend that knowledge production about “place” is a critical component of placemaking—and one which public health and planning scholars/practitioners alike tend to discount or outright dismiss.

In public health, much place-health work falls within the subfield of social epidemiology. And much like traditional epidemiology, most social epi—despite its name—is not very “social” at all (Petteway et al., 2019; Smylie et al., 2012), and follows the same positivist, reductionist, settler-colonial, white-supremacist logics. Procedural and methodological norms preclude expressions of/actively mask community residents’/research participants’ agency, discounting/devaluing their knowledge/expertise while simultaneously dispossessing them of their stories/experiences (“data”). In this regard, relationships between researchers and residents/research participants represent not only the re-inscription of social hierarchy, but the reification of place-health research as (re)colonization. Conceptual and methodological modifications are thus fundamental to appropriately frame, assess, and address spatial inequalities in health. In other words, we need to reimagine and remix what it means to represent place within place-based public health and planning work, and critically interrogate the extent to which standard practices—as placemaking processes of sociospatial (mis)representation—constitute acts of epistemic and symbolic violence.

In this spirit, this presentation will discuss a collection of projects rooted in critical, critical race (Ford & Airhihenbuwa, 2010), and Black feminist theory (Parker, 2016), as well as principles of community-based participatory research and decolonizing methods, as potentially instructive expressions of procedurally and

epistemically just place-health research practice. These projects used exclusively resident-driven participatory methods to examine aspects of daily place-health experiences, exposures, risks, and opportunities. Residents' works suggest that such approaches can afford opportunities to democratize local place-based public health and planning work, and can allow for identification of local/regional placemaking mechanisms implicated in spatial health inequalities. Diversifying community health and planning assessment approaches to include community-generated data offers a process to decolonize traditional practices and co-create place-health new knowledge(s), thus affording residents opportunities to articulate sociospatial counternarratives to contest, resist, and/or enhance the pre-existing data narratives that animate local place/health and health equity discourse.

## COVID-19 AND THE IMPACT ON ENVIRONMENTAL JUSTICE COMMUNITIES

Abstract ID: 265

Abstract within Pre-Organized Session 57

DIXON, Benika [Texas A&M University] [benikad@tamu.edu](mailto:benikad@tamu.edu), presenting author

The environmental justice literature demonstrates that Black, Latino, and low-income individuals reside in closer proximity to hazardous waste facilities and are disproportionately impacted by exposure to environmental hazards in the workplace and in their neighborhoods. Living near toxic facilities and exposure to environmental hazards have been associated with poorer health and disproportionate negative health outcomes among these populations. The COVID-19 pandemic has also disproportionately impacted Black and Latino communities across the country. These disparities which can be seen in cases, hospitalizations, and deaths are primarily due to inequities in the social determinants of health (i.e., economic stability, healthcare, education and neighborhood and environment). These same systemic inequities seen during the pandemic are those that make many of these communities most vulnerable to environmental exposures. Epidemiological research studies have shown that elevated levels of fine particulate matter (PM 2.5) are associated with increase in COVID-19 mortality. Excess environmental exposures have been associated with higher rates of a range of health effects including cancer, and respiratory and cardiovascular diseases which are associated with increased risk of severe illness and mortality from COVID-19.

This presentation seeks to discuss the impacts of COVID-19 on environmental justice communities.

Promoting human health and wellbeing is at the core of urban planning research and practice. Despite the growing consensus on the notion that “place matters” in health, evaluating the “causal” impacts that the place has on health has been limited. It is in large part due to the methodological and ethical challenges in executing rigorous experimental research in community-based population studies, as well as limited funding opportunities to support large-scale longitudinal studies needed to assess such causal impacts.

Natural Experiments (NEs) emerged as promising ways to assess causal impacts of various community-level interventions on health, that are typically not suitable for traditional controlled experimentation. NEs refer to observational studies that examine exposures to an intervention that is not designed by the researcher, which often include changes in the environment and policies.

This roundtable session consists of two parts, with its participants representing urban/transportation planning, public health, landscape architecture, architecture, and community engagement. For the first half, the roundtable participants will provide an overview of two on-going NE projects funded by the National Institutes of Health: Active Living Austin (ALA, 2015-2021) and Active El Paso (AEP, 2018-2023). These longitudinal, case-comparison studies represent two common types of NE interventions: “relocation” in ALA (i.e. people moving to a walkable community) and “exposure” in AEP (i.e. new transit service in the neighborhood). Using both subjective (survey and travel log) and objective measures (GPS and accelerometer), these projects examine short-term and long-term casual effects of the two interventions on people’s mobility, physical activity, and social interactions. These studies also explore spatial and temporal patterns of outdoor activities to identify specific design features and policy elements associated with positive outcomes. The presentations will cover general research design and study execution strategies commonly used in NEs, followed by the specific strategies employed in ALA and AEP (e.g. propensity score matching, multiple comparison groups, multi-channel marketing, and machine learning algorithms). They will also discuss expected and unexpected challenges (e.g. baseline data collection time constraint, dynamic changes accompanying the target intervention, predatory survey takers, participant recruitment/retention, and sample bias), effective responses to those challenges, and lessons learned from implementing these projects over the past 6 years.

The second half will be devoted to facilitated audience-participant interactions. Attendees will be given the opportunity to post/raise questions throughout the roundtable session, and selected questions will be discussed during this time. We anticipate this second part to offer opportunities to further discuss challenges, lessons, and tips about designing, getting funding for, and implementing various NEs on health and mobility related topics, and to highlight the importance of interdisciplinary collaborations and partnerships with local stakeholders in NEs. The ALA and AEP teams include principal investigators from Urban Planning/Transportation, Landscape Architecture, Public Health, and Architecture, and investigators from Computer Science, Statistics, Kinesiology, Health Promotion, and Community Outreach. The teams also collaborate closely with community stakeholders such as the developer and the transit agency.

By attending this roundtable session, audience can expect to: (a) understand types of NEs and their unique challenges and opportunities with examples from two current NE projects led by the roundtable participants; (b) learn about the strategies to designing and implementing a robust NE project and getting it funded; and (c) discuss why NEs hold strong promise in research dealing with environment-health intersections.

HE, Qian [The University of Texas at Arlington] qian.he@mavs.uta.edu, presenting author  
LI, Jianling [The University of Texas at Arlington] jjli@uta.edu, co-author

Mental health issues are among the biggest problems in human society (Layard, 2005). According to the recent report by the National Institute of Mental Health (2019), nearly one in five adults in the United States is living with mental health illness (a total of 51.5 million). The consequences of mental health issues affect individual well-being and challenge the welfare system at the national level (Dustmann & Fasani, 2016). Studies in environmental criminology and public health identify crime as an essential environmental stressor (Lewis & Riger, 1986; Perkins &

Taylor, 1996) because crime may distress both the physical and subjective well-being. The spatial characteristics of crime make it an important environmental factor in affecting people's mental health through both direct experience (victimization or witness) and indirect experience (fear of crime upon the knowledge of crime status).

In the field of urban planning, the neighborhood environment is recognized for its association with mental health and crimes. However, limited empirical studies have examined the relationship between crime and mental health within an environmental context. This study fills the gap in the literature by examining the potential moderating effect that neighborhood environment (built environment and social environment) could potentially have on the relationship between crime (property crime and violent crime) and mental health (the percentage of sadness, the percentage of hopelessness, the percentage of nervousness, and the percentage of restlessness). The built environment is measured through the degree of mixed land-use, the percentage of parks and recreational land-use, access to transit facilities, and alcohol-related establishments; and the social environment is measured through the concentrated disadvantage and residential instability, while controlling for the demographic structure. Using five-year longitudinal data (2015-2019) from the Dallas - Fort Worth (TX) metropolitan area and the spatial lagged modeling technique, findings from this study will provide planning and policy recommendations to build healthy and crime resilient communities in a proactive approach.

#### Introduction

In response to calls to use local public policies to improve the food system (Pothukuchi & Kaufman, 2000), city planners increasingly consider ways to enhance access to healthy foods, particularly in communities where nutritional resources are more supportive of an unhealthy rather than healthy diet. National City, the site of this investigation, prioritizes "healthy food supplies... especially in areas where a healthy food supply... is not located within a half to quarter mile away." Access to food is often expressed in terms of distance but travel time and modal choice are less frequently considered.

Interventions that improve the nutritional quality of food offer one way to improve community health (Dillemuth & Hodgson, 2016). However, small and independently-owned stores face challenges stocking healthier products (Gittelsohn et al., 2014; Powell et al., 2019). BrightSide Produce (BrightSide) addresses the challenges faced by stores when attempting to carry fresh produce. BrightSide delivers produce to stores weekly with no minimum order requirements and manages the produce for the store by ordering, merchandising, providing training on produce handling, and pricing.

#### Research Strategy

Previously, we analyzed disparities in access to grocery stores based on multimodal travel times (Swayne & Lowery, under review). We build on this work focusing on National City, CA, a small, 9.12 mi<sup>2</sup> municipality where the majority of residents are members of minority populations, and have lower household incomes and higher poverty, unemployment and food insecurity rates than in San Diego County. Additionally, National City contains a neighborhood that has been designated a food desert.

To determine whether BrightSide improved access to food for National City residents, we examine how changes in travel distances and travel times to local fresh produce retailers changed since implementation at thirteen independently-owned stores in National City. Using our baseline food landscape of grocery stores, we add the BrightSide locations to examine how the addition of these retailers changed multimodal access to fresh produce.

#### Findings

The introduction of fresh produce into BrightSide stores reduced minimum travel time by transit to a healthy food outlet for 29 of the 54 census block groups (CBGs) in the study area. Among these CBGs, there was an average one way travel time reduction of 4.9 minutes. Twelve CBGs that previously lacked access to a store within a 10 minute transit commute now have access to at least one store. For shoppers traveling by car, minimum travel time was also reduced for just over half of the CBGs. However, these reductions in travel time were much smaller — likely due to the fact that travel times by car are shorter on average. Changes in travel time were clustered in the west and southwestern portions of National City where there is no supermarket.

#### Takeaway for Practice

Improvements to land use regulation and zoning that bolster food security are a priority for planners but may require time to obtain approvals and negotiate policy changes. Our results demonstrate that in National City, BrightSide improved access by transit to healthy foods. These results have important implications for planning practice where efforts to add brick-and-mortar grocery stores or transit routes are often met by onerous economic development processes. Instead, planners may consider smaller-scale innovations like this one to support food access. These interventions may not need to be focused on food retail outlets — opportunities exist to implement and examine similar interventions such as farmers' markets, community gardens, mobile markets, and adaptive reuse of brownfield sites to support the food environment.

Background: African American or Black individuals disproportionately live in neighborhoods with limited access to greenspace, such as parks and walking/bike trails, due to persistent racial residential segregation [1]. Black neighborhoods undergoing greenspace redevelopment could amplify existing social environmental stressors and increase displacement vulnerability related to, for instance, moving due to concerns of not affording higher rent or being evicted, increases in financial strain [2], and social exclusion from the newly created spaces and erasure of their community likeness as well as heightened vigilance from anticipated discrimination [3]. Although these stressors may contribute to poor sleep, data are sparse.

Methods: This study used the Atlanta BeltLine, as the greenspace redevelopment project of interest, to investigate the relationship between social environmental stressors associated with residential displacement and various sleep dimensions among Black adults. The Atlanta BeltLine is a public-private greenspace redevelopment project that was initiated in 2005 and that will ultimately result in improvements to 700 acres of existing parks, the addition of 1300 acres of new and expanded greenspace, 33 miles of new multiuse trails, and a 22-mile loop of rail transit service by 2030. We employed a transformative convergent parallel mixed methods study design to analyze the data from the African American Sleep & Health Study (2019) [4]. Two census block groups, within the Atlanta BeltLine target development area, classified by a displacement risk index [5] as medium to high-risk areas of residential displacement were matched using propensity score matching to block groups within the City of Atlanta that were unexposed to the Atlanta BeltLine. Adjusting for demographic characteristics, linear regression models were used to estimate associations and 95% confidence intervals (CIs) between social environmental stressors (i.e., everyday discrimination, heightened vigilance, moving due to concerns of not affording rent or being evicted, and financial strain) and self-reported (n=66) as well as objective (n=32) measures of total sleep time (TST) in hours along with sleep disturbances (SD) (i.e., trouble falling and staying asleep). Objective TST was log-transformed to meet normality assumptions. For the one-on-one semi-structured interview data (n=20), we conducted content analysis using a constant comparative approach in NVivo 12 to identify contextual factors, themes, and relationships.

Results: Among 66 participants, 46% were 48+ years of age, 59.4% were women, and 67% had greater than high school level education. The association between moving due to concerns of being evicted and objective TST was moderated by exposure to greenspace redevelopment, after adjustment. Unexposed participants who moved due to concerns of being evicted had lower mean objective TST by 53% (CI: 35.67% - 65.86%, p<0.001) compared to those who did not move. There were no statistically significant differences among exposed participants (CI: -0.05 - 0.60, p=0.08). Participants experiencing medium financial strain was associated with a 7.68 (CI: 0.21 - 15.15, p<0.05) increase in self-reported SD compared to participants experiencing no financial strain, after adjustment. Adjusted models for everyday discrimination and heightened vigilance were associated with 0.26 (CI: 0.03 - 0.49, p<0.05) and

0.49 (CI: 0.17 - 0.81,  $p < 0.05$ ) increase in self-reported SD, respectively. Qualitative themes indicated that for exposed participants financial strain, few affordable housing options, and the “white gaze” from their new white neighbors were factors that were increasing the pressure of residential displacement and subsequently their sleep.

**Conclusions:** Our findings revealed specific social environmental stressors related to greenspace redevelopment including pressure of residential displacement influenced specific sleep dimensions (TST, SD). Future research should conduct prospective studies to examine the temporality and magnitude of associations. The findings will have implications for urban planning and public health strategies that are focused on creating healthier and more equitable communities.

## **HOW DO HOUSING TYPOLOGIES AFFECT MENTAL HEALTH?: A CASE STUDY OF ACCESSORY DWELLING UNITS (ADUS) IN LOS ANGELES AND LONG BEACH**

Abstract ID: 66

Individual Paper Submission

TAKAHASHI, Lois [University of Southern California] [lmakaha@usc.edu](mailto:lmakaha@usc.edu), presenting author  
MUKHIJA, Vinit [UCLA] [vmukhija@ucla.edu](mailto:vmukhija@ucla.edu), primary author

Serious mental distress is rising, and has been exacerbated by COVID19, worsening social isolation. Stable and quality housing is seen as an integral determinant of mental health, but we still know little about the influence of housing types. Where there is evidence, housing type (Evans, Wells, & Moch, 2003) and housing quality (Evans, Wells, Chan, & Saltzman, 2000) are shown to significantly affect mental health. The housing typologies however tend to be rather coarse (low-rise vs high-rise, single family vs multi-family). To address this gap, we examine the effects of a particular housing type, accessory dwelling units (or ADUs, also known as “granny flats”) in Los Angeles and Long Beach, two California cities with population size differences and mental health outcomes, but otherwise similar housing and income profiles.

ADUs are “self-contained units located on a property of a single-family home” (Been, Gross, & Infranca, 2014). Some argue that ADUs facilitate elder and child care (Liebig, Koenig, & Pynoos, 2006), potentially contributing to better mental health outcomes. Like most of the US, California’s cities are characterized by single-family zoning, and until recently most ordinances precluded ADUs. In Los Angeles, where enforcement against unpermitted ADUs is based on complaints, 10-15% of single-family houses have unpermitted ADUs. In contrast, in Long Beach, where enforcement is proactive, less than 5% of single-family houses have unpermitted ADUs based on our preliminary data.

The State of California now requires all jurisdictions to remove regulatory barriers—such as parking, setback and owner-occupancy requirements—to allow ADUs by-right on single-family-zoned lots (California Assembly Bill 2299 and Senate Bill 1069, effective January 2016, and Assembly Bills 68, 881 and Senate Bill 13, effective January 2020). However, the pace of regulatory reform has varied. Los Angeles has been at the vanguard and, in 2019, permitted over 5,600 ADUs. In contrast, Long Beach permitted 104 ADUs in 2019.

What are the potential effects of ADUs in single-family-zoned neighborhoods on mental health? We assess the likely effects of ADUs in single-family neighborhoods on mental health by (1) analyzing the prevalence of existing ADUs irrespective of their legal status (i.e., formally permitted, unpermitted, and grandfathered), and, (2) estimating the potential association of ADUs and mental health status in Los Angeles and Long Beach.

For our primary explanatory variable, we estimate the number of ADUs using publicly accessible permit data and multiple listing service (MLS) data for homes for sale for spring 2021. Our previous research indicates that in addition to information on permitted ADUs, MLS listings include clues to the presence of unpermitted ADUs through photographs, descriptions and allusions to rental opportunities (Mukhija, 2014). We check discrepancies between the advertised size of the house and its recorded size in the County Assessor's database and standardize ADU prevalence by calculating the likely percentage of single-family zoned lots with ADUs in each city.

For our primary dependent variable, we use city level mental health data, available through the Los Angeles County Public Health Department. The data suggest that though Long Beach has similar or lower poverty rates, lower housing rent burden, and higher homeownership rates, mental health is slightly worse than Los Angeles. We test the hypothesis that ADUs may be a significant factor in these mental health differences using descriptive and multivariate analysis. We use the findings to draw lessons for community design, housing, and health.

#### **GREEN SPACE AND SUICIDE ATTEMPTS: INVESTIGATING THE MODERATING ROLE OF AREA DEPRIVATION**

Abstract ID: 83

Individual Paper Submission

LEE, Ryun Jung [Texas A&M University] ryunjunglee@arch.tamu.edu, presenting author

LEE, Sungmin [Texas A&M University] sungminlee@arch.tamu.edu, primary author

SCHERR, Sebastian [Texas A&M University] scherr@tamu.edu, co-author

Background: Spending time in green space in urban areas is a source of wellbeing, especially mental health promotion. Areas in greater proximity to more green space were found to be associated with less mental fatigue,

stress, and crime, and higher social cohesion in the neighborhoods (Beyer et al., 2014). Despite these significant psychosocial benefits of green space in urban areas, we still do not know much about their boundary conditions. For example, it is well documented that the availability of green space is not equally distributed across neighborhoods but varies along the lines of their residents' socioeconomic status thus exacerbating local health inequalities (Astell-Burt et al., 2014). Above and beyond the mere amount of available green space, the living quality and the maintenance of the green space also contribute to perceived safety (Mitchell & Popham, 2007). Less maintained and more deprived neighborhoods usually have less access to green space, and if available, the green space is of lower quality and in conjunction with more safety concerns (Astell-Burt et al., 2014). At the same time, suicides and the much higher number of oftentimes undocumented suicide attempts also concentrate in disadvantaged neighborhoods (Rehkopf & Buka, 2006). However, it remains unclear to what extent area deprivation and available urban green space, both of which indicators for mental health, help understanding the likelihood of local suicide attempts.

**Purpose:** The aim of this study is to investigate whether tree canopy cover, an indicator for urban green space, is related to the number of suicide attempts in the local area. In order to address the lack of knowledge about boundary conditions, we also explored whether the level of area deprivation moderated the association between green space and suicide attempts.

**Methods:** Focusing on the city of Cincinnati, OH, we used count data of local suicide attempts between 2015 and 2019 and analyzed for  $n = 361$  census block groups in how far the suicide attempts were related to the tree canopy cover that we calculated on 30m pixel levels for the sampled area. As a moderator, we used the Area Deprivation Index (ADI)—a composite measure of neighborhood socioeconomic disadvantage (e.g., formal education, income, poverty, and housing indicators). We controlled our models for the foreclosed properties (average length of vacancies) and local crime rates (violent/property) during the observation period, and the population density. Negative binomial regression models have been fitted to test the association of tree canopy with suicide attempts and tested the moderating role of area deprivation.

**Results:** A total of 3,442 suicide attempts was observed during the 2015-2019 timeframe in the city of Cincinnati, OH. After adjusting for our control variables (i.e., foreclosed properties, violent crime rate, and property crime rate), we found a negative association between tree canopy cover and suicide attempts ( $B = -.585$ ,  $p = .025$ ) and a positive association between area deprivation and suicide attempts ( $B = .015$ ,  $p < .001$ ). Importantly, area deprivation moderated the association between tree canopy cover and suicide attempts ( $B = .019$ ,  $p = .042$ ).

**Conclusion:** Our findings suggest that local tree canopy cover might be a useful tool to improve local mental health-related outcomes such as suicide attempts. Results also showed that the effects of tree canopy cover were stronger in less disadvantaged areas than in highly disadvantaged areas, suggesting that interventions to the local living quality and safety in conjunction with the provision of more urban green space might be most effective to reduce local suicide attempts and increase mental well-being. For environmental justice, interventions to qualitatively improve green space can be critical to disadvantaged communities.

## **ACKNOWLEDGING, DISMANTLING, REPAIRING, AND PREVENTING: A CONTENT ANALYSIS OF ENVIRONMENTAL JUSTICE AND HEALTH EQUITY IN CALIFORNIA GENERAL PLANS**

Abstract ID: 91

Individual Paper Submission

WAGNER, Jenny [University of California, Davis] [jlwagner@ucdavis.edu](mailto:jlwagner@ucdavis.edu), presenting author  
BRINKLEY, Catherine [University of California, Davis] [ckbrinkley@ucdavis.edu](mailto:ckbrinkley@ucdavis.edu), co-author

This research catalogues Environmental Justice (EJ) policies that aim to reduce health disparities among historically marginalized populations caused by past and future land-use planning. Recent legislation in California (SB 1000, 2016) requires that general plans formally address EJ in new adoptions beginning January 1, 2018 in order to mitigate the environmental, health and financial burden that planning has historically placed in low-income and BIPOC communities. Environmental Justice became a federal policy in 1994 (President, Proclamation, 1994) with the aim of protecting the fundamental right to clean air, land, water, and food. California stands out as a state that is building tools and policy to include Environmental Justice in land-use planning. A better understanding of EJ policies already in use can further the transferability of successful policies while helping state agencies provide guidance based on existing planning practices. The purpose of this paper is to explore how cities are already integrating EJ into planning, with attention to the content and targets of EJ-related policies as well as the unique local demographic and geographic contexts which may shape approaches to EJ.

We used Natural Language Processing to read for EJ policies across 461 California cities. City general plans were selected for further analysis based on topic model fit for EJ. We applied qualitative content analysis to a subset of city general plan documents to understand patterns in policies as well as unique or context-specific approaches to address EJ in California. In total, seven general plans were selected for our analysis, including representatives of Northern California, Southern California and the Central Valley, as well as urban, suburban, and rural contexts. Policies within each plan were coded for both content and priority populations/areas, allowing us to identify patterns in policies with a stated focus on vulnerable groups compared to a focus on places.

Across all seven plans, there were 628 discrete EJ policies with a focus on vulnerable populations or communities. We identified policies relevant to EJ across all required elements of city general plans: Housing, Circulation, Land Use, Health, Safety, Open Space, Air Quality, and Noise. Our results show cities in California have taken initiative by enacting a broad range of EJ policies even prior to the state mandate to do so.

Housing, transportation and land-use elements contained the most EJ policies across all elements. Within housing elements, most EJ policies aimed to address the acutely chronic Californian housing crisis, which has only deepened since the 1970s. Of 141 policies focused on housing and EJ, policies most commonly included support for affordable housing and most frequently prioritized “low-income residents”, particularly in policies related to affordable housing, housing preservation, mixed-income neighborhoods, multi-family housing, public housing, and rental assistance. Within circulation elements, EJ policies were concentrated in subcategories such as active and alternative transportation, Complete Streets, transit-oriented development, and Safe Routes to School. Across land use elements, prominent EJ policy themes included siting compatibility, buffer zones or barriers, mixed-use development and infill, and renovation or modernization of buildings or properties. Our findings explore EJ in greater depth in areas of housing, circulation and land use, as well as all other elements required of cities in California.

Local policies and innovative bottom-up efforts can embolden states and other cities to establish requirements that support EJ and reduce health disparities stemming from land-use planning. We hope this review of local policies in diverse California cities will inform both guidelines for and creation of new policies that push the boundaries and fill in the gaps of the current suite of policy options.

## **AFFINITY AND USAGE OF TECHNOLOGY IN GENERAL, AND TELEHEALTH IN PARTICULAR AMONGST MICHIGAN OLDER ADULTS DURING THE COVID-19 PANDEMIC**

Abstract ID: 96

Individual Paper Submission

KOTVAL-K, Zeenat [Michigan State University] kotvalze@msu.edu, presenting author

Central Research Theme: The Covid-19 pandemic and the travel restrictions imposed by many states led people to resort to technology for many of their daily needs. From ordering groceries online, to communicating and staying in touch with friends and family via social media, many of the daily needs were being met through revised behaviors and dealt most often with technology. However, older adults have been known to not adopt technology with the fervor that younger generations have grown to. This puts older adults at a disadvantage during times when travel is restricted. Increasing the adoption and usage of technology for all purposes, including healthcare appointments, would particularly benefit this population cohort.

Methodology: Primary data collected through online surveys targeted to older adults, aged 60 and over, living in Michigan, is the basis of this study. The survey responses were collected through a Qualtrics panel, where they distribute a survey and collect responses as per the study's needs.

Findings: Preliminary results indicate that since this survey was an online survey, there is a bias in the use of technology. However, even with that bias, 40% of the respondents had not used zoom/skype or the like to connect with friends and family during the travel restrictions. Over 80% had not shopped for groceries online and had them delivered, over 57% had not shopped for and got their prescriptions delivered, 72% had not visited their healthcare providers' website to request an appointment, and 75% had not used telehealth. Barrier to using telehealth and factors that would encourage them to use it more are discussed. The study points to an emerging need for older adults to take more advantage of technology to overcome some of the barriers in accessing healthcare and being more socially active. Isolation has been known to be a serious issue in older adults especially during the pandemic, and although technology cannot replace having real contact with people and being able to move about in the community, it helps to a certain degree to elevate mental and overall wellbeing.

Relevance to planning scholarship: Research on the aging population has suggested that although they increasingly prefer to age-in-place, they often suffer from physical, mental and socially isolation as they do not tend to move around in their community as much as they did when they were younger. The Covid-19 pandemic has exacerbated this isolation as travel and mobility is not a personal choice but a mandated restriction during these times. Results

indicate the need for older adults to be able to adopt and use technology and devices for multiple purposes that would enable them to successfully age-in-place and remain physically, mentally, and socially active.

KIM, Junghwan [Harvard University] junghwan\_kim@fas.harvard.edu, presenting author  
KWAN, Mei-Po [The Chinese University of Hong Kong] mpk654@gmail.com, co-author

In recent decades, air pollution exposure is one of the critical environmental factors that have negative impacts on people's health. Many studies have investigated sociodemographic disparities in people's air pollution exposure, which may result in disparities in their health outcomes (e.g., Chakraborty, 2009). For these studies, one of the critical tasks is to accurately assess how and to what extent people are exposed to air pollution (Diez-Roux, 2001). Most previous studies assumed that people are static and remain in their residential neighborhoods and considered a fixed administrative unit (e.g., census tracts) as the most important and relevant neighborhood where air pollution affects people (Kwan, 2018). In other words, previous studies have adopted the residence-based exposure assessment.

We argue that evaluations of the sociodemographic disparities in people's air pollution exposures obtained by residence-based assessments can exacerbate the neighborhood effect averaging problem (NEAP; Kwan, 2018). The NEAP is the methodological problem that mobility-based exposures tend towards the mean level of the population of a study area when compared to their residence-based exposures (Kim & Kwan, 2021; Kwan, 2018). As a result, the assessment of people's exposure to mobility-dependent environmental factors can be erroneous when people's mobility is ignored. Specifically, the NEAP implies that using residence-based exposure assessments might lead to erroneous evaluations of the sociodemographic disparities in such exposures. Furthermore, given that current public health policies largely rely on residence-based exposure assessments, the NEAP implies that their evaluations of sociodemographic disparities in exposures might be erroneous and lead to inefficient allocations of policy efforts and resources.

Only a few studies to date have provided an in-depth examination of the NEAP for studies that evaluate sociodemographic disparities in people's exposure to air pollution. To fill this gap, our research seeks to examine the NEAP in the evaluation of sociodemographic disparities in people's exposure to air pollution (outdoor ground-level ozone) by employing GIScience methods and a one-day activity-travel diary dataset of 3790 people collected in Los Angeles, California. Specifically, this study asks the following two research questions. RQ1. How does the NEAP affect the evaluation of sociodemographic disparities in people's air pollution exposures? RQ2. Which social groups with high residence-based exposures do not experience neighborhood effect averaging?

First, the spatial regression model results indicate that using residence-based exposure assessments (1) overestimates the disparity in exposures between African-American and White people and low- and middle-income people and (2) underestimates the disparity in air pollution exposures between workers and non-workers. This is because of the different manifestations of neighborhood effect averaging of each group. Therefore, the results imply that ignoring human daily mobility can exacerbate the NEAP when examining the sociodemographic disparities in air pollution exposures.

Second, 560 participants have a relatively high residence-based exposure level. Among them, 194 participants are doubly disadvantaged in air pollution exposures. The results of a spatial autologistic regression model indicate that, for those who live in high air pollution neighborhoods, non-workers have significantly higher odds of being doubly disadvantaged in ozone exposures than workers. Most non-workers are doubly disadvantaged people because they tend to spend most of their time in their residential neighborhoods, as the spatial entrapment hypothesis suggests (McLafferty & Preston, 1996).

This study concludes that ignoring human daily mobility can aggravate the NEAP in the evaluation of sociodemographic disparities in air pollution exposures. One important policy implication of our results is that public health policymakers should consider human daily mobility to take the NEAP into account when evaluating sociodemographic disparities in exposures. Furthermore, policymakers should pay special attention to the doubly disadvantaged group to fully mitigate sociodemographic disparities in people's air pollution exposures.

#### **EXPLORING THE MENTAL HEALTH IMPLICATIONS OF TRANSIT- AND PEDESTRIAN-ORIENTED DESIGNS AND COGNITIVE ARCHITECTURE FOR ADOLESCENTS: AN ECOLOGICAL MOMENTARY ASSESSMENT STUDY**

Abstract ID: 169

Individual Paper Submission

BUTTAZZONI, Adrian [University of Waterloo] [anbuttazzoni@uwaterloo.ca](mailto:anbuttazzoni@uwaterloo.ca), presenting author  
MINAKER, Leia [University of Waterloo] [iminaker@uwaterloo.ca](mailto:iminaker@uwaterloo.ca), co-author

Rates of mental illness among youth continue to rise (Collishaw, 2015) with some recent estimates suggesting that 13.4% of youth are affected by a mental disorder (Polanczyk et al., 2015). As the global population is becoming increasingly urbanized, the physical, natural, and other sensescape (e.g., noise) features of such urban environments are poised to become principally important determinants of mental health for a greater share of youth populations than at any other point in history. Presently, it is understood that certain features of urban environments can either

promote or impede mental health; however, study of urban environments and youth mental health are beset by crude measures of environmental influences (e.g., residential space, level of ‘urbanicity’) which lack exactness, and larger quandaries such as the issue remaining relatively understudied when compared to adults (Bundy et al., 2018). Examining specific urban forms and architectural styles and their connection with the mental health of youth populations holds the potential to improve the understanding of this relationship, as well as enhance the concept of universal design in urban planning. To this end, a number of specific urban and architectural designs have been suggested to have salutary impacts on human mental health, including pedestrian- and transit-oriented designs (PTOD) and cognitive architecture (CA) principles. PTOD, broadly, comprise a series of urban designs such as imageability (features that create an impression; e.g., landmarks), enclosure (vertical elements; e.g., buildings), human scale (physical qualities; e.g., wayfinding signs), transparency (street-level considerations affecting visual scope; e.g., windows), and complexity (visual richness; e.g., number of architectural styles) that are intended to promote active lifestyles (Ewing, 2013). Likewise, CA principles such as biophilic design (nature in urban design), fractal patterns (repeated similar patterns), and symmetries (repeated designs) have been suggested to have distinct relationships with the human brain that may affect mental health (Salingaros, 2014). To more precisely investigate youth mental health and urban environments, the present study examines the associations between six emotional indicators (positive affect, negative affect, calm, anxious, restorative, demanding) and five PTODs (imageability, enclosure, human scale, transparency, complexity) and three CA principles (biophilic design, fractals, symmetries) in a probability-based sample of 100 adolescents (10-16 years old). The study applies an ecological momentary assessment and repeated measures survey design to explore how specific PTODs and CA concepts impact the self-reported mental health of adolescents. While completing an online survey via their mobile phones, participants traversed a predetermined 1.65 km route near downtown Kitchener, Ontario featuring six distinct urban settings (multi-modal trail, residential street, bluespace, greenspace, public transit stop, and built-up downtown street) that had been scored for the PTOD features, as well as directly observed real-world examples of each CA principle (biophilic design - urban garden; gothic church façade – fractal patterns; heritage building – symmetries). Mixed-effect models (MEMs) controlling for age, gender, subjective social status (i.e., youth-based measure of SES), household demographics (i.e., parental supervision), birth order, and physical activity levels were used to analyze the six emotional indicators across each of the distinct urban settings. MEMs with the same controls were used to investigate positive-negative affect with respect to symmetries, anxiety-calmness regarding fractal patterns, and restoration-demand in association with biophilic design to assess the implications of the CA concepts. Results of the study are forthcoming and will be discussed during the presentation. Findings from this research can inform planning practitioners on how to design more urban spaces that promote mental well-being—more particularly, which specific urban and architectural designs may be beneficial to the mental health of younger populations—and contribute to updating notions of universal design in planning.

## ANTICIPATED WILLINGNESS TO SHARE RESOURCES IN A DISASTER SCENARIO: THE ROLE OF SOCIAL TIES IN PLACE-BASED COMMUNITIES

Abstract ID: 237

Individual Paper Submission

IDZIOREK, Katherine [University of North Carolina Charlotte] kidziorek@uncc.edu, presenting author

ABRAMSON, Daniel B. [University of Washington] abramson@uw.edu, co-author

CHEN, Cynthia [University of Washington] qzchen@uw.edu, co-author

In the United States, disaster preparedness planning and outreach have historically been approached in a top-down manner that targets individual households. A one-size-fits-all approach overlooks the richness of place-specific resources and relationships that could be leveraged to support disaster resilience. It is generally understood that social ties and social infrastructure constitute critical support systems for communities during times of disaster (Aldrich 2012, Klinenberg 2015). However, clear gaps exist in the understanding of social behavioral responses to resource scarcity in a disaster scenario, including resource-sharing within communities (Thomas & Mora 2014). Furthermore, standard approaches to resilience planning tend to shift the responsibility for “being resilient” from government onto individuals and communities (Davoudi 2012). In this context, community members’ willingness to share resources becomes an important factor in disaster response given the isolating effects of many types of disasters on communities and the subsequent need for localized self-sufficiency. Emerging research on disaster sharing indicates that attitudinal factors such as trust play an important role in supporting sharing in a large-scale evacuation context (Wong, Walker, and Shaheen 2021). This study contributes to advancing that exploration by focusing on anticipated willingness to share specific types of disaster resources at the local level, within place-based communities.

Our motivation for working at the community scale is driven in large part by the anticipation of a large seismic event in the Pacific Northwest. In the case of such an event, communities will likely be on their own for an extended period of time, and they may need to rely on local resources for meeting basic needs. In a large earthquake scenario, people are likely to have limited access to – and a limited supply of – resources needed to carry out essential everyday activities. These resources range from items that provide sustenance, like food and water, to networked systems that enable transportation and communication.

In this study, we examine specifically the differences of community members’ willingness to share a range of items needed to carry out essential everyday activities and the role that strength of social ties plays in that willingness to share. Using data gathered in three characteristically different Washington State communities, we aim to better understand willingness to share so as to help inform community-based disaster preparedness efforts. By engaging community members through focus groups and a sample survey, this research explores the roles of social ties, social attitudes, and local knowledge in supporting anticipated willingness to share resources within communities. We focus on attitudes that relate to disaster preparedness, community social relationships, and relationship to place in order to better understand the potential for community-scale interventions that could help to support disaster preparedness in specific contexts.

Our findings support the development of context-specific disaster preparedness strategies and suggest that trust-building within place-based networks should be viewed as a practical measure to support resilience. We offer evidence that person-to-person and person-to-place relationships serve as critical resources for supporting community well-being in the face of disruption. These findings can be applied practically by disaster preparedness planners and community-based organizations seeking to prioritize the distribution or development of disaster preparedness resources within community settings.

## **BUILDING ALL-AGES-FRIENDLY COMMUNITIES IN SHANGHAI: MEASUREMENT OF 15-MINUTE COMMUNITY-LIFE CIRCLES' WALKABILITY AND THE URBAN PLANNING RESPONSE.**

Abstract ID: 238

Individual Paper Submission

ZHAN, Ye [College of Architecture and Urban Planning, Tongji University] zhanye@tongji.edu.cn, presenting author  
YU, Yifan [College of Architecture and Urban Planning, Tongji University] yuyifan@tongji.edu.cn, primary author

**Background:** A sufficient number of studies have highlighted that walking is conducive to increasing physical activity, and a walk-friendly neighborhood reduce the risk of obesity and noncommunicable diseases (NCDs), ultimately to improve walking behavior and public health. In 2016, China promulgated the "SHANGHAI PLANNING GUIDANCE OF 15-MINUTE COMMUNITY-LIFE CIRCLE", the core of which is to build a 15-minute walkable neighborhood. The concept of community-life circle emerged in Asia and becoming global focus in the Post-COVID-19 World.

**Purpose:** Walk Score is a tool evaluates how a particular location is supportive of residents' walking, based on the distance to various public facilities. Studies with Walk Score are lacking in developing countries, and most of the current research focuses on the entire population. Therefore, this paper aims to: (1) evaluate the walkability of 15-minute community-life circle in the center area of Shanghai from the perspective of the elderly and children with the modified method based on Walk Score. (2) analyze the accessibility of specific public facilities that are frequently used by the elderly and children in Shanghai. (3) provide insightful suggestions for building healthy and all-age-friendly communities in urban China.

**Methods:** Digital geographic data, including 10484 communities and public facilities Points of Interest (POIs) with geographical coordinate (WGS84), road networks, are acquired from API of Amap. Demographic data, which are collected from the sixth national population census. The Measurement of Walk Score includes 4 main steps: (1) assigning raw weights for selected public facilities. The survey was conducted by means of a questionnaire among 846 respondents. (2) Through the API of Amap, the walking path planning function that can respond to the real-time traffic conditions is called. Considering the walking characteristics of the elderly and children, 75 m/min and 70m/min are selected to calculate the time for them to reach various facilities within the 15-minute walking range. (3) computing the total scores and modifying the scores according to decay factors; and (4) normalizing scores to 0–100.

**Results:** As for both groups, a few high walkable communities (Walk Score $\geq$ 70) are concentrated around the core area composed of 4 districts. And the farther away from the core area, the lower the score. In terms of elderly's walkability, the proportions of the communities with higher walkability (walk score $\geq$ 70) are 28%. For children, the

figure was 33%. It is worth noting that for the elderly, 30% of the districts have inferior walkability (walk score ≤ 49), while for children, the proportion is 23%.

For further research, the bivariate local Moran's I statistic was performed to capture the correlation between the proportion of a pedestrian group within one certain subdistrict and the corresponding score in GeoDa. The results revealed, the "high-high" clusters (proportion of population at a location and corresponding score at the surrounding places are both high) appeared in the core area. Both for elderly and children, the "high-low" outliers appeared in 2 subdistricts indicated mismatches of the 15-min community-life circle. The study also analyzed the walkability of a particular public facility, revealing that, in Yangpu District, the walkability of facilities such as community health centers, stadiums, parks which are frequently used by both groups of people, is lower.

**Conclusions:** Walk Score can be used to quantify the walkability of 15-minute community-life circle, and the standardized rating is helpful for horizontal comparison. There is an imbalance in Shanghai where high walkable communities are clustered in the core area and inferior are clustered on the edge. In addition, there is also a mismatch between population density and walkability. These are areas that need to be improved in the future through measures such as adjusting land use and increasing public facilities.

## THE ROLE OF LOCAL GOVERNMENTS IN PROTECTING COMMUNITY WELLBEING DURING COVID-19 IN SOUTH KOREA

Abstract ID: 240

Individual Paper Submission

KIM, Yunji [Seoul National University] yunjik@snu.ac.kr, presenting author

JEONG, YeongAh [Seoul National University] angel02052@snu.ac.kr, co-author

In 2020, the COVID-19 pandemic threatened the health and wellbeing of communities around the world and continues to do so. As planners and policymakers try to learn from other countries, the research thus far has been focused on national responses with national governments as the unit of analysis. Yet, local governments are critical actors of protecting and promoting community health and wellbeing.

South Korea has been considered a model case for responding to COVID-19, leading to popular use of the term "K-quarantine." However, recent research has pointed out that the success of "K-quarantine" rested on the role of local governments, the private medical and biotechnology sector, and citizens. What role did Korean local governments play in the response to COVID-19? How did citizens evaluate these responses? This paper uses policy briefs, news reports, and local government website data to explore the role of local governments. Next, the paper uses 2020 national survey data (sample size=16,555) to examine how citizens evaluated local government responses to COVID-19.

Many of the critical responses to COVID-19 in South Korea were local government initiatives. Not only were local governments in charge of implementing national-level directives, but also, they actively planned and executed local responses. For example, the widely publicized drive-through testing center was first implemented on a local district scale in the City of Goyang, South Korea that was quickly adopted by other local governments. The thorough contact tracing and rapid information sharing with the public about confirmed cases were made possible with the cooperation of local governments. Policies that are now national, such as requiring a mask on public transit or requiring a QR code check-in at public facilities, were ideas from local governments. Local governments have also led policies on economic recovery. Local government leaders argued that a COVID-19 emergency fund was necessary and distributed stimulus checks to their residents before the national government. Moreover, recognizing that COVID-19 safety measures, such as renting and using disinfection machines and installing acrylic shields, may be cost-prohibitive for business owners, some local governments have been delivering disinfectants, renting disinfection machines, and providing acrylic shields for free. Local governments have also adopted local ordinances to incentivize property owners to decrease rent for their tenants.

Another critical component of successful planning in times of crisis is citizen responses. On the one hand, culture will play an important part in following social distancing or mask regulations. Meanwhile, citizen trust in the government and local authorities and their perceptions of local measures will also shape the level of compliance. This paper will use national survey data on how citizens evaluated the danger of COVID-19, local government responses, and other citizens' responses. Finally, the paper will discuss lessons and limitations of Korea's response to COVID-19 from a local planning perspective.

The findings of this study will have practical implications for local planners responding to large-scale crises and emergencies while trying to enhance community wellbeing. Moreover, the findings will allow us to test how citizen evaluations are related to local planning responses.

#### **TECHNOLOGY AND AGING IN PLACE: AN INVENTORY AND ASSESSMENT FOCUSING ON THE NEIGHBORHOOD, MUNICIPALITY, AND METROPOLITAN SCALES**

Abstract ID: 253

Individual Paper Submission

LYU, Yingying [Harvard University] yingyinglu2011@gmail.com, presenting author  
 FORSYTH, Ann [Harvard University] aforsyth@gsd.harvard.edu, co-author

#### Research Questions

Research on the potential benefits of technology for aging has been thriving since the term "Gerontechnology" was coined in 1990s (Schulz et al., 2015). While much has been written about technologies helping older people age in

place inside homes, less attention has been paid to the neighborhood and city environments they inhabit including streets, parks, transportation options, and delivery systems (Liu et al., 2016; Pu et al., 2019). Meanwhile only a small part of the smart city literature has specifically targeted older people. This paper reviews assistive technologies that operate outside buildings, responding to two questions: What new urban-scale technologies are available to support older people using their neighborhood, municipal, and metropolitan environments as they age in place? How might these technologies enable older people to use their urban environments more safely, comfortably, and autonomously?

## Methods

Reviewing both scholarly and gray literature, we compiled an inventory of urban scale aging technologies, focused on those with a physical form rather than smart-phone applications. We also adapted technology typologies or classifications developed for technologies at the person and building scale to look more specifically at technologies at the block, neighborhood, city, and metropolitan level. These identified domains of technology such as mobility, and functions including monitoring, diagnosis, and intervention. The inventory and the typology further refine each other.

## Results

We found a wide range of technologies that can potentially help older people in multiple life domains including physical and mental health, mobility, social connectedness, safety, and everyday activities and leisure. However, most technologies focus on improving mobility and safety—for example pedestrian crossing sensors, smart crossing signals, wayfinding tools, mobility support robots, vehicle access equipment, automated delivery, fall monitors, and smart streetlights. Less common were technologies for using spaces in a more static way, e. g. enhancing audio or monitoring air quality. More technologies are needed especially for supporting social encounters in neighborhoods and improving mental health. Moreover, some technologies rely on infrastructure such as streets and sidewalks which are unevenly provided.

## Implication

Given growing numbers of older people and increasing numbers who live alone (Forsyth et al., 2019), this review identified a range of cutting-edge technologies that can help older people inhabit and use urban spaces more safely, effectively, and independently. Understanding urban-scale technologies to support aging could help urban planners who target a more age-friendly environment to transform urban spaces to accommodate the emerging technologies.

## Conclusion

Technologies have great potential to help older people thrive beyond homes at the urban scale by facilitating their physical and mental health, mobility, social connectedness, safety, and everyday activities and leisure.

## THE EFFECTS OF TRANSPORTATION BARRIERS ON LOSING JOB IN CANCER PATIENTS

Abstract ID: 334

Individual Paper Submission

ETMINANI-GHASRODASHTI, Roya [University of Texas, Arlington] roya.etminani@uta.edu, presenting author

ARIF QAISRANI, Muhammad [University of Texas at Arlington] muhammad.khan10@mavs.uta.edu, co-author

Continuing working is one of the most critical challenges that cancer patients face in terms of social, financial, individual, and psychological impacts on their lives (Boer et al. 2009). Approximately 26% to 53% of cancer patients meet unemployment, job loss, and quit working during or after treatment (Egmond et al. 2017). Three main domains can negatively affect losing a job in cancer patients, including 1) treatment-related factors, 2) sociodemographic characteristics, and 3) work-related factors. While the effects of health-related and work-related factors on the losing job in cancer patients have received much attention in public health, the effects from the transportation barriers in patients' work trips are still ambiguous. Although a rich set of the literature investigated cancer patients' transportation barriers (Silver, Blustein, and Weitzman 2012), the impacts of working trip burdens on cancer patients' continuing/losing their job received less attention. Only a few studies have examined the role of working travel behavior in cancer patients' employment status (Peteet 2000; Moore 1999). To address this limitation, this study aims to understand how working trips can result in losing a job or not accepting a job position by cancer patients during a treatment process. Hence, this study seeks to address the following research questions: 1) How does travel to work influence cancer patients' losing job when controlling the effects from treatment-related and sociodemographic factors? 2) Which factors contribute to cancer patients' employment status, transportation, or treatment-related burdens?

This study employs a survey conducted across the U.S. in 2019 and utilizes data from cancer patients who received radiotherapy and chemotherapy treatments. Comprehensive questions were asked to collect data related to work trips, treatment trips, and travel burden in journey to work while considering two types of treatments including radiotherapy and chemotherapy. With data collected from the survey, machine learning models are further employed to assess the factors contributing to patients' losing jobs quantitatively.

Results suggest that working trip attributes included trip mode and trip length, have a significant impact on cancer patients' job loss. Moreover, work travel burdens such as lack of access to public transportation leads to the losing job in cancer patients. The need for assistance with travel to work due to the treatment side effects is the other factor impact cancer patients regarding losing/discontinuing their jobs.

Our study results suggest that in addition to the direct effect of cancer, logistic barriers related to work can cause cancer patients to lose their jobs. Insights generated in this study have great potential to help policymakers and planners make informed decisions to enhance cancer patients' accessibility to work and improve their health outcomes.

## COVID-19 AND OUTDOOR RECREATIONAL WALKING: EXAMINING THE MODERATING EFFECTS OF AREA DEPRIVATION

Abstract ID: 337

Individual Paper Submission

LEE, Sungmin [Texas A&M University] [sungminlee@tamu.edu](mailto:sungminlee@tamu.edu), presenting author

LEE, Chanam [Texas A&M University] [chanam@tamu.edu](mailto:chanam@tamu.edu), co-author

ORY, Marcia [Texas A&M UniversityTexas A&M Health Sciences Center] [mory@tamu.edu](mailto:mory@tamu.edu), co-author

**Background:** The COVID-19 pandemic has significantly constrained engagement in physical activity critical to optimal physical and mental health. Thus, outdoor walking has become increasingly popular as a safe and affordable means to stay active and fight against social isolation while following social distancing protocols. However, findings from a small body of published studies on the impacts of COVID-19 on outdoor recreational activity have been inconsistent. Some studies found negative effects of the pandemic on recreation visits and values (Landry et al., 2020), while others reporting increased outdoor recreational activities during lockdown (Venter et al., 2020).

Opportunities to engage in outdoor recreational activities depend heavily on the availability and quality of recreational locations (e.g., parks, trails, neighborhood streets), which is substantially associated with neighborhood socioeconomic circumstances. Prior studies have shown that those living in deprived neighborhoods with limited physical activity resources engaged in lower levels of physical activity and walking (Jones et al., 2009) and had poor health status (Reijneveld et al., 2000). Those living in deprived/disadvantaged neighborhoods tend to have poorer health outcomes and greater risks of COVID-19 infection, compared to their counterparts (KC et al., 2020). However, it remains unclear how and to what extent COVID-19 and area deprivation impact outdoor recreation walking.

**Purpose:** This retrospective study aims to address these research gaps by examining: 1) the effects of the COVID-19 pandemic on outdoor recreation walking (frequency and location) and 2) if such effects are moderated by neighborhood deprivation, measured with Area Deprivation Index (ADI).

**Methods:** A total of 1,046 participants living in El Paso, Texas was recruited in July 2020. Online surveys were used to measure participants' demographics, socioeconomic status, and daily life change in mobility due to the COVID-19 pandemic. ADI was used to rank the neighborhoods of the survey respondents by their socioeconomic characteristics, using the 2018 US Census American Community Survey. The neighborhoods were then categorized into those of low deprivation (ADI ≤ 57) and high deprivation (ADI score ≥ 87) according to ADI quartiles. To understand the differences of COVID-19 impacts on outdoor recreation walking, we used a difference-in-difference (DID) test to examine the pre-during COVID-19 differences in recreational walking between those living in areas of low and high deprivation.

Results: During the COVID-19 pandemic, weekly recreational walking minutes decreased significantly ( $\Delta$  mean Change=-28.28, S.E.=9.24 min/week), compared to pre-COVID-19. However, recreational walking among those living in areas of high deprivation decreased more than those in low deprivation areas. Compared to pre-COVID-19, recreational walking in neighborhood streets and green spaces increased during COVID-19 in low deprivation areas but decreased in high deprivation areas. Although recreational walking in parks decreased in both areas since COVID-19, we found steeper decreases in areas of high deprivation, compared to areas of low deprivation. ADI did not show significant moderating effects for the frequency of recreational walking. However, the DID tests indicated that the pre-during COVID-19 difference in green space visits between high and low deprivation areas was significant ( $B = -.708, p=.013$ ).

Discussion: While the COVID-19 pandemic has negatively affected engagement in overall recreational activities, disparities were found in the use of different recreational locations during COVID-19. We found that the COVID-19 impacts on recreational walking were more evident in disadvantaged neighborhoods with greater deprivation. Accessible green spaces and safe neighborhood streets appear promising for equitable promotion of outdoor recreational walking, which can help residents in deprived areas cope with negative physical and mental health impacts of such pandemic.

## HOW TRAVEL TO HEALTHCARE PROVIDERS INFLUENCES QUALITY OF LIFE (QOL) IN CANCER PATIENTS DURING TREATMENT?

Abstract ID: 339

Individual Paper Submission

MOZAFFARIAN, Ladan [University of Texas, Arlington] ladan.mozaffarian@uta.edu, presenting author  
ETMINANIGHASRODASHTI, Roya [University of Texas, Arlington] roya.etminani@uta.edu, co-author

While advanced treatment methods and early detection have decreased cancer mortality rates, there are still deficiencies in addressing cancer patients' Quality of Life (QoL) during and after treatment. For cancer patients, in addition to physical and emotional well-being and social functioning, cancer characteristics such as type and stage of cancer and type of treatment, as well as cancer patients' access to healthcare providers (Drury et al., 2020), are among the most crucial factors to affect their QoL. Few studies have specifically examined the role of transportation in cancer patients' QoL. While the relationship between physical aspects of QoL and transportation has received inconsistent attention, the QoL's psychological, social, and financial aspects were rarely addressed (Lee & Sener, 2016). Poor accessibility and transportation barriers can limit patients' range of choices, their regular daily life, and

their social interaction opportunities, and therefore, will affect their QoL (Lee & Sener, 2016).

Although literature has investigated the health care accessibility for cancer patients (Zullig et al., 2012), impacts of transportation barriers on cancer patients' QoL have not been addressed directly. Treatment-related issues such as its schedule, duration, frequency, and side effects resulting in travel barriers can dramatically affect cancer patients' QoL life. For patients who need to travel to treatment centers; especially if they do not have access to either public transit or a car; transportation can become a real obstacle (Coughlin & King, 2010). Although travel accessibility and its effects on cancer patients' health outcomes have received ample attention in the literature, the association of travel burden with cancer patients' QoL is less considered. Therefore, this study aims to provide evidence to identify 1) To what extent transportation-related aspects may affect cancer patients' QoL? 2) How transportation-related barriers of two different treatment types (radiotherapy and chemotherapy) are associated with cancer patients' QoL?

This study uses a cross-sectional survey of cancer patients in the U.S. in 2019 diagnosed and followed radiotherapy and chemotherapy treatment (n = 750). The structural equation model is used to investigate the effects of transportation-related barriers on cancer patients' QoL. We explore the effects of key variables, such as cancer patients' sociodemographic attributes, treatment characteristics and travel behavior to health care providers; on QoL. Lack of access to appropriate transportation is considered as the travel burden factor mediates the effects from key variables on QoL during the radiotherapy and chemotherapy treatments.

The findings of this study indicate that travel behavior including trip mode, trip length and trip frequency to healthcare providers for receiving radiotherapy and chemotherapy considerably influence the QoL of patients during the treatment. Besides, lack of access to transportation mediates the effects of key variables on QoL. Moreover, the results indicate the relationships between lack of access to transportation, travel behavior factors and QoL is different for radiotherapy and chemotherapy treatments. Our results can support the studies suggest that transportation as a burden mainly affects patients who have lower socioeconomic status, those with no access to a car, and those with a lower level of social support (e.g., Zullig et al., 2012). Moreover, this study complement the findings from studies argue that more distance to the healthcare facilities is associated with lower QoL aspects among cancer patients (e.g., Ambroggi et al., 2015). Our results suggest that QoL measurement can be used as a policy tool by communities and local governments to evaluate the extent to which the mobility and built environment meet patients' needs with chronic disease.

### THIRD-PARTY FOOD DELIVERY AND THE CHICKEN SANDWICH + FRIES: HOW FOOD DELIVERY PLATFORMS ARE CHANGING OUR RELATIONSHIP TO FOOD IN DENVER, COLORADO

Abstract ID: 386

Individual Paper Submission

QUARLES, Hillary [University of Colorado - Denver] [hillary.quarles@ucdenver.edu](mailto:hillary.quarles@ucdenver.edu), presenting author

Worldwide revenues from third-party food delivery platforms have more than doubled between 2017 and 2020 and are expected to reach \$96,864.4 million by 2024 (Statista, 2021). Uber Eats, a behemoth in global food delivery, controls 29% of the market and is valued at \$20 billion. Its revenues in the first half of 2020 surpassed the entirety of its revenues in 2019 (Business of Apps, 2020). The dramatic expansion of food delivery revealed in these statistics reflects a seismic transformation in our food system based on convenience and contract labor. How does the rise in food delivery affect community foodways? What are the impacts on our cities and food environments? Using qualitative surveys and semi-structured interviews of restaurant owners, drivers and consumers in Denver, Colorado, this research examined how food delivery platforms change our relationship to food by territorializing culinary spaces, including restaurants, kitchens and pantries through behavioral economics and deskilling.

In *Speculative Visions and Imaginary Meals: Food and the Environment in (post-apocalyptic) Science Fiction Films*, Jean Retzinger describes the critical role of food beyond nutrition: "For food not only shapes our bodies, but it structures our lives, fashioning daily rituals and helping mark significant rites of passage. Food connects us to others both directly, through shared meals, and culturally, through shared 'tastes'" (Retzinger, 2008, p. 370). What happens when food is divorced from our daily routines and when rites of passage are marked by takeout containers rather than products of love? The explosion of third-party food delivery is transforming the diet of Denver residents in real-time, slowly diminishing our memories of food traditions and encroaching on foodways. Food delivery platforms undermine community foodways by robbing consumers of both culinary skills and taste.

The research builds on the theory of brokerage in which brokers use their central position and exclusive control to structure and regulate values, exploiting inequality (Vonderau, 2019). Food delivery platforms function as the central controls of the food delivery system, regulating platform users and their communication and influencing what foods are perceived as desirable. The research also incorporates the theory of culinary deskilling, examined in *Deskilling the domestic kitchen: national tragedy of the making of a modern myth?* (Lyon et al., 2003). Food delivery platforms enable us to bypass the development of cooking skills, undermining the reproduction of knowledge required to sustain foodways.

This research reveals how food delivery platforms in Denver, Colorado, change our relationship to food by providing convenient homogenized and idealized food choices that disconnect us from our home kitchens and pantries and rely on a highly-choreographed network of independent contractor drivers to feed us. Food identity is lost in the chicken sandwich + fries that is delivered from a dark kitchen located in an industrial area to a customer living in a high-rise downtown by a college student who lives off campus on the edge of town. As Belasco argues, "Food identifies who we are, where we came from, and what we want to be" (Belasco, 2008, p. 1). The chicken sandwich + fries tells little about who we are, but a lot about the consumers we are becoming. Policy makers, planners and designers should take note – as third-party food delivery platforms change our relationship to food, they also change the food infrastructure of our cities.

## IS TRAVEL BEHAVIOR AN EQUITY ISSUE? USING GPS LOCATION DATA TO ASSESS THE EFFECTS OF INCOME AND SUPERMARKET AVAILABILITY ON TRAVEL REDUCTION DURING THE COVID-19 PANDEMIC

Abstract ID: 398

Individual Paper Submission

GROSS, James [University of Southern California] grossjam@usc.edu, presenting author

LIU, Jody [University of Southern California] jodyl@usc.edu, co-author

HA, Jaehyun [University of Southern California] jaehyunh@usc.edu, co-author

With recent research identifying mobility restrictions for alleviating the spread of COVID-19, governments have implemented stay-at-home measures, which in turn produced significant changes in people's travel behaviors. Despite these orders, however, people still have to commute for work or to acquire essential goods. To better understand how these necessary trips influenced changes in individual mobility due to the pandemic, this study focused on the relationship between trip frequency and distance to median incomes, as well as between trip frequency and distance to supermarket density. We made use of the University of Maryland COVID-19 Impact Analysis Platform as our primary source for GPS travel data to study mobility changes at the county-level across the United States. Results of spatial lag regression models showed that trip frequency and distance were significantly different before the outbreak of COVID-19 and during three peak periods of COVID-19 infection. Specifically, we found both frequency and distance of trips to be negatively correlated to median income; that is, households with higher incomes were found to have reduced their frequency and distance of travel during the outbreaks. Additionally, we also found a negative correlation in frequency and distance of trips to supermarket density. Thus, we conclude that individual choice in adherence to staying-at-home is less dependent on the lockdown measures and more influenced by financial capacity and access to necessary goods and services. These findings could help inform policy development and programmatic responses to help people reduce their mobility. For example, government authorities might consider monthly stimulus or other financial support programs that would allow people greater access to delivery services. In the future, urban planners and policymakers should address the root causes that lead to such economic disparities and food insecurities, in order to build resilience in the face of possible future pandemics.

## THE ROLE OF EQUITY AND CLIMATE PRIORITIZATION IN FEDERAL SUPPORT FOR LOCAL FOOD SYSTEMS EXPANSIONS

Abstract ID: 400

Individual Paper Submission

KELMENSEN, Sophie [University of North Carolina at Chapel Hill] sophiekelmenson@gmail.com, presenting author

Local and regional food systems are increasingly recognized as an avenue for enhancing local resilience and environmental sustainability, driving local economies, and mitigating food apartheid. Yet little is understood about the ability of these efforts to advance these goals concurrently. Indeed, case studies suggest that sustainability has been pursued at the expense of social justice. This paper analyzes the impacts of the federal Local Food Promotion Program administered by the United States Department of Agriculture (USDA), which aims to enhance access and availability of local and regional agricultural products, particularly in under-resourced communities. The program provides support for both planning and implementation in local and regional food systems expansions. To assess the potential impact on local economies, this paper tests for positive impacts on the number of nearby small and medium farms (a proxy for local and regional food producers) and their sales, as well as local vegetable sales, compared to communities where an organization unsuccessfully applied for funding. To assess commitments to environmental sustainability and social justice, grant applications and final outcome reports to the program are analyzed. These applications, in conjunction with context about applicant organizations and socioeconomic data on host communities, reflect the myriad of ways organizations imagine food systems interventions and provide important information regarding the extent to which sustainability and equity are centered within their work and USDA's priorities.

## SOCIAL ISOLATION, MOBILITY, AND HEALTH AMONG OLDER CHINESE IMMIGRANTS IN THE GREATER TORONTO AREA, CANADA

Abstract ID: 454

Individual Paper Submission

DEJOHN, Amber [University of Toronto] amber.dejohn@mail.utoronto.ca, presenting author

WIDENER, Michael [University of Toronto] Michael.widener@utoronto.ca, co-author

LIU, Bochu [University of Toronto] Bochu.liu@mail.utoronto.ca, co-author

LIU, Zhilin [Tsinghua University] zhilinliu@mail.tsinghua.edu.cn, co-author

\*A similar abstract was submitted/accepted last year but due to the pandemic, we were unable to present this paper. However, we have adapted to the current context, and would like to present the findings at the 2021 meeting.

As older adults progress through the life course they are at higher risk of social isolation (Keefe et al., 2006), which

has been shown to be more predictive of mortality than smoking cigarettes (Pantell et al., 2013). This social isolation could be further exacerbated when coupled with international migration, which also creates barriers to social participation and senses of belonging. Social isolation is both related to and a potential cause of loneliness, and together these two phenomena have been shown to have a reciprocal relationship with worsening physical and mental health outcomes (Cacioppo & Cacioppo, 2014). Building strong social support networks is integral to supporting health among older migrant populations but built environments may pose barriers to their formation or quality (Lamanna et al., 2019). Older Chinese adults (65y+) made up 10.5 percent of the Chinese-Canadian population in 2011, but are commonly underrepresented in federal datasets and warrant further attention (Zhang, 2019).

To explore the impact of the built environment on an older immigrant population's social and physical health, this research captures data on individuals' daily mobility patterns and activities. Surveys and activity logs from 130 Mandarin-speaking Chinese immigrants over the age of 60 are collected across urban and suburban neighborhoods in and near Toronto, Canada in Spring 2021. Single-day activity logs are used to construct spatiotemporal activity spaces for each participant, providing representations of participants' shifting experiences with built environments and allowing this study to move beyond commonly used residence-based measures. Quantitative results, including descriptive statistics and estimated model results, of the surveys and activity logs will be presented with a focus on how social connections in Canada and urban mobility barriers impact levels of social isolation (frequency of social engagements), loneliness (De Jong Gierveld 6-item scale), and self-reported health (SF-12). Survey findings related to changes in social connectedness during the coronavirus pandemic are provided for context. These results will provide a comprehensive look at social isolation and inform urban planning policy aimed at improving overall levels of social and individual health among older, Chinese immigrants in an urban center of migration. As immigration continues to shape how urban landscapes are occupied and modified, understanding social relationships is key to incorporating this growing demographic into the urban fabric.

#### A LONGITUDINAL ANALYSIS BETWEEN TRANSIT INVESTMENT AND ECONOMIC HEALTH

Abstract ID: 484

Individual Paper Submission

YU, Chia-Yuan [University of Central Florida] chia-yuan.yu@ucf.edu, presenting author

Transit-oriented development (TOD) has been recognized as a solution to reduce traffic congestion (Dawkins and Moeckel 2016). Because introducing a rail system may gradually improve the accessibility and provide amenities around the transit area, it could potentially act as an environmental intervention in promoting walking behaviors. The improved accessibility and amenities in the vicinity of transit areas could often be capitalized into housing values (Wessels, Pardo, and Bocarejo 2012). However, transit system may also result in negative externalities such as noise and pollution (Seo, Golub, and Kuby 2014), which could negatively impact property values.

Although several studies explored the effect of rail access on residential housing values (Seo, Golub, and Kuby 2014; Yan, Delmelle, and Duncan 2012), two limitations have not been considered. First, most studies explored the property value changes solely after the operation of a transit system, which could not comprehensively capture the dynamics between the transit investment and housing value changes. Second, most applied a hedonic price framework and did not account for the selection bias by using an intervention-control design, which may bias upwardly the effects of public transit on housing values (Yu et al. 2018).

This study applied a pre-post and intervention-control design to examine the changes in housing values before-and-after the several stages (announcement, construction, and operation) of the transit investments of SunRail in Orlando, FL. For the application of a pre-post design, this study considered several time periods to explore the changes in property values. This study conducted the pre-post comparison for the announcement (2008-2011), construction (2011-2013), and operation (2013-2016). For the intervention-control design, this study selected residential parcels within the 1-mile buffer from each transit station as the intervention group (exposed) and those located between the 1-2-mile buffer from the station as the control group (non-exposed). The data source for the parcel-level property value was from Orange county property appraiser for 2008-2016. Propensity score matching is a widely used matching procedure to create observationally similar intervention and control groups.

From the announcement to the operation (2008-2016) of SunRail, this study showed that the changes of residential property values within the 1-mile buffer around stations had no significant difference than those located in the 1-2-mile buffer. Considering the property values for different stations, three stations (Florida Hospital, Church Street, and LYNX Central) generally shared the same pattern in terms of the change of property values. During the announcement period (2008-2011) for these three stations, the residential parcels in the exposed areas were more resilient in weathering property value declines than those in the control areas. But during the operation period (2013-2016), housing values in the exposed areas increased less than those in the control areas. One of the potential explanations is the surrounding urban designs. These stations are located in areas with relatively high densities, connected sidewalk infrastructure, and walk-and-ride features, which provides a high level of accessibility and encourages more walking behaviors. Such a design cultivates a culture for public transit and could thus contribute to preferences for housing in close proximity to transit. During the operation period, however, the added noise and pollution from the rail on top of the busy traffic may lead to a lower level of willingness to pay for the house within the 1-mile buffer.

This study has provided critical implications for transportation and urban planning. The economic effects from transit investment during different time phases have informed several stakeholders such as urban planners and transportation planners to consider the built environments around transit stations. The contextual environmental characteristics could affect not only the accessibility and amenities but also the economic values manifested in housing values.

## **BUILDING SPATIO-TEMPORAL COMPARISONS: GENTRIFICATION AND HEALTH FROM THE NATIONAL TO THE NEIGHBORHOOD LEVEL**

Abstract ID: 492

Individual Paper Submission

SPURLOCK, Danielle [University of North Carolina at Chapel Hill] dspurloc@email.unc.edu, presenting author

A substantial body of literature links neighborhood conditions to health outcomes (Diez Roux & Mair, 2010; Kawachi et al., 2009), but the relationships among gentrification, displacement and health remain unclear. This uncertainty stems, in part, from challenges to measurement: the definition and presence of gentrification, geographic scale, and time (Tulier, Reid, Mujahid, & Allen, 2019). The dynamic nature of gentrification complicates its definition although considerable scholarship exists using existing data sources (Ding, Hwang, & Divringi, 2016; Freeman, 2005). Data availability shapes the geographic scale at which many studies occur, which can present a modifiable areal unit problem. The uneven progression of gentrification and displacement confounds the linkage between exposure and health outcomes measured at the individual level. In short, despite the central roles gentrification, displacement, and health disparities play in urban policy discussions, we need considerable research to clarify relationships among these topics. In this study, we explore datasets linking gentrification and health at the national, state, city, and neighborhood level over time.

We will integrate an existing dataset with national, state, and city data with local findings on gentrification and health. Our previous work created a database linking gentrification indices at the census tract to the CDC's 500 Cities: Local Data for Better Health, and the U.S. Small-area Life Expectancy Estimates Project—USALEEP. We operationalized gentrification using approaches developed by Freeman (2005) and Ding, Hwang, and Divringi (2016). CDC's 500 Cities dataset contains data for 27 measures of chronic disease related to health behaviors, health outcomes, and use of preventive services and the USALEEP dataset (also known as the Neighborhood Life Expectancy Project) provides life expectancy at birth for most U.S. Census tracts for the period of 2010-2015.

In collaboration with Communities in Partnership, a nonprofit based in Old East Durham, and community residents, we will conduct a second round of household survey stratified by type of housing tenure (i.e., tenancy versus owner-occupied) using community based participatory methods in May 2021. The previous survey of 120 household (~12% of the neighborhood) in April 2018 will provide a pre-COVID 19 datapoint. Both surveys include questions on housing affordability, attitudes, and beliefs about displacement and/or the threat of displacement, and self-reported health status and behaviors.

By utilizing two similar but different definitions of gentrification, exploring multiple geographic scales including a sub-census tract neighborhood, and measuring health outcomes at multiple points, we hope to build on the literature linking gentrification and displacement to health and continue the dialogue between community stakeholders and decision makers on the topics on disinvestment, gentrification, and displacement and the social determinants of health.

## ARE STATE-LEVEL FOOD SYSTEMS CHARTERS AND PLANS HELPING TO SCALE UP THE ALTERNATIVE FOOD MOVEMENT?

Abstract ID: 502

Individual Paper Submission

HOEY, Lesli [University of Michigan] lhoey@umich.edu, presenting author  
COLASANTI, Kathryn [University of Michigan] kcolasan@umich.edu, co-author  
WUNSCH, Jessica [Lincoln Institute of Land Policy] jwunsch@umich.edu, co-author  
ANANDANPILLAI, Mrithula [University of Michigan] mrithula@umich.edu, co-author

The 2010 Michigan Good Food Charter was one of the first statewide visions for building a more just, green, and healthy food system. At least 18 states and multi-state collaborations now have similar food systems charters and strategic plans. Uniting these initiatives is a desire to collaborate across fragmented efforts, share knowledge and resources, and ultimately, scale up the alternative food movement. Looking at Michigan a decade later and in the midst of hundreds of stakeholders devising another 10-year plan, we ask: What impact, if any, are these ambitious, participatory planning efforts having on food systems, and in particular, on state-level food policy?

Framed around policy science theories, our methods include a content analysis of food-systems related legislative bills that were passed and attempted over the last 20 years, before and after the launch of the Charter. We also carried out interviews with over two dozen policy advocates – including lobbyists, activists, and advocacy organizations – as well as state legislators and bureaucrats who have acted as policy champions.

We discuss in our findings how food systems problems were effectively (and not so successfully) framed to have political resonance among legislators, how advocates took advantage of – or failed to leverage – strategic windows of opportunity (e.g., the launch of the Charter, shifts in the political balance across different administrations, COVID-19, etc.), and how coalitions were mobilized and utilized for policy advocacy (e.g., a short-lived, statewide food policy council, and numerous Charter-inspired food systems networks). The food systems issues that have remained blind spots, topics that have been most contentious, and the causes that have been most amenable to state-level policy change in Michigan suggests what may await advocates in other politically divided places. Ultimately, we suggest ways that state-level food systems charters and plans can be strategically leveraged to build more momentum around food systems transformation.

## ASSESSING THE IMPACTS OF NEIGHBORHOOD ATTRIBUTES ON EVALUATIVE, EMOTIONAL, AND EUDEMONIC SUBJECTIVE WELL-BEING IN FIVE US CITIES

Abstract ID: 518

Individual Paper Submission

DAS, Kirti [Princeton University] [kirtid@princeton.edu](mailto:kirtid@princeton.edu), presenting author  
RAMASWAMI, Anu [Princeton University] [anu.ramaswmi@princeton.edu](mailto:anu.ramaswmi@princeton.edu), co-author

Understanding and promoting well-being has been regarded as a crucial goal in academic research and policy making, as it has long been considered key to the creation and maintenance of healthy, productive societies (Diener, 2009; Durand, 2015). The use of objective proxies of well-being, such as income, literacy, and life expectancy, as well as subjective measures, such as how life is perceived and experienced by individuals, is common across the globe. The subjective approach to measuring perceptions and life experiences is based on subjective well-being (SWB), defined as “a person feeling and thinking his or her life is desirable regardless of how others see it” (Diener, 2009). Furthermore, existing research has found that there are three distinct dimensions/components of SWB: evaluative/cognitive, affective/emotional, and eudemonic SWB (Oguz et al., 2013).

In designing and managing living environments, urban planners have the potential to enhance the well-being of residents and provide opportunities for all to flourish, making it critical for them to understand how the built environment influences well-being. The built environment exerts its influence on SWB through its physical characteristics, social environment, access to services, opportunities it affords residents, and the promotion of certain kinds of behavior. Despite the theoretical significance of connecting planning to SWB, the consideration of SWB in planning is relatively recent compared to other disciplines such as psychology and public health, leading to significant gaps in the planning literature, including inadequate research on the emotional and eudemonic aspects of SWB and the omission of key SWB determinants in analyses due to a lack of interdisciplinary perspectives. Additionally, the prominent use of techniques such as importance–performance analysis (IPA) in urban planning to identify neighborhood infrastructure investment priorities to improve residents’ well-being may have significant limitations, as they assume a linear and symmetric relationship between neighborhood attribute performance and SWB. In contrast, a growing number of studies from fields such as economics (Mikulić, 2007) and sustainability planning (Ramaswami, 2020) have suggested that the influence of neighborhood attributes on SWB may be asymmetrical and that viewing the world through a linear and symmetric lens could lead to the misallocation of resources.

In this study, we hope to fill current gaps in the literature and the analysis techniques by examining whether the influence of neighborhood environment attributes on evaluative, emotional, and eudemonic SWB is linear or asymmetrical while drawing from the interdisciplinary literature on SWB to include a comprehensive list of determinants in our analysis.

For the study, using an online survey, data is currently being collected in five US cities including Austin, Newark, New York City, Tallahassee and Los Angeles with an anticipated, overall sample size of 8000. The data being collected includes measures of evaluative, emotional, and eudemonic SWB used by the U.K. Office of National Statistics (Oguz et al., 2013), socio-demographic characteristics, home and neighborhood attribute perceptions, and other variables known to influence SWB.

Using piecewise regression, we will identify improvement priorities based on the nature of the relationship between neighborhood attribute performance and SWB (symmetrical or asymmetrical) and average attribute performance. Additionally, we will focus on highlighting ways to promote equity by exploring neighborhood improvement priorities based on income, race, and gender. Finally, incorporating data from five cities will enable comparison of determinants of SWB across diverse geographies, making it possible to explore potentially global versus localized determinants of SWB. Contributions to existing research in the field and policy implications will be discussed.

The physical distancing requirement implemented due to the current pandemic is reshaping our urban space with transformation of the built environment ranging from temporary changes of physical design to possibly more permanent ones. As cities attempt to recover from the economic shock of the pandemic, there is a pressing need for urban planning scholars to understand the effectiveness of this new wave of built environment transformation and its long lasting social and economic impacts. This study examines built environment and social demographic impact factors on food retail business continuity in the city of Seattle during the height of pandemic lockdown, from May 2020 to December 2020. The research questions are: 1) What are the key physical design factors that help businesses continue to operate during the pandemic? 2) How are businesses located in neighborhoods with different social demographic characteristics performing during the pandemic? 3) What are the effects of these factors during peak periods of the pandemic?

This study consists of empirical, mixed-methods research, surveying for patterns of facility design, service models,

modifications, and economic outcomes of service providers, before and during the pandemic. From May to June, 2020, the research team conducted a field survey and collected data from 926 businesses from 40 census block groups, which covers 17% of all food retail business in the city of Seattle. In November to December, 2020, the research team repeated the field study and conducted a follow-up survey of business owners through in-person and telephone interviews. The data were joined with other publicly available datasets, including food businesses permit data, Google Knowledge panel, zoning information, and census data.

For the food businesses in the sample (n=926), 25 percent of businesses (n=237) were either temporally or permanently closed by June. The analysis of the March to June data suggests that facility design was a determining factor, as businesses with parking lots, within strip malls, with drive-thru facilities and in converted homes were more often open, and storefronts were closed in the same proportion as the population as a whole, while food courts, marketplaces, and storefronts on alleys were more likely to be closed. In addition to regression analysis, this study applied a conditional inference tree analysis to identify business clusters that shared similar urban surroundings and operational status. Results show that businesses located in urban areas with less pre-pandemic employment had the highest survival rate while businesses located in urban areas with high pre-pandemic employment and large low-income population, found in parts of the downtown area, had the lowest survival rate. The same set of analyses were applied to the November/December data. The comparison between the two datasets identifies factors that help promote the economic resilience of food businesses over the course of the pandemic.

The study offers three major implications for policy and planning practice. First, while facility design and the surrounding urban space play a key role for business continuity during the pandemic, food related businesses differ in terms of the initial physical design of space available to them and can be found to mimic temporary changes observed from others in their neighborhood. Second, the extent of physical change across neighborhoods differs in relation to socio-economic characteristics, which suggests that public agencies and planners have an opportunity to mediate the effects of the pandemic through a combination of shared information, resources, and technical support. Third, the study found that neighborhoods suffering the most from the economic shock of the pandemic are those dominated by single-use office buildings. The results reemphasize the importance of mixed-use development for economic resilience and vitality during the pandemic.

#### EXAMINING THE SPATIAL PATTERNS OF COVID-19 CASES IN AUSTIN AND HOUSTON, TEXAS.

Abstract ID: 587

Individual Paper Submission

JIAO, Junfeng [The University of Texas at Austin] jjiao@austin.utexas.edu, presenting author

CHEN, Yefu [UT Austin] chenyf56@utexas.edu, co-author

BUTCHER, Victor [UT Austin] victorbutcher@utexas.edu, co-author

COVID-19, a new viral disease discovered at the end of 2019, has significantly impacted human life for the last year and half. Previous studies have investigated the spatial patterns of COVID-19 cases in high-density urban areas (Kim et al., 2021; Maiti et al., 2021; Mollalo et al., 2020). This study explores the spatial patterns of COVID-19 cases in low-density urban areas and how different spatial factors might affect their distribution over time. (Sun et al., 2021; Zhang & Schwartz, 2020).

This study focused on three research questions: What spatial patterns did COVID-19 cases have in the Austin and Houston areas? What spatial factors were associated with COVID-19 cases in these areas? Were these spatial factors similar across cities and time periods? Specifically, this paper investigated the relationships between socio-demographics and COVID-19 case distributions through the application of two models: ordinary least squares regression and geographically weighted regression. Our study area included Travis County, where Austin is located, and the combined area of Harris and Fort Bend Counties, where Houston is located. All data were captured at the zip code-level.

Our findings showed that different vulnerable groups experienced high levels of COVID-19 risk at different periods of the pandemic. The global model showed that households in poverty were at high risk during the beginning of pandemic, and African Americans were at high risk both during the beginning and post-peak stages. Locally in Harris and Fort Bend Counties, Hispanic Americans were at high risk during the post-peak stage. In Travis County, Hispanic Americans were at high risk during the beginning of the pandemic, and households in poverty were at high risk during the post-peak stage. The local models further showed that households in poverty living in the southern part of Houston were at high risk during the beginning of the pandemic, and both African American and Hispanic Americans who lived in the periphery of Harris and Fort Bend Counties were at high risk during both the beginning and post-peak stages. We also noticed travel behaviors and educational attainment level played modest roles in predicting COVID-19 outbreaks, and that their effects changed over time.

This study provides three policy implications. First, vulnerable groups experienced high levels of COVID-19 risk at all stages of the pandemic. Local governments need to be aware of this disparity so that they can allocate health services, economic relief and vaccines equitably. The southern part of Houston and the southeastern part of Travis County showed a strong spatial disparity in terms of COVID-19 infection rate, especially in neighborhoods with high percentages of African American and Hispanic American populations. Second, travel behavior variables had a modest relationship with the spread of COVID-19, at both the beginning and post-peak stages. Third, this study proved that various spatial factors have associations with COVID-19 outbreaks in different regions and at different periods of time. It is difficult to identify a common or universal indicator for governments to target, so interventions to mitigate the spread of COVID-19 must be implemented based on local situations.

**Abstract:** Mental health for the elderly has attracted growing scholarly and policy attention as society continues to age. Planning scholars have focused on how residential environments (e.g., public space or greenspace/neighborhood relationships) affect the elderly's mental health, either directly or indirectly through the daily activities of elderly people. Active lifestyles with more time spent on physical and social activities are often believed to positively affect the elderly's mental health (Aihara et al., 2011; Shergold, 2019; Bhandari et al., 2020). However, elderly residents may engage in different types of "health-promoting active lifestyles," subject to the residential environment, family co-residence pattern, as well as the cultural context in which the elderly live.

In previous studies, behavioral factors are aggregated and discrete (Movahedi et al., 2016; Flores et al., 2020), and the effect of active lifestyle on mental health remains understudied on a non-aggregated and consecutive level. Considering the empirical evidence from non-western countries remains lacking, typical lifestyles of elders in developing countries warrants attention. In this study, we examine the relationships between daily activity patterns of older adults in Beijing and their mental health outcomes and explore the social and built environmental determinants of activity patterns of varying health implications.

Data used in this study include a questionnaire of socio-demographics and health and an activity diary for a typical weekday of 724 senior residents (aged 60 and above) from 14 neighborhoods in Beijing collected in November 2020. We employ a novel multi-channel sequence optimal matching method to identify typical activity patterns of older adults. This approach has a strength to analyze not only duration of activities, but also the sequential order and social contexts of those activities throughout a day. Five distinct patterns with varying levels of engagement with their families and residential neighborhoods are found: family care-giver, family pace-setter, neighborhood active participants, self-engaged groups, and care-receiver. Logistic regression models are administered to examine the relationship between those typical activity patterns and mental health outcomes, with covariates adjusted for. We further explore socio-economic and built environment factors associated with those health-promoting or health-damaging patterns of daily activities.

Results show that: (1) "family care-givers" and "neighborhood active participants" were more likely to report positive mental health, while "care-receivers" exhibited the lowest mental health scores; (2) despite a moderate proportion of physical activity, self-engaged older adults still showed relatively low scores in mental health metrics. These results highlight the health benefits of actively engaging in both household and neighborhood-based social activities for the Chinese older adults. Planning for the age-friendly city in an urban Chinese context would benefit from promoting social and physical activities in older adults' residential neighborhoods.

## EXPLORING THE NEXUS BETWEEN SOCIAL VULNERABILITY, BUILT ENVIRONMENT, AND THE PREVALENCE OF COVID-19: A CASE STUDY OF CHICAGO

Abstract ID: 628

Individual Paper Submission

KASHEM, Shakil [Kansas State University] shakilkashem@ksu.edu, presenting author  
 LEE, C. Aujean [The University of Oklahoma] Christina.A.Lee-1@ou.edu, co-author  
 BAKER, Dwayne [Queens College, CUNY] dwayne.baker@qc.cuny.edu, co-author  
 GONZÁLEZ, Silvia [University of California, Los Angeles] sil.rgonzalez@ucla.edu, co-author

COVID-19 has significantly and unevenly impacted the United States, disproportionately affecting socially vulnerable communities. While epidemiologists and public health officials have suggested social distancing and shelter-in-place orders to halt the spread of this virus, the ability to comply with these guidelines is dependent on neighborhood, household, and individual characteristics related to social vulnerability. Considering initial spread of the virus in major urban areas, researchers have sought to understand what aspects of the built environment impact COVID-19 cases, particularly the role of urban density and social distancing (Li et al., 2021). While some studies have attributed density as the cause of COVID-19 spreading at the local level (Nguyen et al., 2020) or overcrowded housing conditions as a predictor of COVID-19 death counts (Hu et al., 2021), ongoing debates exist concerning how density and overcrowding impact transmission. In addition to built environment factors, sociodemographic characteristics were also identified to impact COVID-19 prevalence and spread (Bryan et al., 2020; Kim & Bostwick, 2020).

Given the profound and emerging social equity implications of the COVID-19 pandemic, in this study we adopted the social vulnerability framework to highlight how both built environment and socioeconomic factors contributed to the COVID-19 prevalence. We utilize structural equation modeling, and a variety of data including anonymized mobility data from SafeGraph, to examine the direct and indirect effects of social vulnerability and built environment factors on COVID-19 prevalence over two time periods. We use Chicago, Illinois as a case study and find that zip codes with low educational attainment consistently experienced higher case rates over both periods. We also find that population density is not significantly related to the prevalence in any period. However, we show the movement of people at the zip code level made a significant contribution over the longer-term period (March to November 2020), but not during the shorter-term period (March to May 2020). Our results suggest social vulnerability played a more influential role in COVID-19 prevalence than built-environment factors, highlighting the complex and intersectional nature of race and class and the built environment on airborne disease spread.

## **#DEFUNDAPD: GRASSROOTS ORGANIZATIONS' EFFORTS TO ADDRESS OVER-POLICING IN PLANNING A CASE STUDY OF AUSTIN, TX**

Abstract ID: 691

Individual Paper Submission

PIZARRO VÁZQUEZ, Bianca [The University of Texas at Austin] pizarro@utexas.edu, presenting author

During recent years there has been a growing interest in addressing problems of policing through planning. Displacement, unequal access, and consequences of neoliberal policies have inspired a global mobilization of marginalized and low-income populations at the heart of cities (Domaradzka, 2018). Often materializing through grassroots organizations, they have begun to tackle what it would mean to address the issue of over-policing through anti-racist strategies (Sherman, 2020). In Austin, TX, on August 13th the city council unanimously voted to remove \$150 million from the Austin Police Department's budget and reinvest it in social services. This paper's objective is to explore how grassroots organizations work with and influence policy toward anti-racist planning. This is done by inquiring into how both the defunding process itself and the divestment of funds can be avenues toward justice.

The insurgent nature of Austin's grassroots organizations who mobilized toward the defunding of its police department, reflects those efforts by insurgents globally. Since this paper investigates how grassroots organizations shape anti-racist planning processes, I build my arguments off Critical Race Theory and Insurgent Planning framework by centering the research around the counterhegemonic community led initiatives responding to urban inequality. These help us examine how planning both influences and is influenced by race, as well as the understand how planning responds to the neoliberal co-option of inclusion and participation (Miraftab, 2009; Gale & Thomas, 2018). The insurgent framework emphasizes how and why these organizations use the opportunity of the police defunding movement to leverage more just planning.

Drawing from these frameworks, the questions I seek to answer include the following: How did grassroots social justice organizations shape the planning processes through policy decisions regarding police funding in Austin? What role do grassroots organizations play in these processes? What other actors play an important role in this? What relationships did the organizations develop leading to anti-racist planning demands? I employed case study methodology to best acquire a qualitative understanding of the issue at hand. This case study draws from 12 interviews with key stakeholders, newspaper articles, city council meeting minutes, primary documents such as budgets and memos, as well as social media posts utilizing hashtag #DefundAPD. The preliminary findings suggest that the networks which materialized throughout this process are necessary to study in depth to fully understand the insurgent nature of this practice.

The field of planning has been faced with unmasking its own racial implications. This study is an example of this, making connections between the grassroots mobilization efforts to defund the police and planning processes in Austin, Texas. It is a difficult task to restructure powerful systems backed by powerful interests, but it is possible. Planning offers an opportunity to redistribute the power it has willingly given to capitalism and shift it to the people. By studying the role that these grassroots organizations have undertaken to influence police defunding, it can advance knowledge between these relationships and can lead to better planning practices and policy outcomes.

## THE IMPACT OF COMMUTING ON HEALTH OUTCOMES AMONG LOW-INCOME COMMUNITIES IN DALLAS-FORT WORTH METROPOLITAN AREA

Abstract ID: 710

Individual Paper Submission

HAFIZ, Mohammed [University of Texas at Arlington] mohammedf.hafiz@gmail.com, presenting author  
 REYES-SÁNCHEZ, Ariadna [University of Texas at Arlington] ariadna.reyessanchez@uta.edu, co-author  
 MOZAFFARIAN, Ladan [University of Texas at Arlington] ladan.mozaffarian@uta.edu, co-author

The concerns regarding public health had increased in the past few decades in the United States. According to the Center for Diseases Control and Prevention (CDC, 2018), obesity rates have rapidly escalated in the past decade. While obesity is one of the main reasons to cause other health outcomes, including type 2 diabetes, high blood pressure, heart diseases, and some types of cancer, data shows that the obesity rate has increased among adults from 27.4 percent to 30.9% between 2011 and 2018 (CDC). Also, the rates of severe obesity have increased from 5.7% to 7.7% (CDC, 2018).

Several studies documented the difference in health outcomes in different sociodemographic and socioeconomic groups. While sociodemographic includes age, race, ethnicity, and gender, socioeconomic status includes education, income, occupation, employment, and living conditions (Institute of Medicine, 2003). Many studies found that socioeconomic status can influence obesity and diabetes among different races and sex groups. Indeed, there is a strong relationship between socioeconomic status and unhealthy behavior, including smoking, physical inactivity, a less nutritious diet, and alcohol consumption, as stated by The Institute of Medicine (2003).

Travel behavior has also significantly impacted health outcomes, especially obesity (Samimi & Mohammadian 2010). Actually, travel mode choice is an essential factor to influence physical activity, including walking and bicycling. An investigation found that regions with lower obesity rates are less likely to travel via automobile (Jacobson et al., 2011) or have better access to public transit (L. D. Frank et al., 2008). Also, research shows that a 1

percent decrease in automobile use can decrease obesity by 4 percent, and transit use had the highest impact on general health; however, auto-use had the highest impact on obesity, and people who use transit are least likely to be obese (Samimi et al., 2009).

The Dallas-Fort Worth metropolitan is an auto-dependent area where employees' commute time, which is 26.8 minutes, is 3 minutes longer than average US workers. Also, among commuters, around 89% drive to go to work, 1.32% use public transit, 1.25% walk, and 0.14% commute by bike. Moreover, 43% of DFW area households own two cars which are 3 percent higher than average US households (ACS 2018).

This research investigates how commuting to work affects health outcomes in low-income groups in the Dallas-Fort Worth Metropolitan area. Based on much research, we understand that low-income communities face a higher risk of having a chronic disease; therefore, we seek to understand if commuting and travel behavior increases the risks among the low-income groups. We will use data collected from CDC, 500 cities, and (BRFSS) for public health data, and census data for examining socioeconomic, sociodemographic. However, public health data is considered to be nested. Therefore, we use multi-level modeling as a method to answer the research question.

As a result, we expect income and race have a high impact on public health. Besides, the built environment is one of the most critical factors that affects an individual's lifestyle, causing health issues. The relationship between the built environment and public health has been widely investigated in different cases. However, each research is a different case with different scenarios. Similar to these studies, our research is unique due to the attributions of this paper.

#### PLAY AFFORDANCES IN URBAN NEIGHBORHOODS OF KOLKATA

Abstract ID: 720

Individual Paper Submission

ROY, Arindam [University of Cincinnati] arindam.daap@gmail.com, presenting author

Children play has been historically outdoors, and it is through these play instances that children learn about the environment, engage with other children, develop social skills, and negotiate the use of space with other users. Rapid urbanization and lack of policies for children's play spaces have increasingly marginalized outdoor play opportunities for the urban child. The case is even more critical in highly dense cities of developing countries like India. This paper addresses the lack of spatial studies in developing countries to understand children's use of outdoor spaces. The study analyzes and compares three distinct neighborhoods (from the older city and the

contemporary sprawl) in Kolkata, a major metropolitan city of India, in the light of Gibson's theory of affordances. The affordance of an environment refers to its attributes that can support different functions. While the importance of children play is realized by scholars and children-friendly organizations, the question remains how they are being realized especially in the newly built neighborhoods.

Taxonomy of affordances adapted for Indian context is used to look at the perceived affordances in the neighborhoods. Spatial analyses at macro and micro scale are employed to study the affordances in terms of urban morphology, street characteristics, block dimensions, housing typology, and diversity of open spaces. Both residential streets and fields are considered as essential play spaces in India. Open space analysis looks at the type of open space, its physical dimensions, ground cover, surrounding elements, elements on the open space itself, sense of urban room (if any), access points from nearby streets, typology of the surrounding streets and its interface with the space itself. Further, sections, and detailed mapping of the play spaces are performed to look for the negative affordances or triggers of play (or absence thereof), and label the play environments as friendly, adapted, restrained, or neglected.

The study finds limited physical affordances in the relatively newer neighborhoods of Kolkata compared to the older city neighborhood. The residential street layout of the newly built neighborhoods lacks the sense of enclosure and corner notches that can support play environments for children. The newer streets offer lesser loose spaces, diversity, and possibilities. The block dimensions of the newly built neighborhoods are longer and offer fewer streets with low traffic, thus negatively impacting the possibility of children play. The play fields or parks in different neighborhoods vary quantitatively and qualitatively. While the number of such spaces are much higher for new neighborhoods, they offer limited affordances due to sameness and lack of interactive elements. Static and dynamic interactive elements like walls, bricks, stones, pebbles, water pipes or irregular mounds are only present in the case of older city neighborhood. Newer play-spaces are more suitable for playing sports like games, however, require more equipment due to lack of enclosure or elements that can be utilized to modify the built environment. The findings also suggest over-maintenance, manicured parks, and behavior-restrictive use of play spaces can lead to sterile environments that create restrained play environments by not offering triggers of play or possibilities of shaped affordances.

The findings of the paper underscore the disconnect between scholars of children literature and city planners, emphasizing the need for urban planners to imbibe play affordances while designing urban neighborhoods. The paper reiterates the need to further research children play in contemporary neighborhoods by understanding actualized affordances of these spaces through ethnographic studies, interviews, and behavioral observations. Finally, the paper ends with some design and policy implications for residential neighborhood design that can create opportunities for outdoor play in the contemporary urban densely populated neighborhoods.

### **THE E3 COLLABORATIVE: PLACE-BASED FOOD JUSTICE IN ENCINITAS, CALIFORNIA**

Abstract ID: 757

Individual Paper Submission

NEWTON, Josh [University of Texas at Arlington] jdn8492@mavs.uta.edu, presenting author  
MARTINEZ-COSIO, Maria [University of Texas at Arlington] mcosio@uta.edu, primary author  
RABINOWITZ BUSSELL, Mirla [University of California, San Diego] mbussell@ucsd.edu, co-author

“Think globally, act locally,” has become a catchphrase indicating the importance of local solutions to climate change. Environmental policy instability at the national level—best seen in the recent shift between the Trump and Biden administrations—has forced local actors to become more proactive in addressing climate change issues. One such issue receiving increased attention at the local scale is the resiliency of food systems through sustainable agriculture and food justice. Food justice and sustainable agriculture are included in the second UN Sustainable Development goal because climate change and other problems are causing increased hunger around the world (United Nations, 2018). Marginalized communities are particularly overburdened by the effects of climate change; therefore, food systems presents an opportunity to address equity issues at the local level while confronting global climate change. These realities point to the need for community-based approaches that “radically transform the global food system” (Werkheiser & Noll, 2014). This requires planners to collaborate with varying stakeholders to address the social and environmental effects of food deserts, food production, food transport, and food waste (Cabannes & Marocchino, 2018, 14). However, Born and Purcell claim that as planners become more involved in food systems work, they cannot fall into “the local trap” of assuming that work at smaller geographic scales is inherently sustainable and just (2006). Planning research, then, needs to evaluate local initiatives to highlight best strategies for producing equity and sustainability.

This paper will examine the E3 Collaborative (Encinitas Environmental Education Collaborative), a cooperative of nonprofit and public organizations in North County San Diego including the Leichtag Foundation, Encinitas Union School District, Magdalena Ecke Family YMCA, Seacrest Village Retirement Community, the San Diego Botanical Gardens, and San Dieguito Heritage Ranch. Through a place-based approach, these organizations have created an ecosystem for social and environmental equity and food systems justice by sharing knowledge and resources, creating joint programming, and increasing community knowledge and health. For instance, the Leichtag Foundation operates a 67.5-acre campus for food justice. The Leichtag Commons includes Coastal Roots Farm—a Jewish community farm; 900,000 square feet of greenhouses for sustainable agriculture research; and the Hive—a workspace for community nonprofit collaboration and development. Considering the reality of increased public-private collaboration in global neoliberalism, this case raises multiple questions. What is the impact of this collaborative model in working to transform food systems to address problems of social and environmental equity? How does the collaborative use place to overcome these issues? What policy and practices can lead to similar approaches in other localities?

Using an inductive research approach, we perform a case study of the E3 Collaborative to determine what types of systems lead to food justice on the local scale. The case study will be conducted through interviews with the organizations’ staff and leaders to understand their unique individual and collective contributions to enacting social and environmental equity in Encinitas and the broader region. Likewise, the Encinitas’ planning department will be interviewed to understand how planners are incorporating this resource into their climate action plan. Data from interviews will be supplemented with secondary data and analyzed using systems theory. Communities, nonprofits, and public organizations makeup a complex system; thus, it is important “to examine the elements of systems as they interact through stakeholders seeking to change the social” and environmental sphere (Martinez-Cosio and Rabinowitz Bussell, 2013). This study will expand the literature on local climate change and equity solutions, provide practitioners and scholars with recommendations for a place-based model for food justice, and indicate how planners can incorporate initiatives such as this in their community resiliency efforts.

## PLACE-BASED HEALTH INEQUITIES: ADVANCING CONCEPTUALIZATIONS OF HEALTHY BUILT ENVIRONMENTS FOR IMPROVED SOCIAL JUSTICE

Abstract ID: 809

Individual Paper Submission

STENBERG, Keely [University of Waterloo] kastenberg@uwaterloo.ca, presenting author

DEAN, Jennifer [University of Waterloo] Jennifer.dean@uwaterloo.ca, co-author

The professions of public health and urban planning emerged through a shared goal of combatting the spread of communicable diseases in over-populated and unsanitary urban areas during the mid 19th century (Barton, 2009). After a shift in focus, where public health pursued germ theory and urban planning concentrated on housing and transportation (Corburn, 2009), the two disciplines joined forces again in the late 20th century to address rising chronic disease and climate crises (Barton, 2009). This reunification was spurred by increasing recognition of the physical environment's role as a determinant of key health behaviours (e.g., physical activity, nutritious eating) (Macintyre et al., 2002). A plethora of work that is often termed 'healthy built environment' literature has since emerged, connecting practices and theories from both public health and urban planning. While much of this work recognizes the impact of the built environment on health, the health inequities of many population subgroups remain; the persistence of place-based health inequities is evident in the implementation of many healthy city initiatives, including the World Health Organization's Healthy Cities movement in the 1980s (Corburn, 2009).

Through a critical reading of the healthy built environment literature, we interrogate the state of knowledge on place-based health inequities. Our discourse analysis is guided by the two questions: 1) How has healthy built environment literature conceptualized 'health equity' over time? 2) What solutions are recommended to support practitioners addressing health inequities in their communities? Our analysis is based on key academic journal publications over the twenty-five-year period following the reunification of the public health and urban planning disciplines (i.e., 1980s-2010s). Using themes that emerged from within these texts, we discuss how the term health equity is defined and operationalized as well as illuminate the populations, areas, and scales of focus in this literature. Finally, we critique the recommendations put forward with respect to the potential of practitioners and researchers to address place-based health inequities.

Overall, this work showcases some persistent challenges in realizing health equity in place: inconsistency in definition and operationalization of health equity as well as oversight of the root causes (Marmot et al., 2008). As such, it is recommended that scholars working within the healthy built environment realm clearly outline for what, whom, and where health inequities exist in order to avoid further marginalizing vulnerable populations and for suitable interventions to be implemented in practice (Marmot et al., 2008). Researchers and practitioner should also 1) consider the impact of the physical and social neighbourhood environments on a range of populations, not just

those with low socio-economic status; 2) explore how health inequities are experienced in less populated areas, such as rural and remote locations, and peri-urban zones (Macintyre et al., 2002); and 3) compare the impact of local, regional, and national initiatives on the experience of vulnerable populations in place. Scholars have recommended the use of stakeholder collaborations and the creation of healthy public policy to assist in addressing health inequities (Marmot et al., 2008); however, strategies for practitioners to implement these recommendations are noticeably deficient, necessitating the call for increased discussion on how planners can both develop and support interventions aimed at addressing place-based health inequities, such as healthy city initiatives, especially through collaboration and policy.

#### **EVOLUTIONARY HISTORY OF TRANSFORMATIVE INITIATIVES IN FOOD POLICY: LANDSCAPE CONTEXT, INSTITUTIONALIZATION, AND LOCAL AGENTS IN PUBLIC FOOD PROVISION IN SOUTH KOREA**

Abstract ID: 818

Individual Paper Submission

SON, Seulgi [University of Michigan] [seulgi@umich.edu](mailto:seulgi@umich.edu), presenting author

A broad consensus on the need for food systems transformation has globally risen in both academia and practice with deteriorating issues of climate change and vulnerabilities in food supply chains, particularly exposed during the COVID-19 pandemic. The main objective of transformative actions is to create fundamental changes in the underlying institutional structures that currently shape food practices from production, processing, distribution, consumption to waste disposal. For those actions to gain consistent momentum, it is necessary to understand the types of operations and the mechanisms in which they can permanently impact the locked-in conventional food system. With the case of public food provision policy in South Korea, this paper argues that public food procurement can play a critical role in (re)building regional food systems when democratic participation of local grassroots actors is guaranteed. This study also suggests the necessity of a spatial perspective – an effort to enhance urban-rural linkage going beyond the long-existing urban-rural dichotomy in planning practice – in establishing a long-term vision in public food policy.

Transitions are a useful lens to illustrate structural changes leading to the current food system and provide a vision for future change. The evolutionary history of public food provision in South Korea showcases how niche-level grassroots movements can scale out and become a mainstream food policy to establish economically and environmentally more sustainable local food systems. This paper draws on the theories of sustainability transition and food regime to construct a historical narrative of transformative food initiatives in the Korean context since the early 1990s. Food systems transitions in South Korea feature four stages: a) strong government regulation from the decades of dictatorship before the 1980s, b) grassroots movements for public intervention in food procurement since the 1990s against an expansion of free trade agreements and global food corporations (school food movement), c) implementation of innovative food policy since the 2010s as a result of a bottom-up breakthrough in the locked-in system (Free Universal Environment-friendly School Lunch Program), and d) a current experimenting phase of a food politics where cooperation and co-optation coexist in public-led food planning (Urban-rural

Coexistence Public Meal Program launched in 2017 as an expansion of the existing school lunch system).

Transitions in the Korean food systems delineate a possible pathway in which accumulated dynamics between local grassroots actors and the incumbent regime make a breakthrough in the paradigm of public food policy at the juncture of niche-level movements, landscape-level pressure, and institutionalization. The history of public food provision in South Korea underpins three components that some scholars find necessary to build collaborative governance in achieving sustainability transition: self-reflexivity, co-learning, and network. The (re)construction of the Korean case will contribute to inspiring emerging global food initiatives, especially facing food systems disruptions caused by COVID-19, in leveraging the pandemic as a landscape-level opportunity to create a meaningful change toward more resilient food systems.

HAFIZ, Mohammed [The University of Texas at Arlington] mohammadf.hafez@yahoo.com, presenting author  
ANJOMANI, Ardeshir [The University of Texas at Arlington] anjomani@uta.edu, co-author

Over the past few decades, literature provided a better understanding of the factors affecting an individual health outcome. Scholars found that physical activity is the most influencing lifestyle behavior affecting health outcomes. Physical activity greatly impacts diseases such as obesity, heart diseases, diabetes, and some types of cancers (Stokes et al., 2008). Frank (2000) found that the rate of diseases including; coronary heart disease, diabetes, and some cancers would be reduced if physical activity increases towards the inactive population.

As some research in public health documented a strong linkage between physical activity and public health, other research documented increased public health benefits from physical activity such as walking, bicycling, and access to transit (Frank, 2000). Overall, a wealth of research found notably that pedestrian-friendly communities boost physical activity, impacting urban residents' health (Frank, 2000; Leslie et al., 2005; Stokes et al., 2008; Suminski, Poston, Petosa, Stevens, & Katzenmoyer, 2005). However, crime and safety are factors that influence physical activity.

Humpel et al. (2002) reviewed 16 studies investigating environmental correlations of adult recreational physical activity and revealed less evidence of crime related to physical activity. Also, Leslie et al. (2005) found that traffic safety from crime in high and low-walkability neighborhoods did not differ in terms of physical activity. However, Suminski et al. (2005) found that safety had the second-highest impact among women and men, where women are 4.5 times more likely to exercise in safe neighborhoods, while men are 5.9 times more likely to exercise.

In 2018 in the Dallas-Fort Worth metropolitan area, the average physical inactivity decreased to 23.7 percent than 34.9 percent in 2017 (Centers for Disease Control and Prevention). Also, there was a decrease in the total number of violent crimes from 27,204 in 2017 to 26,178 in 2018 (FBI Uniform Crime Reports). Adding to that, between 2014 to

2018, the percent of fatal motor vehicle crashes involving cyclists or pedestrians decreased to 43.6 percent than 50.56 percent (National Highway Traffic Safety Administration's Fatality Analysis Reporting System) between the years 2010 to 2014, relatively between 2010 to 2018, a 0.03 percent increase in the percentage of workers who commute by walking and a 0.01 percent decrease in workers commute by bike (American Community Survey).

This research explores the impact of crime and safety on physical activity in the DFW metropolitan area. Mixed results revealed the effect of crime and safety on physical activity; therefore, we seek to investigate if the decrease in crime and fatal motor vehicle crashes involving cyclists or pedestrians is the cause of the proliferation of physical activity DFW area. We collect our data from several resources, including FBI Crime Counts, American Community Survey, and 500 cities.

As a result, we are expecting that crime and safety are factors impacting physical activity. However, these factors may not be related to travel behavior towards commuters. In conclusion, according to the literature, crime is the least likely to impact the health of residents of urban environments.

SWAYNE, Madison [San Diego State University] mswayne@sdsu.edu, presenting author

LOWERY, Bryce [University of Oklahoma] bryce.c.lowery@ou.edu, co-author

Spatial access to sources of food influences rates of diet-related disease experienced by food-insecure communities. Physical access to food appears to matter in a number of contexts, lending support to efforts to more meaningfully explore and address the spatial arrangement of nutritional resources like grocery stores, farmers' markets, and other components of the food system (Pothukuchi and Kaufman, 1999; Eckert & Shetty, 2011). Access, being able to financially and physically acquire food, along with the availability or the physical presence of food, and the capacity to prepare and consume food constitute the food security of neighborhoods (Jones, Ngure, Pelto & Young 2013). Food security, the ability to obtain and eat enough safe and nutritious food is often associated with hunger, malnutrition, and starvation but, increasingly it is also seen as a contributor to rising rates of non-communicable conditions associated with poor dietary quality (FAO, IFAD, UNICEF, et al., 2019). Global rates of diabetes, obesity, and heart disease give cause for alarm and suggest an important role for regional, urban, and rural planning professionals to intervene (WHO, 2017). Understanding how the location of sources of nutrition contributes to the

well-being of neighborhoods offers opportunities to improve health through physical interventions in the built environment. Investigations into the food security of communities use a variety of techniques to explore the ways that physical access to sources of food influence dietary preferences, eating habits, and health outcomes. Early research in this area focused primarily on broad measures of access, frequently defined solely by distance but more recent models incorporate factors such as mode and travel time as characteristics of the environment that influence decisions about where individuals shop for groceries. Refining techniques used to measure access to food remains an important part of understanding the relationship between the spatial arrangement of the nutritional resources, like grocery stores, and the well-being of neighborhoods. One approach for addressing this gap in our understanding of the connection between food security and transportation mode is to employ real-time travel estimates over transit and road networks to more precisely measure food access. In this paper, we employ the Google Distance Matrix API for calculating both the distance and time residents have to travel to reach nearby grocery stores and full-service supermarkets by private car or by public transit in San Diego, California. The Google Distance Matrix API uses the most common mobile phone application for wayfinding, Google Maps, to estimate multimodal access calculations based on travel mode and precise origin and destination locations. It is likely that residents needing to navigate to a local grocery store (by private car or by public transit) would rely on Google Maps to check traffic, road conditions, and transit schedules. Results suggest that distances between residents and food outlets are constant across modes of transport but travel times are highly differentiated by mode. Trips to stores by transit are on average, three times longer than trips by car. This paper offers a new understanding of the potential for incongruence between spatial proximity and true accessibility in the built environment.

## CARROTS OR DONUTS? THE INFLUENCE OF RELATIVE FOOD ACCESS ON COMMUNITY HEALTH OUTCOMES

Abstract ID: 951

Individual Paper Submission

RANGARAJAN, Shriya [Cornell University] sr2248@cornell.edu, presenting author

Food deserts, that is, areas with insufficient access to healthy and affordable food, do not have a consistent definition. Studies find them concentrated in low-income, racially disadvantaged neighborhoods and typify them as either a problem of physical access - measured in terms of the geographical proximity of resident populations to grocery stores, supermarkets and outlets selling nutritious food - or financial access - measured in terms of affordability of such foods (US Department of Agriculture, 2011; Walker et al., 2010). Implicit in these categorizations of food deserts, but absent in most studies (see Gordon et al., 2011 for an exception), is a measure of relative access to healthy and unhealthy foods.

This project investigates the influence of relative access to healthy and unhealthy foods (fast foods) on health outcomes of study areas and discusses its implications for the typification of food deserts. The need for

incorporating a measure of relative food access is hypothesized for two reasons: (i) For low-income populations who are food insecure or have insufficient transportation, consumption is not only about what foods are close and affordable but what foods are closer and more affordable; (ii) Food consumption is behavioral; shifting consumption habits towards healthier alternatives involves changing relative access. Evidence for the latter can be found in studies which show that introducing fresh food options does not significantly change consumption practices.

I define three measures of relative food access for each spatial unit in the sample dataset: (i) relative physical access, or the difference between the average distance to a healthy versus unhealthy food establishment; (ii) relative count - the ratio of the number of healthy to unhealthy food establishments; (iii) relative affordability or price difference between an average healthy meal and an average unhealthy meal.

Building on previous methodological approaches which incorporate GIS analysis (Charreire et al., 2010) and market basket studies (Short et al., 2007), I construct a sample dataset for selected census tracts in cities of Upstate New York - Syracuse, Rochester, and Buffalo – using a combination of primary and secondary data sources. Four main categories of data are included: (i) GIS data from online maps for the geographical location of large grocery stores, smaller supermarkets and five of the most common fast-food chains; (ii) Market basket data (physically collected) for prices of a standard, average, nutritious and less nutritious meal; (iii) Health outcomes at the census tract level – rates of heart disease, high cholesterol, and diabetes - from the databases of the 500 Cities project (2016-2019) conducted by the Center for Disease Control; (iv) Place-specific attributes such as income levels, racial composition, and vehicle access from the US Census and Food Access Research Atlas of the US Department of Agriculture.

Using GIS techniques, spatial statistics, and econometric analysis, the project analyses how relative access to healthy and unhealthy foods influences critical health outcomes. Findings from this research provide evidence for a more nuanced classification of food deserts: one that combines multiple access indicators and combines both healthy and unhealthy foods. An extension of this project develops a spatial kernel estimator for health outcomes in terms of food access. Policy implications for this include advancement of a statistical technique for situating and pricing food outlets to improve public health outcomes.

#### **“ASSESSING THE PHYSICAL FEATURES AND BARRIERS OF NEIGHBORHOOD PARKS/PLAYGROUNDS TO PROMOTE PA IN ALL AGE GROUPS – A CASE STUDY OF KARACHI, PAKISTAN.”**

Abstract ID: 952

Individual Paper Submission

SADAF, Afsheen [University of Florida] afsheen82@ufl.edu, presenting author

Parks and playgrounds are community assets which are considered to promote PA and leisure activities among all age groups. Neighborhood parks are not only meant to support different physical and recreational activities but also engage people in different kind of social interaction. Although neighborhood parks must function in a way to cater to the requirements of all age groups, but not all parks/playgrounds are designed to reflect this approach in practice. Previous studies confirm the strong relation between increase hour in parks/playgrounds use and the availability, quality, and safety of the design features of parks/playgrounds. The overall design of the parks/playgrounds determines how the park will be used by different age groups. One cross sectional study between US and UK parks also revealed that “innovative design” of a playground increase (double) park use and PA among various age groups. According to some studies, increase in number of play elements and structures also contributes to increase in PA in children. Park choice behavior is believed to be age dependent: for example, some studies suggest that children and youth/adults use parks/playgrounds more than older adults and senior citizens.

This comparative study intends to examine how various design approaches, facilities and features in different neighborhoods parks/playgrounds contributes to increase in PA and parks/playgrounds use in all age groups in Karachi, Pakistan using “System for Observing Play and Recreation in Communities (SOPARC)”. This study also explores barriers and missing of those design approaches, facilities and features in different neighborhoods parks/playgrounds which substantially decrease PA and parks/playgrounds use in all age groups. A random sample of approximately 50 to 60 neighborhoods parks/playgrounds in all three SES is assessed to evaluate how different age groups use parks/playgrounds based on their needs and choices, related to their age. Various categories of age include children, teenager, youth /adults, and senior citizens. A mixed method approach of data collection and analysis is used i.e., quantitative, and qualitative and ArcGIS/GEE were used to further analyzed the data spatially.

#### **SOCIAL CAPITAL, COMMUNITY ADAPTATION, AND FOOD SECURITY: A CASE-STUDY OF AGRI-FOOD COMMUNITIES OF UPSTATE NEW YORK**

Abstract ID: 966

Individual Paper Submission

RANGARAJAN, Shriya [Cornell University] sr2248@cornell.edu, presenting author

Overview: This paper, part of a doctoral dissertation, reports analyses from a survey of producers in Upstate New York, which aims to understand how social capital has mediated their production and marketing adaptations during the pandemic. Findings aim to forward research on community resilience, adaptation, and cooperative ownership of local economic resources.

Background: Disruptions in global food chains due to COVID-19, in tandem with the economic downturn, is exacerbating food insecurity world over; this has disproportionately affected low-income communities and racial minorities. Demand and supply distortions across agri-food processing, retail, and labor, have resulted in a paradox of food shortages on the one hand and food wastages in farms on the other, which point to a breakdown of global supply chains. This study is motivated by media reports which suggest that smallholder agriculturists within local food systems have experienced a spike in demand (Robey, 2020); and have utilized connections with other farmers and local consumers – their social capital, in other words - to develop alternative production and marketing strategies (Mohs, 2020), and consequently ensure continued food supply within the regional food system.

In academic literature, social capital – trust, cooperation, membership in groups – has been linked to food security, producer cooperatives, direct marketing, and other successes of local food networks (Cone & Myhre, 2000; Uphoff & Wijayarathna, 2000). It has also been indicated in studies of disaster mitigation and resilience (Aldrich & Meyer, 2015) although its links to adaptation in situations of economic shock are understudied.

Hypotheses: Resilience here, is hypothesized as an interplay of three factors: (i) Greater product diversity and access to social capital in small farms enable them to better respond to systemic shocks; (ii) Supply chain resilience is a tradeoff of spatial proximity between localized actors which contributes to less disruption, but fewer redundancies which results in overreliance on nodal actors; (iii) Product diversity and spatial proximity create opportunities for local food systems to adopt cooperative, closed loop, and resource efficient practices. This study thus attempts to understand the adaptive strategies that local food actors have adopted in response to the pandemic and how access to different forms of social capital has influenced their ability to adapt.

Methodology: This paper reports findings from a survey administered to producers in the agri-food industry in Upstate New York in partnership with Cornell Cooperative Extension's on-ground network of farmers. This survey covers pre-pandemic operations, adaptations to the disruptions of the pandemic, and social capital access of the respondent. Using a combination of econometric and spatial analysis, results investigate the role that social capital plays in local community adaptation in times of economic stress.

Implications: Practical implications of this study are ongoing efforts by civil society organizations and local governments (including New York State) to strengthen local food and stimulate local economies in depressed regions. Academic contributions of this project include efforts to examine the interrelations between social and spatial natures of resilience and understand its implications for economic policy.

## LOCAL INSTITUTIONS AND COMMUNITY HEALTH POLICIES: A COMPARATIVE ANALYSIS

Abstract ID: 982

Individual Paper Submission

CHATTERJEE, Vaswati [Villanova University] vaswati.chatterjee@villanova.edu, presenting author

ARAPIS, Theodore [Villanova University] theodoros.arapis@villanova.edu, co-author

This research aims to understand the role of local governments in community health planning and services during public health crises. While much has been written about the need and process of local government emergency planning, there is limited knowledge on the effect of local institutions on emergency planning efforts taken by local governments, particularly in the context of community health. Crisis management policies are often shaped by local institutions and require collaborative governance as well as leadership (Kapucu and Garayev, 2011; Kapucu, 2015). Among different forms of formal local government institutions (that include Mayor-Council, Council-Manager, and Commission form of governments), studies have emphasized on the effectiveness of Council-Manager form of government in executing policy-making leadership (Zhang and Feiock, 2009; Zhang, 2014). City Managers have been found to effectively lead collaborative governance because of their managerial expertise, ability to facilitate citizen engagement; and communicate and collaborate across various agencies—factors that are instrumental in decision-making during a crisis.

We examine the effect of local institutions on community health policies among local governments in Florida (n=30) and Pennsylvania (n=70) during the COVID-19 pandemic. Based on responses provide by 100 local governments, our preliminary analysis suggests 3 major findings. First, results of Fisher's Exact Test suggest that local governments in Florida tended to be more proactive in COVID-19 response compared to Pennsylvania -i.e., rolling out public awareness campaign, providing masks, sanitizers, medical supplies, expanding services to homeless and elderly people, reaching out to businesses to take protective action, and taking community input in COVID19 response. Second, we found evidence that there is a positive association between local institutions and perceived effectiveness of public health strategies during COVID-19, i.e., compared to other forms of local governments, a council-manager form of government was more likely to report COVID-19 testing as an effective measure. While the association is positive and statistically significant, it is relatively weak (Somers' d = 0.161, p=0.068). Finally, local governments with council-manager form of government also tended to be more proactive in collaborating with other stakeholders when developing community health response strategies, for example—reaching out to private businesses during the pandemic ( $\chi^2(1, N = 100) = 2.667, p=0.10$ ).

## RISK COMMUNICATION AND INSTITUTIONAL RACISM: THE PROTECTIVE HEALTH EFFECT OF REFUGEE COMMUNITY ORGANIZATIONS

PIMENTEL WALKER, Ana Paula [University of Michigan] appiment@umich.edu, presenting author  
SANGA, Naganika [University of Michigan] nsanga@umich.edu, co-author  
GONZALEZ, Odessa [University of Michigan] odessagb@umich.edu, co-author  
YOSHIHAMA, Mieko [University of Michigan] miekoy@umich.edu, co-author

The COVID-19 pandemic has had a greater health impact on ethnoracial minorities and other vulnerable socio-economic groups (Webb Hooper, Nápoles & Pérez-Stable, 2020; Antwi-Amoabeng et al, 2020). Resettled refugees and immigrants can be characterized as a vulnerable group during the pandemic, despite the absence of health data by immigration status. When resettled refugees enter the U.S., they are largely exposed to adverse social determinants of health (SDH) (Vargas, Sanchez, & Juárez, 2017). Community involvement, especially of vulnerable populations, is an essential public health response to coronavirus disease 2019 (COVID-19) (Marston, Renedo & Miles, 2020). Yet, our research demonstrates that communities of refugee background rarely belong to networks of urban governance (Gonzales Benson & Pimentel Walker, 2021). This study documents the efforts that Refugee-led Community-Based Organizations, henceforth, RCOs underwent to participate in public health responses to COVID-19 and offset its detrimental aggravation of the (SDH) in their communities.

Given the importance of community involvement in containing infectious diseases, we documented, via the Daily Summary of Activities surveys and in-depth interviews, the range of social support that RCOs provided in the early months of the pandemic. The survey was developed through a collaborative process as part of a Participatory Action Research to provide tools for creating and maintaining a record of activities that could help RCO with grant writing and record-keeping. The survey tool was developed, tested, and adapted with refugee leaders. Based on RCOs' use and access to technology, we developed a short Qualtrics survey that allowed respondents to fill a summary of their daily community and organization-related activities in under one minute. The co-developed survey recorded RCO activities to support individuals and families. We analyzed 1074 responses from 16 RCO leaders regarding their activities to serve Bhutanese and Congolese communities during March - September 2020. Remote interviews with each refugee leader took place in the first two months of the pandemic and then in the end of summer 2020. The interviews contextualized RCO leaders' involvement with the health care system and built from an ongoing Participatory Action Research that started in 2018, with three RCOs in a U.S. midwestern county.

Our study finds that the three RCOs (one of Bhutanese and two of Congolese background) played an important role protecting their community members by: 1.-providing support services to offset the pandemic shocks and, 2.-fighting institutional racio-ethnic bias in healthcare systems, social services, and labor market. In the absence of institutional support systems, RCOs became the main conduit for delivering culturally and linguistically responsive health information and in some cases, safety equipment during the pandemic. Concurrently, RCOs also educated healthcare systems about refugee needs, advocating for recognition and inclusion. Findings demonstrate the need to establish protocols for refugee community involvement prior to public emergencies, promoting mutual health literacy.

## **SEEDS OF RESISTANCE: COMBATING SPATIAL INEQUALITY WITH URBAN AGRICULTURE**

Abstract ID: 1002

Individual Paper Submission

PRECIADO, Emanuel [University of California Irvine] preciade@uci.edu, presenting author

The case of Santa Ana, California provides an opportunity to investigate the relationship between food, space, and possibilities for urban agriculture as a means to acquire urban land to address food insecurity. I expect to learn about the processes involved with starting a community-owned urban farm that formed into a worker cooperative then started a community-supported agriculture (CSA) program, and seeking to scale up by acquiring more land to produce food. I propose to do a study on an urban farm organization in Santa Ana in order to examine their impact not only on local food policy but also the various networks and political actors they have ties to at varying scales (i.e., county, regional, state) and how UA can (re)shape the urban terrain. Building on Granzow and Shield's (2020) recommendation to pursue how UA tactics can be scaled up and institutionalized in ways that might better effect change (p. 295),

My case is puzzling because city-owned community gardens normally address personal food cultivation, community building, and add green spaces to the city, but are not typically started with the intention of creating systems change to the local economy, food systems, and/or policy changes. Past scholarship on urban agriculture has focused on communities that have lost gardening and farming space or the individual benefits of gardening. Not only does Santa Ana's community-owned urban farms provide residents green spaces to host events build community but they are scaling up urban agriculture in the city as part of a larger movement for racial, economic, and environmental justice that seeks to regain public lands to help combat spatial inequalities disproportionately affecting working-class, immigrant, and communities of color.

By comparing Santa Ana's city-owned community gardens and community-owned urban farms, I plan to conduct a qualitative study examining how under-resourced communities acquire and sustain resources for urban agriculture drawing on resource mobilization theory (McCarthy and Zald, 1977). Urban agriculture refers to not only intensive urban food production but also the strategies employed by advocates (Granzow and Shields, 2020) to advance a progressive food policy agenda and (re)shape the urban landscape to better meet the needs of the community. Santa Ana's community-owned urban farms seek to address spatial inequalities caused in large part by gentrification, where redevelopment projects for housing, shopping centers, and transportation have "routinely spatially alienated Latina/o, the working class, and immigrant residents" of Santa Ana and shaped the built environment we see today (Gonzalez, 2017). Recently, the COVID-19 pandemic has exacerbated an already challenging set of circumstances for working families of Santa Ana, affecting even the most basic human needs, like food, for the city's most vulnerable residents: working families, immigrants, and communities of color.

While it is not uncommon for communities to start community gardens for a variety of reasons, some of those reasons even overlap with the goals of Santa Ana's community-owned urban farms like creating green spaces that are social and foster community, community gardens do not normally (a) seek community-ownership of land (b) seek to make healthy and culturally relevant food accessible for all residents, or (c) seek to address structural inequalities through policy changes. My study aims to understand how Santa Ana's first community-owned urban farms operate compared to city-owned community gardens, as a small group of individuals has been able to harness the necessary resources to acquire unused urban land for urban farming.

Food-insecure areas in the US metropolitan regions face substantial challenge in identifying precise locations of the vulnerable population and to accurately estimate the demand for food related services. Currently available identification methods, such as the ones used by USDA, rely on broad strokes to delineate the entire ZIP codes or Census Tracts as 'probable food deserts'. On one hand this method is less reliable in making precise demand estimates causing already resource-strapped service providers to adopt arbitrary estimation, while on the other hand a large section of the impacted population gets unnoticed or underserved. Hence, in absence of an accurate data-centric estimation method, there is substantial misalignment between the service providers' perception of demand and the actual service needs of the people in food-insecure neighborhoods. This paper focuses on using granular geospatial data and advanced analytics to identify such neighborhoods, their socio-economic characteristics, and predict the demand for food service. The outcome of this exercise is expected to provide accurate estimation for local and regional agencies - including governments, non-profits, transit authorities, etc. - to make operational decisions.

The USDA identifies Census Tracts as low-income low-access if more than 20% or more of tract population are under poverty and 33% of the tract population are more than ½ mile in urban areas (10 miles in the case of rural tracts) away from a supermarket or a large grocery store, and other measures of accessibility and income such as vehicle ownership, dependency on public transportation, participation in Federal food assistance programs, etc. (USDA, n.d.) While a broad delineation of food insecurity at the tract level is adequate for determining the amount of federal or state assistance allocated to the localities for addressing the issue, this delineation is not particularly useful for the service providers to make resource allocation decisions. The limitation of this approach is widely acknowledged in the current literature including (McEntee & Agyeman., 2010; Morton & Blanchard, 2007).

Neighborhoods with food insecurity share remarkably similar distress indicators such as poverty, blight, unemployment, high crime, diminished accessibility, poor health, homogeneity of minority races, concentrated poverty, higher population density, low performing schools, and increased reliance on supplemental nutrition programs such as SNAP and WIC (Coleman-Jensen et al, 2019; Beaulac, Kristjansson & Cummins, 2009).

The tools to address food insecurity adopted by the communities, local governments, or non-profit organizations may come in a variety of forms such as food pantries, soup kitchens, community gardens, urban farms, mobile grocery stores, etc. However, accurate delineation of food insecurity at the neighborhood or street level, granular demand projection, and better understanding of the socio-economic and cultural makeup of communities are needed in order for the tools to achieve effective outcomes.

In this paper, we present the findings from a pilot study conducted in Richmond (Va.) Metropolitan Statistical Area to show how granular geospatial data and advanced predictive analytics could be used to (1) delineate food insecurity areas at census block level, and (2) estimate food service demand (e.g. pound per week) at the household level. We use actual grocery store addresses, and network data - composed of urban roads and sidewalks - to determine grocery catchment zones. Further, we intersect demographic and socio-economic data (including household income, unemployment, family size, age groups, race and ethnicity, vehicle ownership, reliance on public transportation, etc.) from American Community Survey (ACS) with tax parcel data obtained from local government planning departments and transit service data obtained from the Greater Richmond Transit Authority (GRTC) to build our predictive models.

We conclude by identifying relevant factors needed to delineate food deserts and to conduct demand projection that can be adapted to other metropolitan regions.

#### CONCEPTUALIZING URBANIZING FOOD SYSTEMS DIMENSIONS OF ACCESS

Abstract ID: 1051

Individual Paper Submission

USHER, Kareem [Ohio State University] usher.21@osu.edu, presenting author

ANANDHI, Aavudai [Florida Agricultural and Mechanical University] anandhi.swamy@fam.u.edu, co-author

GRAGG, Richard [Florida Agricultural and Mechanical University] Richard.gragg@fam.u.edu, co-author

JIRU, Mintesinot [Coppin State University] mjiru@coppin.edu, co-author

While the majority of studies are focused on objective measures of access, much less have explored the concept of food access. In a previous paper, one of our authors applied Penchansky and Thomas' (1981) concept of health access to the concept of food access. Though helpful in highlighting five critical dimensions of food access while also capturing broader themes of spatiality, temporality, objectivity and perception, our

colleague's conceptualization does not provide a way to analyze the cause-effect interactions between the five dimensions and the urbanizing food environment. In this study, we argue that expanding and modeling the dimensions of access and their interactions is critical to the analysis and decision-making initiatives of sustainable urbanizing food systems. With the use of spiderweb diagrams, we demonstrate the degree of interactions among the five dimensions with respect to the societal elements of perception and objectivity. We used the DPSIR causal framework to analyze the cause-effect relations between the five dimensions and the DPSIR components: drivers, pressures, state, impact, and response. The five dimensions are further conceptualized for spiderweb and DPSIR for low, medium and high interactivity. The conceptualizations are applied to three case studies from the literature.

#### **SMALLHOLDER RESISTANCE AND RESILIENCE IN A NEOLIBERAL INDIA: A STUDY OF SUB-NATIONAL AGRICULTURAL MARKET POLICY IN KERALA STATE**

Abstract ID: 1056

Individual Paper Submission

SANDERS, Lanika [Food Systems and Healthy Communities Lab, University at Buffalo] [lanikacsanders@gmail.com](mailto:lanikacsanders@gmail.com), presenting author

The livelihoods of India's nearly 126 million smallholder farmers are built upon agricultural insight and innovation born from the country's long agrarian past, but face fragility in the midst of federal strides towards an evermore industrialized and commercialized future. In the wake of the Government of India's 2020 passing of three farm bills aimed at deregulating the agricultural sector, smallholder farmers are left with significant threats to food and job security. In this context, I examine past and current federal agricultural policies in India, with particular focus on how market legislation impacts smallholder farmers. Zooming in on the Indian state of Kerala, where the 2020 farm bills have yet to significantly impact farmers, I explore how state-level policy can serve as a means of resistance against neoliberal federal policies. To capture the impact of legislative activity on smallholder farmers' day-to-day experiences, I center my analysis in qualitative interview data collected in 2018 and 2020, supplemented with government documents and statistical records. I set forth several policy-based recommendations for how sub-national governments can support the retail activities of smallholder farmers to help cultivate healthier lives and livelihoods throughout the food system.

### Background:

A regional food system (FS) is the soil-to-soil system that encompasses production, processing, distribution, acquisition, consumption, and management of food-related waste in a region. A regional FS depends on resources, technologies, stakeholders, relationships, policies, laws, and information to enable food to move from farm to plate. Across Western New York (WNY), FS activity is a key driver in the regional economy with food and agriculture playing a central role in not only local economies but also the local community fabric. Despite the many strengths in Western New York's regional FS, it is also frayed.<sup>1</sup> Low nutrient, hyper-processed foods are readily and cheaply available, while high nutrition foods are hard to come by in low-income neighborhoods.<sup>2</sup> Consolidation in the food industry has shortchanged farmers and consumers. Wages and benefits for workers in the food supply chain—farmworkers, restaurant workers, grocery store workers—who harvest, pack, process, and shelve food are limited. Farming continues to be a high risk business, especially for small and medium sized farms, and those operated by farmers of color. Times of instability such as the one during the COVID-19 pandemic illuminate and exacerbate inequities in the food system, resulting in worsening crisis-related outcomes.

### Objectives:

This study extends the argument that the concept of food environments goes beyond typical food access and food desert analysis<sup>3</sup> by examining the advantages and potential challenges of using methods of co-production and participatory mapping to create a GIS-based food systems platform.

### Setting:

This paper reflects on a mapping and food systems assessment project, Community-Centered Healthy, Equitable, Ecological and Regional Food Systems Mapping Project (CHEER), in the nine-county western New York Region. The CHEER project is a participatory and mixed methods mapping project involving inclusive planning processes where stakeholders in the WNY food system co-design an informational portal that maps and monitors problems (as the stakeholders themselves articulate) and/or opportunities.

### Methods:

The paper will draw on a reflection of the process of co-production as well as mapped and visualized data. Mapping and data visualization will be produced with open source data (e.g. New York State, USDA) using ESRI mapping technology. Information gathered from community meetings and presentations will dictate the structure and content of the data portal. These methods contribute to existing research addressing the methodological gaps in food environment analysis by incorporating components that represent a broader understanding of the regional food system.<sup>3</sup>

#### Results:

We hypothesize that food systems mapping informed by community stakeholders will produce a more useful tool for stakeholders across the food value chain to visualize and understand key information and monitor change across the regional food system. It is hypothesized that aligning stakeholders across the food system using one centralized informational platform will improve transparency and promote better community and policy outcomes.<sup>4</sup>

#### Implications for Planning Practice:

The implementation of a co-produced data portal can have a profound impact on building a deeper understanding of the WNY regional food system<sup>5</sup> and on connecting stakeholders to the many networks within the food value chain. Examining the inclusive processes of a co-produced data portal provides the opportunity to develop a methodology for collaborative mapping projects that leverage the vast array of mapping tools and technologies with the local expertise of community stakeholders creating a useful informational platform to inform and guide better policy and community outcomes.

BROWN, Camile [Food Systems and Healthy Communities Lab, University at Buffalo] camilebr@buffalo.edu, co-author

BOAMAH, Emmanuel [Food Systems and Healthy Communities Lab, University at Buffalo] efrimpon@buffalo.edu, co-author

RAJA, Samina [Food Systems and Healthy Communities Lab, University at Buffalo] sraja@buffalo.edu, co-author

Scholarly psyche forms the foundation for how phenomena are widely perceived, explored, approached, and evaluated. The use of terminology, their meanings, and interpretations have a critical role in depicting the nature of

food issues. There is a framing problem around how corner stores are discussed in the public health literature. Failure to accurately convey the nature of corner stores allow for a habitual misuse of scholarly language that misguides education, future research, policy, and interventions designed to alleviate burdens that affect people. Nationwide Black residents are more likely to be exposed to food environments providing unhealthy food options that increase risk of diseases, reflecting their increased likelihood to acquire such diseases. The culture of corner stores in Black neighborhoods represent one of many phenomena that has been widely explored, yet existing discourse in literature misrepresents conditions and stalls strides toward appropriate solutions.

Language should be used in such ways that expose, in a forthright manner, the the historical legacy of racism that underlie conditions in neighborhoods. The current formality and standardization of research practices regarding corner stores can silence nuances that have a vital role in influencing the health and socioeconomic situation of the Black people. Further, a lack of experiential knowledge on behalf of scholars from radically different social situations than those they aim to study further hinders clear understanding of issues. Failure to acknowledge the social conditions historically imposed and unaddressed on Black people only silences the nature of their experience thus limiting authentic resolution.

This paper unpacks the way in which the corner store literature frames problems. The paper identifies and critiques themes and language emerging from the existing literature. These critiques are informed by experience, historic documentation, and analytical constructs deployed in the Black Studies literature.

### **PHYSICAL AND MENTAL HEALTH DISPARITIES BETWEEN MIGRANT AND NON-MIGRANT FAMILIES: THE CASE OF DEARBORN, MICHIGAN**

Abstract ID: 156

Poster

MAAITA, Marah [Michigan State University] maaitam1@msu.edu, presenting author

KOTVAL-KARAMCHANDANI, Zeenat [Michigan State University] kotvalze@msu.edu, primary author

Studies have shown that cultural changes can positively or negatively affect psychological, behavioral, and physical outcomes when different cultures come into continuous contact (Leopoldo 2003, Berry 1992, Amer 2007). Most of the changes occur in the non-dominant group (migrants) due to the settlement in the dominant sub-group society (Berry, 1992). The majority of research done in the United States and North America has focused on these changes for larger immigrant and minority groups such as Hispanics/Latinos and Asians (Amer, 2007). However, in the United States, we have a sub-group that is largely understudied, resulting in misunderstood data in mental and physical health; Arab Americans (Amer 2007, Abuelezam 2018). Arab American's in the U.S. are categorized as "Caucasians or whites," misleading the use of data for both sub-groups, "whites" and Middle Easterners. This discrepancy leads to misidentification, identity crisis, and an overlook on a minority sub-group facing critical health problems that

omits them from receiving proper social services and appropriate healthcare (Amer 2007, Bertran 2017). Using the random sampling method, we sent out 4,000 postcards linked with an online survey to households in Dearborn, Michigan, to collect data on physical and mental health from Middle Eastern households and non-Middle Eastern households. Dearborn is characterized as being 90% white (U.S. Census 2019), when in actuality, about 30% of the residents are Arab, making it the area with one of the largest Arab concentrations in the country (U.S. Census 2003). We proceeded with an approximate 10% response return rate with a sample of 360 used to determine mental health disparities and behavioral habits (cigarette/tobacco/alcohol consumption and eating habits) before COVID-19 and since COVID-19, physical health disparities (obesity and chronic illnesses), and the role of built-environment and socio-economic status on these health indicators. Through inferential statistics and logistical regressions, our results indicate that Middle Easterners experience higher mental health problems such as greater feelings of restlessness, fear of physical health, less feeling of happiness, and other indicators of stressors before and since the COVID-19 pandemic. We also found that Middle Easterners are less likely to have healthcare coverage than non-Middle Easterners coinciding with our finding of less likelihood to visit a doctor or health facility. Further, in our sample, Middle Easterners earn much less in annual income and have much less educational attainment than non-Middle Easterners. However, our sample showed that Middle Easterners are less likely to be obese and have chronic illnesses than non-Middle Easterners, although there were no significant differences in eating habits. We examine Dearborn's built environment to discern the accessibilities to health facilities, groceries, and walkability to determine our recommendations to improve mental and physical health and accessibility to facilities.

#### HOMELESSNESS AND PERCEPTIONS OF INSECT-BORNE DISEASE RISK IN A CHANGING CLIMATE: A STUDY OF THE UNSHELTERED POPULATION IN CAMBRIDGE, MASSACHUSETTS

Abstract ID: 559

Poster

HOOPER, Michael [University of British Columbia] michael.hooper@ubc.ca, presenting author

This project examines how people experiencing homelessness manage risks posed by insect-borne diseases. Concerns over risks posed by insect-borne diseases have increased with realization that climate change is expanding the range of many insects responsible for such diseases. The rise in insect-borne illnesses is captured by the increasing number of US cases of Eastern Equine Encephalitis (EEE), which resulted in 13 fatalities in 2019. Reflecting these worries, cities are taking steps to protect residents. For example, in response to the 2019 EEE

outbreak, some municipalities placed curfews on public parks. In Cambridge, MA, the city posted warning signs in parks calling for vigilance and outlining safety measures. Such measures involve not staying in parks at night and wearing appropriate clothing and insect repellent. Nonetheless, many of these same parks are home to growing populations of unsheltered people who are particularly vulnerable to the risks posed by insect-borne diseases. This project asks if unsheltered people are aware of insect-borne disease risks, whether they take steps to protect themselves from such illnesses and, if so, what those steps involve. Furthermore it seeks to understand how cities might better protect their unsheltered populations from the growing threat to health and well-being posed by insect-borne diseases.

Homelessness is a growing challenge globally. In the United States, over 3.5 million people experienced homelessness in 2013 (Liebler et al., 2016). Broadly, the homeless population can be divided into two sub-populations: the sheltered, who reside in emergency shelters, transitional housing or safe havens, and the unsheltered, who stay in places not primarily intended for habitation, such as on the streets, and in abandoned buildings, vehicles, or parks (Solari et al., 2014). Virtually all studies of diseases in the homeless population have focused on the sheltered. For example, several studies have identified the diseases and conditions common within the sheltered homeless population, including tuberculosis (Badiaga et al., 2008). These studies have resulted in proposed and implemented interventions, such as shelter-based health screenings. However, such studies have generally failed to consider the unsheltered population, and this is also true with respect to studies of insect-borne illnesses, which have been limited to such topics as bed bugs and body lice infestations in shelters (Leibler et al., 2016).

The method of data collection for this study focuses on interviews. Eight-five unsheltered Cambridge residents who sleep out of doors were interviewed in 2019. The interviews asked where people spend time and sleep and how they do or don't manage risks from insect-borne diseases. Data analysis involved, first, coding answers to interview questions, by assigning answers to non-overlapping categories. Then, the more detailed answers to interview questions were used to contextualize patterns in these initial findings and present a nuanced picture of how the unsheltered population in Cambridge manages risks posed by insect-borne illnesses. Ultimately, the results show that these risks are of considerable concern to the interviewees and that virtually all interviewees have concerted strategies they deploy to minimize their exposure to, and risk from, insect bites. These strategies provide the basis for recommendations cities can adopt to better protect unsheltered residents and to reduce broader risks posed by insect-borne illnesses, which are expected to increase with climate change.

Disaster recovery research has historically been associated with governmental action (Pathak and Ahmad 2018; Phillips 2015) as is often assumed that governments are better positioned in providing aid in the interests of the public (Bisri 2013; Carlson et al. 2017; Davison et al. 1997; Pathak and Ahmad 2018). However, recent research has shown that hierarchical and rigid governmental structures are often not capable of meeting recovery needs (Olshansky, Hopkins, and Johnson 2012), and may lack capacity to adapt to catastrophic events (Lindell, Prater, and Perry 2006). Therefore, current disaster recovery research is often characterized by the rise of nonprofit activity (Ganapati 2009). With more horizontal and adaptive structures, nonprofit organizations are better at building social cognition, promote social trust and reciprocity which in turn fosters social capital (Ganapati 2006; Islam and Morgan 2012). This study examines recovery actions of nonprofits within the health and related community development sectors in response to compound and consecutive disasters

Despite researchers and policy practitioners commonly agreeing that nonprofits are important to recovery, we continue to lack critical insights into how these stakeholders navigate recovery themselves, the challenges they face in providing key recovery services and how they adapt to the recovery situation as it evolves. We especially lack information on how nonprofits navigate cascading, compound, and consecutive disasters which may reduce their capacity to perform recovery functions or interact with other stakeholders such as governmental agencies and local residents. This study examines nonprofit experiences with recovery service provision in the context of three consecutive and simultaneously occurring disasters in Puerto Rico, namely, the 2017 Hurricanes Irma and Maria, the 2020 Southwest Puerto Rico Earthquake Sequence, and the 2020 COVID-19 pandemic.

The study poses two main research questions: (1) how are challenges posed to nonprofits operations compounded over multiple disasters; and (2) how does a nonprofit's experience with service provision in one type of disaster event help them to prepare or respond to a different type? The proposed article focuses on these gaps in the literature in the context of Puerto Rico that has recently been impacted by multiple major disasters, including the 2017 Hurricane Maria, the 2020 Southwest Puerto Rico earthquake sequence and the ongoing COVID-19 pandemic. The study's main data collection method includes phone surveys with non-profit agencies (n=300), including those that are health-focused and/or that undertake health-focused initiatives. The surveys are supplemented with longitudinal data from Form 990 Returns filed by nonprofits (available through GuideStar) as well as with in-depth, semi-structured interviews with nonprofit agencies' leadership (e.g., executive directors) and staff most knowledgeable of these agencies' ground operations (e.g., project managers and field workers) (n=40).

Our research finds that health and non-health focused nonprofits in Puerto Rico were able to use their Hurricane Maria and earthquake experiences to become more efficient at facilitating information flow, fill resource gaps, and mediate between the government and residents in recovery planning efforts during the COVID-19 pandemic. During Hurricane Maria and 2020 earthquakes nonprofit organizations changed their missions, programs, and target populations in order to adapt to the current public health crisis. Our research also shows that in order to build capacity they engaged in a variety of capacity-building strategies, including information-seeking, networking and resource sharing. Our research can help planners, emergency managers, governments, and other stakeholders to better engage with nonprofits during recovery from compound and consecutive disaster events. This study is supported by funds from the Center for Disease Control (CDC), and the National Science Foundation (NSF) received through the Natural Hazards Center at Boulder CO.

## UNPACKING THE IMPACTS OF NEIGHBORHOOD ENVIRONMENTS ON INDIVIDUAL DEPRESSION BASED ON DEEP LEARNING TECHNIQUES

Abstract ID: 614

Poster

KIM, Ji Il [Hanyang University] patoto@hanyang.ac.kr, presenting author

WOO, Ayoung [Hanyang University] ayoungwoo@hanyang.ac.kr, primary author

Depression is a growing concern in Korea, in particular, due to the increasing appeal of "work-life balance" and "healthy" lifestyles. Depression reduces the individual quality of life and even leads to suicidal thoughts and behavior. Korea's suicide rate is the highest among the Organization for Economic Cooperation and Development (OECD) countries, and depression has been considered as one of the critical factors affecting suicidal thoughts and behavior in Korea (Shin et al., 2017). In response to this situation, there is a growing interest in various environmental components that may affect individual mental health and depression.

Multifaceted factors, especially in terms of socioeconomic attributes, social environments, and individual physical activity and health-related characteristics, may affect individual mental health and depression. Many public health studies point out that individual and social attributes (e.g., age, social support, etc.) are significantly associated with mental health and depression (Domènech-Abella et al., 2020). However, beyond such characteristics, neighborhoods where people live may substantially influence residents' mental health. For instance, neighborhoods with higher levels of green space may reduce individual depression, whereas distressed communities with higher noise, air pollutions, and crime rates may exacerbate residents' mental health (Miles et al., 2012). Despite many studies showing the relationships between neighborhood conditions and individual mental health, there is a limited understanding of the mediating effects of physical activity and walking behavior on individual depression level. Furthermore, most existing literature on the impacts of neighborhood conditions on mental health is limited in identifying neighborhood environments because previous studies rely heavily on surveys to measure neighborhood conditions. Our study fills this gap by examining the mediating effect of physical activity and walking behavior on depression based on deep learning techniques.

We conducted a household drop-off survey of 1,000 residents aged 19 or older in Seoul, Korea, in order to specify the relationships between neighborhood environments and individual depression. The survey questionnaires included various socioeconomic attributes, social environments, and individual physical activity and health-related characteristics. Based on the data, we used the structural equation model (SEM) to examine the mediating effect of physical activity and walking behavior on the depression level and the identified factors (e.g., neighborhood environments) related to physical activity, walking behavior, and depression level. Individual depression was measured by the Patient Health Questionnaire-9 (PHQ-9). The PHQ-9 consists of nine questions and is designed to

answer each respondent's experience and corresponding situation related to depression in the last two weeks. Physical activity and walking behavior were identified by the frequency of walking, medium-intensity and high-intensity exercises, and the average daily performance time. Notably, this study employed deep learning techniques, based on the semantic segmentation using Google Street View (GSV) panoramic images, to estimate respondents' neighborhood environments (e.g., mixed land use, green area ratio, and accessibility to amenities). This approach has the advantages of high accuracy and low cost compared to the survey to identify neighborhood environments (Ki and Lee, 2021). We also included various identified factors related to individual depression level such as socioeconomic characteristics (e.g., gender, household income, education, etc.), social supports (i.e., measured the Multidimensional Scale of Perceived Social Support Scale), and individual health-related and behavior attributes (e.g., BMI, regular meal, deep sleep, and non-smoking and drinking). The results of this study could be used as a guideline for supporting policies to identify and improve neighborhood environments alleviating individual stress and depression.

#### IMPACT OF COVID PANDEMIC ON UNIVERSITY FOOD PANTRY PATRONS

Abstract ID: 776

Poster

KHANDELWAL, Shruti [Michigan State University] khandel8@msu.edu, presenting author

The COVID-19 pandemic has revealed some limitations and challenges in systems established to provide food security to the neediest families and individuals. Food insecurity is defined as the feeling of having the inability to access or afford nutritious food to feed oneself or one's family (Hunger + Health, Feeding America, n.d.). Since March 2020, restrictions and social isolation have had pronounced effects on behaviors (regarding food procurement and consumption) and food security for many university students studying in the U.S. International students suffer from food insecurity due to their limited access, acculturation, and budgetary constraints while studying at US institutions (Kim & Cronley, 2020; Soldavini & Berner, 2020; Sherry, Thomas, & Chui, 2010). Stress can be categorized as physical, mental or psychological, psycho-social stress and psychospiritual stress (Friedman, W.J., 2020). While physical (Keenan, Christiansen, & Hardman, 2021) and mental stress (Martin, Maddocks, Chen, Gilman, & Colman, 2016) have been associated with food insecurity, the other two have not been linked in combination with physical and mental stresses.

Many institutions provide access to food banks on campus to help students to avail foods at no cost to them. Using logistic regressions, this research study aims to assess stress related to food insecurity during the COVID-19 pandemic for students (n=78) using a food pantry at a large research university. Out of 78 responses, 85% were students 15% were non-students, 53% were international and 80% were responsible for grocery shopping. The results indicate food insecurity is statistically significantly related to physical stress ( $p < 0.05$ ), and physical and mental

stress combined, and total stress (all four included) but not mental, psychosocial and psychospiritual stress individually. Access to food pantry is also statistically significantly related to food insecurity. Recommendations for institutions to improve ‘means of access’ for students facing food insecurity and tap into local social and cultural organizations for off-campus students to access foods are discussed.

#### AIR POLLUTION AND SPATIAL HETEROGENEITY IN PNEUMONIA MORTALITY

Abstract ID: 934

Poster

JUNG, Suyoung [Sungkyunkwan University] syjung1228@skku.edu, presenting author

JUN, Hee-Jung [Sungkyunkwan University] hjun@skku.edu, co-author

Air pollution by particulate matter has seriously threaten individual health worldwide. Particulate matters are very small and easily absorbed into the body, thereby leading to respiratory disease such as pneumonia when exposed for a long time (Kyung and Jeong, 2017). Exposure to particulate matters also affects the shortening of life expectancy (Brunekeerf, 1997). The understanding of the spatial relationship between particulate matters and health is critical in order to effectively control air pollution. Although there are a few studies using spatial analysis (e.g., Chu et al., 2015), there are a few studies analyzing spatial heterogeneity between particulate matter and pneumonia deaths (e.g., Zhang et al, 2019). However, there is no study that have been conducted across the country. Given that physical and socio-economic characteristics differ by locality, the effect of particulate matters may vary by locality. For example, the magnitude of particulate matter effect may be lower in rural areas because air ventilation is easier compared to urban areas. In this regard, this study asks the following research questions: Does the impact of particular matters on pneumonia deaths differ by geographic location?

To examine the research question, we use the Cause of Death Data in Korea and use the pneumonia mortality at the local level as a dependent variable. For the independent variable, we use the local levels of PM 2.5 and PM10, the major types of particulate matters. Additionally, we include physical environmental factors (e.g., population density, urban area ratio, green area ratio), socioeconomic factors (e.g., poverty ratio, self-reliance ratio of local finance, number of hospital), and policy factors (e.g., disaster management budget). We employ a geographically weighted regression model that can estimate spatially varying effects of particulate matters and other factors affecting local pneumonia mortality. The empirical results show that the impacts of particulate matters on local pneumonia deaths vary by locality.

## **DIAGNOSING PEDESTRIAN WALKING BEHAVIORS AND ENVIRONMENT FEATURES WITH WEARABLE SENSORS - TOWARD SAFE AND HEALTHY COMMUNITY**

Abstract ID: 1058

Poster

NAM, Yunwoo [University of Nebraska Lincoln] ynam2@unl.edu, presenting author

Walkable environment can be facilitated or constrained by the characteristics of built environment features. Disordered and unpleasant neighborhood environment holds up physical activity of residents. Therefore the diagnosis of facilitators and barriers to walkable environment is a critical step to design active, safe and healthy community. To investigate the conditions of walkable environment, the development of a high-quality and reliable assessment framework and tool is essential. Conventional methods are perception surveys and visual audits. However, these approaches are influenced by respondents' subjectivity and do not adequately handle the differences of various population groups while the influence of barriers and facilitators of physical activity changes by age, health conditions, and the ability to perform some activities. To address the research gap, the research team proposes an innovative and noble approach to assess the built environment using physical body responses with wearable sensors. Built environment impacts human's behaviors while walking on a path, and a body response is the reaction of a body system to a surrounding environmental stimulus. Such responses can provide beneficial information that can be used to investigate the relationship between human's activities and built environments.

The research method includes a wide array of objective measures available as well as field observation methods. The team developed a reliable community assessment tool by integrating visual audits with sensing data. To assess types, levels, and locations of built environment features on a pre-defined path, visual audit forms were developed and used. To analyze walking behaviors, the team used acceleration signals of several tri-axial accelerometers fixed on the pelvis and ankles of participants. Spatial and temporal gait features were analyzed. To examine the relationship among features of built environment and walking behaviors, Machine Learning (ML) Model is applied. Study areas are the City of Lincoln's neighborhoods.

The findings clearly show that locations and types of built environment features are strongly associated with pedestrian's walking behaviors. To identify implication of our findings for policy, the paper discusses environmental strategies to promote positive neighborhood effects and reduce adverse effects.

ZHANG, Ming [the University of Texas at Austin] zhangm@austin.utexas.edu, co-author

At many U.S. planning programs, the twin conditions of financial reliance on international students and intellectual claims of global impact raise the question: do schools actually deliver transformative planning educations that catalyze students' careers, especially for those who return to their home countries? American academic planning programs face the conundrum of maintaining student enrollment at a time when global urbanization levels and rates underscore the need for urban planning. With domestic enrollment steadily declining, some programs have come to rely financially on international student enrollment, which peaked in 2014 at 956 but has since also steadily declined to 705 in 2019 (PAB, 2019). Meanwhile, many schools tout the global impact and aspire to train not only planning technicians but future change makers.

This roundtable explores how U.S. planning education impacts international students—both ideologically and professionally, using the case of students from mainland China as an entry point. America's pedagogical influence on Chinese planners has a long history (e.g., Wong, 2013), but since 2007, mainland Chinese students increasingly study planning in the U.S., even as overall international enrollment declines, accounting for nearly half of some master's planning programs' students. Yet, while studies have broadly examined international planning education broadly (ACSP, 2019), little research has focused on mainland Chinese students. How do their careers differ from domestic students? How does their U.S. education impact their careers in China?

The panel kicks off with a brief presentation sharing the results of a recent study that (a) interviewed around 40 alumni who graduated from U.S. planning programs then returned to China (aka haigui or "sea turtles") (Weingarten, 2020); (b) interviewed 15 planning faculty in the U.S. and China; and (c) surveyed mainland Chinese alumni of U.S. programs in architecture, landscape architecture, urban design, real estate, and planning to situate planning students' trajectories compared to those of allied fields. The findings:

1. Underscore the challenges that haigui confront due to differences in the scope of planning in China versus the U.S., the types of places that employ planners, and the skills needed to secure employment.
2. Suggest that China's rapidly evolving urbanization and planning policy landscape creates new opportunities for U.S. planning education to be relevant for Chinese students; and
3. Holds a mirror up to gaps in U.S. planning education that would benefit all students, domestic and international, if addressed.

We then open the session to a panel discussion with senior educators from the U.S. and China to collectively reflect

on the two-way transcultural impact of U.S. planning education. Questions for discussion include: What are the differences between planning in the two countries? What tensions exist between trends in U.S. planning education, especially as they relate to social equity, racial justice, and decolonization (Sen et al., 2017), and prospects for haigui graduates, whether in China or the U.S.? What do current debates and prospects for planning in China suggest about potential future learning and teaching at U.S. planning programs? How can U.S. planning programs better support international students' learning and career development?

The panel, while focused on the experiences of mainland Chinese students and China-U.S. exchange, shines a light on the limitations and prospects for U.S. international planning pedagogy more broadly. We invite anyone who teaches international students and is curious about these topics to join the conversation.

### 10.196 ROUNDTABLE - ZONING FOR EQUITY: A NEW MULTI-CAMPUS COURSE AIMING TO UNDO EXCLUSIONARY ZONING

Abstract ID: 196

PENDALL, Rolf [University of Illinois at Urbana-Champaign] [rpendall@illinois.edu](mailto:rpendall@illinois.edu), organizer, moderator  
GARCIA, Ivis [University of Utah] [ivis.garcia@gmail.com](mailto:ivis.garcia@gmail.com), participant  
PFEIFFER, Deirdre [Arizona State University] [Deirdre.Pfeiffer@asu.edu](mailto:Deirdre.Pfeiffer@asu.edu), participant  
WHITTEMORE, Andrew [University of North Carolina] [awhittem@email.unc.edu](mailto:awhittem@email.unc.edu), participant

In this roundtable, we will discuss an innovative course that will be offered for the first time in fall 2021 in eight accredited planning programs. The aim of the course is for students to identify policy and practices that could make zoning more equitable (we call these blueprints) and action plans for getting those policies and practices enacted (we call these playbooks).

We will capitalize on the instructors' broad knowledge of the origins of exclusionary zoning and past efforts to make zoning more equitable to develop lectures and other material that all students will engage asynchronously every week. Students will also meet synchronously weekly in two different formats. First, cell meetings will involve students meeting with other students on their own campuses to advance their work on assignments on (1) Origins (the history of exclusionary zoning in their host community/state), (2) Past efforts (past reform efforts in their community/state), and (3) Ending it here (proposed blueprint and playbook for their community/ state). Second, comparative learning labs will bring students together across campuses after each of these assignments is complete to reflect on intersections/divergences among the diverse place-based cell assignment outcomes. By the time of the ACSP conference, we will have completed two of the comparative learning labs and be starting on the Ending it Here

segment.

At least some instructors intend to establish relationships with advocacy groups and planners in their home communities before the class gets underway, tapping into local knowledge about the history of exclusion and reform as well as insights about Blueprints and Playbooks. In some cases, planners or advocates may have a specific goal in mind before the class begins (e.g., analyze and amend a city zoning ordinance, draft a legislative proposal). In others, practitioners may serve more as an audience or resource than as a client.

The four lead organizers of the course are proposing and will lead this workshop; we hope also to be joined by other instructors.

All academics know the pace of change in program curriculums tends to be slow; unfortunately, the pace of climate change just keeps increasing. How have planning programs done in updating curricula to include climate change knowledge? In this round table, noted educators from five developed and largely English-speaking countries will briefly review their studies of the level of integration of climate into planning pedagogies, and then along with attendees, we will try to make sense of the barriers to faster change, the gaps and opportunities that different countries are finding. The studies have been designed to be internationally comparative and were organized with the United Nation's Planning for Climate Action (P4CA), which allows us to draw some broad conclusions about uptake. Similar work is planned by scholars in other global regions, and to the extent this information is available, we will present it. With this base line established, conversation will turn to the drivers for change or stasis, including student interest, accrediting and professional bodies, emerging scholars, institutional constraints and incentives, and other emergent vectors. Attendees will have the opportunity to reflect on what is working in their institution, department and country, and together we hope to draw some shared lessons on how to leverage existing resources to increase the pace of change in our curricula. We invite non-climate-specialists to attend--administrators who are seeking ways to increase climate education in their curricula, doctoral students, those who do not yet include climate issues in their own courses--alongside experienced climate change educators, to create a robust discussion of this critical issue.

 WILLIAMS, Darien [MIT] darienaw@mit.edu, participant

2020 changed our teaching. The abrupt switch to online learning was part of that change and in the early days of the pandemic many of us spent hours recording lectures, overhauling content, and creating new assignments. But life--and teaching--since March 2020 haven't just been about Covid-19 and technology. Among other things we've taught through a looming eviction crisis, heightened (and long overdue) attention to systemic racism, nationwide protests along with a more visible Black Lives Matter movement, contested elections and violence at the US Capitol, and economic devastation borne largely by Black and Latino women. These events, too, have pushed into our classrooms and pedagogy. They have also exacerbated the compounding issues of work, family, poverty, oppression and trauma faced by many students and faculty.

Most of us recognize that our teaching goal shouldn't be to return to our pre-pandemic normal. But without reflecting on what we have learned and experienced in the classroom (virtual or not) since last March it's difficult to understand what our new normal should be. Just as urban crises don't automatically lead to "better" or more just cities once a recovery begins, a teaching crisis like the one we've experienced since March 2020 won't automatically lead to "better" or more just courses, programs, and pedagogies, either.

The goal of this roundtable is to have a broad conversation about the lessons we might take with us from pandemic teaching. Together with our audience we will reflect on and process our experiences in the classroom and reconcile what we've lived since last March with our hopes and goals for our future instruction. Guiding questions our panelists will think about to prepare for the session include, and that we ask audience members to reflect on as well, include:

1. How did the series of events from March 2020 onwards change the pedagogy and content of our courses?
2. How do we create meaningful space for grief and processing in our classrooms?
3. Looking forward, what changes should we keep in our courses—and which should we discard?
4. How can we move towards "resilient courses," or courses built to quickly respond to events external or internal to the classroom?
5. What lessons have we learned about *\*how\** to reflect on or determine if changes to content, pedagogy, etc. are necessary in our courses?

6. What have we learned about how we relate to each other in the classroom—not just as instructor & students but as co-inhabitants in spaces of crisis?

### 10.434 ROUNDTABLE - NEGOTIATION IN A POLARIZED WORLD: WHAT SHOULD WE TEACH PLANNERS?

Abstract ID: 434

OZAWA, Connie [Portland State University] ozawac@pdx.edu, moderator  
KAUFMAN, Sanda [Cleveland State University] s.kaufman@csuohio.edu, participant  
ELLIOTT, Michael [Georgia Institute of Technology] michael.elliott@design.gatech.edu, participant  
SHMUELI, Deborah [Haifa University] deborah@geo.haifa.ac.il, participant

An ongoing global pandemic. Divisiveness. Partisanship. Global climate change. Sea level rise. Natural disasters. Income and wealth gaps. Tribalism. Explicit racism. These are some of the contextual challenges which planners face as they exercise their profession in communities around the country.

Do negotiations and collaborative approaches to community problems still have a place? Can divided parties come together and work out a mutually acceptable agreement? Do planners have a role here? Are they equipped with the necessary skills to foster community dialog and problem solving? Or, are collaborative decision processes obsolete and have new planning approaches and tools become necessary?

We propose that the skills of negotiation and facilitation continue to be helpful to planning professionals and have not lost their relevance despite the conflicted contexts in which planners operate. Precisely because diverse groups with competing interests and divergent values have voice and increasingly use it, planners find themselves facilitating contentious interactions while also working within constraints and mandates imposed by their own institutions. We return to a question that has been asked for several decades, but has now become more urgent: can planners facilitate protracted dialogues while also advocating for values of their profession, such as social equity, ecological sustainability and a healthy economy? How can we as planning educators help equip them for these challenging times? What are the limits to what planners can do?

Our roundtable will take on these issues; four negotiation instructors and facilitators with more than 120 years of experience between them—and different perspectives—grapple with pedagogy questions, seek consensus, and invite participants to join in the debate.

We ask:

When are negotiations appropriate/feasible/helpful in the planning context, and are there situations in which they are not?

Can negotiation techniques and skills overcome today's planning challenges? If so, how? If not, why not?

What is the role of planners in contested value spaces?

What should we teach our planning students to help them meet current community challenges and foster

deliberative processes?

What are effective methods for teaching negotiation skills?

Michael Elliott (Georgia Tech), Sanda Kaufman (Cleveland State University), Connie Ozawa (Portland State University) and Deborah Shmueli (Haifa University) will briefly present their perspectives on these questions, surfacing areas of agreement and differences among them. Then we will invite participants to join in the discussion and share their experiences and outlook. We will also discuss teaching technique, resources and examples which we have found especially enlightening and effective for students.

### **10.731 ROUNDTABLE - TRANSFORMATIVE TEACHING AND RACIAL JUSTICE: NAVIGATING POLITICS, THE PANDEMIC, AND ZOOM**

Abstract ID: 731

WONG, Karna [University of California Irvine] karna.wong@uci.edu, organizer, moderator, participant  
ERICKSON, Emily [Alabama A&M University] emily.erickson@aamu.edu, participant  
FLORES, Nina [California State University, Long Beach] nina.flores@csulb.edu, participant  
NAKAOKA, Susan [California State University, Sacramento] nakaoka@csus.edu, participant

From 2020 to 2021, students lived through two impeachment trials and a heavily contested Presidential election that culminated in violent riots in the nation's Capital. They are dually outraged and mobilized about police brutality, which has resulted in the unnecessary and unjust deaths of Black lives (Dave, et al., 2020; Dreyer, et al., 2020; Skoy, 2021). They are fearful, frustrated, and furious by the increased anti-Asian sentiment during the coronavirus (COVID-19) pandemic and the resulting violence and deaths (Chen et al., 2020; Gover et al., 2020; Tessler et al., 2020). Furthermore, students, their families, and their communities are dealing with economic (Blustein & Guarino, 2020; Fairlie et al., 2020; Şahin et al., 2020) and housing instability (Ong et al., 2020; Wong et al., 2020) and physical and mental health issues. Domestic violence (Boserup et al., 2020; Kofman & Garfin, 2020; Leslie & Wilson, 2020) and hate crimes (Chen et al., 2020; Gover et al., 2020) have risen during the pandemic. The cumulative effects of these traumatic events affirm our roles as educators who teach critical thinking, empowerment, equity, and justice. And all the while, students and instructors were engaging remotely.

Let's "talk story" and share our experiences, hardships, and resources (or lack of resources) about teaching in a remote/online environment. As women and/or people of color, we will discuss how developing a curriculum based on critical race theory and popular education can empower students in their academic, professional, and personal lives. We will reflect on the survival skills that we relied on as we taught in the context of our students (and ourselves) coping with the global pandemic, isolation from shelter-in-place, remote learning, teleworking, and the lessons that we can take with us as we move back to in-person teaching.

### 10.803 ROUNDTABLE - INTERDISCIPLINARY SERVICE-LEARNING PROJECTS THAT TURN SMALL, UNDERSERVED COMMUNITIES INTO SMART CITIES

Abstract ID: 803

LI, Wei [Texas A&M University] wli@tamu.edu, organizer, moderator  
 LEE, Chanam [Texas A&M University] chanam@tamu.edu, participant  
 BIAN, Jiahe [Texas A&M University] jiahe.bian@tamu.edu, participant

 CALVESBERT, Tyrene [Texas A&M University] tyrene@tamu.edu, participant

Smart-city technologies have shown increasing potential in addressing urbanization challenges and promoting sustainable development. While many cities around the world are seeking ways to advance a vision of becoming a smart and connected community, small and rural communities are left behind. They typically have a low population density, lack public transport services, and offer limited accessibility to daily services, making it particularly challenging for residents to fulfill their essential travel needs and access healthcare. They often lack the funding and resources to implement smart-city projects.

On the other hand, current urban planning education has yet evolved to prepare students who can adapt to rapid technological transformation and tackle real-world challenges (Grimaldi & Fernandez, 2017). In the era of smart technologies, it becomes increasingly essential for students to develop interdisciplinary study skills to synthesize the specialized in-silo knowledge and work collaboratively (Brown, Harris, & Russell, 2010; Culhane et al. 2018).

To train the urban planning students to solve real-world problems by unleashing the power of technologies, Faculty members at Texas A&M university have developed with a novel interdisciplinary service-learning pedagogical model named ENDEAVR ([www.endeavr.city](http://www.endeavr.city)). It has gained strong supports from local government and visionary leaders from the industry. Since the Fall of 2019, more than 150 students from urban planning, landscape architecture, civil engineering, computer science, visualization, and other allied disciplines have participated in this program.

The panelists will share experiences about this model and facilitate discussions that will inspire the next generation of planning education.

The roundtable panelists seek to address the following questions:

What are our student learning objectives, and how was the curriculum designed to meet these objectives?

How did we engage the community? How are we building and maintaining the long-term university-community-industry partnerships?  
What are the challenges we faced when guiding the student projects in an interdisciplinary setting?  
How do we measure students' learning outcomes?

#### Theoretical Context

Between every growing threats from a changing climate and protests for the Black Lives Matter movement sits the important fact that climate change and justice are inextricably linked in the context of planning (Shi et al. 2016). Sustainability planning tries to address this interlinked challenge, however in practice it does not always measure up to its intentions (Agyeman, Bullard, and Evans 2002; Agyeman et al. 2016; Bulkeley et al. 2013).

Formal sustainability planning practice at the local government level in the United States began in the early 1990s (Wheeler 2013; M. J. Sirgy, Rahtz, and Swain 2006). At the time a handful of early adopter cities developed plans that specifically included the concepts of sustainability. At this time, some cities developed indicator projects to measure their progress (M. J. Sirgy, Rahtz, and Swain 2006). Specific examples include Sustainable Seattle, which was developed outside of the city government and Santa Monica, which was development by the city's Task Force on the Environment (Bertone et al. 2006). Building on this work a group of over 200 expert volunteers worked through a consensus-based process to create the STAR Communities Rating System in October of 2012 (Siew 2014).

LEED for Cities and Communities (LFC) is a sustainability framework and rating system that is built on these earlier efforts as well as incorporating elements from other rating systems and the evolving SMART Cities initiatives, of which CitiStat is a well-known example (Perez and Rushing, 2007). LFC is revolutionizing urban planning, development and operations, while also improving life for people around the world. Using the Arc performance platform, LFC projects can measure and manage their community or city's water consumption, energy use, waste, transportation and quality of life. By utilizing strategies and policies identified in credits and pre-requisites of the rating systems, cities and communities can continuously improve their performance.

Today, there are professors across the country using LEED for Cities and Communities as a pedagogical tool. However, some have noted that for any tool, it is a struggle to achieve an idealized version of sustainability that fully

integrates equity with other sustainability objectives. In this session we aim to explore this tool, discuss future directions for its integration in teaching contexts by working with cities and communities, and engage in a lively debate around areas for improvement.

#### Discussion Topics & Areas of Engagement

We have two main goals for this session. First it is to introduce others to the LEED for Cities and Community's framework (referred to as LFC below) as a pedagogical tool. Second, is to collectively explore this tool and debate its strengths and weaknesses. Therefore, this session will focus on fostering dialogue between participants and the audience. We will use the following topic areas and questions to create an open and engaging conversation:

- 1) How did you / would you use the LFC framework in your class? What preparatory learning is required to do so?
- 2) What other frameworks complement LFC? Or perform better as a teaching tool?
- 3) What benefits do you / could you see from using the framework? What draw backs did you experience from using the framework?
- 4) How could LFC address issues of equity and inclusion in the classroom and beyond the classroom walls?
- 5) How did you / could you use the framework to create an inclusive learning experience?

## 10.1046 ROUNDTABLE - PEDAGOGIC LESSONS FROM THE PANDEMIC FOR RESILIENT AND UNIVERSAL GISCIENCE EDUCATION

Abstract ID: 1046

ZANDIATASHBAR, Ahoura [San Jose State University] [ahoura.zandiatashbar@sjsu.edu](mailto:ahoura.zandiatashbar@sjsu.edu), organizer, moderator  
ROHRMEIER, Kerry [San Jose State University] [kerry.rohrmeier@sjsu.edu](mailto:kerry.rohrmeier@sjsu.edu), participant  
KOS, Richard [San Jose State University] [richard.kos@sjsu.edu](mailto:richard.kos@sjsu.edu), participant  
ALBERT, Jochen [Hunter College] [jochen.albrecht@gmail.com](mailto:jochen.albrecht@gmail.com), participant

The last spring semester ended abruptly; courses were cut short with an immediate shift to remote learning. The COVID-19 pandemic has caused a reset in the way we think about teaching and learning. Although online learning was not a new discourse, the pandemic caused a forced shift to distance learning on a global scale while many educational institutions were not yet prepared for full online teaching. While the disruption and tension caused by the pandemic affect disciplines, it is more intensely felt in disciplines depending on hardware laboratories, such as Geographic Information System. A year after preparing for moving back to in-person teaching, we are left with major questions like how resilient are our education practices? Can we (i.e. educators, planners, decisions makers and learners) adapt quickly when the next unannounced disruption occurs? Is our resiliency accounting for universal teaching principles? This panel sponsored by the Center for Spatial Analytics and Visualization at San Jose State University brings in UCGIS award winner GIS educators from Hunter College and The Graduate Center of the City University of New York and San Jose State University to discuss the helpful practices for a resilient and universal GIS education, educational practices for GIS online teaching that can overcome inequities in resources and insecurities among students (e.g. unequal access to stable, GIS-appropriate devices or technical literacy), practices for achieving a resilience and universal GIS online education that meet the DEI principles, and pros, cons, nuts and bolts of GIS online education.

The panelists in this session are:

Prof. Jochen Albrecht, GISP, is a professor for computational and theoretical geography at Hunter College and The Graduate Center of the City University of New York. Having supervised the individual GIS work of over a thousand students and designed and taught more than 20 different GIS courses, he received in 2018 the University Consortium for Geographic Information Science's GIS Educator of the Year award. Dr. Albrecht currently serves on the boards of the GIS Certification Institute, the California Geographic Information Association, as well as Bay-Geo and has been on the boards of the Urban and Regional Information Systems Association, and three specialty groups of the Association of American Geographers. He is author of two books, and more than 50 refereed articles. Part of his current research is the development of a new process-oriented Body of Knowledge for GIS education that implements real-world GIS workflows derived from industrial business process models.

Prof. Rick Kos is a certified urban planner and a faculty member in the Master of Urban Planning program at San Jose State University since 2007. He serves as the department's Graduate Advisor and Practitioner-in-Residence, preparing his graduate students for professional practice in urban planning. Rick's areas of research and teaching include applications of GIS to urban analysis, community engagement in the neighborhood planning process, and transportation planning. Rick earned his bachelor's degree in environmental planning and urban design from Rutgers University and a Master of Regional Planning degree from the University of North Carolina at Chapel Hill.

Prof. Kerry Rohrmeier, AICP, is an Assistant Professor in the Department of Urban and Regional Planning at San Jose State University. Her research on arid cultural landscapes scales from regional planning, to land use planning policy, down to placemaking. As an educator she challenges students to incorporate geotechnology for data collection and GIS for spatial analysis in all her planning and methods courses.

The session will be facilitated by Ahoura Zandiatashbar, assistant professor of Urban and Regional Planning at San Jose State University.

## **INDIVIDUAL PAPER SUBMISSIONS**

### **HOW TO TEACH URBAN BIG DATA FOR TOMORROW' TOWN PLANNERS. DISCUSSION AROUND THE SYLLABI OF THE TOP RANKED AMERICAN SCHOOLS OF ARCHITECTURE.**

Abstract ID: 33

Individual Paper Submission

ALBERINI, Carlo [Mohammed VI Polytechnic University - School of Architecture Planning and Design [SAP+D]]  
carlo.alberini@um6p.ma, presenting author

Fast urbanization pace, resilience and climate change, as well as sustainability and post-COVID19 *new normal*, will represent an unprecedented mix of challenges that cities will have to face with in the coming decade. In order to be able to manage this complexity, the next generation of town planners will have to integrate their consolidate knowledge whit these new *classic* topics, aiming at enhancing a transdisciplinary and holistic approach to the urban analysis and planning process.

Alongside this evolution, and due to the development of technologies related to the Internet of Things, Artificial Intelligence, Big Data and Data Mining, our society is entered in his fourth industrial revolution. For an urban planning perspective, industrial revolutions have always represented a disruptive moment in the lives of cities. What will be the impacts of this new digital revolution on city planners university training? In answering this question, this paper aims to investigate the contribution that Urban Big Data can have within the curricula of the Schools of Architecture.

By adopting a qualitative and quantitative approach to analyse the syllabi of the top ranked American Schools of Architecture, this work aims to presents a first picture of the different approaches and contents of this promising teaching module. To design and plan smart, resilient and sustainable cities, architects and planners have to master the gathering of the urban big data and theirs use, to strength the understanding of the way in which cities lives, and dwellers habits evolves.

Syllabi reviews findings, highlight that this relative new teaching module may represent an interesting field of experimentation for shape and define the angle of attack that schools of architecture want to propose for the use of this must to have tools for all the professionals involved in the city management.

This work is intended to constitute a modest contribution to the debate on the theme of teaching urban big data in the schools of architecture. Further in-depth studies could be dedicated to the analysis of the didactic offer that other schools can provide to students involved in studies of economics and management, engineering, social studies and governance, just to name a few.

## CLIMATE TRANSFORMATIONS THROUGH PEDAGOGICAL TRANSFORMATIONS IN PLANNING EDUCATION

Abstract ID: 103

Individual Paper Submission

OVERSTREET, Kelly [University of Kansas] keheiman@ku.edu, presenting author

LYLES, Ward [University of Kansas] wardlyles@ku.edu, co-author

‘What does a transformative planning pedagogy for climate change look like?’

Kansas might be the last place one would think to look for the answer to this question. After all, the state is the home of the Koch brothers’ fossil fuel and libertarian enterprises that attack climate action as antithetical to ‘freedom.’ In this review, however, we synthesize interconnected streams of theory, empirical research, and practical examples that have informed our efforts at the University of Kansas to transform planning pedagogy, particularly in climate change-focused courses.

Climate transformation requires nothing short of a) addressing racism, sexism, homophobia and other forms of exclusion b) intertwined with settler colonialist and capitalist systems that c) treat land, people, living beings, and knowledge as means of production rather than inherently valuable (Johnson and Wilkinson 2020, Holthaus 2020). Simply acknowledging these daunting barriers is emotionally fraught, a point largely ignored in climate change discourse until recently. Increasingly climate scholars, educators, and activists make persuasive arguments that we must engage collectively with grief and hope, anger and joy, and other emotions if we are to understand and dismantle oppressive systems and build a sustainable and just climate future (Ray 2020, Walsh et al. 2020). Similarly, planning scholarship gradually focuses more attention on the emotional and relational dimensions of public service (Lyles and White 2019). Arguments that we must overcome our longstanding tendency to ‘plan with half a mind’ gain traction and push us to actually plan with compassion, as called for in the AICP Code of Ethics (Baum 2015). In one of the few existing pieces on climate planning pedagogy, Lyles and Stevens raise coping with emotionally taxing issues as a critical challenge for instructors (2020).

Across the globe, recent climate action developments are instructive for how to build transformational planning pedagogies. Youth-led global movements such as Fridays for Future and 350.org have harnessed righteous anger to reset the moral foundation of climate debates and inspired millions to move from concern to action. Indigenous-led direct actions center deeply relational Indigenous knowledge, wisdom, and practices as the path to a sustainable future, perhaps most visibly the NoDAPL movement in North Dakota but taking shape in thousands of locations globally (Estes and Dhillon 2019). And, the grassroots, multi-cultural Sunrise Movement prominently led by BIPOC women galvanized broad-based support for a Green New Deal grounded on principles of shared public power, distributional economic mobilization, and rectification of past injustices (Goh, 2020, Prakash and Girgenti 2020). The lessons for planning education include: 1) de-centering narrow Western, paternalistic, and hegemonic worldviews and broadening our knowledge bases, 2) empowering the voices of those who have wielded the least power historically; and 3) creating opportunities to foster shared understandings, taking time for mutual care and healing, and supporting collective action.

Our literature review spans thinkers embedded in Indigenous, Black, Feminist, Queer, and other marginalized communities, whose mediums of expression vary widely and whose ideas often challenge us to unlearn conventional, narrow, purportedly objective ways of seeing the world (c.f. Butler 2012, Gumbs 2020, Simpson 2017). We draw on conceptual insights - and point to mental and somatic practices – from contemplative spiritual lineages that elevate compassion, mindfulness, and mutual care (c.f. Armstrong 2011, Harrington et al, 2002). Further, we point to scholarship that can help us create inclusive, diverse learning environments, while paying attention to trauma-informed practices to avoid propagating harm in spite of our attentions to do the opposite (Erfan 2017, Harrison et al. 2020). Throughout, we include signposts back to the planning literature in order to locate our work in the broader network of attempts at climate transformation.

### **WHAT IS GAINED AND WHAT IS LOST: MIXED-METHODS ASSESSMENT OF THE COVID-19 ON-LINE TEACHING EXPERIENCE**

Abstract ID: 222

Individual Paper Submission

WILLSON, Richard [California State Polytechnic University, Pomona] [rwwillson@cpp.edu](mailto:rwwillson@cpp.edu), presenting author

On-line teaching during the COVID-19 pandemic disrupted teaching practices in planning on an unprecedented scale. My initial focus was on loss – experiencing frames of confinement relating to losses in human connection, field work, community engagement, and group discovery. Liberating aspects of on-line teaching emerged slowly, with time and experience. This paper provides a mixed-method account of what was lost and gained in my classes, using time-series analysis of teaching evaluations and instructor self-reflection.

Pedagogy is a significant topic in the planning literature, but on-line pedagogy is less developed. Since planning involves participatory action research (e.g., Wilson 2020) at least some aspects of planning education are incompatible with on-line learning. For example, planning climate justice requires engagement with affected communities. Similarly, studio classes use group projects, tactile engagement, and group feedback to address new roles and modes of practice, all of which benefit from in-person contact (Long 2012, and Botchwey and Umemoto 2020).

The assessment reviews six courses in the undergraduate and graduate programs in Urban and Regional Planning at Cal Poly Pomona. The courses address climate change planning, theory and policy analysis, and professional practice. Prior to the pandemic, the courses were taught in-person, supported by learning management systems and some asynchronous hybrid activity (previously evaluated in Willson 2008). Data sources include two forms of class evaluations, grade performance, and qualitative reflection.

Time-series comparison of class evaluations over a five-year period show no decrease in ratings during the on-line semesters. Surveys of the on-line teaching aspects show high ratings for the classes as compared to in-person offerings (4.1/5 on Likert scale where 1 = very poor and 5 = very good). The highest preference for class structure in a post-COVID environment is hybrid (partly on-line, partly in class) offerings. These results must be interpreted with care. For example, students may have rated classes more generously because of a shared experience of gratitude – that professors and students could continue their work. Further, the students may not know what they missed in an in-person format, or prefer these classes because they ease commuting or allow more outside work.

While qualitative assessment is always justified in pedagogy questions, the visceral change in teaching modalities especially justifies it. Practices I normally relied on were disrupted - spontaneous interpersonal dynamics, teaching rituals, ability to 'read' the room, and fieldwork, and group problem solving. Disruptive visual aspects were unsettling, such as seeing oneself and experiencing students' cameras turned off. Gains include greater intentionality in course design and student socialization, democratized participation, additional discussion modalities, value-added activities through student chat, ability to call on students by name, and frictionless engagement of guest speakers and reviewers.

This research seeks to provide one professor's account that can be combined with and compared to many others to support the development of post-COVID-19 pedagogies that are true to the planning endeavor.

#### THE JOY OF MANY STORIES: ZINE-MAKING AND STORY-MAPPING IN PLANNING PEDAGOGY

Abstract ID: 500

Individual Paper Submission

ASHTARI, Atyeh [University of Illinois at Urbana Champaign] [ashtari2@illinois.edu](mailto:ashtari2@illinois.edu), presenting author

HUQ, Efadul [University of Illinois at Urbana Champaign] [ehuq2@illinois.edu](mailto:ehuq2@illinois.edu), co-author

MIRAFATAB, Faranak [University of Illinois at Urbana Champaign] [faranak@illinois.edu](mailto:faranak@illinois.edu), co-author

Planning education aims to actively prepare students to tackle issues of social and spatial justice. We argue that how we teach is as important as what we teach; and to that end, storytelling can play a central role in planning education. However, how storytelling can be integrated effectively in planning education remains an open question. In this paper, we reflect on our experiences of teaching two undergraduate urban planning courses centered around issues of international planning, globalization, urbanization, planning and social inequalities. They were composed of students from diverse social and cultural backgrounds, leading to tensions as well as opportunities for an enriching

classroom experience. We will critically reflect on the alternative approaches to planning education employed in these classes that centered storytelling through art-based and digital pedagogical strategies: zine-making and story-mapping. Zines allowed students to connect complex theories to their lived experiences in interesting and relevant ways. Multimedia story-mapping, incorporating audio, video, texts, and images, allowed students to collaborate through a multisensory approach in making sense of places, even those farther away from their lived realities such as engaging with faraway worlds for students from the United States.

Acknowledging the salient role of storytelling in planning is not a new turn (van Hulst, 2012). There is a slim but sustained discourse on how to use storytelling in planning pedagogy and practice. The pedagogical approaches discussed in scholarly circles have been mostly limited to using scenarios and role play in class (Meligrana & Andrew, 2003), using creative writing (Baum, 2017), critical autobiography of students with particular attention to how their social attributes have affected them (Sandercock, 2003); and using movies and reflective essays (Isserman et al, 2010). These existing pedagogical conversations around storytelling can be renewed as new generations of planning educators enter the field, and broadened to bring attention to the evolving and innovative ways in which storytelling can be centered in planning education to further students' critical thinking and collective empowerment. Continuing to intervene in planning pedagogy in order to create alternative pedagogical approaches is timely and necessary if we are to re-imagine our classrooms as spaces of transformation, hope, and joy.

We draw on the rich insights and frameworks of Critical Race Theory (CRT) and Feminist Pedagogies (FP) in sculpting the pedagogical strategies of art-based and digital story-making introduced in this paper. CRT scholars draw attention to the importance of narratives and counter-narratives in storytelling. They highlight that not all narratives are equally heard and acknowledged. Further enriching the attention to silences and running through our zine-making and story-mapping practices are three principles of feminist pedagogy—participatory learning, acknowledging and crediting personal experience, and furthering critical thinking skills, that help students to imagine alternatives towards more humane urban futures.

In our course development, we aimed to empower students to collectively take charge of the course goals, objectives and assessments, and create a caring community of learning where different perspectives can be explored. Incorporating lived experiences in the classroom at times engendered strong emotions, but the difficult conversations did not undermine the dignity of learners as we emphasized seeing the connections and disconnections between differing perspectives emerging from particular experiences. Innovating course assignments in light of insights from CRT and FP, we aimed to cultivate an imaginative and discomforting empathy in the students and a simultaneous sense of joy in seeing, hearing and telling the many stories of faraway intimate urban worlds.

In this paper, we introduce each course and the teaching methods employed, and discuss the main pedagogical strengths, limitations, and opportunities of such alternative planning coursework based on students' multimedia products, follow-up conversations, and our recollections.

## PLANNING HETERODOXY IN THE GLOBAL SOUTH: IMPLICATIONS FOR INTERNATIONAL PLANNING EDUCATION AND DISCOURSE

Abstract ID: 542

Individual Paper Submission

KOLO, Jerry [American University of Sharjah] [jkolo@aus.edu](mailto:jkolo@aus.edu), presenting author

ALSHAFIEI, Salem [American University of Sharjah] [salemalshafiei@gmail.com](mailto:salemalshafiei@gmail.com), co-author

This paper uses the term ‘planning heterodoxy’ to depict urban planning and development models that dot the landscape of cities in the global south (Schmidt-Kallert, 2017), starting primarily at the turn of the 21st Century. Conceptually and physically, planning heterodoxy raises questions, or introduces curious dimensions to discourse, about planning orthodoxy. Planning orthodoxy implies planning theories and paradigms that emanated in the West and have dominated planning education and practice around the world since the turn of the 20<sup>th</sup> Century (UN-Habitat, 2009). Planning orthodoxy seems enduring in spite of radical shifts in the political, economic, cultural and environmental contexts in which planning occurs in cities in the West and the world over. Faludi (1996) argued that synoptic planning remains the ‘root’ of subsequent theories, while UN-Habitat (2009) stated that the post-modernist planning remains the dominant model worldwide. How do planning programs in the global south address the unique questions and dimensions posed by planning heterodoxy for the young, curious and impressionable graduate students that come largely from societies witnessing planning heterodoxy? The paper addresses this question, first by reviewing examples of the planning heterodoxy from various parts of the global south, and second by examining, as a case study, the United Arab Emirates (UAE) in particular and the Gulf Cooperation Council (GCC) countries in general. Irrefutable evidence exists to support the contention in this paper that the GCC as a geo-political region qualifies as the birthplace and laboratory of planning heterodoxy, starting during the blooming stage of neoliberal globalization in the late 1990s. Zeroing in on the most reputable professional graduate planning program in the UAE, this paper discusses examples of recurring questions that are raised about both planning orthodoxy and heterodoxy in graduate planning seminars over a 14-year period (2006-2020). The paper discusses how the questions are addressed in the curriculum and in discourse. The paper concludes that, increasingly, critical and substantive questions and challenges are being raised about planning orthodoxy by the young generation of graduate planning students in the global south, and also by young Western-educated planners from countries of the global south. The paper suggests specific principles and guidelines for addressing the contrasts and challenges in both the curriculum and in discourse.

## ROBINSON CRUSOE AND THE REMAKING OF AN UNDERGRADUATE PLANNING CURRICULUM

Abstract ID: 579

Individual Paper Submission

UREY, Gwen [California State Polytechnic University, Pomona] gurey@cpp.edu, presenting author

Planning programs evolve, responding to changes in the field's professions, institutional pressures, and pleas for changes from within the academy. For example, recent scholarship drawing attention to the need to diversify and promote inclusivity in planning programs' faculty, students, climate, and curricula may foreshadow strengthening of curricula in these areas. This paper focuses on the project of curricular change specific to the undergraduate planning curriculum.

PAB-accredited undergraduate planning programs (UGPPs) represent a minority of PAB-accredited programs (7% in 2018) and graduates (13% in 2018). Historically, the same PAB criteria (at least through the 2017 standards) govern UGPPs as Master's programs. Undergraduate degrees include many more units than a Master's degree, but UGPPs face institutional competition for those units due to general education, acceptance of coursework from community colleges, etc.

In contrast to an evolving curriculum, where changes occur course by course, or thematically to strengthen or introduce an area, Cal Poly Pomona (CPP) completely changed both of its PAB-accredited programs. In 2013, CPP committed to converting from quarters to semesters commencing with Fall 2018. While many campus faculty saw this as a shipwrecking storm on a sea already roiled by budget cuts and labor strife, the planning faculty exploited "re-vision" resources to examine every curricular piece of our programs. With five thematic threads--planning theory, urban design, ethics, methods, and social justice—as initial signposts, veteran faculty embarked on a process requiring them to let go of all existing syllabi, write new course outlines, possibly to profoundly change their own classes, and to embrace new elements in the core. Whereas the two programs had looked similar in 2014, with the master's program offering greater depth, the two programs that emerged in 2018 are much more distinct from each other. This paper focuses only on the undergraduate curriculum.

The shipwreck metaphor captures the sense of being in a state of prolonged emergency felt by faculty from beginning this work in 2014 to showing up in August 2018 for the first term on semesters. Like Robinson Crusoe, faculty had to invent in an environment characterized by both opportunities to create something new and better, and threats: a calendar with fewer terms, retirements, and the unknowns of new faculty coming. First, this paper frames the process using Daniel Defoe's Robinson Crusoe as a metaphorical frame. Next, the paper examines evidence from the outcomes to address the central question--did we, as some say of Crusoe, reinvent our "own imaginative empire" (Erickson 1982, 68), or did we, as others argue, merely replicate the old?

Outcome evidence includes the curricular artifacts, such as syllabi and requirements for the major. In addition, since students have experienced the curriculum for three years, evidence includes empirical data about the experiences students have had overall and with new elements, in particular the specializations introduced with semesters. Students must choose one of four options: 1) Community Development and Social Justice; 2) Infrastructure and Transportation; 3) Resiliency, Sustainability and the Environment; or 4) Urban Design. Before-and-after data from 2014 and a 2021 alumni surveys, as well as from a current University-funded study of how students perceive the options may illuminate effects of the curricular change. The inquiry will pay special attention to how students learn about diversity and inclusion, which are much more explicit elements in the core. Whereas current PAB criteria place equity, diversity and social justice among values required to be learned in a planning program, these threads are woven through areas of knowledge and skills, as well.

## DOCTORAL EDUCATION AND THE ACADEMIC JOB MARKET IN PLANNING

Abstract ID: 646

Individual Paper Submission

GANNING, Joanna [Cleveland State University] [j.ganning@csuohio.edu](mailto:j.ganning@csuohio.edu), presenting author

It is incontrovertible that the North American higher education system produces more PhDs than the academic job market can accommodate. Both peer-reviewed scholarship and the popular press support this view, with recent article headlines such as "Who Will Hire all the PhDs? Not Canada's Universities" (Fullick, 2013) and "For Would-Be Academics, Now is the Time to Get Serious About Plan B" (Wood, 2020). While PhDs enjoy low unemployment rates (i.e., Passretta, Trivellato, and Triventi, 2019), many work on a contingent status as adjuncts while those transitioning to industry face a steep learning curve, as many doctoral degree programs do not provide the skills necessary for non-academic careers (Edge and Munro, 2015; Larson, 2020; Main, Prenovitz, and Ehrenberg, 2019; McAlpine and Austin, 2018; Meldonado, Wiggers, and Arnold 2013). Critics argue that universities perpetuate the job market imbalance because doctoral students support faculty research and provide an inexpensive source of labor for teaching (Boulos, 2016). Scholars suggest a range of responses to the over-production of PhDs, including more transparency about the likelihood of academic job placement for graduates, non-academic skills training, and public funding to support job placement in various ways. This research basis covers various academic domains, including social science, and some disciplines within the social sciences, though not Planning specifically.

This paper reports the results of a three-year project designed to describe doctoral education and the academic job market in Planning. Data from a survey of programs enables the estimation of the rate of production of new Planning PhDs, academic job placement rates, the percentage who entered doctoral education aspiring to an academic career, and facets of their training. Job market data are used to describe market size, timing, and specializations sought. These data inform the academy on the balance between supply and demand for academic labor in Planning, enabling prospective students to be better informed, offering insights for job seekers, and prompting discussions about Planning education.

The Planning academy produces between 265-295 new PhDs per year. These graduates are competitive, having teaching experience and published or publishable research. The primary job market in Planning (effectively, the ACSP Career Center) shows considerable stability year to year in terms of size (COVID-19 notwithstanding), with 100-110 academic jobs posted per year, of which 75-100 are open to new PhDs. Though the number of jobs in any given specialization fluctuates, the relative popularity of the most commonly-sought specializations remains

consistent. Graduates face competition from assistant professors making lateral moves as well, with preliminary data suggesting this happens in about half of all opportunities open to new PhDs. The primary job market likely accommodates 50-60% of graduates finding academic employment (or about 25% of graduating cohorts), with a large share navigating the secondary (i.e., informal) job market. Survey data from program directors suggests approximately one-third of graduates do not aspire to academic careers. This paper illustrates realities of academic employment for recent graduates, and includes recommendations for programs.

### A REFLECTIVE ACCOUNT OF INSTRUCTING REMOTE PLANNING STUDIOS IN THE TIME OF COVID-19

Abstract ID: 659

Individual Paper Submission

KIM, Jongwoong [West Chester University] JKim@wcupa.edu, presenting author

This paper reflects on the author's experience of instructing two remote planning studio courses during the COVID-19 pandemic (2020-2021) and lessons learned from it. West Chester University has responded to the pandemic by switching most of its classes to be remote (online) since March 2020. The author instructed two online Planning & Design Studio courses in fall 2020 and spring 2021 for graduating seniors and master's students. Students, however, generally do not prefer online teaching and learning to the traditional face-to-face experience because of the perceived deficiencies in motivation, self-efficacy, and cognitive engagement (Aguilera-Hermida, 2020). Adopting a staged critical-thinking framework, this paper analyzes the author's teaching approaches and student learning outcomes (Németh & Long, 2012) in these courses to identify emerging challenges and opportunities of instructing planning studios during, and possibly after, the COVID-19 pandemic. Focusing on Planning Skills (The Planning Accreditation Board, 2017), the student learning outcomes were assessed via the course assignments, the student project management reports, and the author's observation, which were supplemented by the student course evaluations. The study finds that the lack of in-person coordination and cooperation between students appeared to be the biggest challenge, while utilization of multiple cloud-based teaching, learning, and practicing platforms such as Zoom, ArcGIS Online, D2L, and Google Map could create "virtually immersive" planning studio environments. Building upon the learned lessons from Alizadeh, Tomerini, & Colbran (2017), this study proposes a "blended" format for planning studio courses, particularly in the post-vaccine/pandemic era.

## **BRINGING SOCIAL JUSTICE AND COVID-19 INTO THE (VIRTUAL) CLASSROOM: LESSONS FROM PANDEMIC TEACHING**

Abstract ID: 889

Individual Paper Submission

HECKERT, Megan [West Chester University] mheckert@wcupa.edu, presenting author

FRITSCHLE, Joy [West Chester University] jfritschle@wcupa.edu, co-author

KIM, Jongwoong [West Chester University] JKIM@wcupa.edu, co-author

What research question(s) are you trying to answer?

The COVID-19 pandemic and the early-2020 murders of Ahmaud Arbery, George Floyd, and Breonna Taylor brought questions of public health and social justice to the forefront of American consciousness. Racial disparities in COVID-19 exposures and health outcomes highlighted both the strong historical roots and pervasiveness of inequity, often highlighted through connections to planning practices such as historic redlining (NCRC, 2020). While the pandemic served to bring additional attention to the consequences of social injustice, it also provided a background for perpetuating those injustices as social distancing protocols were used to disproportionately police protestors and BIPOC (Hoover & Lim, 2020).

This reality provided a backdrop for a 2020/2021 academic year in which faculty were often teaching through new modes with distanced (and often distant) students. Guided by a belief that these issues were both too important and too pervasive in our students' lives to ignore, we sought ways that we, as planning educators, could bring this historic moment meaningfully and thoughtfully into our classrooms. Ultimately, the questions we hope to answer include: 1) How can scholars in planning and related fields incorporate the twin-crises BLM and COVID-19 in the classroom?, and 2) How did these factors shape or alter general classroom dynamics even when they were not the explicit subject matter?

How will you validly address and answer the question(s)?

Our department has developed several new modules and a new course intended to explore issues of social justice as it relates to the discipline of planning. We will discuss multiple approaches to incorporating social justice and public health lenses into existing courses and newly created courses, combining stories from our department with a review of recent literature on planning pedagogy.

Meaningful and New Findings:

We will describe efforts to incorporate social justice in large and small ways into existing courses while discussing the pros and cons of approaches that incorporate it across the curriculum compared to the creation of new courses explicitly focused on these issues. Among the best practices and initiatives we will discuss are:

Developing new modules within topical courses to explicitly focus on social justice within specific dimensions of planning

Connecting social justice to the United Nation's Sustainable Development Goals

Creation of a new course on GIS and Cartography for Social Justice

Focusing on aspects of Universal Design for Learning as a means for creating a more socially just classroom

Infusing social justice into practical courses such as planning design studio courses We will additionally discuss classroom practices and approaches adopted due to the pandemic and the ways in which they both facilitated and hindered attempts to meaningfully address social justice concerns.

Relevance and implications of your research to planning scholarship, practice, and/or education

Equity, diversity, and social justice are recognized as a vital component of planning education and are recognized as such in the Planning Accreditation Board's accreditation standards (PAB, 2017). Though these topics are clearly identified and understood as a vital component of planning education, they are not widely discussed within the pedagogical planning literature (Sen et al., 2017). Our intention here is to bridge the gap between the robust planning research literature on social justice to focus more explicitly on its implications for classroom practice.

## **EVALUATING THE OREGON EXPERIENTIAL LEARNING MODEL: LESSONS FROM CLIENTS, STUDENTS AND ALUMNI**

Abstract ID: 1059

Individual Paper Submission

MARGERUM, Richard D [University of Oregon] [rdm@uoregon.edu](mailto:rdm@uoregon.edu), presenting author

PARKER, Robert [University of Oregon] [rgp@uoregon.edu](mailto:rgp@uoregon.edu), co-author

DRLIK-MUEHLECK, Aniko [University of Oregon] [aniko@uoregon.edu](mailto:aniko@uoregon.edu), co-author

STEINER, Bethany [University of Oregon] [bethanyj@uoregon.edu](mailto:bethanyj@uoregon.edu), co-author

Planning has had a long tradition of studios or workshops based on an experiential learning model, where students apply their learning to real life settings (Long, 2012; Roakes & Norris-Tirrell, 2000). Roakes & Norris-Tirrell (2000) note that service learning is a subset of experiential learning that emerged during the civil rights era. The goals of this approach were teach students about diversity and redress power imbalances of marginalized communities (Butin 2010, p. 91). While there have been some success stories (see for example Reardon, 1998), these efforts have often fallen short of their goals. Universities have often not sustained the ongoing partnerships needed to maintain community relations (Reardon 1998). Projects were sometimes taxing on community partners who were burdened with student training (Cushman 2002; Bortolin 2011). Furthermore the four months of a typical course is rarely enough time for students to learn the necessary skills to be useful to a community partner (Mihail 2006).

For over 40 years, the University of Oregon has run Community Planning Workshop (CPW) to help train graduate students in an intensive experiential learning setting. While CPW was inspired by the service learning model, it has been based on contractual relationships with clients supported by university funding. It is managed by full-time,

non-tenure track faculty who coach the students and work with the clients to ensure real learning opportunities and high quality products. This relationship has led to long-term relationships with clients, external funding for the experiential model, and research publications.

In this paper, we evaluate the learning outcomes and products of CPW over a ten year period. This study utilizes surveys of alumni and students over several years. We also interviewed clients, alumni and students to assess its community and student impact. This combination of surveys and interviews have allowed us to examine both short and long-term impacts on student learning. We also examine the benefits and qualities of the outcomes for the client organizations.

We found that students struggled with the messiness of real world practice and had difficulty reflecting on their learning during the workshop. Student experiences also varied, depending on clients, projects, and team dynamics. However, as they progressed through additional studies and their careers, students found that CPW prepared them very well for professional practice and in many cases influenced their career direction.

Clients were mostly highly satisfied with the quality of the work and the university-based, student-led efforts allowed for more experimental projects. Clients also noted that student teams combined with faculty oversight provided them with more extensive consultation efforts, data, and analysis than consultant-led projects. While projects sometimes required additional time commitments from clients, they were often energized by working with students and the University.

In exploring the findings with faculty, alumni and clients, we also noted challenges and shortcomings. First, there has been an increasing interest in work related to underrepresented and underserved communities, but these kinds of project require deeper community relations to be successful. Faculty and program staff are exploring partnership models with communities and community organizations, while maintaining the contractual model. Second, the Oregon model involves the integration of teaching, research and service, which requires a mixture of School, contract and research grant funding. This model does not fit neatly in the University's budget silos, leading to continual challenges to the funding structure. Finally, while CPW has integrated research and service into their work, it has been challenging to align client needs with faculty research interests that could lead to publishable work.

**PLANNING IN THE FACE OF PAUCITY: COUNTERING THE LOSS OF INSTITUTIONAL CAPACITY IN SMALL AND MID-SIZED CITIES.**

Abstract ID: 1070

## Individual Paper Submission

WEST, John [Ball State University] jhwest@bsu.edu, presenting author

Effective, public and democratic planning is greatly needed in places where it is least present: small and mid-sized cities that have lost financial and personnel capacity as a result of population decline and state policy. Since the economic crisis of 2008, mid-sized and small cities in the mid-west have lost capacity for planning as a result of economic decline and state fiscal austerity (Dewar & Thomas 2013). The author provides a model of urban institutional decline, in which cynicism about public services leads to disinvestment in public institutions, which in turn provides justification for further disinvestment. Drawing on four years of action research in Muncie, Indiana, establishing a new public institution, a land bank, the author describes the challenges of planning in the face of institutional shrinkage. Drawing on this experience the author argues that new federal spending initiatives will not suffice for rebuilding effective planning and local governmental practice. Planning professionals working in disinvested communities will have to create new institutions and repair existing ones. The paper concludes by considering the pedagogical needs of planning students who face a paucity of effective local institutions. Planning educators must focus attention on leadership, entrepreneurialism, and state policy advocacy to equip students with the skills to build institutions that are effective, public and democratic.

The Post-War II Era has been characterized by increasing dependence on private markets to distribute goods and services. This period has also been marked by significant cuts in social welfare spending and the erosion of labor rights in the United States and Europe as these regions struggle to address increasing global competition in a context of deregulating financial markets and unstable trading relationships. These trends, along with changing occupational structures within these countries, caused by a shift from manufacturing to service-based economies has led to increasing disparities in income, wealth, and power within major metropolitan regions. The disappearance of well-paying manufacturing jobs for those with limited education resulting from this transformation has pushed many working-class families into poverty while causing others to become economic migrants forced to abandon their hometowns in search of better economic opportunities elsewhere.

Feeling abandoned by mainstream politicians, many of these economically vulnerable families have embraced populist candidates who advocate market-based economic policies, smaller government, lower taxes, fewer entitlement programs, restrictive immigrant policies, deregulation of business and racist victim-blaming to address the economic and cultural concerns of working-class families. While the emergence of populist leaders such as Donald Trump, Boris Johnson, Marine LePen and Friedrich Merz has been the focus of much political analysis and debate, the growing numbers of cities pursuing redistributive economic policies and participatory planning to counter uneven patterns of metropolitan development and neo-liberal urban policies has received less scholarly attention. This session will examine the evolution, current state and future potential of what Pierre Clavel described in 1986 as The Progressive City which emerged in the late 1960s and 1970s when neighborhood residents, environmental activists, trade union officials, Civil Rights leaders and good government reformers came together to build broad-based coalitions to elect City Councilmembers and Mayors committed to improving the economic status and amplifying the political voice of non-elites in municipal policy-making.

These municipal officials and the grassroots movements that supported them sought to address the increasing economic and political marginalization of poor, working-class, and middle-income families through import substitution, First Source Hiring, planned manufacturing districts, linkage, inclusionary zoning, industrial retention, urban land banks, rent control, cooperative economic, Living Wage and participatory budgeting policies. This panel will present three compelling profiles of contemporary Progressive Cities in the United States and Europe that highlight how they have networked with other cities in order to influence state and national urban policies. Among the Progressive City case studies to be presented are the: redistributive development policies of New York City, NY, a global city; Paterson, New Jersey a former textile, apparel, and silk weaving production center; regional development plan of the Jackson Rising Movement and Lumumba Administration (Jackson, MS), and the sustainable planning and development efforts of Preston, UK. Special attention will be focused on the strengths and weaknesses on municipal reform movements, regardless of how inspired they may be to address powerful globalization forces and increasingly influential neo-liberal economic policies promoted by transnational organizations such as the World Bank, International Monetary Fund, and the United National Development Program and the international and

national economic, finance, and trade policies of the G7. The panel seeks to critically evaluate the continued effectiveness and value of the Progressive City Movement in an age in increasingly powerful global economic integration. Framed in another way, have the most successful Progressive Cities led to regional, provincial, and national reform efforts capable to mitigating and/or challenging the most destructive impacts of neo-liberal economic policies and structure adjustment strategies in the US and Europe?

## **INDIVIDUAL PAPER SUBMISSIONS**

### **NEIGHBORHOOD PLANNING AND SCHOOL SEGREGATION: HOW NEIGHBORHOOD PLANNING WAS USED TO KEEP SCHOOLS SEGREGATED IN THE POST-BROWN V. BOARD OF EDUCATION ERA**

Abstract ID: 6

Individual Paper Submission

RETZLAFF, Rebecca [Auburn University] rcr0001@auburn.edu, presenting author

The research question addressed in this paper is: how was neighborhood planning in general, and the neighborhood unit theory specifically, used by urban planners in Alabama to keep schools segregated in the post-Brown v. Board of Education Era?

Clarence Perry developed the neighborhood unit theory in 1929, building on previous neighborhood planning work by others that began in colonial times. The theory provided guidelines on how to design a human-scale neighborhood, including the details on the distribution and quantity of residences, shopping areas, streets, community services, and schools. Under the theory, neighborhoods should be centered on a small school, have 5,000 to 9,000 residents, with heavy traffic kept to the exterior, well-designed streets, and at least 10 percent of the land dedicated to parkland and open space. Perry's ideas gained popularity among social reformers of the 1920s and was used as the basis for the Garden Cities movement, including Radburn, New Jersey.

Although Perry's work was primarily concerned with planning and construction on undeveloped land, the neighborhood unit idea also gained popularity in already urbanized cities. In 1957 planners in Montgomery, Alabama proposed using the neighborhood unit theory as the basis for planning. Each neighborhood would contain about 5,000 people, a school, a playground, public buildings, and shopping. Higher density neighborhoods would contain more than one school and a park. Montgomery also used the neighborhood unit theory in its 1963 plan. In both plans, the neighborhoods were also segregated by race. Other cities in Alabama used neighborhood planning to keep schools segregated, including Union Springs, Opelika, and Birmingham.

Adoption of the neighborhood unit theory was a way to keep schools segregated in response to the desegregation

of Little Rock high school 1957. By adopting the neighborhood unit theory, school officials could argue that school segregation was due to neighborhood segregation – not official school policy. In just a few years, Montgomery’s landmark school desegregation case, *Carr v. Montgomery*, would be making its way through the court system. The plaintiff in the case, Arlam Carr, Jr. and his parents Arlam and Johnnie Rebecca Carr, sought to enroll their son in a white public school, and attorneys for the school board argued that segregation of the schools was not due to an official school policy, but due to the preferences of people to live near their own race.

In this paper, I analyze plans in Alabama that use the neighborhood unit approach and how those plans would impact school desegregation. The method used in this research is an analysis of archival data on comprehensive planning and neighborhood planning in Alabama, as well as an analysis of school segregation legal cases. The paper argues that there was a close relationship between planning and school segregation in Alabama, with many plans using the neighborhood unit theory as an intentional strategy to keep schools segregated after the *Brown v. Board of Education* Decision.

The research finds a clear connection between neighborhood planning and school desegregation in at least four cities in Alabama. The Planning Commissions in Birmingham, Montgomery, Opelika, and Union Springs adopted neighborhood unit approaches to planning in order to avoid desegregating schools. In school desegregation court cases, attorneys for the school board argued that school segregation was due to neighborhood segregation. The relevance of this research is new insight about the relationship between school segregation and planning in the South during the civil rights era, which are two issues that are often not connected in planning research. The research has implications for current planning practice because schools in major cities in Alabama are largely still segregated.

#### REVISITING THE ESSENCE AND PURPOSE OF REGIONAL PLANNING: A HISTORICAL ANALYSIS OF THE REGIONAL QUESTION

Abstract ID: 29

Individual Paper Submission

GALLAND, Daniel [Aalborg University] dgalland@plan.aau.dk, presenting author

TEWDWR-JONES, Mark [University College London] m.tewdwr-jones@ucl.ac.uk, co-author

HARRISON, John [Loughborough University] J.Harrison4@lboro.ac.uk, co-author

An emerging debate on the state of regional planning focuses on the need “to reassert the purpose and values of planning by rediscovering the content, conceptualise multiple and fluid forms of planning frames, and reposition the planner as an orchestrator and enabler of planning regional futures” (Harrison et al 2021, p.6). This contention is based on the premise that regional planning discussions have for a long time been overly fixated with issues

regarding its institutional frame to the detriment of the everchanging content of the real-world picture of regional problems and opportunities. Our argument is that as regional planning turned into an institutionalised and uniform bureaucratic apparatus in most parts of the world, it moved away from being a spatially selective activity where it was needed, divorced from place specific needs and increasingly resented (ibid.).

This paper contributes to that debate by opening discussion around the rediscovery of the very essence, purpose and values of regional planning. First, we identify the hallmarks of regional planning based on punctual episodes that took place during its intellectual heyday in the interwar period. We revisit the first wave of regional thinking by addressing: (i) the rationale behind the problematisation of regional issues and questions (i.e. regional problem-framing and problem-solving from the lens of regionalism as a form of advocacy in specific contexts); (ii) the building blocks and early proposals of regional planning as well as the understanding of 'the region' both as a constructed phenomenon and as a product of the process of regionalisation; and (iii) the planning conception of the future and its ensuing implications.

We then move on to assess the historical evolution of regional planning as it became an institutionalised and professionalised activity during the post-WWII era. We open up the key debates which took place in the journal *Regional Studies* (and make links to key debates in other planning journals) during the 1960s-1970s to contend that regional planning ramified into three parallel planning paradigms. The first paradigm refers to rational procedural thought which prioritised development plans and the planning system (Kuklinski, 1970; Lichfield 1967). The second paradigm denotes early systems planning aided by the early use of computing modelling and analytics which perceived cities and regions as machines (Wilson, 1969). The third paradigm alludes to the early work of substantive theorists who focused on welfarist issues and the need of citizens and planning's outcomes as stories of unjust political intent (Mayhew, 1969).

Finally, we develop a discussion based on the premise that the resulting ramification of regional planning into divergent purposes, styles, regional constructs and time conceptions not only blurred its essence but also rendered its original spatial attributes and place-making qualities fuzzier and thereby much less perceptible. We conclude that revisiting the genesis and original purpose and values of regional planning is an important step in the quest to revive its function, namely addressing regional needs in a place-specific way through multiple, adaptive, flexible and agile forms of planning regional futures.

#### CREATIVE PLANNER: THE INTERDISCIPLINARY INGENUITY OF HENRY WRIGHT

Abstract ID: 275

Individual Paper Submission

LARSEN, Kristin [University of Florida] klarsen@ufl.edu, presenting author

Though best known for his ten-year partnership with Clarence Stein, with whom he designed Sunnyside Gardens in Queens, New York; Radburn in New Jersey; and Chatham Village in Pittsburgh, Pennsylvania, Henry Wright's career transcended these iconic landmark communities. He moved seamlessly between the professions, advancing his design, housing, community planning, and regionalist philosophies. His writings challenge us to reassess multi-scalar, interdisciplinary approaches that acknowledge and coordinate the design and function of the built and natural environments as a comprehensively planned whole. Wright informed his designs with intrinsic environmental qualities, networks, and community needs. Further, his capacity to envision innovative solutions transcended the emerging boundaries among the professions to bridge design thinking from the scale of a single unit to an entire region.

Throughout his career, Henry Wright (1878-1936) was at the forefront of practice. While with noted landscape architect, George E. Kessler from 1902-1909, Wright characterized his work as "Landscape Engineering – Design for Parks"; then as "Town Planner" for the Emergency Fleet Corporation during World War I; and "Site Planner" for Chatham Village. He drafted a proposal for a New York State Plan in 1926 that incorporated a landscape regionalism, which anticipated layered mapping as a tool to guide land use decisions. In 1931-32, he served on the President's Conference on Homebuilding and Home Ownership to explore and promote innovations in large-scale development and then contributed to the early formulation of the PWA Housing Division, which pioneered the first federal public housing program during the Depression. As one of only two U.S. members on a task force of the newly formed National Association of Housing Officials, he examined the initial impacts of that program in 1934, breaking new ground in housing advocacy. Just before his untimely death in 1936, he operated an innovative graduate studio to educate emerging leaders in architecture, planning, and housing. Underlying these pioneering initiatives was a deep understanding of the relationship between people and the landscape, from the individual living unit to the regional level.

Using primary and secondary sources, including unpublished papers and plans, correspondence, writings, and accounts from the period, this study focuses on critical junctures during Wright's career to inform our understanding of the emergence and power of his interdisciplinary approach. It applies an interpretive-historical methodology to contextualize and critique this archival material. Wright embraced an understanding of places – their ecology, networks, hierarchies, and connections – and the role of institutions to shape these places into quality, complete communities. His practice engaged with emerging institutions – local and regional planning to coordinate land uses, transportation, and green networks; to create infrastructure efficiencies; and to ease access to services and amenities as well as federal and state policy-making to advance housing affordability. As planners are called to connect urban, regional, cultural, economic, and environmental issues, reintroducing Wright's ideas offers solutions through place-making at the interface of design for housing reform, ecological understanding, community capacity and function.

## IDENTIFYING, CONSERVING, AND ACTIVATING CHINESE-AMERICAN CIVIL RIGHTS HERITAGE: A PROPOSAL FOR A LANDSCAPE APPROACH

Abstract ID: 276

Individual Paper Submission

STARKS, Charles [University of Pennsylvania] cstarks@design.upenn.edu, presenting author

The dramatic rise in anti-Asian violence in the United States that began during the coronavirus outbreak in 2020 has deep roots in a long history of hatred directed at peoples with origins across the Pacific. The other side of this story is that Asian-American communities have an equally long history of fighting official repression and asserting their civil rights. Yet the sites of Asian-American civil rights history are hidden in urban landscapes, often unacknowledged by official designation, rendering them invisible and contributing to the othering of Asian-Americans as not truly a part of American narratives. Although the National Park Service has, in the last 20 years, undertaken studies to identify sites, progress has been slow, and the site-based approach inherently limits commemoration of this history to a few isolated locations. Moreover, the umbrella term “Asian-American” itself is a pan-ethnic category that embraces numerous communities with their own histories, such as Arab-American, Chinese-American, Filipino-American, and Indian-American, just to name a few. While there are commonalities among the struggles these groups have faced, each has interacted with place and civil rights in its own way.

This paper addresses the limitations of past work by sketching out a tailored approach that focuses on Chinese-American civil rights heritage, including but not limited to ethnic enclaves known as “Chinatowns.” One of the major difficulties to recognizing Chinese-American civil rights history in conventional ways has been that much of that history happened in some of the densest, most heavily shared and contested ground in American cities. Public approaches to heritage designation that try to carve out monuments as isolated landmarks are difficult to implement in such places and unlikely to provide more than token recognition. Further, due in part to historical experiences of repression and isolation, traditions of commemoration and remembrance undertaken by Chinese-American communities themselves have tended to be relatively private. The paper contends that by embedding civil rights heritage in the planning process, highlighting the validating districts and connections between dispersed sites, daylighting buried history, and valorizing intangible heritage, planners, preservationists, activists, and community members have the potential to successfully make Chinese-American civil rights heritage visible and signal that the struggle for civil rights happens in everyday spaces.

To develop a civil rights landscape approach for the Chinese-American experience, this study first reviews two categories of recent heritage literature—one concentrating on civil or human rights, and another that treats urban heritage as landscape-based rather than site-based. Drawing upon recent scholarly histories of Chinese-American struggles for civil rights, the study then relates these movements to preservation opportunities in selected US metropolises. It presents maps of civil rights landscapes that integrate many heretofore unrecognized spaces with existing designated landmarks. These maps acknowledge that while ethnic enclaves such as Chinatowns are important in such histories, the reality of the Chinese-American civil rights landscape goes well beyond such bounded neighborhoods to include government buildings, residential suburbs, and even cemeteries. The study concludes with an informed provocation of how an increasingly visible Chinese-American civil rights landscape could emerge over time if this civil rights landscape approach were embedded into planning and preservation.

## **APPLYING A CRITICAL RACE SPATIAL ANALYSIS: UNDERSTANDING THE HISTORIC AND CONTEMPORARY CONTEXT OF UMASS BOSTON'S PRESENCE ON THE HARBOR POINT PENINSULA AND ITS ROLE AS AN ANCHOR INSTITUTION**

Abstract ID: 569

Individual Paper Submission

BATCHVAROV, Velina [University of Massachusetts Boston] [velina7b@gmail.com](mailto:velina7b@gmail.com), presenting author  
LUTZ, Nora [University of Massachusetts Boston] [nora.lutz001@umb.edu](mailto:nora.lutz001@umb.edu), co-author

We apply critical race spatial analysis to situate universities as anchor institutions within minoritized urban neighborhoods. As an anchor institution on the Harbor Point peninsula, UMass Boston has an opportunity to develop impactful campus-community relationships and private-public partnerships. Dorchester Bay City (DBC) is a new multimillion dollar, 5.9 million sf development proposed on university-owned public land, which will challenge UMass Boston to reexamine its presence on the peninsula (amongst other upcoming developments). While no university or public agency is able to influence economic and social trends independently (Etienne, 2007), and the effects of the new developments are not well understood, the university could benefit from documenting its long-standing relationship with local communities, and reposition itself as a key anchor contributor in developing 21-st century sustainable public-private partnerships that will stimulate local ecosystem development while addressing racial and spatial justice issues. This pilot study will address the following questions:

What role has UMass Boston played historically as an anchor institution since it moved from downtown Boston to its campus to the peninsula in 1974?

What role has UMass Boston played as an urban developer? What role is it playing through its involvement with the DBC and its campus redevelopment?

How do these roles align with the UMass Boston's mission and vision?

How has the perception of UMass Boston changed for local stakeholders, considering these new development projects? This pilot is a mixed-methods study that builds on an exploratory study by Nora Lutz on UMass Boston's role in the DBC development. Its purpose is to situate the university as an anchor institution by expanding data sources to include historic and current perceptions of UMass Boston's role as an anchor institution. The data collection includes: interviews, archives, press releases, campus master plans and strategic planning documents, university announcements, Boston Planning and Development Agency records. These will be triangulated with GIS and Census data about the make-up of the peninsula residents and neighboring communities.

Etienne (2007) and Winling (2018) use CRSA to visually display the role of universities in gentrification and neighborhood transformation. Through mapping the racial makeup of neighborhood change, the "color-line," a term coined by W.E.B DuBois, becomes apparent and difficult to ignore. It raises questions about whose interests the campus redevelopment projects have served, and exposes the intentionality behind them. This partially explains Baldwin's (2015) warning that universities have become the second or third biggest employers and landowners, yet their role in the new knowledge and technology economy remains largely "unexamined." Contrastingly, the universities are co-dependent on the vitality of their neighboring communities (The Campus as City, 2019). As anchor institutions, they cannot reallocate their campuses without significant costs, so they must form symbiotic relationships and invest in developing strong and equitable campus-community relationships. Perry & Wiewel (2015) present case studies of the universities embracing their public good mission and spearheading transformational changes working with diverse communities.

UMass Boston has the most diverse student population of any university in the city of Boston and represents the makeup of Boston's residents (over 51% Latinx, Black, or Asian/Pacific Islander, BPDA, 2020). Over 60% of students are from marginalized backgrounds, and less than half are first generation, and Pell grants recipients. Unlike other 4-year institutions in the area, UMass Boston attracts mainly students who are local to the area. As an anchor institution, UMass Boston has played a critical role in diversifying the local ecosystem's workforce. Understanding its role in community development has become more important with the effects of the double pandemic, climate change, racial, and social justice movements, and neoliberal forces threatening the extinction of public space, citizenship, and democratic engagement.

### THREE EPISODES OF BUILDING NEW TOWNS IN INDEPENDENT INDIA

Abstract ID: 584

Individual Paper Submission

VIDYARTHI, Sanjeev [University of Illinois at Chicago] svidy@uic.edu, presenting author

KUMAR, Ashok [School of Planning and Architecture, Delhi] a.kumar@spa.ac.in, co-author

TARAFDAR, Ayon [School of Planning and Architecture, Vijaywada] ayon.tarafdar@spav.ac.in, co-author

Literature describes the building of new towns across different countries since the postwar period in substantial detail (e.g., Forsyth and Peiser 2019). This paper extends this line of scholarship by mapping and illustrating three distinct phases of new town building activity since India's independence in 1947.

Driven by post-independence fervor for nation-building and industrialization-led development, the first episode (late 1940s - until late 1970s) comprises well-known cases like the brand-new cities of Chandigarh and Bhubaneswar designed by Le Corbusier and Otto Königsberger respectively. In fact, during this period, the fast-expanding public sector undertook the state-sponsored development of more than 100 new towns for a variety of purposes (e.g., industrial townships, state capitals, education centers, rehabilitation towns and port cities) across the length and breadth of vast country (Prakash 1969).

The second episode of new town building followed the liberalization of India's trade and economic policy beginning in the late 1980s. Scholars have studied the development of new towns sponsored by state agencies promoting regional economic development as well as private players seeking profit and prestige in local places. Notable examples include the new towns of Rajarhat adjoining the eastern metropolis of Kolkata and Magarpatta near the western city of Pune (Bhagat 2011).

Not much is known, however, about the third episode of new town building activity that is currently ongoing. Based on preliminary research, we find a wide variety of sponsors (e.g., provincial governments, public sector agencies, local development authorities and private players) collectively promoting new towns both in the vicinity of expanding metropolises as well as industrializing places located in the hinterland. Prominent examples include New Dhule in central India and GIFT city in the western state of Gujarat. Country's powerful central government seems to be supportive as well. For instance, the Ministry of Housing and Urban Affairs (MoHUA) recently supported the 15th Finance Commission's recommendation for a grant of Rs 8,000 crore as aid for 'incubating' eight brand new cities, in the first-ever direct central support for new town development (Mehrotra, 2021).

By comparing and contrasting the three episodes of building new towns along pertinent dimensions (e.g., overall planning policy, project purpose, principal design ideas and concepts, plan sponsor, implementing agency and more) this paper will locate the collective significance of these distinct efforts in the long-term planning trajectory of independent India. It will conclude by drawing useful insights and lessons for planning scholars.

#### **SOLDIER-PLANNERS IN COLONIAL MOROCCO: AGENTS OF THE “DARK SIDE OF PLANNING”**

Abstract ID: 771

Individual Paper Submission

ELGAMAL, Asmaa [Massachusetts Institute of Technology] [aelgamal@mit.edu](mailto:aelgamal@mit.edu), presenting author

Planning scholars have long critiqued the use of planning as an instrument of control and domination. This “dark side of planning” (Flyvbjerg 1996) is particularly salient under colonial rule, where land use regulation and spatial (re)organization were among the tools used by colonial powers to structure systems of racial segregation and maintain control over subject populations. While the outcomes of these practices have been widely explored, lesser attention has been paid to the role played by colonial administrators—with their varying motivations, agendas, and ideological bents—in shaping planning decisions.

Using the colonial administrator as a focal point, this paper brings a more agentic lens to understanding how planning rationalities become infused with the logics and practices of security. Specifically, it examines how land use planning in protectorate-era Morocco (1912-1956) was influenced by the dual roles of French colonial administrators, who embodied the responsibilities of both planners and security agents. It suggests that a historicized understanding of planning policy requires an investigation of a set of “security dilemmas” through which administrators came to understand their role as agents tasked with the regulation of relationships between land and people in order to reduce the potential for dissidence, defection, or resistance.

The paper borrows from Vaughan's (1996, 2004) methods of historical ethnography, relying on archival documents

to elucidate the organizational cultures and structures of colonial planning, as well as the ways in which individual agents interpreted actions and events. Through an analysis of official reports, training manuals, correspondence, and personal memoirs of military and civilian administrators, the paper demonstrates how colonial agents' personal understandings of their mission and profession contributed to the infusion of planning with logics of security and control. Furthermore, building on the Bourdieusian concept of the social field, it suggests that "planning as control" (Yiftachel 1994, p. 216) is not a pre-determined outcome, but a product of an expanded security field in which inter-connected agents—both military and civilian—negotiate and perform a range of security functions over the course of their regular administrative duties.

While grounded in the Moroccan colonial experience, this paper has several important implications for planning scholarship. First, it brings a more agentic lens to understanding the processes through which the "dark side of planning" is produced and sustained. Second, it demonstrates the value of incorporating military history into our understandings of the relationship between planning and security. Finally, it highlights historical ethnography as a tool through which one may unpack the dilemmas, decisions, and debates which animate planning practice.

#### **PLANNING AND THE EVER EVOLVING ECOLOGICAL IMAGINATION: AN ECOLOGY-CENTRED PLANNING HISTORY OF VANCOUVER BC**

Abstract ID: 846

Individual Paper Submission

LAMONTAGNE, Neal [University of Alberta] nlamonta@ualberta.ca, presenting author

Understanding the city, its limits, and its possibilities from an ecological perspective is a well-established and intellectually dynamic field of study. But how influential has the diversity of work on an evolving understanding of ecology and cities been on city planning and design practices? Which types of ecological principles find easy adoption and which types find resistance? And to what degree is the relationship of influence reciprocal? And how does the influence of ecology ebb and flow in relation to other emergent concerns around sustainability, urban livability and resilience?

This paper explores the relationship of ecology to planning as they both (co) evolve over time, using Vancouver (BC, Canada) as the primary case. In Vancouver, we find a city that has embraced ecological perspectives into design and planning practices and has adopted successive sustainability oriented plans, yet is typical in employing only a limited subset of an expansive ecological imagination in application. By using a historical analysis of city planning documentation and projects, further informed by the perspective of influential actors over time, the paper will present a unique perspective both of planning history and urban ecology. Further, this paper explores the translation, and the limits of such translation, on the full spectrum of planning activity (not limited to sustainability, habitat or green infrastructure planning), especially how ecology interrelates with other emergent policy concerns

relevant to the contemporary city.

The paper will present research that demonstrates that ecological thinking has been influential at key periods in the city's planning history but not often at moments of heightened policy work on urban sustainability and while frequently addressed in planning documents have rarely translated into sustained implementation. Further, despite early influence on urban form in the 1970s and 1980s, with a few important exceptions, ecologically-centred design thinking has lost influence as climate concerns became more ascendent and influential in policy development and implementation. This paper will illustrate the evolving relationship between ecology and localized planning and design movements and argue that a renewed interest in an ecological imagination as a generative force in planning and design is still underdeveloped and holds promise for meaningful evolution of the city.

### **RACE, RENEWAL, AND DISPLACEMENT IN CANADA: THE LEGACY OF URBAN RENEWAL**

Abstract ID: 867

Individual Paper Submission

AUGUST, Martine [University of Waterloo] martine.august@uwaterloo.ca, presenting author

Urban Renewal projects in postwar America systematically displaced racialized communities to make way for commercial and civic redevelopment, road building, and public housing development. In Canada, slum clearance and urban renewal were similarly destructive, selecting low-income communities with "blighted" housing for clearance and displacement. Despite the impact of this program, there have been no studies that have explored its impacts as a whole. Over 20,000 families in 85 Urban Renewal sites were displaced between 1948-1973 through this program. This paper explores the pre-renewal racial composition of urban renewal areas, and the role of race and ethnicity in prompting revitalization initiatives, based on census data of sites and references to ethnic, racial, and religious make-up of sites in planning documents. This study of the dynamics of racialized displacement in Canadian urban planning history, through a systematic study of urban renewal sites, based on planning documents (Urban Renewal 'schemes' and plans), 1961-1971 census data, and displacement outcomes.

## FROM URBAN RENEWAL TO THE BELTLINE: ATLANTA'S USE OF PUBLIC HEALTH NARRATIVES TO RESHAPE THE CITY

Abstract ID: 877

Individual Paper Submission

OCONEILL, L. Katie [Georgia Institute of Technology] l.katieoconnell@gatech.edu, presenting author  
BOTCHWEY, Nisha [Georgia Institute of Technology] nisha.botchwey@design.gatech.edu, co-author

Health and the protection of public health has been a common theme in city redevelopment. Dating back to the early days of planning, city neighborhoods were labeled as places of alienation and degeneration. Often the language took on a public health narrative or discourse that equated blight to a metastatic cancer infecting surrounding neighborhoods. The best remedy was to wipe out the disease through slum clearance and urban renewal. This narrative changed in the 1990s as cities across the United States saw significant shifts in demographics as middle-class white families moved back into cities. To attract these residents, cities promoted themselves with large development projects that promised healthy living for all. Through each major redevelopment initiative, government agencies promoted their plans using a specific, yet evolving dominant narrative, which justified reshaping the city as both necessary and in the best interest of all residents, especially the displaced.

The City of Atlanta followed these same patterns over the last 100 years from urban renewal through the current citywide greenway project, the BeltLine. Other scholars recognize displacement as a consequence of Atlanta's redevelopment projects but few focus on the official discourse used to sway public opinion. In relationship to that gap, this paper compares Atlanta's redevelopment narratives from urban renewal to its current citywide greenway project, the BeltLine, to understand how city officials utilized public health language to rationalize displacement. While it is vital for researchers to recognize the power embodied in dominant narratives, by amplifying only one side planners perpetuate a system that continually boosts the voice of privilege and silences others. With that understanding, this paper includes counter-narratives of residents and businesses in neighborhoods impacted by redevelopment as they pushed against expansion plans and watched their communities get restructured by outside forces. The method used for this paper is an analysis of archival data through a critical discourse analysis lens as it is concerned with the power of language on social and political contexts. Historical documents include government and community plans as well as newspaper articles.

This paper finds that Atlanta saw the redevelopment projects of urban renewal and the BeltLine as once in a lifetime opportunities for the city to rejuvenate and redefine itself. Both projects centered themselves around the language of health with urban renewal documents centered around the language of contagious disease while the Beltline instead focused on its ability to create a healthier population with better quality of life through improved access to parks and recreational facilities. As the city's redevelopment narrative did not vastly change from urban renewal to BeltLine, neither did the community's counter-narrative which recognized the city's role in creating blight while at the same time noting the city's data did not match their lived reality. Through both redevelopment projects, community organizations emphasized their desire to have control in creating their own vision for the future.

## **RACE IN THE BUILT ENVIRONMENT: AN ANALYSIS OF TRANSPORTATION PLANNING DECISIONS AND REGIONAL SEGREGATION IN DETROIT, MICHIGAN**

Abstract ID: 947

Individual Paper Submission

PFAFF, Robert [University of Michigan] robpaff@umich.edu, presenting author

Detroit and its surrounding suburbs are the second most segregated metropolitan area in the United States. Existing research establishes that racial disparities in the built environment have been historically shaped by discriminatory processes such as redlining, predatory lending, restrictive covenants, block busting, and urban renewal. To date, no one has examined how public transportation systems have contributed to existent racial segregation in metropolitan areas. My research analyzes major transportation planning decisions in a case study of the City of Detroit between 1922 and 1970 and explores how these decisions impacted racial mobility during a period of significant racial shifts across the entire metropolitan region. This research uses case-study methodology to study Detroit, Michigan and conducts qualitative analysis of primary-source historical city documents like memos, reports, minutes, correspondence, and engineering sketches. Archives used in this research are the Burton Historical Collection (City of Detroit), Walter P. Reuther Library (Wayne State), the Bentley Historical Collection (University of Michigan), as well as State of Michigan archives, and federal archives at the Library of Congress. Findings demonstrate that beginning in 1947, City of Detroit officials directly intervened to restrict budgets, veto engineering plans, and reduce bus service to ultimately prevent public transportation route expansions into newly settled suburban areas. These actions were taken despite a state-wide referendum that permitted the city transit agency wide authority to operate bus routes into adjacent suburban areas. I argue this denial of service, although not solely responsible for segregation, significantly exacerbated racially exclusionary practices by limiting physical mobility that contributed to the black and white segregation of the city and suburb. This research is significant because it contributes an additional dimension to understanding how city planners, policy makers, and officials historically segregated cities and regions along racial lines during a period of mass suburbanization. Knowing how exclusionary processes functioned historically is critical to dismantling them in present plans and future initiatives to design equitable transportation policy that serves all residents in a metropolitan region.

## **AN INSTITUTIONAL ETHNOGRAPHY OF THE INDIAN 'DESIGN CELL': ANALYZING NEOLIBERAL PLANNING EDUCATION.**

Abstract ID: 975

## Individual Paper Submission

TYABJI, Azhar [University of British Columbia] azhartyabji@protonmail.com, presenting author

Drawing methodologically from institutional ethnography and assemblage theory (Delanda 2016; Sorensen 2018), my paper offers a comparative case study of planning students' subjectivities in two Indian planning schools, focusing on the decades following India's neoliberal reforms in 1993. The intervening years since that turbulent shift from Soviet-era 'soft' socialism have witnessed intellectual ferment in the pedagogical design and delivery of urban and regional planning education in India, in response to new market-driven indices of 'progress' and 'success'. The pedagogical design of planning has mostly followed larger institutional shifts in planning legislation and policy. When read intellectually against an anthropology of the post-Soviet condition (see, for example, Collier 2011), therefore, my Indian example raises the compelling question: if students imagine themselves becoming professionals working in the service of the neoliberal state, in what ways do they philosophically trouble its market logic?

My paper begins by framing its case studies in a theoretical proposition: the phenomenological concept of a school of thought and its boundedness as a thing worth analyzing. The theory serves to animate my analysis of two Indian planning schools whose teaching philosophies distill schools of thought that define post-socialist market values, even as they try to combine principles of old-school welfarism and the new individualism.

The literature on schools of thought offers several critical points of departure. Cetina (2007), for example, has argued that institutions embody 'epistemic cultures' characterized by commonly-shared languages of values, aspirations and aesthetics. Cetina's proposition extends the 1930s-era ideas of Ludwik Fleck, a Polish philosopher of science who first proposed that schools of thought begin as 'thought collectives' with what he called a distinct 'style' to them. This notion of a thought collective, when applied to the history of planning education in India, suggests the phenomenological possibility of reading the 'planning school' as an epistemic entity with its own distinctive culture of thought and practice, something the educationist John Dewey had first imagined in the 1930s.

My case studies instantiate problems in how such a culture of thought might evolve. I examine the rise of private-sector individualism as a moral virtue in planning school, in an increasingly business-savvy India that discounts students' subjective self-formation while foregrounding the acquisition of 'soft skills', that is, behavioural qualities that are desirable in the neoliberal marketplace. This is the direct consequence of knowledge institutions having been corporatized, where planning ideas now increasingly intersect epistemologically with the disciplines of management studies and public policy.

My paper analyzes one curious cultural phenomenon: the 'design and research cell' in planning schools in Mumbai and Ahmedabad, India. An institutional ethnography of the 'cell' reveals a quasi-corporate, for-profit agency that serves as an academic laboratory for 'immersive' practice. My story narrativizes how the ritualized operating concepts that serve to govern corporatized planning practice complicate the subjective formation of students as moral individuals who have to navigate between the regulatory regimes of standardization and bureaucratic expectation and their human impulse to make decisions. In so doing, students find themselves sometimes at cross purposes about the moral implications of reconciling market pragmatism and *realpolitik* with outlier-dom, questioning their own place as individuals in a 21<sup>st</sup>-century nationalisation project that has begun to reward a compliant, universalizing citizenship.

The history of planning in India has as yet received no anthropological attention; historiographers have tended to cast the profession's story in largely political-economy terms (see, for example, Kumar et alia 2020). By applying an ethnographic lens, this paper's analysis will newly experiment with distilling anthropological insights on a culture of privatized planning education in an emerging economy, towards making the case for an alternative historiography of Indian planning institutions.

## FROM IDEAL TO REAL, FROM GLOBAL TO LOCAL: ERNEST HÉBRARD'S 'WORLD CENTRE OF COMMUNICATION' AND 'THESSALONIKI'S RECONSTRUCTION PLAN'

Abstract ID: 1027

Individual Paper Submission

RODI, Alcestis [University of Patras] alcestis.odi@gmail.com, presenting author

Utopian cities are often dismissed as unrealistic. Yet, their critical and intellectual approaches revolutionize the ways we design and shape our cities. There is a striking resemblance between Ernest Hébrard's pre-WWI ideal plan for a 'World Centre of Communication' (1913) commissioned by Hendrik Christian Andersen and post-WWI Thessaloniki's Reconstruction Plan (1918). Beyond the obvious formal analogies, the paper argues that correlations originate from a shared urban ideology that endorses people's unity.

At the outset of the 20<sup>th</sup> century visions for world-embracing unity not only set the foundations for world organizations such as the United Nations, but also initiated the discourse on the World City. Responding to growing international idealism, manifestos and design proposals emerged in search of the ideal architecture and urban form for a capital of all nations. Efforts for universalism evaporated during WWI, yet, less ambitious, both in ideology and form/image, city plans followed aspiring to implementation after recovery from war. The paper investigates the understudied reductions between Hébrard's aforementioned designs. Based on drawings and plans' descriptions, I trace the shifts in urban ideology and morphology. For the former, I argue that the ideology thins from a unification of nations to a unification of cultures, thus, there is a reduction from global to local. For the later, I argue that the form scales down from generic to specific and from pattern to module, thus, there is a reduction from ideal to real.

In terms of ideology, the paper argues that the Nations' unification is pursued in the open World Centre with its sophisticated organization of urban life and space aiming to stimulate peace and human progress. The same ideology triggers the responsive intention of cultures' in multicultural, at that time, Thessaloniki. As a utopian city, World Capital could be established at any place and time. The specific situation, both geographical and cultural, of Thessaloniki grounded Hébrard's aspirations. The paper also identifies ideologies of unity in the naming of the main axes and public spaces of both schemes. In terms of morphology, Thessaloniki's plan is directly related to World Centre's Beaux-Arts urban planning and architectural vocabulary. Both plans are strongly axial, composed of hierarchical networks of radial polygons linked by boulevards, flanking axial parkways oriented towards the waterfront. I argue that in Thessaloniki, Hébrard fractalized World Centre's pattern and articulated its typomorphological elements so as to connect the historic monuments with contemporary life. Based on plans' analysis, the paper identifies Thessaloniki's central district with the World Center's Quartier, a modular unit able to repeat itself in the city. The Quartier's attributes -scale, geometry, dimensions, topological organisation, main boulevard, street pattern, city block sizes and density of intersections - are all present in Thessaloniki's plan. Furthermore, the network of historic monuments, so far interpreted as the starting point of urban design identifies with the layer of public landmarks as found in the World Centre. When uses incompatible with the peaceful World Capital have to be

introduced, Hébrard reconditions the programmatic attributions of the design. Moreover, close-knit patterns of programmatic association as described in World book are also witnessed in Thessaloniki's plan. Pondering this, the ideal and general turns to real and site-specific.

In 21<sup>st</sup> century, a plethora of Adjective-Cities such as Smart, Green, Resilient, Healthy and Just City introduced as ideal models by recent urban theory creating a distinctive new phase in urban planning. The paper draws on the ways Hébrard shifted his ideological and spatial utopia for realisation within a less perfect social and physical context, aiming to stimulate current planning scholarship, practice and education to approach these new, ideal Adjective-Cities as working definitions, not polemic statements.

#### **INCLUDING PRESERVATION IN PLANNING: THE 1993 ALBINA COMMUNITY PLAN IN PORTLAND**

Abstract ID: 1091

Individual Paper Submission

REDAELLI, Eleonora [University of Oregon] redaelli@uoregon.edu, presenting author

The intersection of historic preservation and urban planning has advanced over the years. Revitalization has been a central theme for this intersection, but the literature has not yet analyzed how a comprehensive plan—a crucial planning tool for growth and development—has included preservation. In this paper, I investigate how the city of Portland, Oregon, integrated historic preservation into its comprehensive plan, focusing on Albina. Portland developed a comprehensive plan considering several scales, resulting in an array of documents released over the years. Through a neo-institutional analysis, I look at these documents aiming to understand (1) the underlying institutions—such as compliance procedures, formal rules, and operating practices—that frame preservation policies within a comprehensive plan and (2) the approach to preservation implied in these policies. The findings show how the inclusion of preservation into planning is structured by different level of government, it is developed through an array of documents covering different scales, and it is part of an effort to enhance the vitality of neighborhoods. Overall, preservation is framed as a community asset, bringing attention to the history of the local community, its people, and its built and natural environments. However, historic districts, which are the major preservation efforts emerging from the plan, lack the strengths of both a comprehensive approach to planning and an urbanistic approach to preservation.

## **DALLAS AND THE RISE OF BIG D: REFLECTIONS FROM CITY PLANNING AND PLACE BRANDING IN AN AMERICAN ENTREPRENEURIAL CITY IN THE 20TH CENTURY**

Abstract ID: 1104

Individual Paper Submission

BONAKDAR, Ahmad [York University] bonakdar@yorku.ca, presenting author

Despite its prominence as a major trade city in the South, Dallas has remained strikingly understudied. While Dallas's narratives of growth championed by city planning manifested in increasing entrepreneurial policies over time, the significance of such growth and the way it came to exist have remained mostly unknown to city planners.

This paper traces Dallas's historical lineage of growth and city planning through archival analysis and interviews with key informants to unfold the ways that the city has elevated its place as a quintessentially entrepreneurial city. Revisiting Dallas's trajectory of growth drawing on city planning, this paper unravels how Dallas has become a booster city and what specific strategies it has adopted to become a business-friendly city. The paper's historical analysis reveals that Dallas's long-standing tradition of promoting a visible city has stayed alive; although Dallas has long been struggling with the legacy of the stigma associated with the JFK assassination, the city has bolstered and expanded its business-friendly reputation in the post-Kennedy era.

### **PLANNERS' ROLE IN NON-CONTACT VISIONING PROCESS: CASE STUDY OF BUSAN, SOUTH KOREA**

Abstract ID: 241

Individual Paper Submission

YEOM, Jae Weon [Pusan National University] jaywo7@naver.com, presenting author

KANG, Seung Won [Pusan National University] allan92@naver.com, co-author

JANG, Sae Woom [Pusan National University] bb1211@pusan.ac.kr, co-author

JUNG, Ju Chul [Pusan National University] jcjung@pusan.ac.kr, co-author

[Problems] This paper aims to present planners' role in non-contact visioning process, since COVID-19 pandemic has accelerated conversion to a non-contact society. As the application of hyperconnectivity and superintelligence of the Fourth Industrial Revolution accelerated by COVID-19, most of communication are now carried out in a new 'space' based on the information technology. These changes have also affected citizen participation visioning process of urban comprehensive plan. Therefore, it is necessary to study the change of planners' role in non-contact visioning process.

After paradigm shift of urban planning from the rationality of experts to the consideration of mutual stakeholders, citizen participation in the urban planning process has become highly important (Burby, 2003). Citizen participation process has been criticized in that the process based on communication consumes more time and cost than conventional plans (Wates, 2000). Nevertheless, citizen participation should be continuously implemented in order to minimize external effect of urban plan by securing rationality and fairness (Peltonen & Sairinen, 2010). As system and social awareness about citizen participation in the process of urban planning improved gradually, municipal governments in South Korea operated citizen planning group in visioning process of urban comprehensive plans. In particular, as the period of visioning 2040 Urban Comprehensive Plan overlapped with the spread of COVID-19, Busan Metropolitan City conducted visioning of urban comprehensive plans in a new 'space' for the first time among in South Korea.

Since offline visioning process of urban comprehensive plan was replaced by a new method, there was a need to reprioritize planners' roles in non-contact manner in comparison with offline process.

[Research Methodology] The study area of this paper covers Busan Metropolitan City in South Korea, which has operated 4 offline from 2015 to 2019 and 2 online citizen planning groups in 2020. We participated 6 citizen planning groups and played as a facilitator in helping citizen planning groups vision well.

[Findings] Compared to offline meeting, non-contact visioning process can enable more stakeholder participation in the planning by solving spatial constraints problem. However, in order to activate citizen engagement, planners should play a role in solving the following issues. Citizens in planning group pointed out the problem of communication among the participants as a disadvantage of the non-contact visioning process compared to offline manner. Also, they pointed out the inconvenience of media. In particular, issues raised by citizen groups were found to have a great influence on the digitally underprivileged. Actually, some of citizens who were not familiar with online environments or who could not afford costs for the internet were unable to participate in the citizen planning groups even though they wanted to do so. If the problems are solved, non-contact visioning process is expected to

contribute to expanding bottom-up planning process in all areas of urban planning. Therefore, planners should play a role in removing constraints so that digital vulnerable group can communicate well in the visioning process.

[Policy Implications] Non-contact visioning process of citizen participation may be further activated by increasing infrastructures to support elderly citizens and those who are vulnerable to access to the internet. Also methods for including digitally vulnerable citizens such as providing free Wi-Fi and granting data service vouchers should be considered. In addition to incorporate citizens who are not familiar with online environment, various methods should consider such as providing online conference software guidelines, pre-education for citizen group, and pre-testing of the online system.

## HOUSING PLAN IMPLEMENTATION IN THE UNITED STATES: A CASE STUDY APPROACH

Abstract ID: 260

Individual Paper Submission

TRAN, Tho [Texas A&M University] thotran2211@gmail.com, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Housing plays a central role in connecting individual, family, and society in human life. Provide decent housing at an affordable price, in a suitable living environment is the ultimate goal of housing policy in the United States, as well as many other countries. The U.S. Department of Housing and Urban Development (HUD) creates a financial mechanism that requires the submission of a Consolidated Housing Plan to support affordable housing development and other housing-related activity in a city, as a condition of receiving funding through the formula block grants. These funds are used to support the proposed affordable housing development agenda of the local jurisdiction. The plan plays a crucial role in increasing affordable housing choice and providing quality community development activities for local people, especially for low-income households. Yet little research undertakes an evaluation of plan quality for Consolidated Housing Plans. Only two studies that tackled the housing issue in plan evaluation literature were found in a thorough literature search, and the most recent one was published a decade ago. More importantly, the quality of housing plans has never been addressed. This gap raises the concern toward how local government distributes federal resources in the areas that facing the increasing risk of natural disasters like a hurricane, flooding, and sea-level rise.

Plan implementation is a critical phase realizing plan's goals and objectives. This research uses case study approach to compares and contrasts the implementation process of Consolidated Housing Plan. Two cities are chosen from the sample of more than 70 cities across the nation. This research proposes three-level analysis including city, neighborhood, and project scale. At city-level analysis, we use the method of mapping to show the distributions of population and funding. At the neighborhood-level analysis, we use location quotient index to examine the geographic location of beneficiary neighborhoods. At the project-level analysis, we use spatial analysis methodologies such as kernel density analysis and local indicators of spatial association. Together, these approaches show the location, size, and type of the funding, then, overlaying them with the distributions of different income groups. The findings highlight the spatial mismatch between population distribution and funding allocation. They

also identify some serious issues regarding the way public dollar was spent at local level when comparing between two case studies. The study raises some significant concerns toward the implementation of a housing plan and proposes some strategies to increase the efficiency of the planning process.

### TRACKING PLANNING DECISION MAKING PROCESS USING ELECTED OFFICIALS' SOCIAL MEDIA COMMUNICATION

Abstract ID: 368

Individual Paper Submission

HAN, Albert [University of Texas at San Antonio] [albert.han@utsa.edu](mailto:albert.han@utsa.edu), presenting author  
LAURIAN, Lucie [University of Iowa] [lucie-laurian@uiowa.edu](mailto:lucie-laurian@uiowa.edu), co-author

Our work focuses on how elected officials' preferences and priorities impact planning decisions and actions. At all levels of government, the formulation, adoption, and implementation of public plans and policies are inherently political processes. Impetus for change may be spearheaded by elected officials, bureaucrats, or civil society entities, and plans and policies may be prepared by planners with public input. Yet, in the end, plans and policies adoption and implementation, which typically require matching resource allocations, are decisions made by elected officials. Understanding elected officials' priorities and commitments to distinct planning issues is thus essential to understanding implementation, and therefore also to promoting implementation capacity in all planning domains, from densification, housing affordability, to bus and light rail transit (Grant, 2009; Laurian et al., 2004, 2010)

At the local level, the priorities of elected officials cannot be deduced from national partisan platforms. In previous work, we assessed those priorities by examining the campaign social media posts of candidates for office in the 2017 Calgary municipal elections vis-à-vis plan contents (using big data analytics tools). This proved to be a reliable methodology to assess candidates and elected officials priorities, for instance on topic such as taxes, downtown development, infrastructure, and specific transit lines (Han et al., 2020).

Three years have passed since those elections, and councilors and mayor are starting to prepare for the next electoral cycle. Thus, it is time to assess whether those commitments have translated into plan and policy adoption, budget allocations and actual project implementation. The planning priorities of the mayor and city councilors may have changed since the 2017 elections, as councilpeople deliberates, engage in mutual learning, and respond to public pressures, financial constraints, and regulatory mandates.

We hypothesize that elected officials' planning priorities expressed during the electoral campaign and since on social media are significant predictors of actual decisions made and implementation for key planning goals and objectives. We test this hypothesis by tracking elected officials priorities, as they evolve over time, and contrast them with votes as found in council meeting minutes to examine whether priorities translate into actual decision-making (e.g., votes on budget allocations). We manually examined the minutes of all 37 city council meetings since the election, and employed Semantic Network Analysis and Sentiment Analysis to analyze 25,624 Tweets collected from the 14 elected officials.

We are exploring the relationship between elected officials' planning priorities, as identified through their social media posts, and implementation outcomes (or lack thereof). This will be an important tool to help planners, researchers and lay residents identify the cause of the progress in planning, or of implementation gaps.

## RESEARCH ON THE PATTERN EVOLUTION AND DEVELOPMENT TREND OF DEVELOPMENT ZONES IN CHINA

Abstract ID: 399

Individual Paper Submission

WANG, Qixuan [College of Architecture and Urban Planning, Tongji University] wxq3@qq.com, presenting author  
REN, Jie [College of Architecture and Urban Planning, Tongji University] renjie\_cathy@163.com, co-author

As one of the important system designs of reform and opening up, China's practice of development zones has experienced nearly 40 years of development process since 1984. Development zones is an important institutional space for China's reform and opening up, and all kinds of development zones at all levels have become an important platform for opening up and innovative development now. The existing research about the spatial pattern of development zones often focuses on one specific type. However, there are already several different development zones at the national level and they have formed a clear system. So, it is crucial to understanding the roles of various types of national development zones which are important spatial development platforms in China. Through analyzing the evolution of the distribution of the five main national development zones, and exploring the interaction between the development zones and the national opening up policy, it is found that: (1) China's development zones are driven by national macro policies, and each type of development zones have functional and spatial complementation in the process of opening up; (2) The evolution of development zones' spatial distribution reflects the focus-change of the national opening-up policy: from the eastern coastal areas to the central and western regions; (3) At present, there are some problems in China's development zones, such as function homogeneity, transformation dilemma, and high cost of policy implementation. We should give reasonable policies according to the types and development stages of development zones, in order to promote the experimental and innovative functions of different development zones. Based on the analysis, this paper summarizes the core institutional problems existing in the current practice of China's development zones, including the deviation from the original intention, the lack of legal system, and the generalization of the institution, and then puts forward some suggestions for the future development zone governance, such as re-shaping the functions, improving the rules and regulations, and reconstructing the system of innovation region.

BARRY, Janice [University of Waterloo] janice.barry@uwaterloo.ca, presenting author  
 NOVACEVSKI, Matt [University of Melbourne] m.novacevski@unimelb.edu.au, co-author  
 BOYCO, Morgan [University of Waterloo] mwboyco@uwaterloo.ca, co-author  
 LEGACY, Crystal [University of Melbourne] crystal.legacy@unimelb.edu.au, co-author

Community engagement is a key component of urban planning in Western liberal democracies. Its role in planning is strengthened by efforts to create baselines and mandates for participatory practice through formal institutional and policy structures. However, existing research has revealed that an overly formal and institutionalized model can undermine the transformative potential of participation (Beebeejaun & Vanderhoven, 2010). A standardized model risks avoiding broader structural problems that produce inequality, concealing existing power differences, and focusing on the production of outcomes to serve the interests of government and project proponents rather than citizens (Brownill & Inch, 2019; Legacy, 2017; Hillier, 2003). In this paper, we examine the role of the International Association of Public Participation (IAP2) in this standardization process. IAP2 was created in 1990, with the initial goal to create a forum through which public participation practitioners could share and learn from best practices, ideas, and stories. It has since grown into an international federation with the regional bodies in the United States, Canada and Australasia being particularly active in the promotion of IAP2’s Spectrum of Participation, Code of Ethics, Core Values, and multiple training programs. These training programs include the flagship 5-day “Foundations in Public Participation” course, which covers both the planning of participatory processes and public participation techniques.

In this paper, we use the tools of critical discourse analysis to examine how IAP2 is intersecting with local government planning practices in Ontario, Canada and Victoria, Australia. We find that IAP2 is having a significant influence on how public participation is conceived and enacted in cities and towns across these two provinces/states. In Victoria, the influence is emerging at the legislative and policy scale, with the IAP2 Spectrum and Core Values having a demonstrable impact on the creation of new guidelines and standards for deliberative processes. Here, IAP2 ideals have become synonymous with the idea of a ‘best practice’, with references to IAP2 materials serving to legitimize and offer a kind of ‘gold seal’ for a wide range of government interventions. In Ontario, the scale of IAP2’s influence on municipal planning practices is slightly different. There, IAP2’s particular approach to designing and planning public participation has had uptake with many municipalities creating government-wide community engagement strategies that are intended to guide all engagements with the public, not just those that occur within the context of planning. Several municipalities have also taken the additional step to promote, if not require, IAP2 training amongst their staff, as well as consultants responding to Requests for Proposals. In this paper, we critically examine the widespread uptake of IAP2 principles and practices. The focus of our work is to consider how IAP2 seeks to improve and create guidelines for participatory practice and to critically assess the potential consequences of such standardization efforts for planning. Guiding this investigation is the

question, does the widespread uptake of IAP2 approaches “raise the floor” for participatory planning practice, while also “lowering the ceiling”?

Public schools are more than educational institutions; they are public assets that have long proven essential parts of healthy, sustainable, and complete communities (Collins, Allman & Irwin, 2019; Vincent, 2006; Gibbons & Machin, 2008). Yet, public elementary schools are being permanently closed across Canada, and particularly within urban and rural settings in Ontario. For over a decade, closure decisions by Ontario's public-school boards have been directed by the Ministry of Education's (MoE) pupil accommodation review model. This model is driven by guidelines that have been criticized for prioritizing economic efficiency, while ignoring the broader consequences that school closures have for the liveability of the communities they serve (Collins et al., 2019; Witten et al., 2001). In turn, the model has created toxic atmospheres of tension, conflict, and resentment within many affected communities, at times leading to a sense of powerlessness among residents and demonization of school board staff (Fredua-Kwarteng, 2005). A more holistic understanding of the impacts of school closure processes and outcomes are vital to a responsible planning practice in both urban and rural contexts.

In this paper, we unpack the community impacts of school closures through the lens of both process and outcome. We conducted 20 in-depth interviews with residents in four Canadian communities where school closures had occurred. The interviews explored residents' involvement in the school closure process, their experience of the mandated engagement process, and their perceptions of whether their engagement was valued by decision-makers. In terms of outcome, residents were asked how the school closure influenced their wellbeing, work-life balance, travel behaviours social connections, and feelings about their community including changes to the long-term liveability of their community. The interviews were conducted remotely via phone or Zoom due to the ongoing pandemic, and residents were sampled from a household survey which was distributed to the community. The results of the interviews were transcribed verbatim and thematically analyzed.

The results indicated that, overwhelmingly, residents did not feel that they had the chance to meaningfully participate in the school closure process, and that their voice was not heard throughout the engagement process. Many felt manipulated and betrayed by the mandated engagement process with consequences that extended beyond future engagement with the MoE. The local knowledge of the residents further shed light on the

shortcomings of current governance practices involving school closures. Further, the findings illuminated the lasting impacts of the school closure decision on the communities with outcomes related to physical, social, political and economic aspects of the local neighborhoods. Of note, even residents who were not directly involved with the school (either with children who attended the school, or through attending community events with the school) felt the sense of community in the area had decreased since the closure.

#### **THROUGH THICK AND THIN: UNDERSTANDING DENSITY NARRATIVES KEYWORDS: ZONING REGULATION, AFFORDABLE HOUSING, DENSITY, POLITICAL ECONOMY OF HOUSING, LAND-USE**

Abstract ID: 765

Individual Paper Submission

JAIN, Amrita [University of California Irvine] avjain@uci.edu, presenting author

Shortage of affordable housing in US cities is attributed to a general lack of adequate housing supply. This supply side constraint has led policy makers, planners and a host of other actors to promote changes in land use regulations that allow for higher density housing. Scholarship on up-zoning and easing density restrictions link it to increase in housing affordability and reduction in racial and income segregation (Lens & Monkkonen, 2016). On the other hand, critiques of up-zoning advice against assuming up-zoning as a panacea. They argue that dense neighborhoods do not necessarily result in affordability (Rodríguez-Pose, A., & Storper, M. 2020). However, even though a rich scholarship examines and debates the effect of density on affordability, little is known about how narratives around density are framed and how that impacts the way urban space is imagined and used.

This paper addresses this gap by conducting a systematic analysis of over 3000 public comments made to the City of Minneapolis as it became the first city in the country to ease single family zoning restrictions in favor of higher density housing. These comments were made across three phases of the plan's public engagement process which began in 2017 and continued till 2019, spanning all 83 of the city's residential neighborhoods. Through this database of public comments, this paper puts together a phenomenology of urban density that focuses on how "language and aesthetics" of density shape the contestation around space in the contemporary urban (Rao 2007, Perez 2020).

In 2018, amidst a heavily contentious public opinion, Minneapolis City Council approved a new comprehensive plan that eliminated single family zoning restriction in the city. Prior to the plan, the zoning ordinance allowed single family homes on more than 70% of the land zoned for residential purposes. This restrictive zoning, the city argued, led to a historic low vacancy rate in a growing city that caused excessive pressure on both renters and homeowners. Minneapolis 2040 plan was touted to be "bold, big and brilliant" (New York Times 2019). Amongst a plethora of other cities that were trying and failing to ease density restrictions, Minneapolis had set the stage for a big change.

In Minneapolis, as the plan was underway, two citizen-led groups, one in support and one in opposition of the plan began mobilization. ‘Neighbors for More Neighbors’ a pro-density group outlined how changes in density can help “dismantle institutional racism”(Medium, 2017); whereas ‘Minneapolis for Everyone’, an anti-density change group argued that density changes will “benefit developers at the cost of neighborhoods” (Minneapolisforeveryone2019). The narratives employed by these two groups demonstrate how density is differently experienced, perceived, negotiated, and contested.

Fusing two methods, political claims analysis (Koopmans and Statham 1999) and political discourse analysis (Gamson 1992), this paper conducts an in-depth analysis of an archive of public feedback. The public feedback database includes demands, criticisms and proposals obtained from open house community events, online comments on websites and through emails. The aim is to capture the form, range and effect of different claims made and narratives employed by residents in response to Minneapolis 2040 plan. This approach captures how residents challenge and put forth new interpretations and frames of density that redefine cultural and political norms of what cities should be.

While US cities are undergoing new geographies of densification, it is important to understand the narratives associated with these changing geographies. Although density comes across as a technical tool to enhance productive space, it is also responsible for engineering new relationships between material and people (Perez 2020). This work contributes in understanding the contradictions of density as an urban epistemology in the context of displacement and housing crisis.

#### A COMPARATIVE ANALYSIS ON NOISE POLICIES IN THE UNITED STATES AND EUROPEAN UNION

Abstract ID: 910

Individual Paper Submission

LIANG, Hanbing [University of Wisconsin - Madison] hliang8@wisc.edu, presenting author

Environmental noise has long been recognized as detrimental to human health. In 2011, the World Health Organization estimated that at least one million lives were lost due to the disease burden from traffic noise pollution in Western Europe alone. Excessive or abrupt noise can lead to cardiovascular disease, sleep disturbance, annoyance, low productivity, cognitive impairment in children and hearing loss (World Health Organization, 2018). Studies from the U.S. also indicated that 9 of 10 adults in New York City are exposed to noise levels exceeding the recommended 70 dBA limit established by EPA. In the U.S., it was estimated about 72.6 million urban dwellers were exposed to excessive noise in 2010, an increase from the 66 million people nationally (both urban and rural) in 1981 (Hammer et al., 2014). While air, water and other sources of pollution are decreasing in the U.S., noise remains one of the only environmental pollutants increasing in the U.S.. In Europe, research and policy innovations on sound environments have continued to grow in recent decades. The WHO European Office has led several studies of noise regulation and control. Several EU countries, including the UK, are frequently assessing and updating guidelines for

community and environmental noise (Kang, 2007).

This study critically reviews the literature on noise control policies in the U.S. and Europe. It begins with a comparative analysis of the withdrawal of the Federal Government's role in noise regulations in the U.S. and the expansion of rigorous research and policy innovations focused on noise control in Europe. Efforts to reduce noise or prevent pollution often require intensive planning among stakeholders. Compatible land use planning, sound level limits, spatial and temporal restrictions are commonly implemented regulations. Strategies such as soundscape management is a recently emerged approach that can be integrated into the planning process (Adams et al., 2006). Findings from this study suggest that there is much to learn from planning practices in Europe, including approaches that can be adopted and modified for future noise policy in the U.S..

### **A NEW, ROUGHER ERA OF CONFLICT? EXPANDING THE PLANNER'S TOOLKIT FOR COLLABORATIVE PLANNING IN THE FACE OF GROWING POLARIZATION, FRAGMENTATION AND INEQUALITY**

Abstract ID: 931

Individual Paper Submission

ZELLNER, Moira [Northeastern University] [m.zellner@northeastern.edu](mailto:m.zellner@northeastern.edu), presenting author

MILZ, Dan [University of Hawaii] [dmilz@hawaii.edu](mailto:dmilz@hawaii.edu), co-author

CAMPBELL, Scott [University of Michigan] [sdcamp@umich.edu](mailto:sdcamp@umich.edu), co-author

Recent research confirms our professional experiences and personal perceptions: the US has entered a new era of political sectarianism (Finkel et al 2020). Our current era is marked by contesting ideologies and an intense desire to dominate or 'own' the opposition. This dynamic demands that we draw distinct tribal boundaries, avoid interacting with our adversaries, and justify our positions and conquests as morally righteous. Every dispute, no matter how trivial, becomes an opportunity to 'know thy enemy,' reaffirm your distaste for them, and bolster your ironclad belief that your adversaries are not just wrong but evil. As a result, these forces are now far more pervasive, bleeding deeper into our civic and personal lives. One might have hoped that the unruly, dissonant national political culture would not trickle down to the municipal level, but alas there has been no firewall insulating local civic culture. Assumptions that planners once could make, walking into a public meeting, about a base level of shared values and community knowledge, mutual respect, and a willingness to listen and compromise to resolve community disputes, can no longer be taken for granted.

This paper is motivated by an ongoing effort to understand the role planners may play in deeply rooted conflicts at a time dominated by polarization. In a now receding era of American urban life (an era we might view with nostalgia

as one of resurgent urban vitality and peace sandwiched between the Urban Crisis and the Trump era), planners often faced only a subset of the larger constellation of social conflicts. Conflict, for planners, was relatively circumscribed by matters that: impacted property values, affected the health and safety of community members, and concerned the allocation of municipal funds. To address these conflicts, planners folded alternative dispute resolution techniques into their practice (Susskind and Ozawa 1984). Through role playing simulations and other pedagogical innovations, planners learned how to engage adversaries to uncover the interests and values that underlie particular positions (Innes and Booher 1999). Focusing on motivations instead of desires helped many planners work through conflict to make plans that incorporated mutually agreeable trade offs and compromises. These techniques emerged alongside the communicative and argumentative turns in planning and as such were fitted to the models of disputes with which planners were most familiar. Our unsettling concern is that these existing models of conflict have not kept up with the times, and the tools for resolving them are no longer up to the task.

Therefore, we argue that it is high time to reconsider our dispute resolution tactics in planning contexts, and to do so, we explore three alternative strategies: (1) Double down on our commitment to the practices of the past. With more experience in highly contested situations, planners can fine tune their skills to more adroitly handle future conflict. (2) Identify and expand those specific dispute resolution tactics that still work in our polarized climate. For example, joint fact finding shows promise for addressing disputes over facts and may provide an antidote to the spread of misinformation (Matsuura and Schenk 2016). (3) Jettison the old models and tools of conflict resolution and develop radical new approaches suited to the brave new post-truth world. For instance, complexity-based models could decode the nature of conflict and provide communities with new resolution tools (BenDor and Scheffran 2018). To test these three scenarios, we examine the changing characteristics of contemporary planning conflicts and planner's responses. We conclude with advice about which pathway might be preferable and outline some expectations for the ways in which planners will interface with conflict in the future.

#### ***CITIZEN PLACE: INVESTIGATING PARTICIPATIVE PLANNING AND POLICYMAKING***

Abstract ID: 979

Individual Paper Submission

MARPILLERO-COLOMINA, Andrea [The New School] [marpa528@newschool.edu](mailto:marpa528@newschool.edu), presenting author

Shared place is often an unavoidable conflict point between various political, cultural, and economic agendas. For public space to function well, stakeholders must be meaningfully and consistently engaged, rather than just called upon – or worse, demanding to be heard – only after decisions affecting their lives have been implemented by

planners and policymakers. When people are involved from the start, resilience and collaboration is greatly enhanced. If stakeholders are excluded, uncertainty about changes often creates conflict and foments lasting distrust (Gardner, et. al., 2018). The differing ways communities receive a new public good depends on “the state of the system of goods offered” (Bourdieu, 1984). Not only is the good itself important; key also is context: “Urban process implies the creation of a material physical infrastructure for production, circulation, exchange and consumption” (Harvey, 1978: 113).

Using Madrid and New York as case studies; this research explores how cities can effectively implement mechanisms for citizen participation. In 2015, Madrid’s government launched a website, *Decide Madrid* ([decide.madrid.es](http://decide.madrid.es)), that provides a single online location for public decision-making; including budgeting, citizen-led petitions, and giving feedback on proposed legislation. The city’s Office of Civic Participation built the software, *and* turned the code into an open source project called Consul that anyone can download. In 2018, it won a U.N. Public Service Award (in the category, “Making institutions inclusive and ensuring participation in decision-making”). Today, over 400,000 of three million Madrileños use the platform; anyone over sixteen years old who is a registered resident can participate. About \$110 million of projects are funded annually, making it one of the world’s largest participative processes.

Over a dozen cities in Spain, and governments in Buenos Aires, Bogota, and Lima, use Madrid’s Consul software, as does New York’s Participatory Budgeting Project, the largest civic engagement project in the U.S. In New York, the process is open to all residents, aged 11 and older, who live in one of twenty-six participating city council districts. In 2018, New York (with about thrice Madrid’s population) funded \$36.6 million of projects; 99,250 New Yorkers participated, developing hundreds of spending proposals and funding 124 community improvement projects for schools, parks, libraries, public housing, streets, and other public spaces.

Broadly, the research is guided by this primary question: How do multilateral participative mechanisms facilitate citizen engagement that produces effective and equitable planning and policymaking? To investigate, I deploy a three-fold qualitative methodology:

1. Stakeholder interviews: Asking questions that examine how citizens interpret their roles in participative processes and in their community is crucial for this research.
2. Participant observation: Observing and analyzing public (in-person and online) forums to better comprehend how these mechanisms function and to explore power dynamics between stakeholders; “by immersing themselves in the setting, the researcher is able to hear, see, and begin to experience reality as participants do” (Marshall & Rossman, 2011: 140).
3. Reviewing media coverage: Identifying key historical, social, political, and cultural issues at play. Mass media helps set the policy agenda by creating new analytical frames and introducing values or emotions that influence how people interpret and respond to policymaking processes (Stone, 2012).

The research demonstrates how multilateral public engagement makes cities better places to live. Much remains to be learned about implementing effective participative strategies; planning driven solely by political capital can never be effective, and notions of place are constantly changing and being reimagined. While outcomes will never be perfect, cities must create new processes that leverage stakeholders’ capacities to generate ideas.

## **FROM COMMUNITY CREATED TO TOP-DOWN: PARTICIPATING, RESEARCHING, AND GOVERNING FOR RACIAL EQUITY IN HOMELESSNESS**

Abstract ID: 981

Individual Paper Submission

MERCURIO, Sarah [Portland State University] mercur2@pdx.edu, presenting author

ZAPATA, Marisa [Portland State University] mazapata@pdx.edu, primary author

Participatory democracy, collaborative governance, and community based research are frequent phrases in planning scholarship and practice. Yet, what it looks like to engage in these practices while focusing on racial equity remains an open question in practice. Our work examines the question about what it means for homelessness research and evaluation practices to be centered on or rooted in racial equity and people who have or are experiencing homelessness.

A Portland Oregon health nonprofit created a flexible fund designed to help support people experiencing homelessness who are best served by permanent supportive housing. The nonprofit sought our expertise to work with people of color who had experienced homelessness and housing insecurity and/or worked with homelessness service providers, in health care, or as researchers. We reviewed relevant literature and developed a research framework by integrating several participatory evaluation and research examples of collaborative planning and community based research projects. We then interviewed 25 people in Portland, Oregon who were people of color, people who had or were experiencing homelessness, people working at houseless service providers in research areas or working at culturally specific providers, community based researchers of color, and additional health and homelessness systems research experts as needed.

Based on what we heard and read, we compiled definitions, questions, and examples about how to think about research, governance, and evaluation that considers, and ideally acts upon, the needs, experiences, and perspectives of people of color who have experienced homelessness. We start by identifying key core values that a historically white institutions (Health Share in this institution) must internally assess and externally explicate to engage ethically with people of color and people who have experienced homelessness. The institution must be able to understand the ways in which they can and will be transparent about decision making. They must state how and to what degree they are going to share power.

We then discuss how a white dominant nonprofit should engage people of color and people who have experienced homelessness to develop a community driven and racially equitable participatory process to develop a research and evaluation framework. As part of this we also discuss how the long-term governance of this framework would be created. Lastly we synthesize these recommendations into a spectrum of activities to help organizations identify whether their work is top-down, muddled consensus, community informed, community driven, or if they are supporting community centered work.

Overall this research helps planners, policy-makers, service providers, and researchers identify how their participatory processes and governance structures can better work towards racial equity, with people of color, and

with people experiencing homelessness.

### OVERCOMING EXCLUSIVITY IN THE SINGLE-FAMILY ZONE: THE OREGON APPROACH

Abstract ID: 1079

Individual Paper Submission

SULLIVAN, Edward [Portland State University] [esulliva@gmail.com](mailto:esulliva@gmail.com), presenting author

From the 1920s in the United States, the single-family zone (almost always limiting residential uses to detached dwellings) has been the norm. The characterization of apartment dwellings as a “parasite” by the Supreme Court in *Euclid v. Ambler* to justify segregation among residential uses and has since been used as a reason for preserving real estate values and “community character.” In the absence of a comprehensive plan obligation and with the complete delegation of land use regulatory power to local governments under the Standard State Zoning Enabling Act or similar legislation, courts were effectively limited to constitutional grounds to review land use regulations to assure they were not “arbitrary and capricious.” The rise of the use of the Takings Clause provided some relief from governmental overreach regarding individual properties, but did not affect the allocation of lands for residential uses under *Euclid*’s “fairly debatable” standard.

The broad acceptance of zoning in the years following *Euclid*, along with the pattern of complete delegation of land use regulatory power to municipalities and counties, has led to a national pattern of exclusion along racial and class lines, particularly in suburban areas surrounding larger cities. While there have been notable and somewhat effective efforts to respond to exclusionary zoning patterns through an interpretation of the state constitution (New Jersey), or through regional fair share requirements gleaned from state statutory law (New York, Pennsylvania, and New Hampshire), local governments resist change from a system that reenforces segregation based on the use of single-family zones that do not allow other housing types outright. The use of a “fairly debatable” standard supports this pattern and William Fischel’s Homevoter Hypothesis provides evidence of local political resistance to change in the exclusivity of the single family zone.

Oregon has dealt with housing as a state policy objective for a half-century. The state has a planning agency, the Land Conservation and Development Commission (LCDC), which formulates and assures compliance with state land use policies (called “goals”) through a process of “acknowledgment” that certifies those goals are incorporated into required comprehensive plans. Those plans bind land use regulations and actions of public and private persons. Since 1974, Oregon has had a housing goal (To provide for the housing needs of citizens of the state) that requires that buildable land for residential use be inventoried and that local governments encourage meeting housing needs for homeowners and renters. Binding administrative rules detail these obligations and the primacy of the goal and its implementing rules is assured.

Due to trends that make the state a desirable place to live, the decreasing ability of families to afford single-family housing, and the rise of homelessness, the Oregon legislature has authorized more intrusive legislation that affects local zoning. In 2019, the legislature passed HB 2001, which ends the monopoly of the single-family home in single-family zones, providing that for cities with 10,000 or more population, a duplex will be allowed as of right, and for cities of over 25,000, “middle housing” (duplexes, triplexes, quadplexes, townhouses, and cottage clusters) must be allowed in some areas as of right. At the end of 2020, LCDC adopted administrative rules to carry out this legislation.

This paper will discuss the antecedents to the 2019 legislation, other legislation that provides for a single methodology to deal with existing housing and projected needs, and the detailed rules under which the legislation is implemented. In addition to the legal analysis, the political drama that accompanied that legislation will be examined, all as an example of how beneficial change in housing policy may be realized.

## OPPORTUNITIES AND CHALLENGES OF PUBLIC PARTICIPATION IN POST-DISASTER RECOVERY PLANNING: LESSONS FROM GALVESTON, TX

Abstract ID: 1118

Individual Paper Submission

HAMIDEH, Sara [Stony Brook University] sara.hamideh@stonybrook.edu, presenting author

While public participation can improve recovery planning, post-disaster environments pose unique challenges and opportunities that can enhance or undermine participation depending on the recovery policies and features of the planning process. This paper presents findings of archival research and in-depth interviews in a qualitative case study of Galveston (Texas) following Hurricane Ike to examine the challenges and successes of participatory recovery planning in Galveston and the factors that shape these outcomes. Seizing heightened participation momentum after a disaster by engaging residents in a transparent process provides optimism and an opportunity for recovery champions to gain support for their ideas. However, planning while unprepared, homogeneity of participants, and skipping deliberation may limit voices of the marginalized residents in decisions and undermine implementation of the proposals. Under-represented socially vulnerable groups should be included in all stages of recovery planning through deliberate outreach strategies tailored to their circumstances. Supported by professional planners and technical experts, involved stakeholders should engage in deliberation rather than mere input solicitation to increase the effectiveness of post-disaster participatory planning.

# Track 13 – Planning Theory

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### **13.15 PRE-ORGANIZED SESSION - EMOTIONS IN POST-RATIONAL PLANNING: TRAUMA, EMPATHY, AND HEALING**

Pre-Organized Session 15 - Summary

Session Includes 463, 464, 465, 914

HE, Qian [The University of Texas at Arlington] qian.he@mavs.uta.edu, organizer

The Black Lives Matter and Stop AAPI Hate protests spotlighted the power of grief, anger, and love to remake cities, from public space to public policy. As urban planning evolves from the rational and technocratic paradigm towards a more post-rationalist era, there is an increasing awareness that recognizes the importance of emotions in planning (Ferreira, 2013; Hoch, 2006; Lyles and Swearingen-White, 2019; Tate, 2021). Planners are called for urgent action to construct an environment that is justice and supportive, and it is necessary for urban planners to work through emotions in the process of building justice and healing their communities. Emotion-responsive teaching promotes the awareness of emotions in learning, cultivates a safe and supportive classroom, and facilitates growth and healing (Misaka & Giffin, 2021). Building upon the “Emotions in Planning” roundtables at the 2018 and 2019 ACSP conferences, the goal of this session is to promote scholarship around the issues of equity, inclusion, legitimacy, language, privilege, and power undergird, which yield a broader call to examine diverse perspectives and approaches to “emotions in planning”.

Objectives:

- Understand the importance of addressing emotions in planning
- Learn how to work with emotions in planning practice

### **I SECOND THAT EMOTION: EXPERIENCES USING ENGAGED PEDAGOGIES AND EMOTIONAL INTELLIGENCE IN PLANNING EDUCATION**

Abstract ID: 463

Abstract within Pre-Organized Session 15

FLORES, Nina [California State University Long Beach] Nina.Flores@csulb.edu, presenting author

Imagine a job announcement from agency or organization that recognizes the power of emotion, knowing that people affected by some of the most urgent issues facing cities deserve planners who have both technical skills and high levels of emotional awareness. Required qualifications:

Planners whose training includes a focus on understanding the role of emotion in planning;  
Demonstrated potential for understanding the ways in which expressions of emotion are interpreted and distorted through multiple systems of oppression;  
Demonstrated commitment to ongoing development of empathy;  
Demonstrated experience with cultural humility;  
Demonstrated potential for continuing self-reflection and growth. Planning scholars have called for compassionate planning (Lyles, White & Lavelle, 2018), sought to explain why planners resist emotion (Baum, 2015), examined ideas about loving attachment (Porter, et al, 2012), and championed cultural humility (Sweet, 2018). In line with these perspectives, there are clear opportunities for students to begin recognizing the power of emotion during their planning education. When training future planners, in what ways can we as instructors open our classes as spaces for acknowledging, validating, honoring, and encouraging emotional engagement? How can we build emotional education into the core values of planning curriculum?

My teaching is heavily influenced by bell hooks, who in her writing about engaged pedagogies describes instructors as responsible for assessing the emotional intelligence in the classroom (hooks, 2010). In this paper I detail the experience of tailoring my pedagogical strategies in a Critical Race Studies course to support students in untangling feelings from analysis, identifying complex emotions and using them to deepen critical lenses, and intentionally creating space for exploring the role of emotion in learning, class facilitation, and in planning as a field.

#### **LOCALISM IS DETERMINATIVE AND THE EMOTIVE BACKLASH TO REOPENING CALIFORNIA**

Abstract ID: 464

Abstract within Pre-Organized Session 15

FRICK, Karen [University of California Berkeley] kfrick@berkeley.edu, presenting author

California was one of the first states in the nation to institute statewide “shelter in place” public health orders in March 2020 in response to the COVID-19 pandemic. This bold declaration in the subsequent months evolved into the diluted “Localism is determinative. We put out the how, counties decide the when” from Governor Gavin Newsom. Emotive public backlash that erupted in the aftermath of state restrictions partly influenced this response. Some residents and public officials largely identifying on the political right argued the orders caused severe economic harm and government overreach that trampled individual rights and religious freedom. Militia and far right groups also participated offering to provide security to participants. Others harnessed the protests to gather signatures and increase awareness during the nascency of a then largely dismissed gubernatorial recall effort that currently has the potential for voter consideration in fall 2021.

Building from planning and related scholarship on emotions (e.g., Baum, 2015; Boudreau, Boucher, & Liguori, 2009; Trapenberg Frick, 2016) and conservative views (Sager, 2020; Trapenberg Frick, 2021) and drawing from field observation of Sacramento and San Francisco protests combined with online communications and news sources review, I first examine key opposition actors and their emotive narratives and organizing strategies, online and in person. Most striking were protests of varying sizes in public spaces including the state capitol of Sacramento where people rejected social distancing protections purposely interacting at close distances and shunning facial masks, which some called “muzzles”. I then consider the potential galvanizing effect of these protests and activities including increased skepticism of government, public process and science.

## EMOTION AND PLANNING: ANXIETY AND FEAR

Abstract ID: 465

Abstract within Pre-Organized Session 15

HILL, Margo [Eastern Washington University] mhill86@ewu.edu, presenting author

TATE, Laura [Laura Tate Associates/ AHLT Holdings] laura@lauratate.ca, primary author

LYLES, Ward [University of Kansas] wardlyles@ku.edu, co-author

CARVALHO, Nadia [City of Vancouver] nadia.carvalho@vancouver.ca, co-author

This review article builds on an emerging array of planning literature examining emotion as crucial planning knowledge (Baum, 2015; Ferreira, 2013; Hoch, 2006; Lyles and White, 2019; Rodriguez et al, 2019; Tate, 2021; and Trapenberg-Frick, 2016). Emotional knowledge is important in its own right. In addition, improved emotional understanding may further help planners respond to a parallel buildup of events, all sparking significant fear and anxiety, building over the last decade and more.

Globally, such events have included simmering fears about consequences of, and lifestyle changes associated with, climate change. They have been exacerbated by the recent pandemic. Moreover, in both the US and Canada, fear-related events such as protests against police shootings have triggered (and produced backlash to) social justice movements for Black Americans and Black Canadians, and others experiencing systemic oppression. Anxiety and fear about basic survival issues may have similarly played a role in efforts to confront colonialism’s legacy among Indigenous peoples, including Native Americans and Canadian First Nations. As American and Canadian planners with Indigenous, South Asian, and European backgrounds advocating for social justice, we believe our profession must now deepen its understanding of anxiety and its influences on decision making. This could ultimately help us both in advising elected officials and in advising activists or taking on activist roles in planning.

The article conducts a thematic and interdisciplinary literature review on the potential impact of anxiety / fear in supporting or complicating decision-making and activism. Such decisions can include those made by decision-makers, people in advocacy roles, and professional planners/ bureaucrats themselves.

In focusing on anxiety, we appreciate that it can occur at a range of scales (e.g. from the individual to the societal) while also co-existing with wellness and protective characteristics (building from Manderscheid et al, 2010). In short, even when a person or society experiences anxiety, this does not mean they are automatically unwell. Wellness encompasses positive life experiences along with “the capacity to manage one’s feelings and related behaviours, including the realistic assessment of one’s limitations, development of autonomy, and ability to cope effectively...” (Manderscheid et al:1). Thus, anxiety may create chronic challenges; yet those individuals and societies confronting it can also process, and cope with, it effectively while also enjoying a robust quality of life and perhaps even growing from the experience. We describe this as a wellness-informed response to anxiety.

Direct practice-based payoffs emerge from embracing planning's emotional side. One example arises through the public engagement process (Lyles & Swearingen White, 2019; see also Trapenberg-Frick, 2016). During engagement, various emotions directly impact dialogue activity, emerging among community members and among professional planners themselves. In response, Lyles and Swearingen White urge planners to more consciously develop and enhance their emotional literacy. They have traced the broad lines of a conceptual model for planners to use. Their deeply empathic model has three dimensions: planning leadership; cultural humility; and cultivating compassion. In all three dimensions, planners and the communities they serve benefit when planners can unpack how specific types of emotions impact their own perceptions and behaviours as well as those of others with whom they engage.

A second planning benefit from more emotional awareness supports the function of advising, or conveying knowledge to decision makers, to inform choices about future actions (Tate, 2021). Many emotions are impactful in this work. Yet in particular, planning professionals may not consistently or sufficiently acknowledge the decision-maker anxiety which can arise (Tate, Ch. 4). Specifically, planners may fail to acknowledge both the anxiety connected to the decision itself, and the potential anxiety arising when elected officials must learn deeply about technical information embodied in professional advice.

#### **ANGER AND PLANNING FOR ABOLITION: PRODUCTIVE EMOTIONS IN PUBLIC PARTICIPATION**

Abstract ID: 914

Abstract within Pre-Organized Session 15

KOH, Annette [California Polytechnic University - Pomona] akoh@cpp.edu, presenting author

Recently, planning scholars have borrowed from Iris Marion Young's work on difference and Chantal Mouffe's work on agonism, to point out that "irrationality" is not only inescapable in planning processes, it is also essential (Baum 2015; Inch 2014). Beaumont and Loopmans (2008, 98) assert that a "truly radical and plural democracy" requires "irrationalist position[s] sensitive to emotions and passions."

However, in practice, participatory planning and deliberative democracy operationalize a definition of "reasonableness" constructed by and aligned with existing power structures (Kohn 2000). Definitions of rationality/irrationality are raced, classed, gendered, and ableist in ways that reinscribe institutional inequalities and further marginalize those often defined as outside of the legitimate public. At the 2017 TransAlt Vision Zero conference, mobility justice advocate Tamika Butler spoke of their fury when bike activists deemed them a "concern troll" whose critique of the law enforcement aspect of Vision Zero policies was a "distraction" from meaningful safety.

Empirical research on planning's "rationalist" paradigm has detailed the ways that bureaucratic-technocratic professional discourse devalues informal or vernacular modes of expression that are deemed too emotional or illogical (Tauxe 1995). The influential International Association for Public Participation offers a training on "Strategies

for Dealing with Opposition and Outrage in Public Participation” that is designed to help practitioners manage and reduce public outrage through the entire process. The public is also expected to manage their own emotions. The city of Beaverton, Oregon, for example, provides tips on delivering effective testimony at a public hearing that includes the suggestion to read from a prepared script “to organize [your position] and reduce some of the emotion that you might feel about the topic or issue.”

The denial of emotion’s place in planning reduces equitable participation in two troubling ways: one, devalues input deemed as too emotional and thus irrational and, two, disregards historical wrongs and unaddressed traumas in favor of a presentist frame that brackets out other contextual issues (Drew 2012). Furthermore, emotions may have greater centrality and credibility within the public sphere than planners have typically assigned them (Miller 2011).

This paper focuses on the “defund the police” campaign in Los Angeles during the summer of 2020 as a case study of how emotions of anger and fear can be productively inserted into planning processes. In particular, the embodied traumas and affective impacts of over-policing and mass incarceration have ineluctably entered the policymaking sphere (Simpson, Steil & Mehta 2020). Drawing on transcripts of public hearings, local newspaper coverage, media statements, and online events hosted by abolitionist organizers, the paper uses a content analysis approach as a springboard for exploring how emotions can be legitimated within local policymaking and in participatory forums. Far from detracting from the efficacy or persuasiveness, these rhetorical expressions and embodiments of anger and fear recenter the lived impacts and moral realities of municipal budgets. Finally, by foregrounding the affective experiences of policing during the pandemic, community advocates have reframed definitions of “public safety” and “genuine safety” away from abstract platitudes.

### 13.32 PRE-ORGANIZED SESSION - THE PROGRESSIVE CITY AND REGION: AN ANTIDOTE TO CONTEMPORARY NEO-LIBERALISM?

Pre-Organized Session 32 - Summary  
Session Includes 192, 193, 194, 195

REARDON, Kenneth [University of Massachusetts, Boston] kenneth.reardon@umb.edu, organizer

This session will examine the origins, evolution, current state and future potential of what Pierre Clavel described in 1986 as The Progressive City which emerged in the late 1960s and 1970s when neighborhood residents, environmental activists, trade union officials, Civil Rights leaders and good government reformers came together to form coalitions to elect City Councilmembers and Mayors committed to improving the economic status and amplifying the political voice of non-elites in municipal policy-making. This panel will explore the impact of import

substitution, First Source Hiring, planned manufacturing districts, linkage, inclusionary zoning, industrial retention, urban land banks, rent control, cooperative economic, Living Wage and participatory budgeting policies, pioneered by Progressive Cities, on the economic stability and political influence of poor and working class families and communities in the 1980s and 1990s. After comparing and contrasting the American and European Progressive Cities, the panel will discuss the extent to which their redistributive policies have influenced regional, state and national urban planning policies.

Objectives:

- Promote a deeper understanding of the impact of neo-liberal policies in American and European cities.
- Enhance our understanding of the redistributive policies and participatory planning processes of the Progressive City.
- Encourage the evaluation of Progressive City policies and policies as an alternative the neo-liberal urban policies.

## **THE ORIGINS, EVOLUTION AND IMPACT OF THE PROGRESSIVE CITY ON CONTEMPORARY URBAN POLICY MAKING**

Abstract ID: 192

Abstract within Pre-Organized Session 32

CLAVEL, Pierre [Cornell University] pc29@umb.edu, presenting author

In the 1970s and 1980s cities like Berkeley, Madison, Hartford, Cleveland then Burlington VT, Santa Monica, Chicago and Boston elected progressive mayors and city councils. They espoused participatory government and redistributive measures tuned to counteracting inequality. Hopes rested on new policies, but also on the wholesale capture of city halls – with attendant legitimacy and resources.

Not much was heard about these cases after about 1990; and progressives were losing ground overall, as the forces of reaction mobilized in the 1970s. Conservatives launched ALEX in 1973, passed California's Proposition 13 in 1978. Union membership declined, and Republicans dominated state legislatures and governorships, increasingly through the last third of the 20th century. "Neoliberal" doctrine flourished, with proposals for deregulation, austerity, and privatization. Government was no longer the solution to social problems. Progressives resisted, but "capturing city hall" seemed a thing of the past.

This all changed in the second post-millennial decade. Neoliberalism faced new criticism. In part the remedies just weren't working. Dramatically, progressives began to take over city halls again: New York City in 2013, along with Boston, Seattle, Minneapolis, and Pittsburgh; then Newark in 2015, Jackson Mississippi in 2017 among others. There were several important books: J Phillip Thompson wrote *Double Trouble* (2006) pointing to the emergence of a new participatory style among black mayors. Steve Early described a multi-ethnic coalition in Richmond CA in *Refinery Town* (2017). Juan Gonzalez wrote *Reclaiming Gotham* (2017) that, starting with a deeply researched account of Bill de Blasio's first three years as mayor of NYC, found a basis to note that "something different has happened with the current progressive wave; its elected officials are consciously attempting to remain connected to their base of supporters in the way they govern," and rooted them generally in the previous decades of resistance to neoliberal policy that had national scope, but whose effects locally had been little reported or codified.

These events now cry out for further inquiry. How are they different – if they are – from previous attempts? One could frame them as a resurgence of post-sixties radicalism of "progressive cities in the 1970s and 1980s. Equally, the new initiatives and city hall victories got sustenance from a new political terrain. This was Gonzalez' contention.

The question now is whether and how the resistance to neoliberal "remedies" have impacted the localities – what Justice Brandeis once called the "cradle of democracy." This essay will explore this question by reviewing events leading up to the recent elections of progressive mayors: (a) what were the issues raised by the neo-liberal policies

that were tried in the decades before and after 2000, and how did progressives learn from resistance through these struggles? (b) How did coalitions form in this period – in particular, did a new force develop from ties between black and brown minorities and new urban millennials? And (c) To what extent were initial progressive mayoral victories sustained post-inauguration – e.g. in the face of challenges, re-election campaigns?

### EUROPEAN PERSPECTIVES ON THE PROGRESSIVE CITY AND OTHER MUNICIPAL REFORM APPROACHES

Abstract ID: 193

Abstract within Pre-Organized Session 32

PARKER, Simon [University of York] [simon.parker@york.ac.uk](mailto:simon.parker@york.ac.uk), presenting author

Due to a more polarised and pluralist party system as well as significant periods of authoritarian/totalitarian government during the twentieth century, the experience of 'progressive city government' in continental Europe has followed a quite different path to that of the United States. Thanks to the presence of large, and electorally competitive socialist and communist parties with broadly Marxist-Leninist affiliations or sympathies, which in turn linked municipal socialist governments to their counterparts in the trade union and cooperative movements, as well as to intellectuals in a range of relevant professions including architecture, planning, housing, regional economic development and the arts and culture, it was possible to identify vibrant and self-sustaining progressive municipal and even regional polities, which defined their counter-hegemonic position as broadly anti-capitalist (Lefebvre 1970, Marcuse 2009, Mayer 2009). At its peak in the mid-1970s when Eurocommunism appeared to be seriously challenging the social democratic consensus on the left (and with echoes sometime later in the 'new municipal left' of the British Labour Party), a significant number of major European cities - especially in southern Europe - were engaging in radical experiments in social housing and community planning as well as new forms of worker self organised and self managed industries and services (Parker 2001a, 2001b). At the same time, novel forms of grassroots democracy aimed at the decentralisation of decision-making accompanied a shift to a more horizontal form of popular politics as the various urban movements that had emerged during and after '68 became interlocutors with and even provided the personnel for progressive city hall administrations in the following decades (Castells 1983).

However, after the fall of the Berlin Wall and the collapse in support for communist and social democratic parties across Europe, the domination of national governments by neoliberal conservative parties saw a shrinking political base and diminishing budgets for the remaining progressive municipalities with few resources to fight the privatisation of public services and the capture of the planning process by developers and speculators, let alone to rebuild the social movement alliances needed to tackle racial injustice and other forms of discriminatory state violence along with environmental degradation and climate change. In this paper, I draw on my previous work on the municipal left in Europe to explain why progressives have failed to win the battle of ideas over the right to the city, but also how new alliances of progressive mayors and administrations are learning from grass-roots community organising more typical of US progressive city initiatives as a way of compensating for the leadership void created in

the wake of a compromised and degraded formal left-of-centre politics in order to re-plan a more just city.

#### **JUSTICE AT/BEYOND WORK: ECONOMIC JUSTICE MOVEMENTS AND URBAN POLICY CHANGE**

Abstract ID: 194

Abstract within Pre-Organized Session 32

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, presenting author

DOUSSARD, Marc [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, co-author

In the 2010s we witnessed a sea change in how U.S. cities engaged questions of social, economic, and racial justice. The change was overdue. Three decades of urban economic restructuring – post-Fordist deindustrialization, servitization, and financialization – had intensified class-based urban inequalities, and institutional and systemic racism (Mallach 2018). Countering the conventional wisdom that cities would be punished through capital flight if they enacted policies to promote economic justice, dozens of local governments passed – with increasing and somewhat surprising ease – progressive labor market policies that substantially raised minimum wages, and imposed numerous new regulations on private businesses to expand goals like paid time off, inclusionary hiring, and fair scheduling. Most notable is the diversity of cities and counties that passed such policies – they are not simply the tech and financial cities considered “winners” of contemporary capitalism, but also cities that have been battered and bruised by waves of economic restructuring past and present.

How did this happen? Urban scholars historically explained progressive urban governance and policy change in relation to epiphenomenal dynamics – grassroots organizing and coalition-building, and most importantly, the capture of City Hall by progressive actors (Clavel 1986; 2010). Yet the mostly disappointing track record of “progressive mayors” in achieving durable change – from Kucinich and Washington in the 1970s and 1980s to DeBlasio in the 2010s – suggests that a new analytical approach is needed, one that better specifies how power built through organizing gets deployed in the policy change process.

In *Justice at Work*, we advance two core theses about progressive policy change in cities (Doussard and Schrock 2022). First, we argue that the emergence of Economic and Racial Justice (ERJ) coalitions in cities is the critical institutional change underpinning current progressive change. ERJ coalitions represent an extension of past waves of urban organizing since the 1970s – the neighborhoods, living wage and community benefits movements – marked by an intersectional approach to organizing that centers the racialized dynamics of inequality in contemporary cities. Second, we argue that urban policy change operates through dynamics of “urban policy entrepreneurship.” This approach, adapted from Kingdon’s classic model of (federal) policy change (Kingdon 1984), focuses on the interaction of three “streams”: problems, policies, and politics. We argue that “Urban Policy Entrepreneurs” – a subset of ERJ coalitions – use public space and the intangible resources of the city to couple streams and open progressive “agenda windows,” which they populate with policy proposals incubated through networks of national-level organizations. This approach helps us to deal analytically with the structured contingency

of urban policy change, embracing agency in bounded and realistic ways.

Are these changes sufficient to usher in a new era of progressive urban governance? There is a fair basis to be skeptical. The cases of “justice at work” that we document in this book – minimum wages, targeted hiring, and fair scheduling and paid time off policies – largely operate within the context of liberal market economies, seeking to reform them incrementally but meaningful toward more distributionally-just outcomes. Yet we are most encouraged by what we call “justice beyond work” – movements to roll back institutionally-racist and classist policies that flow from the long-run scourge of urban fiscal austerity and entrepreneurialist governance. We argue that these movements build on the ERJ coalitions and successful policy-entrepreneurship tactics deployed around work-based domains. It is this movement – which holds the promise of renewed investment in public goods like education that support the capabilities of individuals, families and communities – that would truly represent transformative change in our cities and communities.

#### **THE SIMETO RIVER AGREEMENT: A CITIZENS' MOVEMENT PUSHING FOR PROGRESSIVE ADMINISTRATORS?**

Abstract ID: 195

Abstract within Pre-Organized Session 32

SAIJA, Laura [University of Catania] [laura.saija@unict.it](mailto:laura.saija@unict.it), edu, presenting author, primary author

RACITI, Antonio [University of Massachusetts Boston] [antonio.raciti@umb](mailto:antonio.raciti@umb), co-author

FERRIGNO, Medea [City of Regalbuto] [medeaferrigno@gmail.com](mailto:medeaferrigno@gmail.com), co-author

The Simeto river agreement is a “regional development plan” inspired by the values of social and inter-species solidarity that has been officially adopted by 10 cities of the Simeto river Valley, in Eastern Sicily. There are at least three reasons that makes this plan worth of mention in a session reflecting on the heritage of Clavel’s progressive city concept: 1) it is the outcome of a 10-year-long popular mobilization aimed at pushing ‘administrators’ to abandon the usual ‘extractive’ development route for embracing zero waste philosophy, climate change adaptation, organic agriculture and social inclusion; 2) it contains an innovative shared governance mechanism where mayors sit at the decision making table with the University and the Simeto Participatory Presidium, i. e. an umbrella organization encompassing more than 50 civic groups and organization from all 10 Simeto towns; 3) it is not just a plan sitting on a shelf: officially endorsed in 2015, it has generated significant outcomes on the ground in terms of financial investments, institutional learning and civic progress. Key lessons from this experience will be shared by three of the people that have been involved in the planning and the implementation process.

### **13.84 PRE-ORGANIZED SESSION - INCONVENIENT TRUTHS: THE POLITICS OF RACE, REPRESENTATION, AND REDISTRIBUTION IN 21ST CENTURY PLANNING AND PRESERVATION**

Pre-Organized Session 84 - Summary

Session Includes 469, 471, 472, 473, 704

FRIMPONG BOAMAH, Emmanuel [University at Buffalo] efrimpon@buffalo.edu, organizer

This session's panelists argue that in this historical moment, planning must face the problematic nature of equity framing and "inclusion" based on racial representation. New theoretical frames of redistribution and relationality are required cognizant of varying degrees of culturally situated complicity with oppressive modes of power. Panelists contemplate the following questions. What does government selection of intermediaries and specific discursive spaces for funding reveal about the U.S.' progress toward racial justice? Do select intermediaries reinforce assimilationist, pluralistic, or liberating inclusion models based on specific constructions of Black sense of place, Black institutions, and Black sovereignty? Session conveners are concerned with the redistribution of power and expansion of public investments in hard (land) and soft infrastructure (preservation, education), and how the hard and soft overlap or intersect. Panelists will wrestle with the ways varied constructions and proxies for racial representation complicate, contest, or reify racial capitalism and colonial relationality within the US and in other contexts.

Objectives:

- How racial capitalism manifests in planning processes
- The relationship between racial representation and "just" planning outcomes
- Equity planning's shortcomings as a framework

### **INTERMEDIARY INSTITUTIONAL REGIMES AND STRATIFIED INTERGENERATIONAL LAND DISPOSSESSIONS**

Abstract ID: 469

Abstract within Pre-Organized Session 84

FRIMPONG BOAMAH, Emmanuel [University at Buffalo] efrimpon@buffalo.edu, presenting author

ROBERTS, Andrea [Texas A&M University, College Station] aroberts318@tamu.edu, co-author

The land question unveils planning's complicity in the material and immaterial forms of dispossessions in cities. Some observe that the birth of American city planning is a significant marker of when the land interests of the rentier class converged with the governing apparatus of the neoliberal settler colonial state, allowing for new forms of land dispossessions through financialized, oppressive, and exploitative state-capital institutional regimes (Sandercock, 1990; Foglesong, 1986). Several theoretical constructs, such as the growth machine (Molotch, 1976) and urban regime (Stone, 1989) theories, offer insight into how various configurations of state-capital regimes drive and are driven by the land-power-wealth nexus at multi-scales. This paper contributes to our understanding of this nexus by looking at a specific form of state-capital regime—intermediary institutional regimes—and their relevance

in unpacking the land question in planning theory and practice. To pursue this, we draw ideas from stratification economics, which explains how historically contingent structural processes shape the identity formation of dominant and subordinate groups in ways that lead to inter-group differences including forms of material dispossessions (Darity Jr, 2008; Darity Jr et al., 2015). We argue and view stratified intergenerational land dispossessions as the temporal and relational modes of racial land dispossessions through and in sustenance of intermediary institutional regimes. These regimes constitute an actor-network of discursive, planning, legal and extra-legal regimes that (un)map and (in)visibilize racialized spaces and reify racial capitalism through the (re)distribution of land, power, and wealth away from African Americans and other communities of color. We advance three conceptual arguments, interlaced with empirical moments, to illuminate the specific ways through which these intermediary institutional regimes foment stratified intergenerational land dispossessions in planning American cities.

### **EXPANDING BLACK PARTICIPATORY GEOGRAPHIES IN PUBLIC SCHOOL PLANNING**

Abstract ID: 471

Abstract within Pre-Organized Session 84

RODRIGUEZ, Akira [University of Pennsylvania] akirad@design.upenn.edu, presenting author

Although public schools are a critical form of infrastructure in many neighborhoods across the country, they have been fairly marginalized in urban planning research and practice (Bierbaum 2020; Vincent 2006); this marginalization and its effects are multiplied when accounting for race, class and place. In 2019, the School District of Philadelphia announced a Comprehensive School Planning Review (CSPR), a process that six years prior had resulted in the recommendation of closing 57 schools, the majority of which were in Black and Latinx low-income communities (Kitzmilller and McWilliams 2018). As these schools were removed from neighborhoods, critical infrastructure - from access to health and social services to social and green space - were also removed. Black participatory geographies (Rodriguez 2021), in the form of Home and School, School and Community, and other informal educational advocacy organizations, were also displaced from these neighborhoods, occasionally reconstituted in other community places or private charter schools.

This research examines the role of public schools as political spaces for addressing issues of neighborhood (under)development and racial inequity through participatory planning. By centering the public school as a critical infrastructure, and using the comprehensive planning process to strengthen both the physical and social capital therein, this paper demonstrates how the creation and use of “counter-plans” and “counter-spaces” can expand both the scope and scale of the school facility planning process to be more inclusive of marginalized groups and perspectives. In thinking comprehensively about education and school facilities, these counter plans challenge traditional notions about the use, purpose, and ownership of public school facilities, and the role of these facilities in stabilizing and strengthening local communities, and cities more broadly. Using qualitative methods in a multi-site

case study, this paper investigates the mobilization of parents across race and class lines in three planning areas to directly address the racial inequity in school planning processes, and the formation of counter spaces for preserving and maintaining Black participatory geographies in public schools. By comparing different political capacities, development pressures, and mobilization strategies in these areas, I offer recommendations for how planners can support, recognize, and incorporate these counter plans in other planning processes.

#### **LOCAL LIMITS AND LATITUDE FOR THE NATIONAL MAIN STREET CENTER SINCE THE BALTIMORE UPRISINGS OF 2015**

Abstract ID: 472

Abstract within Pre-Organized Session 84

AIDOO, Fallon [University of New Orleans] faidoo@uno.edu, presenting author

In the past decade, urban communities have gained newfound support to seek and sustain investment in their community assets. National nonprofit organizations that have helped municipalities develop historic preservation policies and deploy heritage management practices since the 1970s now work directly with organizations that manage the historic and cultural resources of BIPOC communities. The National Main Street Center (NMSC), a subsidiary of the National Trust for Historic Preservation, not only trains these “Main Street Managers” in commercial revitalization strategies but also advises city planners of corridor reinvestment on equitable development. While the Main Street Approach is an established revitalization and recovery strategy in small towns and suburban cities (Robertson, 2004; Rumbach and Appler 2019), there is limited empirical analysis of its impacts on urban communities, planning, policy and governance. In fact, there is scant literature analyzing the economic development interventions of national nonprofit such as LISC and Enterprise Community Partners (Martinez-Cosio & Bussell 2013), and little recognition of how these intermediary organizations leverage local resources, partner with local bodies and otherwise maximize impact and income (BondGraham 2011; Lowe 2008). In this paper, I explore how (if at all) NMSC’s UrbanMain development plans, heritage programs and governance practices have challenged and changed the course of community economic development for neighborhood organizations participating in Baltimore’s Main Street program between 2010 and 2020. A combination of qualitative and archival research on UrbanMain in its pilot city--Baltimore—will result not only in deeper understanding of an increasingly influential intermediary in community economic development and disaster recovery. Diverse evidence of the National Main Street Center’s embeddedness in urban governance and philanthropy after the Baltimore Uprisings of 2015 shows how local planners make space for national nonprofits to extract and impart value in BIPOC during nationalized emergencies in local police powers as well as federally-recognized local disasters.

## IS PUBLICLY OWNED LAND USED FOR THE PUBLIC GOOD?: THE CASE FOR ADOPTING A DECOLONIAL ETHOS IN LAND REDISTRIBUTION PLANNING IN BUFFALO, NY

Abstract ID: 473

Abstract within Pre-Organized Session 84

LIPMAN, Micaela [University of Buffalo] micaelal@buffalo.edu, presenting author

Discourses around redistribution in planning and public policy remain central to envisioning just and reparative cities. This paper focuses on land as an object of and through which urban planning can meaningfully engage in equitable and redistributive politics in racialized and gendered capitalist cities. The paper utilizes an explanatory case study of Buffalo, NY grounded in community perspectives to explore the historical and ongoing city-community contestations around vacant lands. This case study highlights two important tensions in unpacking and pushing for a decolonializing land use planning ethos in a neoliberal, racially segregated Rust Belt City. First, city governments, operating as neoliberal ‘white’ municipal spaces have historically engaged in an entrepreneurial and distributional politics of holding land in trust for the highest bidder. Neoliberal municipal institutional spaces hold land in trust and maximize land values for the highest bidders (Harvey 1989). This tension builds on and advances Peterson’s “City Limits” argument, highlighting a utility-maximizing calculus in Buffalo’s land use politics where development politics cohere around a unitary interest to increase land value, embedded within a converging unitary interest to preserve racialized hegemonic institutional politics and entrepreneurialize government function (Peterson 1981; Wilson and Sternberg 2012). On the other hand, the second tension reveals that racialized hegemonic institutional politics around a unitary developmental agenda for land co-exists with oppositional grassroots, democratically run community organizations fighting for equitable, redistributive, and reparative land politics (Gilbert and Williams 2020). These community organizations epitomize institutional spaces that stand in solidarity with African Americans and other racial minorities for decolonial forms of reparative land redistribution in Buffalo, New York. Such community organizations include community land trusts, land banks and not for profits seeking to develop land for community housing, community gardens, and other community spaces that continue to contest and demand for control of city-controlled vacant lots in Buffalo. The current struggle over vacant land use policy in Buffalo, New York embodies these diverging institutional tensions. Situated within the decoloniality discourses, this paper wrestles with how to de-link the political and hegemonic in ways that bring to the foreground the need for a decolonializing land use planning ethos that supports redistributing land in an authentically communitarian manner. The paper concludes by offering conceptual and policy interventions in envisioning a decolonial land use planning ethos in racial capitalist cities in the United States.

## **LAND USE PLANNING, PATH-DEPENDENCY AND EMERGING NEOLIBERAL POLITICS IN PUERTO RICO**

Abstract ID: 704

Abstract within Pre-Organized Session 84

RAMOS-GERENA, Carol [University at Buffalo, The State University of New York] carolram@buffalo.edu, presenting author

Puerto Rico's governing regime embodies colonially inherited laws, practices, and institutions that reify neoliberal and exclusionary politics around land ownership and use decisions. In the aftermath of the 2017 hurricanes Irma and María, David Carrasquillo, the past president of the Puerto Rican Planning Association, commented that both hurricanes "...washed away local laws." This comment refers to the rising tide of land use planning laws and zoning changes being enacted since 2017 by the Puerto Rico Planning Board. While some may view, and perhaps even welcome, these new zoning maps, zoning codes, and joint regulations, I critically examine these changes as a path-dependent process. Here, I draw ideas from "actually existing neoliberalism" (Brenner & Theodore, 2002) to argue that these emerging changes in land use planning and zoning laws manifest the deregulation and deterritorializing of spatial-institutional spaces (see Brenner, 2004). The reconfiguring of these territorial and institutional spaces allows for decoding wealth through new forms of (re)distributional politics anchored around neocolonial planning regimes, disaster colonialism (Rivera, 2020), and other exploitative and exclusionary planning practices. Leveraging multiple data sources, including archival data, newspaper articles, policy and other legal documents, and notes from legal and public hearings, I offer historical insights into the path-dependent process animating the current land governing regime in Puerto Rico, and the local oppositional efforts, who are leveraging both "invited and invented spaces" (Miraftab, 2009) to contest this emerging neoliberal land governing regime.

## **13.133 PRE-ORGANIZED SESSION - THE "DOUBLE AGENT": CRITICAL REFLECTIONS ON PURPOSE AND CHANGE IN PLANNING**

Pre-Organized Session 133 - Summary

Session Includes 697, 698, 699

RIVERA, Danielle [University of Colorado Denver] danielle.rivera@colorado.edu, organizer

Planners are part realist and part idealist. As such, any planning effort is empirically grounded and materialized by social actors, inclusive of all peoples and all walks of life. Yet simultaneously, planners attempt to formulate collective narratives and visions for “a better future” which requires reimagination of “how things could be different.” This tension can be referred to as the “double agent,” whereby a planner/planning researcher needs to constantly/continually (re)negotiate their intention (or ‘vision’) with the interests of divergent actors in social systems (Jon, 2021). Here, we ask: What is the “purpose” of this “change” that planners hope to make through their intervention/deliberate action, and where do they get inspirations for framing/cultivating this purpose (Lake, 2017)? This session centers critical reflections on planning research and practice. Panelists will reflect upon recent projects relative to existing and emerging concepts of “purpose” and “change” in planning. Panelists will also reflect upon the role of planner and planning researcher in today’s increasingly unequal and polarized world.

Objectives:

- Examining how to enact change through competing demands in planning
- Understanding purpose across competing demands in planning

## **TWO-WAY LEARNING AND POLITICAL SOLIDARITY: TOWARDS A HEART-CENTERED APPROACH TO PLANNING RESEARCH**

Abstract ID: 697

Abstract within Pre-Organized Session 133

VASUDEVAN, Raksha [Teachers College, Columbia University] rv2451@tc.columbia.edu, presenting author

In urban planning, ethnographic research is increasingly common, yet few scholars (Rankin 2009) have engaged in critical reflexivity about their own positionalities, subjectivities, privilege, and ethical considerations while ‘in the field.’ In this paper, I ask, “How in planning do we accommodate multiple epistemologies, or ways of knowing (Sandercock 1999), while also acknowledging that epistemological differences are rooted in making sense of contextual, identity-based experiences (Umemoto 2001)? Moreover, how does our commitment to anti-racist, anti-colonial work shape the research process and everyday decisions we make? In this article, I reflect on a five-year ethnographic project in La Zurza, an informal settlement in Santo Domingo, Dominican Republic. Through a multi-scalar analysis of the lived experiences of young people and the structural forces that they negotiate daily, my work suggests that the legacies of colonialism live on through current governance regimes, while also revealing how everyday practices of young people resist capitalist logics and disciplinary strategies.

Drawing from feminist scholars and geographers (Sultana 2007, Morrison et al. 2013, Whitson 2017), this paper elaborates on a heart-centered approach to fieldwork and qualitative research more generally. I reflect on what it means to be an Indian-American planning scholar in the United States working with residents in the Caribbean. Specifically, I draw inspiration from hooks (2000) to suggest that love, as necessarily political, active, and aspirational, can have important consequences for how we understand our task as planners and how we define our solidarities. I suggest that addressing multiple epistemologies, identity-based experiences, and ‘deep differences’ (Watson 2006) amongst stakeholders in planning and development projects begins with a clear articulation of the researcher’s own normative positioning and an understanding of the specific context within which she is working. Important and often unclear questions around power, voice, ethics, inclusion, access and representation can be sorted through active alignment between knowledge (co)production, representation, and critical reflexivity to serve the best interests of research participants. Moreover, whereas elements of a researcher’s social location may remain momentarily fixed during fieldwork (positionality), the researcher’s self and the research process are also mutually constituted, materially constituted, and constantly dynamic (subjectivities) (Hiemstra & Billo 2017). In a two-way learning process, researchers are tasked with constant and consistent process of critical self-reflection with the intention of asking to what end and for whom planning research serves. Finally, I suggest that making art is one process through which the researcher is able to engage not only in critical self-reflection, but also self-care.

## THE DOUBLE AGENT: LIFE AND PRACTICE AS A PLANNING RESEARCHER/EDUCATOR

Abstract ID: 698

Abstract within Pre-Organized Session 133

JON, Ihnji [The University of Melbourne] [ihnji.jon@gmail.com](mailto:ihnji.jon@gmail.com), presenting author

This reflection paper looks back on the author's past projects, teaching, and collaboration with students to reflect on the difficult practice of working as a "double agent". As someone interested in theory, I hoped to project radical visions about 'what planning should be/what planners should do' during my doctoral training; however, working with students (who want to be government planners or work for private consultancies) and within the university system (which is becoming more and more neoliberal), I sometimes had to negotiate my position a lot to the point where I question myself whether I'm becoming a 'sell-out'. How can we become a radically subversive pragmatist as a planning researcher--who doesn't ignore the reality that students and we ourselves find ourselves in (i.e. job market, market economy/domination...) and yet at the same time can offer new visions and inspiring reimaginings about the city we want? How can we practice a kind of teaching that is not to 'indoctrinate' students (with our own big ideas/ideologies) but to encourage them to reflect on 'justice/equity' values in everyday planning problems? How could thinking through planning research/education across these three axis--'history, collectives, and intangible values behind the tangibles (Jon, 2021)--help us design research and teaching materials for situated, and generative justice (Lake, 2017, 2018; Eglash, 2019)?

The paper tries to address these questions through the author's current research and collaboration with planning students. One of the topics I've studied during the past years was 'environment politics beyond the environment' (Jon, forthcoming), where I described the planning practitioners/environment activists' strategies of convincing the general public to be more conscious with the climate--looking at the cases of Tulsa, Darwin, Cleveland and Cape Town. The planners I've interviewed for this project know the limits of their power within the existing system, however they try to instil the vision that they have through practice and action.

Another topic I've recently worked on with a former student (now a planning practitioner) is about the introduction of micro-mobilities (particularly e-scooters) and what they imply for inclusive/climate conscious planning. Through this project, we've learned that many planners often feel caught in-between the constant emergence of technologies popping up in urban space (introduced by private sector--e.g., Airbnb or e-scooter sharing; Kim, 2019)

and the territorial/situated needs of the public (e.g., public safety, transport equity, we're building a city for "whom"?). The important part of their work was therefore to continually (re)negotiate competing/contradictory interests of public and private--over time, with patience.

In the absence of more ethnographic research on planners and their everyday operation of social values and vision (that they may have encountered during their master's degree training), planning researchers risk perpetuating the on-going division between theory and practice (Campbell, 2021).

#### DIASPORA AND POSITIONALITY IN PLANNING: LESSONS FOR RESEARCH AND TEACHING

Abstract ID: 699

Abstract within Pre-Organized Session 133

RIVERA, Danielle [University of Colorado Boulder] danielle.rivera@colorado.edu, presenting author

"Where are all the Puerto Rican planners? Where are their op-eds?"

These questions were posed at the 2017 ACSP Conference session following the devastation of Hurricanes Irma and María. The question racked many of us for months: why had so few Puerto Ricans planners emerged as experts on their own lands and cultures? This question is examined, here, through the lens of diaspora and its impacts on "expertise" in planning research. Theories emanating from diasporic conditions have received renewed attention in 2021 given the fortieth anniversary of Anzaldúa and Moraga's *This Bridge Called My Back* (1981). This foundational volume opened up discourse on how identities are structured and reified across space. Despite this and other works, however, planning scholars frequently consider "place" and "people" as a singular entity (Eckstein, 2007, p. 24). In this way, diasporic communities are not viewed as part and parcel of planning processes due to the different and varied definitions of "here" and "there" that defines diasporic cartographies (Carter, 2005). Ultimately, relative to planning theory, these works beg the question: What are the epistemological strictures for diasporic planners?

This paper examines these and other conceptualizations of diaspora against the issue of "positionality" in planning research. The goal is to examine how diasporic identities often interfere with designations of "expertise" in planning research. Specifically, these issues are examined within the contexts of Puerto Rico post-Hurricane Maria in 2017 and Haiti post-earthquake in 2005. Planners across the Puerto Rican and Haitian diasporas share their struggles with diasporic identity and, as a result, assisting their communities after these disasters. Disaster studies, more broadly, helps frame the importance of diasporas in "reaching back" following disasters (Shivakoti, 2020). The paper analyses these experiences against common assumptions of space and rootedness that lie at the heart of planning theorizations of preservation. Conclusions point to the need to more deeply engage a wider variety of potential

relationships between space and culture in planning research.

## **ROUNDTABLES**

### **13.700 ROUNDTABLE - CONFRONTING COLONIAL STRUCTURES IN U.S. PLANNING**

Abstract ID: 700

AGYEMAN, Julien [Tufts University] julian.agyeman@tufts.edu, moderator

AIDOO, Fallon [University of New Orleans] faidoo@uno.edu, participant

LAMBA-NIEVES, Deepak [Center for a New Economy and University of Puerto Rico] deepak@grupocne.org, participant

SANTIAGO-BARTOLOMEI, Raul [Center for a New Economy and University of Puerto Rico] raul@grupocne.org, participant

RIVERA, Danielle [University of Colorado Boulder] danielle.rivera@colorado.edu, participant

MENDOZA, AnMarie [UCLA] annie520@ucla.edu, participant

Expanding previous conversations at the ACSP conference (Porter, et al., 2017), this roundtable provides space to discuss the experiences of United States (U.S.) colonies and colonized peoples within planning practice and research. Within planning, however, examinations of (de)colonization and coloniality too often omit the experiences of those under active colonization by the U.S. Reflecting recent calls to conceive of the U.S. as a “settler-colonial place” (Barry & Agyeman, 2020, p. 22), this roundtable centers the experiences of those within the U.S., while reflecting upon the wealth of existing research outside the U.S. at the intersection of planning and colonization (Dorries, 2012). The goal is to challenge discourses of decolonization within the U.S. that routinely omits voices from U.S. colonies and colonized peoples resulting in continued Indigenous dispossession. The roundtable seeks to challenge notions that Indigenous spaces and peoples are somehow “liminal” or “exceptional” within U.S. planning discourse, instead viewing them as central to understanding U.S. planning histories and futures. As a result, we follow Barry & Agyeman (2020, p. 22) in asking: “...what would it mean for U.S. urban planning to both recognize and confront its continued role in erasing these relationships?”

This roundtable provides a space for planners to discuss their professional and academic experiences within U.S. colonial systems and reflect on the strategies they employ to critically engage with colonial strictures and structures. Participants will bring their diverse backgrounds and experiences to discuss how the discipline has been complicit in reproducing uneven power relationships, while also providing insights into the tactics and strategies that can be employed to challenge entrenched systems of oppression. Participants will provide a brief overview of their experiences and then engage in discussion by asking the following questions:

1. Who is planning research on colonies “for”? What are the issues faced when bringing up these concerns in U.S. planning contexts?

2. How must/do we position ourselves between academia, its systems and demands, and the colonized communities we identify with? How can we negotiate representational politics within our communities against the desire to speak freely about our struggles?
3. Whose/which spatial knowledge and epistemologies of colonialism shape planning scholarship and practices?

## **INDIVIDUAL PAPER SUBMISSIONS**

### **MAKING SPACE FOR NATURE: DE-CENTERING HUMANS FROM COLLABORATIVE PLANNING**

Abstract ID: 17

Individual Paper Submission

SWANSON, Kayleigh [University of Waterloo] keswanso@uwaterloo.ca, presenting author  
REEVES, Andrew [University of Waterloo] awareeves@uwaterloo.ca, co-author

In the context of anthropogenic climate change, our collective understanding of ‘justice’ is perpetually shifting in relation to vulnerable people, places, and species (Steele et al., 2015). There is growing evidence that climate change disproportionately affects marginalized human populations, but the effects of climate change are also experienced by a wide diversity of vulnerable nonhuman species and habitats. Yet, discussions of climate justice and its interpretation as both distributive (the allocation of benefits and burdens) and procedural (how interests are recognized) have been “largely confined to the equity implications of climate change on humans” (Steele et al., 2015, p. 121). Moreover, the vulnerabilities of human populations and those of nonhuman species are addressed largely within disciplinary silos.

At the same time, neoliberal planning processes have reinforced a narrow definition of ‘rights’ and a preoccupation with ownership that has marginalized nonhuman species in deliberative processes (Porter, 2014), leading to their dispossession of urban spaces. This disconnect between our understanding of climate justice in relation to the needs of human and nonhuman species, and the ways in which neoliberal planning reinforces this discrepancy, represents a barrier inhibiting the field of planning from tackling climate change in a comprehensive way. There is a pressing need to create new forms of practical engagement underpinned by a more integrated approach to planning for humans and nonhumans alike.

Drawing on the more-than-human and climate justice literature, this paper explores how the scaffolding of collaborative planning theory might be broadened to create a defined space for deliberation on nonhuman needs. Responding to calls from Houston et al. (2018), Jon (2020), and Metzger (2020) to create an urbanism that

“purposefully serve[s] non-human agents as important ‘stakeholders’ in rendering the urban form or conceptualization of planning” (Jon, 2020, p. 416), this paper poses two core questions for creating an urbanism that broadens the human-centered planning frame: 1) How can more-than-human thinking be applied to governance systems that oversee the built environment? 2) Can more-than-human thinking address the gap in collaborative planning between current participatory methods and more-than-human needs (gleaned through both scientific and experiential knowledge) in a manner that enhances climate justice?

To answer these questions, we review more-than-human literature and consider its migration from critical geography to planning. Next, we explore an incremental approach to mainstreaming nonhuman needs in neoliberal planning structures to address the current disconnect. Finally, given the entrenchment of neoliberal planning models within lower-tier governance structures in the Global North, and the challenges posed by the twin crises of climate change and biodiversity loss, we argue that rooting more-than-human approaches to urban development in contemporary planning requires a revised collaborative planning model that decenters humans from planning processes, and better represents the needs of nonhumans.

In the context of climate change, planning theorists must accelerate their work to decenter humans from planning processes and enhance theoretical frameworks for how more-than-human approaches can be operationalized at local governance scales. Embedding more-than-human approaches in local governance structures, while broadening the collaborative planning frame to conceptualize ‘nature’ as a formal planning constituency, will enable planners to act on their responsibility to create just and sustainable cities in the shadow of the climate crisis. Such a profound shift would create urgently needed material and conceptual space for nonhuman actors in shifting urban landscapes.

### THREE HEURISTICS FOR STUDYING PLANNING EXPERTISE

Abstract ID: 74

Individual Paper Submission

BHATT, Jigar [Columbia University] jdb2171@columbia.edu, presenting author

Based on the author’s dissertation experience, which examined economic expertise in development planning, this paper argues that three common assumptions in planning theory and scholarship limit our understanding of planning experts. In response, it presents three rules of thumb, or heuristics, from science studies as a remedy. The first common assumption is that experts’ success or failure rests on the strength or weakness of their rationality rather than their political efforts. Too often, planning theorists, like social reformers in the progressive era, made conclusions about expert influence based on the properties of intellectual rationality alone (Finegold, 1995). The second common assumption is that conflicting rationalities largely exist between experts’ intellectual rationality and

non-state actors' practical rationality (Corburn, 2007; Goulet, 1986; Scott, 1998; Watson, 2003). Many planning theorists assume that state institutions have no internal conflicts or contradictions (Angotti & Marcuse, 2011). The third common assumption in planning theory, with the notable exception of the Advocacy School, is that planning methods are ostensibly technical instruments of rationality rather than political interventions (i.e., Flyvbjerg, 1998).

This paper reconceptualizes these assumptions in planning theory and scholarship using heuristics derived from science studies. A science studies approach is advantageous in helping us rethink expert rationality, power, and methods. First, applying science studies, usually reserved for studying scientists, engineers, or other knowledge workers in laboratories, to planning organizations can help us understand experts' unique political strategies. Second, science studies treats knowledge production as political work that faces resistance and must be overcome (Latour, 1988). Finally, science studies suggests that expert methods black-box ideas and discourse (MacKenzie, 2005).

The first heuristic—"think symmetrically"—recommends that planning scholars treat non-experts and experts evenly: interests and politics define and motivate both groups' work (Bloor, 1981). Instead of speaking truth to power, experts' work is reframed as constructing rationality as power. Rationality becomes a local accomplishment in particular contexts rather than a property that people or organizations do or do not possess (Cabantous et al., 2010). The second heuristic—"look for trials of strength"—asks planning scholars to treat planning organizations as arenas of conflicting rationalities. Planning scholarship often treats the state as monolithic with a unitary logic and neglects conflicts within the state. However, experts, like scientists, have to conduct their work and defend it from competing experts with alternative rationalities, or withstand what Bruno Latour calls "trials of strength" (Latour, 1988). The third heuristic—"unpack experts' methods"—asks planning scholars to open the black boxes of methods. Methods become black-boxed when debates over the procedures of (social) scientific practice appear settled and their internal workings are overlooked. Getting inside methods reveals their political values and can foreshadow their possible political effects (Alonso & Starr, 1989; Dorling & Simpson, 1999; Sinclair, 2008).

These heuristics for studying planning expertise have implications for planning practice by keeping us from falling into the post-modern abyss (Beauregard, 1991). Postmodernism suspended us between the decaying validity of the modernist project and convincing, yet discomforting skepticism of the modern state and its experts (Beauregard, 1991; Putnam, 1992). However, if we think symmetrically and look for trials of strength, we can conceive of planning organizations as plural and diverse rather than singular and universal. Dualities between rationality and irrationality are rejected because power drives rationality and no form of expertise is structurally given or inevitable. Competing experts can enter the organizational arena to make a case for their alternative rationalities. In doing so, they engage in the kind of responsible restoration that Hilary Putnam said was necessary to avoid the dangers of deconstruction (Putnam, 1992: 132).

#### PERIODISING METROPOLITAN REGIONS, PLANNING AND GOVERNANCE

HARRISON, John [Loughborough University] j.harrison4@lboro.ac.uk, presenting author  
DANIEL, Galland [Aalborg University, Copenhagen] dgalland@plan.aau.dk, co-author  
TEWDWR-JONES, Mark [University College London] m.tewdwr-jones@ucl.ac.uk, co-author

There is an inherent contradiction in regional planning: on the one hand, “never before has the necessity for effective regional governance and planning been so great” (Soja 2015, p. 379) and yet, on the other hand, there are those who argue “regional planning as we know it is now defunct and something we need to get used to” (Harrison et al 2021, p. 6).

Our starting point is a concern that much of the work which has approached the question of metropolitan regions, planning and governance has done so over recent decades from one of two perspectives. There is research which is oriented towards abstraction. Here, we can point towards seminal contributions which are geared towards providing broad conceptual and analytical frameworks that situate metropolitan regions within the contours of inter alia globalisation, neoliberalism, political economy, rather than systematic comparative analysis. There is then research which is much more systematic. Here, the approach involves taking an idea, concept or perspective and examining how it works in practice across specific contexts – be it different policy spheres, in specific metropolitan regions, in different national contexts. Both approaches could be considered at different ends of the research spectrum. Each is equally valuable in their own way, however it is our contention that there is an important middle ground between abstract conceptual and systematic comparative approaches which remains largely untapped.

In this paper, we argue that contributions which develop and operationalise broader frameworks for analysis are relatively scarce. Our own approach for conceptualising the planning and governance of metropolitan regions is a heuristic perspective which, due to its focus on thematic (T), temporal (T) and phronetic (P) approaches, we refer to as the TTP framework.

The thematic dimension is founded on four interrelated themes which are arguably the most salient in post-WWII debates over metropolitan change from a planning and governance perspective: institutions, policies and ideas, spatial imaginaries and planning styles.

The temporal dimension involves periodising metropolitan planning history to identify temporally defined scaled moments in how cities and regions have been planned for.

The phronetic dimension recognises the importance of going beyond being captivated by what is perceived of as ‘new’ to be much more critical of claims purporting to newness. Periodising metropolitan planning is an important step in setting us on the path towards conceptualising metropolitan regions ‘in retrospect’ (how have we arrived at this point?), ‘in snapshot’ (what is currently unfolding?) and ‘in prospect’ (what might happen in the future as a result?). Our argument is that a phronetic approach, with its emphasis on change, process and implications takes us closer to answering what we perceive to be the key question – what is at stake for planning metropolitan regions?

This paper introduces the TTP framework, reveals some of the key outcomes from a three-year international project which operationalised TTP, before concluding with a vision that seeks to reassert the purpose and values of planning by advocating going back to move forward.

## **MAKING “A WATERFRONT FOR THE WORLD”: RACIAL CAPITALISM, INDIGENEITY, AND THE MARKETING OF ZIBI IN CANADA’S CAPITAL**

Abstract ID: 332

Individual Paper Submission

DORRIES, Heather [University of Toronto] heather.dorries@utoronto.ca, presenting author

Settler colonialism can be understood as a mode of racial capitalism that shapes urban development. In his formulation of racial capitalism, Cedric Robinson explains that capitalism development is enabled by the creation of racial hierarchies (Robinson, 2010). In the context of urban development, these hierarchies serve the creation of symbolic economies that have significant material consequences for racialized peoples. Examining how Blackness is aestheticized and depoliticized to enable neoliberal forms of urban development in Washington DC, Brandi Thompson Summers observes how “symbolic representations of difference and diversity encourage consumption, while at the same time they precipitate development strategies that privilege middle-class activities and values” (Summers, 2019: 13). According to Summers, urban marketing goes hand in hand with development processes that exclude and marginalize racialized people in urban space while at the same time trading in their imagery. In this paper I will examine how indigeneity is mobilized to justify the contested Zibi condominium project in Ottawa, Canada. I show through a marketing campaign that emphasized sustainability and reconciliation, an aestheticized version of indigeneity was used in the marketing of the project to sanitize histories of settler colonialism and commodify Indigenous presence.

Zibi is situated at Akikodjiwan, an area of spiritual and cultural significance for many Algonquin people. The site has also been a locus for Algonquin organizing, and the focal point for a plan articulated by Elder William Commanda that would see Algonquin stewardship of the site fostered through the development of a National Aboriginal Centre to “inspire respectful and responsible choice for sustainable relationships guided by values of sharing, balance and harmonious co-existence....” (Commanda, 2010). In contrast to William Commanda’s vision for Asinabka, Zibi will be primarily a private residential space comprised of condos, townhouses, and commercial space as well open space.

Construction on the Zibi development began in 2015. While only in its early stages of development, Zibi was already recognized for its commitment to sustainability and as an example of community planning, winning awards from the American Planning Association and International Society of City and Regional Planners. In 2015, the Canadian Urban Institute recognized the project with a Brownie Award for “Communications, Marketing & Public Engagement” for its introduction of a “brand that enhances acceptance and understanding of brownfield redevelopment, regeneration and reinvestment.” Zibi has been marketed as a sustainable project that facilitates reconciliation with Indigenous peoples. In a political context where Indigenous rights are gaining increasing recognition, developers are recognizing that projects may be placed at risk of delay or cancellation if support from Indigenous communities cannot be secured (Moody’s 2020). In this paper I show how the marketing of this project activated narratives of urban sustainability and reconciliation—both laudable goals— in ways that naturalized settler occupation and development. Through this framing, the developer was able to claim Zibi “for the world.” By actively reconstructing the meaning of this territory and its histories and commodifying racial difference, these narratives ultimately foreclosed possibilities for sustainability and reconciliation and affirmed the site as a white urban space.

## PLANNING IN OCEANIA: LESSONS FROM INDIGENOUS PACIFIC ISLANDER POLITICAL THOUGHT

Abstract ID: 346

Individual Paper Submission

LEE, Kevin [Massachusetts Institute of Technology] kevinjl@mit.edu, presenting author  
CAMPBELL, Josh [University of California - Los Angeles] jwcampbell@g.ucla.edu, co-author

The Pacific Islands comprise more than 30 states and territories, distributed across the geographical regions of Micronesia, Melanesia and Polynesia. Within development studies, their myriad barriers to economic development are well-documented (Duncan et al. 2014). High transportation and communication costs decrease returns to private investment. Poor domestic financing mechanisms and high costs of accessing international financial markets raise barriers to entry, particularly for small to medium firms. Weak state institutions—especially insecure property rights and poor contract enforcement—increase macroeconomic risks and promote market failures. Pacific Islands have long-standing aid dependency; with increasingly stringent accountability requirements in aid management, sovereign Pacific Island countries also have increasingly diminished autonomy over the terms of their own development (Murray and Overton 2011).

As argued by Epeli Hau'ofa (1994) development studies effectively constructs Pacific Island economic development as a problem of smallness—borne of its small supply of labor and human capital, small private sector etc. Historically, development scholars and practitioners have sought to resolve this problem of smallness through increasing Pacific Island access to larger markets. Some recommend that the Pacific Islands maintain subsovereign jurisdictional status, attach themselves to larger political-economic powers, and engage in development through exploiting the privileges of immigration, wage differentials and other associational benefits (Baldacchino 2006). Others recommend strategies of regional coordination—ranging from simple coordination of fisheries policies, to deeper regional economic integration via a formal political-economic union (akin to the European Union) and a common currency (akin to the Euro). Both solutions, however, have yielded mixed results. Indigenous sovereignty movements are thriving in many subsovereign Pacific Islands (from Hawai'i to Guåhan and French Polynesia); and regional coordination mechanisms have not yet forged clear pathways for effective long-term regional development.

Despite the ambivalent impacts of Western models of development, they continue to wield hegemonic influence over the region, at the expense of Indigenous visions of development. In this project, we deploy discursive and historical methods drawn from the history of political thought, applying them to a set of contemporary Indigenous Pacific Islander thinkers that have written substantially on issues of Indigeneity, nationalism, regionalism and/or development. These thinkers reject the colonial problem of (physical) smallness; following Hau'ofa, they opt instead to view their island homelands as part of "Oceania"—an ever-expanding transnational social space grounded in Indigenous Pacific Islander identity, epistemology and mobility.

Theoretically, this research forges new connections between Indigenous and transnational planning to think about planning in Oceania. Indigenous planning emphasizes the importance of Indigenous epistemology, but often treats Indigenous communities as locked in place, while sidelining the issue of transnationalism. This is because Indigenous planning has historically focused on Western settler-colonial states (e.g. Australia, Canada, Israel, New Zealand, United States), and not on Oceania. Yet, Indigenous Pacific Islanders are distinguishable from their other Indigenous

counterparts in that there are more of them living in diaspora than there are in their own homelands. Concurrently, transnational planning emphasizes the processes by which the cross-national movement of people, ideas and resources are made possible (Miraftab 2011), but has little to say about how diasporic Indigenous Pacific Islanders continue to maintain connections to their land and ocean, and the processes by which they engage in the decolonization of Oceania.

This research offers two insights for planning practice in Oceania. First, in addition to traditional development actors (the state and international development organizations), it invites planners to examine and harness the role that transnational Pacific Islander networks play in negotiating processes of Indigenous development. Second, it invites planners to align themselves with Indigenous sovereignty movements, and collaboratively build political-economic institutions that center ownership and benefits among Indigenous Pacific Islander communities.

#### REVITALIZING PLANNING THEORY THROUGH VISUAL THINKING? A CRITICAL REAPPRAISAL OF PLANNING'S VISUAL HISTORY AND THE MORALS EMBEDDED IN TRADITIONAL PLANNING DIAGRAMS

Abstract ID: 361

Individual Paper Submission

CAMPBELL, Scott [University of Michigan] [sdcamp@umich.edu](mailto:sdcamp@umich.edu), presenting author

This paper examines the underestimated influence of graphic visualizations in shaping and codifying planning thought. We often employ these diagrams to reinforce and crystalize planning ideas, and assume they are a neutral mirror of the text. But they often have a life of their own. They frame debates, steer our thinking, and tacitly constrain or expand our planning imagination. As a spatial field and as applied social scientists — and as prolific producers and consumers of maps, plans, tables and charts — planners consider themselves as doubly savvy visual thinkers. Yet our field often uncritically views these graphics as unproblematic, passive illustrations of planning ideas.

I explore two arguments: First, these diagrams shape our thinking more than we likely admit, and have unintended consequences. The relationship between visual representations and theories (typically in text and narrative format) is two-way and dynamic. We should therefore curate our use of planning's historical diagrams — and draw new diagrams — with as much critical reflection as we choose our words and tabulate our data. Second, if we seek to revitalize our planning theory (not just as a specialization within planning, but also as the shared forum where we debate planning-wide values and concepts), then we are well advised to critically rethink our visuals as well: to lead this reinvigoration of planning theory as much with graphical as textual arguments.

I begin by revisiting the standard portfolio of diagrams in introductory courses and textbooks. (I focus on graphics laden with planning ideas, rather than reference or thematic maps; illustrative photographs; data tables and charts — except when the latter are used to make conceptual arguments.) It's a familiar list, including: Howard's Garden City (1898); Patrick Geddes' "valley section" (1909); Burgess's concentric zone model (1925); bid rent curves; HOLC's "redlining" maps (1930s); Corbusier's radiant city (1933); NRPB regional maps (1930s); Isard's regional science hexagons (1956); Interstate highway map (1956); Jean Gottmann's megalopolis (1961); Neil Smith's gentrification "rent-gap" (1979); Friedmann's world city map (1986); Duany's transect (1997); etc.

Importantly, this chronology of influential graphics provides only a partial visual history of planning. What voices and ideas have been excluded? These images lean with a deference to clear lines, networks, simplification: modernist infrastructure; idealized visions of efficient mobility; stylized urban economics; aspirational models of "balanced" metropolitan systems — either urban/suburban/rural or the "three Es." This graphical vocabulary fails to engage the breadth and array of planning theory ideas. Important debates within planning theory (e.g., advocacy & communicative action, postcolonialism, social & environmental justice) frequently lack a visual language to drive our thinking.

One might reasonably counter that much of planning theory isn't suitable for graphic argumentation: debates about power, institutions, governance, racism and gender are most effectively engaged through oral and written rhetoric. (And a tour of many planning theory articles confirms this text-centric focus, with the included figures often wordy, unmemorable tables with detailed taxonomies of concepts, variables and actors.) But though planning continues to expand its disciplinary scope into social concerns, we are a discipline that invariably translates these issues into problems of land, property, boundaries and communities — and the primary language of space is the visual language of maps, plans and diagrams, with either existing, projected or idealized land uses. It is not just the explicitly spatial specializations of land use, urban design and transportation planning, but also planning theory, that needs a robust arsenal of communicative and analytical tools — including visualization.

The goals of this paper are thus to both critique the traditional use of diagrams in planning's intellectual history and promote a more critical and reflective visual thinking in contemporary planning theory.

#### **WE ARE NOT PLANNING FOR EQUITY: AN EVALUATION OF U.S. COMPREHENSIVE PLANS**

Abstract ID: 367

Individual Paper Submission

OGUSKY, Adam [University of Texas at Austin] adam.ogusky@gmail.com, presenting author

Interest in equity in planning scholarship, education, and practice is on a sustained rise. While this trend is reflected in scholarly literature and course syllabi, the manner and extent to which equity is shaping actual planning practice remains poorly understood. Are we planning for equity in contemporary practice? How well and to what extent? What definitions of equity are guiding planning practice, if any? How do planners and communities imagine more equitable cities? In order to begin answering these questions, this research project looks to perhaps the most recognizable product of planning practice: the comprehensive plan. These documents—still central to the planning profession—provide a reasonable proxy for the state of planning practice as well as a window into the profession’s overall goals and orientation.

This research is part of a larger project investigating not only the quality of comprehensive plans’ treatment of equity, but also the meanings of equity at work in contemporary planning, their relationship to and dependence upon theories of justice coming from moral and political philosophy, and how comprehensive plans—with their varying meanings and quality with regard to equity—came to be.

This paper will primarily examine the quality of comprehensive plans’ treatment of equity through the use of a plan quality evaluation, with additional analysis on the meanings of equity found in plans and their relation to plan quality. In order to answer the primary question, I have employed a content analysis of a random sample of 25 U.S. cities with populations greater than 200,000 with plans written since 2010 which adapts Berke’s plan quality analysis rubric to focus on equity. To Berke’s existing internal plan quality components I have added evaluative sections for the adequacy of a plan’s treatment of equity, which is based on the proportion of a plan’s goals that include equity-oriented objectives, policies, or actions, and also a section for the importance a plan claims to place on equity, ranging from not mentioned to providing the plan’s organizing principle. This last measure makes it possible to tease out differences between plans that claim equity as a central or important concept but whose actual implementation varies substantially in quality. Finally, plans are inductively coded for their definition(s) of equity, whether explicit or implicit, and for the relation between these definitions and varying theories of justice.

Preliminary findings indicate that we have a long way to go with regard to equity in contemporary comprehensive plans and, by extension, planning more broadly. Plans which mention equity not at all or very little are not uncommon, definitions are often nonexistent or extremely vague, and issues with equity in communities—historic and current—are rarely explained or examined, making it impossible to reasonably formulate remedies.

The findings of this research provide, first and foremost, baseline data for the extent and quality of contemporary comprehensive plans’ inclusion of equity. This information—while instrumental to understanding how we are doing as a profession with regard to planning for equity—currently does not exist. Moreover, the concept of equity in planning is notoriously fuzzy. It is frequently left troublingly vague and underspecified in planning documents and processes, and it is my simple contention that if we cannot define equity, we cannot hope to bring it about, or even recognize it when we see it.

## DO CITIES ACT?

Abstract ID: 414

Individual Paper Submission

POTTER, Cuz [Korea University] cuzpotter@korea.ac.kr, presenting author

Do cities do things? Do they make plans? Do they compete with other cities? Thought statements suggesting that cities do act are commonplace, some warn that treating cities as possessing the same character as persons or firms is misleading. Such phrasing, they argue, obscures conflicts between distinct urban interests and the domination of some of those interests by others. Various defenses of treating localities as actors have been made. Cox and Mair (1991), for example, suggest that territorially coherent social structures can make reflexive decisions. Harvey (2001) has similarly drawn on Whitehead to characterize cities as having structured coherence that lends unity to their actions. This paper will add another.

But not before calling these other defenses into question. Each of them depend on the bifurcation of both space and society into a dualistic interior and exterior. Without territorially delimiting a locality, it is not possible to distinguish one from the other and thus put them into competition or posit that they make plans independent of other localities or ascribe to them personalities. In short, cities are defined by a territorially bound essential nature that makes each one unique. This essentialism breaks down in at least two ways. First, it is impossible to establish a clear boundary that separates the interior from the exterior. The literature on complexity and planetary urbanization has convincingly argued that territorial boundaries attributed to cities are untenable as urban processes like trade, communications, and tourism extend seamlessly outward from urban centers to encompass---ultimately---the entire planet. Planetary urbanists argue that we must adopt a flat ontological understanding of the urban as a set of relational processes that interiorizes everything. Thus, the territorial coherence of social structures is a false notion. Without a territorially coherent base, self-reflexive social structures cannot exist. Second, the analogy between cities and people or organizations is false. The problem lies not in the comparison itself but in the assumption that people, firms, and so on exhibit the essentialism denied to cities. Rather, the very notion of a coherent actor is untenable. Freud, Deleuze, Guattari, and others have clearly illustrated the ambivalence and conflicting desires that inhabit us all. Contemporary anthropologists and biologists have emphasized humans' mutual dependence and inseparability from their social and physical environment. Actor-network theory has arguably gone furthest in eviscerating the boundaries between nodal actors and their networks. In short, people and firms are equally decentered and lacking a clear distinction between their interior and exterior.

Fortunately, cognitive philosophy offers several tools for reassembling distinguishable actors. First, it suggests that humans' highly evolved pattern processing allows us to perceive those patterns of interaction that we identify with cities' social structures. Second, cognitive philosophy offers the intentional stance (Dennett, 1987), which humans employ to attribute consciousness and agency to objects in the world around them. Despite humans' inability to truly understand other peoples' consciousnesses, they attribute intentionality to other people as a shortcut for predicting how others will act. The same stance is applied to other external objects whose internal functioning is not understood, including pets and computers. For simplicity's sake, we assume other objects possess agency. And we can do the same for cities. Despite the lack of identifiable boundaries, we can attribute intentionality or agency as a cognitive shortcut.

This epistemological shift matters for at least two reasons. First, it reconciles the ontological inseparability of the stuff of existence with our own cognitive demand for efficient and effective representation. Second, as incomprehensible artificial intelligences take on more significant urban planning responsibilities, it offers a more robust frame for considering the interaction of biological and algorithmic urban planners.

## ON THE INJUSTICE OF GENTRIFICATION

Abstract ID: 425

Individual Paper Submission

DAWKINS, Casey [University of Maryland] [dawkins1@umd.edu](mailto:dawkins1@umd.edu), presenting author

Many contend that gentrification is unjust and should be opposed wherever it exists. Neil Smith (2010, 117), for example, condemns gentrification as a form of neocolonialism, which "justifies monstrous incivility in the heart of the city." Ruth Glass (1964) first called attention to the injustice of gentrification in the same essay where she coined the term, but most subsequent research on the topic has focused more narrowly on the definition, operationalization, and quantification of gentrification and its impacts. In response to the rise in contemporary anti-gentrification activist movements, scholars have recently returned to the moral questions that first animated Glass's seminal work, offering a range of different, and often conflicting, reasons to label gentrification as unjust.

In this paper, I evaluate several arguments advanced to support the claim that gentrification is unjust. Marxists argue that gentrification is a particular manifestation of the commodification of space that produces unjust forms of residential alienation through the conversion of residential use values into market exchange values (Madden and Marcuse 2016). Civic republicans argue that gentrification fosters domination, because the arbitrary decisions of landlords and in-migrants threaten incumbent residents' temporally extended security of tenure (Putnam 2020). Others argue that gentrification threatens a community's capacity for effective self-governance, destroys local cultural resources, and threatens incumbent residents' place-based sense of personal identity (Hyra 2015).

I examine and evaluate these and other arguments and conclude that while gentrification may be unjust for a variety of reasons, a tension exists between individualist, collectivist, and structuralist perspectives on the injustice of gentrification. These tensions become concrete when claims about the injustice of gentrification motivate policy responses. I offer a path forward that is grounded in a middle-ground normative perspective that is simultaneously individualist and relational. This perspective supports anti-gentrification policies that combat residential displacement and enhance security of tenure for incumbent residents while opposing policies that harm those who wish to inhabit gentrifying places.

## LEARNING FROM PANDEMICS: APPLYING RESILIENCE THINKING FOR COMPLEX ADAPTIVE SYSTEMS TO IDENTIFY PRIORITIES FOR PLANNING URBAN SETTLEMENTS

Abstract ID: 440

Individual Paper Submission

SYAL, Shruti [Virginia Commonwealth University] syals@vcu.edu, presenting author

The COVID-19 pandemic spurred many predictions and prescriptions about the resilience of human settlements. But individual disciplines have different, overlapping conceptualizations of resilience, tuned to their examination of specific areas of concern. Since the pandemic impacted a colossal range of actions and processes at multiple spatiotemporal scales, cementing our expectation of the regularity of *systemic* disturbances, I use resilience theory as developed for the study of complex systems as my conceptual framework to identify priority areas for planning/policy transformation.

### RESEARCH QUESTIONS & METHODS

This interdisciplinary narrative literature review frames human settlements as *systems* and novel diseases as *shocks* to the system, examining the sources of *stress*, *vulnerability*, *redundancy*, and *adaptive capacity*. The research was conducted from January–November 2020, in three overlapping stages (figure 1). From January–June 2020, I reviewed ~500 articles on the COVID-19 outbreak published by dozens of authoritative news outlets, websites associated with publications on planning by professionals and scholars, and on *Nature's* pandemic timeline. Simultaneously examining literature on disease emergence, local and community transmission, and outbreak, I created concept maps linking the myriad, interconnected planning and policy issues to these stages of disease spread. From May–September 2020, I conducted a literature search for this review, guided both by these concept maps and the key research questions emerging from applying the resilience thinking conceptual framework to disease spread. From May–November 2020, I read 237 journal articles, 132 of which are cited in this paper.

### FINDINGS

Examining how *shocks* like novel disease emerge, why human settlements are *vulnerable* to them, which *stresses* exacerbate the impacts of these shocks, and how *response diversity* and *adaptive capacity* help buffer those impacts, revealed five planning/policy issues to prioritize. First, since urban settlements and activities facilitate pathogen transmission between species, reducing 'shocks' like zoonotic diseases and climate change requires not just prioritizing urbanization patterns and land use in urban policies for environmental health, but also animal rearing practices and biodiversity maintenance. Second, since disease transmission is linked to not just contact rate but also host susceptibility, reducing vulnerability by improving equity in access to essential infrastructures like housing, water, sanitation, healthy food, green/public spaces, healthcare—that impact human health directly and indirectly—is critical. In its absence, curbing disease transmission requires focusing on contact rate suppression, but doing so brings human activity to a halt, decimating the economy and livelihoods. Third, the persistence of many pathogens or their vectors in environmental media suggests that built environment & public health professionals must address maintenance of environmental quality at various scales. Fourth, there is a need for redundancy, be it in commodity supply chains (like PPE, food) or data management for say, monitoring & enforcement of home quarantines during a pandemic. Fifth, as the Indian state of Kerala illustrates, social adaptive capacity—which requires investing in social capital (human capital, bonding and bridging relationships), developing social networks between state and non-state actors (via trust and clear communication, reciprocal and repetitive interactions)—is critical to responding to shocks.

## CONCLUSION & CONTRIBUTIONS

This paper has attempted to consolidate the unprecedented swath of causes and impacts of the COVID-19 pandemic to identify priority areas for planning/policy. It is also a first step in developing and applying the theoretical framework for resilience thinking for complex systems study to planning research. The presentation will also:

1. discuss how this framework was developed and applied in this study
2. explain its value in untangling the multi-factorial pathways through which planning impacts urban health
3. explore the possibility of further research by conceptualizing the system and its *boundary, variables, stable states* and scenarios of *regime change*, and the factors impacting the system at higher spatiotemporal scales (*panarchy*) (figure 2)

## **“ESO NO SE DICE!”: STORIES AS PUSHING DISCURSIVE LIMITS FOR THE PRODUCTION AND USE OF KNOWLEDGE IN PLANNING**

Abstract ID: 497

Individual Paper Submission

KOCSIS, Joanna [University of Toronto] joanna.kocsis@utoronto.ca, presenting author

Increasingly, planners are engaging in radical planning practices rooted in relations of solidarity with marginalized groups. However, given that planners are often members of dominant groups and tend to rely on research methods that are conventional to Western modes of knowing, there is a risk that they are reproducing oppressive knowledge hierarchies and missing vital information in the process. Planners often seek to do participation with groups that are underrepresented in, or excluded from, conventional decision-making processes as a way to capture and include their voices in knowledge production and emphasize the agency they have in determining their life trajectories. Radical planning theorists (Miraftab, 2017; Roy, 2009) however, have begun to question how much can be taken for granted about the causal relationship between participation and meaningful inclusion.

Theoretical developments that contribute to efforts to decolonize planning, or at least expose the fallacy of the scientific managerial approach, can be drawn from the work of interpretive scholars (VanHulst, 2012, Sandercock, 2003) which conceptualizes planning as a process of collective sensemaking and applies theories from discourse analysis and narrative theory to emphasize the importance of identity, relationships and emotions in creating “power-sensitive analyses of dynamic processes” (VanHulst and Yanow, 2016: 105). However, while the language of Storytelling is used to celebrate the human dynamics involved in professional planning practice, the same language is often used to undermine the validity of ‘local knowledge’ of the sort that is produced in participatory planning activities. This further highlights the disjuncture between the objectives of radical planning and the practice of

participation.

To create a “power-sensitive analysis of the dynamic process” of knowledge production in a participatory research project concerned with urban social planning with a marginalized group, this paper combines tools from discourse analysis, performance theory, embodiment and psychology. Drawing on research that used personal stories and theatre performances to explore the connections between leisure activities and delinquency among stigmatized youth in Old Havana, Cuba, this paper traces how participants respected or transgressed discursive limits around what is (un)sayable in their storytelling practices. The findings contribute to radical planning theory by highlighting the ways in which identity, relationships and emotions condition some people’s voices and agency in ways that participation enthusiasts’ focus on personal empowerment and individual experience risks simplifying. The analysis highlights how participation practices’ individualist notions of voice and agency, the belief in the ability and responsibility of a person to articulate and act on an issue that troubles them, can make participatory planning ineffective, even potentially risky, when not accompanied by the necessary structure of rights and entitlements for the participating population.

### ON ‘TVA AND THE GRASSROOTS’ AND ‘THE VIEW FROM BELOW’: RETHINKING OUR INTELLECTUAL GENEALOGIES OF PARTICIPATORY PLANNING

Abstract ID: 591

Individual Paper Submission

MALSON, Hilary [UCLA] hemalson@gmail.com, presenting author

More than two decades after the communicative turn in planning (Healey 1992, Forester 1999), and a dozen years after “insurgent planning” decisively shifted the conversation on who constituted a ‘planner’ (Miraftab 2009, Liggett 2009), public participation in planning processes remains a significant terrain of theoretical debate in our field (see, for example, Zakhour 2020 and Alfasi 2021). While the sustained interest in planning’s participatory dimensions is unsurprising, given the paramount importance of serving public interest in this field (AICP Code of Ethics pt. 1, 2016), relatively few intellectual histories tracing participation in planning have been written, and the most recent publication appeared in 2005 – prior to the widespread recognition of insurgent planning (Damer and Hague 1971, Lane 2005). Bearing this in mind, I sought to build upon existing historicizations of planning participation by extending them to the present; however, in reviewing the literature, I encountered numerous works examining public participation in city and regional planning that have fallen out of the canon, yet might meaningfully inform contemporary debates.

In this paper, I analyze two significant, yet little remembered, volumes that were expressly concerned with public participation in planning, and suggest how their (re)incorporation into academic planning discourse might contribute to contemporary theorizations of participation in practice. The first is Philip Selznick’s TVA and the

Grassroots, a study of the Tennessee Valley Authority's incorporation, and cooptation, of white farmers into resource management as part of federal efforts to modernize and develop the region during the 1930s (1949). Selznick's critique, that participation could take on the look of democratization without any redistribution of power, prefigured those made several decades later by planning scholars, who took note as Black communities and other low-income communities of color rose up and burned down US cities. While the federal government introduced programs like Model Cities and phrases like "maximum feasible participation" to quell the unrest, landmark publications including Paul Davidoff's "Advocacy and Pluralism in Planning" (1965) and Sherry Arnstein's "A Ladder of Citizen Participation" (1969) explicitly discussed power and inequality, and explored alternative means of democratizing planning processes in order to address these disparities. Yet, significant as they were, neither of these works foregrounded the perspectives, messaging, and priorities of key actors in the Black Power movement. In their 1972 edited volume, "The View From Below: Urban Politics and Social Policy," Susan and Norman Fainstein did. Essays by Bobby Seale, Charles Hamilton, and Kwame Toure (then Stokely Carmichael) appear alongside those of Herbert Gans and Edward Banfield; the history and theory behind "community control" was articulated by the very minds that conceptualized it. Yet 49 years after these Black Panther Party leaders were published by scholars with profound longevity and significance in our field, the volume has only been cited 16 times.

At present, I see two potential contributions that this deep study of two long-forgotten texts might make to contemporary discourse. In situating federal support for public participation in a pre-Black Power, pre-1960s-social-revolution context, Selznick's TVA study underscores, while complicating, existing arguments on the limitations of participation as a democratic project (let alone a radical, liberatory one). And, as planning and related fields begin to embrace long overdue interventions from Black Studies and theorization from movement-based scholars, it is necessary to reflect upon why, and how, interventions from these very same sites of praxis were previously foreclosed upon.

#### **UNDOING FEARS BY BUILDING HOSPITALITY IN THE SANCTUARY CITY: REFLECTIONS FROM CHELSEA, MASSACHUSETTS**

Abstract ID: 650

Individual Paper Submission

RACITI, Antonio [University of Massachusetts, Boston] antonio.raciti@umb.edu, presenting author

The notion of hospitality is central in shaping planning theories and practices focused on immigration. It has been pivotal in determining the Sanctuary City's concept enabling policies designed to welcome racial others to US cities and territories. However, the Sanctuary City concept itself has also been questioned for its problematic nature strictly dependent upon the very power sanctuaries are supposed to limit: the police power (Roy, 2019). By putting the conceptualization of Sanctuary under scrutiny, this horizon of work poses epistemological, theoretical, and

practical challenges by inviting to re-imagining the idea of hospitality and pushing for undoing structural mechanisms of oppression imbued in existing spatial arrangements for racial dispossession (De Genova & Roy, 2020).

As primary activity determining spatial arrangements, planning must be in itself under scrutiny in the Sanctuary Cities to unveil how practices of dispossession materialize, what forms of hospitality are fostered, and ultimately what type of future ought to be constructed and for whom. From this perspective, theorizations on the City of Difference (Sandercock, 2000) are helpful to explore whether mainstream planning agendas are still ingrained in the modernist paradigm and to what extent they keep cannibalizing and dismissing alternative forms of planning that have the potential to re-imagine hospitality. Especially in contexts characterized by profound difference, planning discourses and practices mainly focus on actions designed to protect the “host” from the “guest” racial other. More specifically, while urban fears perceived by the former primarily enable mainstream planning actions, fears perceived by the latter have been constantly dismissed, increasingly determining geographies of terror and exclusion (ibidem).

In this paper, I am interested in engaging with the debate on fears perceived by and alternative forms of planning enabled by cities’ newcomers to further reflect on hospitality and Sanctuary City’s concepts. I do so by drawing from in-depth interviews, community engagement workshops, and engaged learning pedagogy experiments designed as part of an ongoing research process in the City of Chelsea (Massachusetts). Historically, Chelsea represents the poster child of broken window policing and neoliberal scrutinization for space and racial control (Heatherton, 2018). A more recent history depicts Chelsea as a City going through institutional structural change through a highly collaborative city-wide civic design process (see Podziba’s interview in Forester, 2013) instrumental to fostering its Sanctuary City designation in 2007. Despite the increasing government and community efforts striving for hospitality in the renovated twenty-first century Chelsea, pervasive feelings of fear still rest and profoundly affect residents’ everyday lives.

I argue that future forms of hospitality informing Sanctuary Cities must be grounded in planning approaches intentionally engaging with cities’ newcomers’ ways of being, knowing, and acting. By using the notion of deep knowledge, alternative planning ideas, research, and practice are suggested to overcome the pitfalls of contemporary forms of inclusion of difference and diversity in the city of immigrants. I conclude by offering reflections on how renovated forms of engagement might enable the mobilization of deep knowledge, determining safe sharing spaces instrumental not only to re-imagine hospitality but to re-think planning as an empathetic and caring future-oriented endeavor.

#### MORE THAN MANAGING: PROCESSES OF URBAN DECLINE BEYOND GLOBAL CAUSES AND LOCAL RESPONSES

Abstract ID: 662

KOSCIELNIAK, Michael [Eastern Michigan University] mkoscie1@emich.edu, presenting author

Recent work by planning and geography scholars have aimed to defamiliarize urban decline and shrinking cities (Dewar & Thomas, 2012; Aalbers & Bernt, 2018). This research and analysis positions depopulation and economic instability as the consequences and challenges of neoliberal urbanization and the globalization of capital (Martinez-Fernandez, Audirac, Fol, & Cunningham-Sabot, 2012; Hartt 2018). By paying close attention to the political economy of urban decline, these interpretations and explanations have reinvigorated this once-emergent research domain (Hackworth, 2019; Berglund, 2020). Disinvestment and racist policies force municipal governments to generate and mobilize a repertoire of housing, infrastructure, and fiscal strategies to ameliorate the effects of decline and abandonment. In these characterizations, the process of decline is extralocal and the responses are local.

In this paper, I argue for a reconsideration of this scalar divide and a reflection on its consequences for planning theory and practice. Although the shrinking cities literature helped situate decline as an active and persistent process shaping neighborhoods and cities, its continued privileging of local and global scales concludes cities are in an endless state of managing outcomes and effects. This reliance on certain scales of action conceals the operations of capital (Mezzadra & Neilson, 2019). Following scholarship on the production of urban decline (Akers, 2013; Koscielniak, 2019; Seymour & Akers, 2019; Seymour 2020), I prioritize the pipelines, pathways, and practices that produce decline through the extraction of value from the built environment. Decline, in this refreshed portrayal, is not a withdrawal or absence with a spatial remainder, but a strategy and operation of capital that produces the declining city.

I draw on research from a five-year mixed-methods study of the Detroit Demolition Program (DDP) – the largest residential demolition program in American history – to illustrate the production of urban decline. Since 2014, DDP administrators and demolition contractors have collaborated to wreck over 20,000 vacant buildings. Critics have dismissed the DDP as an attempt to banish Black Detroiters and revive the city's property market for wealthy white newcomers. Boosters have insisted the DDP is an attempt to restore neighborhood stability to retain existing inhabitants. Both perspectives settle upon the DDP as a local response, albeit with different objectives, to the late capital afterlife of predatory subprime lending and foreclosure. However, by focusing on demolition supply chains and the logistical process of backfilling, I show the DDP is neither a sealing off of past decline nor preparation for a revitalized future. Rather, demolishing Detroit is local and regional operation that serves as a continuation of the production of urban decline. Planners and policymakers must view urban decline beyond scales of local and global that insist the former manages the effects of the latter. By approaching decline as a process of value extraction and a form of capitalist urbanization, researchers and practitioners can identify new opportunities to intervene in the production of urban decline.

**THE CONSTRUCTION OF UNCERTAINTY IN URBAN PLANNING: ON POWER AND HOW IT CAN BE OVERTURNED**

ENGELBERG, Daniel [Massachusetts Institute of Technology] dengelberg2@gmail.com, presenting author

Urban planning often considers uncertainty as an impersonal outside force within which communities must make decisions. The various scenario planning approaches ask stakeholders to imagine the outside driving forces and make decisions within those frames. However, if we view uncertainty as a personal affective state, we can understand how uncertainty is socially constructed and maintained. This theoretical paper asks where uncertainty comes from and how it is socially constructed. In order to this, I develop the theoretical underpinnings from the literature and bring in case studies from both professional and academic practice.

Uncertainty exists when an individual place their attention towards action and perceives a knowledge gap between what they know and what they would like to know in order make decisions. Social actors construct uncertainty by guiding attention and influencing the inherent indeterminacy of the subject of that uncertainty. For instance, individuals are socially and materially directed towards the value of car ownership. Simultaneously, maintaining access to a working vehicle is often made extremely precarious for low income communities via land use and transportation policy decision. This construction usually supports the interest of more powerful actors at the expense of less powerful actors. Financiers develop risky housing products that put individual homeowners at even greater risk. Homeowners argue on behalf of zoning that provides them certainty regarding the future of their community, externalizing many environmental quality and housing uncertainties to other communities.

This framing is not meant to remove all latent uncertainties – the exact impacts of climate change are impossible to determine and communities are wise to understand that. Rather, I highlight that social and political avenues may often exist where technocratic rhetoric obfuscates them. Where political will exists, households can be protected against uncertain impacts of climate change no matter the unpredictability of long-range climate system. Introducing political agency into the conversation also introduces the possibility for marginalize groups to wield uncertainty in their own favor. Acts of protest, contestation, and politics reject the simple certainty of a bad outcome. Actors accept the potential of downside risk – arrest and repression – in order to open up possibilities of upside opportunity – policy and structural changes. These actions also push uncertainty back up towards the more powerful actors. Political, social, and economic elites, usually assured in their position, must place their attention toward the kaleidoscopic locations of their misunderstanding.

#### PLANNING WITH RECOGNITION: THREE FRAMEWORKS TO ENSURE URBAN JUSTICE

Abstract ID: 712

## Individual Paper Submission

FRIENDLY, Abigail [Utrecht University] a.r.friendly@uu.nl, presenting author

PIMENTEL WALKER, Ana Paula [University of Michigan] appiment@umich.edu, primary author

Planning theory and practice has been constructed through a broad range of exclusions and categorizations that persist to this day, including ethno-racial disparities, migration status, family type, and gender inequalities. To address such forms of exclusion, we contribute to a debate on planning and recognition of minority rights (Fincher & Iveson, 2008). Urban planning scholars have engaged with three frameworks centered on issues of recognition: multicultural planning, human rights cities, and postcolonial planning. These three frameworks have co-existed for some time, and raise crucial questions for the future of planning theory and practice. Thus, in this paper, we ask the following question: how can planning theory and practice address forms of exclusion through recognition, and what examples from planning practice should inspire future action?

To reflect upon the challenges of planning with recognition, this paper compares and contrasts three approaches to planning theory and practice that address recognition — multicultural planning, human rights cities, and postcolonial planning — through case studies of cities in Canada and the United States. In Canadian planning practice, multiculturalism has been a key influence since the 1990s, with a range of guidelines, best practices, and case studies that have even been used beyond Canada (Qadeer, 2009). Likewise, postcolonial planning in Canada has focused specifically on indigenous planning and First Nations-settler relations (Porter & Barry, 2015). By contrast, in the United States, emerging postcolonial approaches to planning have focused on racial injustices ingrained in the spatial politics of permanent housing insecurity and dispossession (Roy, 2019). Moreover, in the United States, the idea of human rights cities has gained considerable ground in planning practice, as the country has over a half century tradition of municipal human rights commissions, especially since the publication of Rice and Greenberg's 1952 *Municipal Protection of Human Rights in the Wisconsin Law Review* (Grigolo, 2019).

In this paper, we investigate municipal ordinances and human and civil rights commissions at the municipal level that regulate racial profiling, municipal stands on immigration status, and housing discrimination. We analyse resolutions enacted by such commissions, including those on the rights of the homeless, gender neutral bathroom facilities, and indigenous-colonial settler relations, among others. Our study contributes to a growing debate about challenging exclusion and ensuring urban justice through local planning practice. We assess the complementary or contested role that multiculturalism, postcolonialism, and human rights approaches provide towards possible ways forward for planning with recognition. Although postcolonial planning is more grounded in theory and activism, it can provide insights to rethink the nature and scope of human rights issues in cities, to address the legacy of dispossession of historical minorities, while multiculturalism tends to emphasize migration and globalization. These three approaches could improve efforts to build inter-ethnic solidarity and coalition building in cities.

## LEARNING FROM MISTAKES: HOW STATE PLANNERS REFLECTIONS IMPACT THEIR APPROACH TO INSTITUTIONAL CHANGE IN MEDELLÍN, COLOMBIA

Abstract ID: 719

Individual Paper Submission

RESTREPO-MIETH, Andrea [University of Pennsylvania] andream@upenn.edu, presenting author

Reflective practice helps planners develop more robust approaches to their work by refining individual practice (single-loop learning), understanding why events unfold the way they do (double-loop learning) and thinking about how they influence the planning process (triple-loop learning) (Argyris & Schön, 1974, 1978; Schön, 1983; Wilson, 2019). Recent work has analyzed how institutions guide reflection and learning (Forester, 2018; Forester et al., 2019; Mäntysalo et al., 2018; Salet, 2018a, 2018b) yet analysis of how reflective practice impacts institutions is lacking. In other words, while it is well established that reflection is used to alter situations and improve individual practice (Fischler, 2012; Willson, 2021) little is known about how reflection is used to alter planning institutions in a more permanent fashion. How does reflective practice impact a state planner's approach to institutional change? I argue that through reflexivity, planners identify which institutional factors are impediments to improving their practice and take advantage of what I term 'simple junctures' to change existing institutions. These simple junctures stand in contrast with the critical junctures identified in the literature on historical institutionalism (Capoccia & Kelemen, 2007; Collier & Collier, 1991) and its application to planning (Sorensen, 2015, 2018). Simple junctures are also distinct from everyday processes and, as such, present key opportunities for state planners to pursue institutional change.

I build on the literature on reflective practice and historical institutionalism to analyze the actions of 23 state planners involved in the design and implementation of spatial planning interventions in Medellín, Colombia between 1990 and 2015. I trace the history of planning during this period and combine it with document analysis and semi-structured interviews conducted between 2016 and 2017. My analysis shows how reflective practice is employed to learn from mistakes, and most importantly, to analyze the institutional elements that facilitate the reoccurrence of those mistakes. The lessons drawn from those reflections are then mobilized for institutional change during simple junctures such as the implementation of a new housing upgrading program or the design stage for a new partial plan. I identify the conditions that make simple junctures more likely to lead to permanent institutional change such as a planner's ability to make explicit the link between a program's shortcomings and the institutional factors causing it. I conclude by highlighting the limitations of simple junctures in achieving broader structural transformations. Findings show the importance of training planners to reflect on both the individual and institutional factors impacting their practice and on the strategic importance of leveraging simple junctures to partially rectify conditions negatively impacting their practice.

## URBAN PLANNING AND THE CAPITALIST STATE: STRATEGIZING CONTRADICTIONS, CRISIS, AND RELATIVE AUTONOMY

Abstract ID: 721

Individual Paper Submission

BARAN, Ian [University of California Irvine] ibaran@uci.edu, presenting author

State theory has been neglected within planning theory. Yet, an understanding of the state is vital to political action and the struggle for social change. In neglecting a more robust theorizing of the state, urban planning is left with two major conceptualizations of the state. The state is either viewed within an instrumentalist approach, in which the state is a “tool” of capital accumulation, or the state has receded to the background, in which the power relations and contradictions of the state are neglected when analyzing planning. Both of these conceptualizations, present problems when identifying the ways in which planners can make actual progressive change. Marxist planning theorists tend to severely limit the agency of the planner, while the “planning as reform” theorists give too much agency to the planner or neglect constraints of their role. There is truth to both of them though. Reform-oriented planners are correct in highlighting the, however limited, agency of planners and opportunities to act for change, while the Marxists are also correct in understanding the role of planning in the capitalist state to be towards capitalist ends. Without a deeper analysis of the state and the roles of state actors, specifically planners, within the capitalist state, it is difficult to understand how planners work within the capitalist state, while maintaining agency to promote decisions that benefit the subaltern classes. Therefore, to truly understand the capacity to advance progressive change from within the state, one must continue to theorize the capitalist planning state.

This paper aims at developing a theory of the capitalist planning state through Antonio Gramsci, Nicos Poulantzas, and Stuart Hall. These three Marxist theorists provide analyses of the state which, when theorized within planning, interrogates the conditions and factors which influence the degree of relative autonomy for actors within the state as well as contributes to an understanding of the state as becoming a ground for class struggle. Gramsci’s state as organizer of capitalist fractions, elevates key concepts such as hegemony, crises, and “power blocs.” Poulantzas and Hall further Gramsci’s thought, through an understanding of the different institutions of the state as inhabiting “relative autonomy,” which challenges an economic determinist lens. Additionally, both theorize contradictions, crisis and consolidation. This allows for understanding how crisis might lead towards a moment of progressive change, but also how multiple institutions (and power blocs) consolidate into the state form and structure “common sense,” or rule. Their analysis and concepts are vital for theorizing the role and action of urban planners within the capitalist state.

This paper therefore makes two arguments. The first is that planning theorists need to advance a theory of the capitalist planning state. The second is that in doing so, we are able to map how progressive change can be enacted, even while embedded in capitalist governance. I draw on Marxist state theory to advance an analysis of urban planning within the capitalist state. Specifically I employ their concepts of contradictions, crises, consolidation, and “relative autonomy” within the discipline of urban planning. Each of these concepts helps to analyze the conditions that allow for the planner to act radically, even while embedded within a capitalist state that organizes towards capital accumulation. Through this understanding, the planner is part of an institution of the state, while inhabiting a contradictory position. This contradictory position can lead away from decisions making that emphasizes profit and accumulation, towards decisions that advance the causes of the dominated classes. The planner is entangled in the state apparatus and must be aware of how the capitalist state functions, to achieve their potential as a progressive force.

## RELIGIOUS ARGUMENTS FOR AND AGAINST PLANNING IN THE UNITED STATES

Abstract ID: 727

Individual Paper Submission

MANOUCHEHRIFAR, Babak [Massachusetts Institute of Technology] bmanouch@mit.edu, presenting author

This paper conjoins the two historiographies that often ignore one another – namely, planning history and the religious history of the United States. It probes various doctrinal schisms between conservative and liberal religionists over the role and scope of planning in the U.S: the former, for instance, reading Hayek and blending the language of civil liberties with scriptural admonitions; the latter, reading Mannheim and using the rhetoric of moral uplift for planning justifications.

This study identifies four defining moments in forging the relationship between religion and urban planning in the U.S. – namely, (a) at the birth of the planning professions during the late nineteenth century; (b) in the aftermaths of the Great Depression and the increased powers of planning during the New Deal (c) during the Civil Rights era and massive societal backlash against rational planning; and more recently, (d) in the post-Smith jurisprudential era and the past two decades of social and racial outrages.

This paper argues that, in virtually all these defining moments, urban planners have “seen” religion more through the doctrinal debates, and most through the spatial conflicts that involve elements of religion (especially zoning), and less through parallel progressive activism and calls for justice (racial, economic, and environmental) that have been in faith and tackled urban problems as issues of injustice (e.g., racism, poverty, degrading living and health conditions). The paper argues such heated theological-political debates have entrapped our disciplinary imagination into doctrinal abstractions that hang in the thin air, rather than to the emergent forms of social action that rest on firm ground.

## THEORIZING TEMPORALITY AND ‘BECOMING’ IN RURAL ONTARIO: PLANNING COMMUNITIES OF DIVERSITY AND DIFFERENCE OUTSIDE THE COSMOPOLIS

Abstract ID: 747

Individual Paper Submission

DEAN, Jennifer [University of Waterloo] jennifer.dean@uwaterloo.ca, presenting author

Over the past six decades, the settlement locations of immigrants to North America have primarily been cosmopolitan gateway cities and their surrounding suburbs. However, recent policy initiatives in Canada (e.g., federal *Rural and Northern Immigration Pilot*; *Rural Employment Initiative* in Ontario) have resulted in spatial redistributions of newcomers into smaller cities and rural towns. These changing settlement patterns are deemed necessary to mitigate the economic and social impacts of population decline prevalent in small cities and rural communities, while also addressing the barriers to successful integration facing recent immigrants residing in urban areas. These emergent trends provide new opportunities to explore issues and approaches to planning for diversity and difference outside of major urban areas with particular attention to the importance of temporality of/in the changing settlement and resettlement patterns of newcomers in Canada.

The role of time, temporality and ‘timescapes’ have received growing attention over the past decade by critical spatial scholars including those in planning (Degen, 2018; Laurian and Inch, 2019) who note: “planning...is a richly, temporal practice which has not yet fully explored the possibilities that could be opened up by adopting explicitly temporal ways of knowing and acting” (Laurian and Inch, 2019, p. 281). This paper heeds the call to more fully explore the importance of temporality in planning through a study of recruitment and resettlement of diverse immigrants into small cities and towns in Ontario, Canada. This mixed methods study draws on survey and interview data from key informants working within rural communities actively recruiting immigrant populations, as well as focus groups and interviews with newcomer populations who have or are in the process of resettling from urban into rural communities. The analysis highlights the contrast between community-based concepts of time and futurity with the personal temporal narratives and utopian visions of immigrants settling within those communities.

More specifically, the findings from staff and elected officials in rural communities illuminate how preoccupations with past timescapes (Degen, 2018) shape their plans for temporal transformations from a shrinking and stagnant community into a vibrant and ‘welcoming’ one. The temporal sense of ‘becoming’ (Grosz, 1998) is sought through social and economic policies prioritizing immigrant attraction and retention. From the perspective of immigrant participants, the promise of a previously unrealized utopian future in Canada was a primary driver for their decision to resettle outside of urban areas. Immigrants play with time in order to realize their own desire for socio-spatial belonging and personal ‘becoming’ (Grosz, 1998) in Canada.

This paper contributes to recent efforts to shed light on the role of time in planning theory as well as explore emergent issues in planning for diversity and difference (Burayidi, 2015; Qadeer, 2016). Specifically, the paper emphasizes the flexible constructions of time- slowing, pausing, speeding, imagining- that were implemented by communities seeking physical and social change towards and/or back to times of growth and vitality, and immigrants striving to settle, integrate and belong in Canadian society. The paper concludes with a discussion of what the changing settlement patterns of immigrants means for planning communities of diversity and difference outside the cosmopolis.

### **DELUSIONAL OR DISILLUSIONED COSMOPOLITAN?**

Abstract ID: 778

Individual Paper Submission

ZAMBONELLI, Vera [Hawai'i Women in Filmmaking] verazambonelli@gmail.com, presenting author

Scholarships on cosmopolitanism, multiculturalism, interculturalism abound and have similarly long advocated for the right to claim presence in the city, democratizing its spaces and engaging residents fully in civic life as subjects rather than objects. Harvey (2008) insists the “freedom to make and remake our cities and ourselves” as a human right must entail the democratic management over urban development (p. 23). An undergirding principle is the idea that every individual who contributes to urban life should have a say in its operations and planning. This principle favors lived engagement, urban dwelling in a given place over formal status, cultural identity, or group association. Yet, when the urban dweller is a migrant, their life is regulated by immigration policies that set the rules of entry and exit, and define the means the state uses to regulate migrant life. The visa allowance, duration and work permitted, length of permitted stay, entitlement to temporary or permanent residency, and the eventual entitlement to citizenship rights and political participation all create a preordained infrastructure of legality for the life of the migrant (Morawska, 2003) hampering the afflatus that the notion of the right to the city may initially prompt. How do we make sense of our normative theoretical aspirations and immigration policies’ realities? What are the theories that inform the infrastructure of legality for the life of migrants in the US? This paper through surveys, media analysis, and personal experience is an explorative study of normative theories on how to live with diversity in relation to US immigration policies and its most recent developments to understand their respective assumptions, dissociations, trajectories, and impacts on migrant life.

### **WHY DEMOCRATIC PARTICIPATION IN CITY PLANNING MATTERS: SOME DEWEYAN INSIGHTS FOR CONTINUOUS PLANNING CITIES**

Abstract ID: 854

Individual Paper Submission

WOODS, FAICP, David [City of Stamford] dwoods@stamfordct.gov, presenting author

GREEN, Judith [Fordham University] jmgreen@fordham.edu, co-author

Creating inclusive cities that are livable for all requires taking a “systems” approach to complex affordability within deeply democratic planning processes, within which “city people” work with each other and with their officials in ways that are collaborative, contributive, and educative for all participants. My thesis is that pragmatist theories of deep democracy matter in creating livable cities. John Dewey, George Herbert Mead, and their contemporary inheritors in philosophy and urban planning, such as Richard Bernstein, Judith Green, Charles Hoch, John Forester,

and Judith Innes and David Boohar offer important insights on how to more effectively develop real opportunities for a city's people to develop transformative visions and effective strategies for actualizing real and lasting change in their communities.

Deeply democratic urban planning processes must take seriously how the role of planners has changed since 1960, as outline by urban planning theorist John Forester in *The Deliberate Practitioner* (1999):

Because social planning is the guidance of future action, planning with others calls for astute deliberative practice: learning about others as well as about issues, learning about what we should do as well as what we can do. So when city planners deliberate with city residents, they shape public learning as well as public action. By sharing or withholding information, encouraging or discouraging public participation, city planners can nurture public hope or deepen citizens' resignation.

As his language suggests, Forester draws equally on Dewey's concept of participatory democracy and on Jürgen Habermas concept of collaborative deliberation. In partial contrast, as I will explain in this paper, my Dewey-inspired, public-inclusive, pragmatist planning model focuses on collaborative participatory democracy. This model, which David Woods outlined in *Democracy Deferred: Civic Leadership after 9/11* (2012) includes three key principles:

1. In contrast to contentious, anti-authoritarian models of participatory democracy, collaborative participatory democracy emphasizes among other factors the "educative function" of participatory events and planning processes, as these can affect both "ordinary" citizens and elected and appointed leaders.
2. Participatory democratic city planners place relatively greater emphasis on how specific social issues develop through direct interaction among groups and individuals, so as to produce shared community goals and values.
3. Last but not least, a distinctive feature of participatory democracy, in contrast to deliberative democracy, is concern about empowerment of citizens to develop their distinctive voices.

Building on this deeply democratic participatory planning model, we explore contemporary examples and applications of Deweyan pragmatist urban planning scholarship, which has been greatly influenced by Richard Bernstein's work. Our paper's final section will explain why democratic citizen participation continues to matter for "continuously planning" twenty-first century global cities.

#### **MAKING USE OF LOCAL CLIMATE PLANNING ACTIVISTS: SHARPENING TOOLS FOR MAPPING SHIFTS IN COST ASSIGNMENT AND BENEFIT CAPTURE UNDER ENVIRONMENTAL POLICY CHANGE**

Abstract ID: 892

TONEY, Benjamin [University of Southern California] btoney@usc.edu, presenting author

The global movement to address human-influenced climate change offers opportunities to reshape social, political, and economic practices toward mutually favorable outcomes. However, as restrictions and incentives are created toward climate objectives, new spatialities and new temporalities of difficult-to-observe costs and benefits emerge, often burdening groups and individuals that do not have the capacity to avoid exogenous cost assignment or benefit restriction. This can mean a high likelihood of resistance to climate change mitigation policies and practices that could be challenging to climate policy implementation over time, or that climate-beneficial policies may result in exacerbating structural inequality; an also less than ideal potential outcome. In advocacy planning, communicative planning, and other branches of the activist bent, a justice-oriented effort has adopted the tactic of structuring formal institutional practices of participation in which members of the public are brought into formal procedures to report useful data for institutional decision matrix consideration. While professional planners play a crucial institutional role in shaping governance and market outcomes to change the chemical and physical consequence of socioeconomic activity, there is an extent beyond which they have the capacity to observe certain fluid spaces and times. I argue that planners can also learn to read the “resistant texts” (Winkler, 2018) of groups involved in documenting and challenging local and global environmental externalities from outside the typical state-market nexus. Further, Planners can look to the efforts of both groups which self-identify with planning directly in branding as well as those which associate with planning indirectly by issue selection. Using a sample novel to the Planning academy of grant applications to the Liberty Hill Foundation in Los Angeles between 1976 and 2003, I apply case study methods using qualitative content analysis to demonstrate how progressive planning activists during that period perform discursive and spatial mapping of environmental externalities, critique and structure the cost assignment and value capture strategies for groups affected by environmental policy changes, and illustrate the complicated repositioning under environmental policy change that can create conflict between groups which might otherwise have been expected to be in justice-oriented alignment on environmental, political, and socioeconomic objectives. Lessons for institutional planning actors include an incipient method for data acquisition beyond the edges of the formal institution’s grasp, tools for understanding how environmental policies which are on average useful toward climate objectives might still create relative positions of advantage and disadvantage at local scales, and the potential for conflict resolution and preemption through communication, data documentation, and context-based scorekeeping.

**MAKING "THE PUBLIC" IN IMMIGRANT CITIES: POLITICS, THE MACHINE, AND THE STATE IN QUEENS, NY**

DEFILIPPIS, James [Rutgers, The State University of New Jersey] jdefilip@rutgers.edu, presenting author

The “public interest” is at the heart of what planners do and is enshrined in the first principle of AICP’s code of ethics. But it is obviously a concept that is loaded with ambiguity and contested meanings. This is true in any context, and neither a unitary “public” nor shared “interests” should be assumed a priori in any context. But this is perhaps particularly true in multiracial and multicultural immigrant areas where the existence of a unitary public with shared interests would seem least likely to be “a given.”

It is this lack of a unitary public in immigrant societies that has led moral philosophers from John Rawls to Michael Walzer to David Miller to advocate for strict limits to immigration. Ethnic, cultural, and racial diversity in their framings is itself a barrier to the forming of a coherent public. Mass immigration is therefore incompatible with a coherent, unitary public. Walzer’s famous line that, “to tear down the walls of the state is not...to create a world without walls, but rather to create a thousand petty fortresses” (Walzer, 1983, p. 39) is a useful expression of this thinking. And while there has certainly been significant pushback among planning theorists like Sandercock to these perspectives, they have also found support in our field among theorists like Fainstein (for whom “diversity” is clearly a problematic component of her “just city” [2010] framework). Importantly, the pushback from planning theorists such as Sandercock comes despite the fact that she shares their skepticism of the idea of a unitary public in multicultural spaces (Sandercock, 1998). Thus, for planning theorists like Fainstein the lack of a coherent public in immigrant cities is a problem to be overcome, while for those like Sandercock it is a feature of the contemporary city that is worth celebrating.

This talk takes a rather different approach to these debates. In understanding “the public” it assumes neither a shared interest nor shared identity. Instead, the public is an inherently heterogeneous and contentious realm that is produced in and through participation in public life. In a way that mirrors the old argument from democratic theory that democracy is produced through democratic practice (see, for instance, Pateman, 1970), there is no public independent of public participation (Dewey, 1927). Therefore, the questions of the existence or coherence of the public in immigrant societies becomes not a question for theory, but a question for empirical observation.

The site for these theoretically-informed empirical observations is Queens, NY. Queens is almost 50% foreign born, and is the most diverse county in the United States (Hum, *et al.* 2021). The talk focuses on three realms of formal political activity: 1) community boards, which play an advisory role in the frameworks of New York City government; 2) the Democratic political machine, which is the central player in much of electoral politics in Queens; and 3) electoral politics – at all tiers of government (from the City Council, to State Representative or Senator, to Member of Congress). It uses these three realms of public participation – and the role of immigrants in them – to argue that coherent (if always heterogeneous) publics can be, and are, constructed in the most diverse places. It further argues that we can see this not by looking to the theorists, but by looking to those that actually are constructing the publics in our cities.

## ***INHABITING DIGITAL SPACES: THE RIGHT TO THE CITY AND THE POLITICS OF MOBILITY***

Abstract ID: 933

Individual Paper Submission

NOSTIKASARI, Dian [Drake University] dian.nostikasari@drake.edu, presenting author

FOSTER, Nicole [Northland College] nfoster@northland.edu, co-author

The urban is a hybrid mixing and layering of physical and digital spaces where algorithms, visualizations, and big data contribute to produce geographies of exclusions as well as new claims, sites and strategies for political action. The Right to the City's (Lefebvre 1996) focus on the appropriation of urban space for collective use has provided a useful frame for analyzing spatial struggles in the neoliberal city. However, these interventions occur mostly at 'lived' spaces, serving as dialectical openings for reimagining a just city. Increasingly, cities are constructed through visual technologies, which hold particular power in establishing legitimacy to policy-makers and the public. Space is often produced digitally before it is produced physically as experienced/lived infrastructure through conventional visualization methods such as mapping, as well as methods emerging out of a "new era in real-time data visualizations, models, path-finding algorithms and Pokémon" (Madden 2014: 479 in Shaw and Graham 2017). This raises the question on whether the right to the city must now include an "informational right to the city" (ibid). An "informational right" is especially crucial in transportation planning where planners and engineers rely on specific technologies (e.g. modeling) in conceptualizing transportation spaces. However, these methods 'black box' knowledge so residents only have access to inputs and outcomes. As such, this paper seeks to investigate how the Right to the City can be broadened to include how residents might appropriate both conceptual and lived transportation spaces in order to produce just outcomes. This paper addresses the following questions: (1) What are the mechanisms through which space is conceived, perceived, and lived through the lens of transportation planning?; (2) how might claims for technical information challenge dominant transportation policies and spatial production?; (3) how might participants inhabit these conceptual spaces enabled by technologies?

The article utilizes a case study approach with a focus on mobilization around opposition to highway expansion in two Texas cities: Dallas and Houston. Both metropolitan regions in Texas are well-known for their sprawling cities and high private car dependency. Using textual analysis, the study reviews news articles, social media, and documents from TxDOT's public participation process. While the Dallas case finds ground in a coalition of professionals, residents and other stakeholders by challenging assumptions built into the justification of proposed projects, the Houston case demonstrates the role of advocacy in mobilizing protests and expertise to produce alternative forms of knowledge and claims to space. Both cases challenge assumptions about how transportation 'needs' are often determined in conceptual planning spaces and attempt to halt the trajectory of highway projects by enacting alternative forms of citizenship and ways to claim rights to spatial justice. We then explore how these claims are grounded in specific sites and places, yet intertwined with issues of climate justice through localized practices for the purpose of reducing greenhouse gas emission, broadening sustainability frameworks, and conceptualizing perceptions of residents' needs including "those on the wrong side of digital divides" (Schwanen 2019: 7). Challenging the legitimacy of institutionalized knowledge production consequently forms part of a larger claim to the right of the city.

## THE PROMISE OF PLANS: AFFECT, DESIRE, AND COLLECTIVE FUTURES

Abstract ID: 943

Individual Paper Submission

DUNN, Peter [University of Washington] ptdunn@uw.edu, presenting author

This paper uses the idea of “promise” to examine the affective dimensions of plans. A promise connects visions of a shared future with a subjective experience of desire in the present. Planning’s promises are well known: sustainability, equity, community, efficiency, and prosperity are among those most commonly found in plans’ imagined futures. While planning is replete with stories of failed promises and unrealized plans, the question this paper follows is not how they fail, but how the promise itself nevertheless survives. Inspired by studies of technologies that retain their persuasive power in the imagination despite their shortcomings in actuality, I argue that a plan works by mobilizing the affective orientations of those with the power to continually produce, maintain, and repair its promise. Planning scholarship has a long history of critically examining the contents of its utopian visions and the value-laden processes by which they are created, but far less attention has been given to theorizing the performativity of plans. In other words, building on Sara Ahmed’s (2010) examination of the “promise of happiness,” this paper asks not what plans’ promises *are*, but what they *do*.

My empirical basis is a study of transportation planners’ recent engagement with new mobility technologies, specifically emerging app-based ride-hailing and shared mobility services. Led by major tech companies and their investors, these new interventions in urban transportation promise reduced traffic congestion and emissions, greater mobility equity, more efficient policy supported by big data, and even the fun and freedom of travel. Although they do not endorse these pitches wholesale, planners and policy-makers co-produce these promises in their implicit and explicit visions of future urban mobility. Qualitative data drawn from stakeholder interviews, municipal regulations, industry conferences and publications, and documentation of mobility software development shows how subjects’ present desires and actions are co-constituted with an anticipatory orientation to mobility promises. In doing so, I illustrate how plans work by mobilizing affect.

My examination of this dynamic draws on two related literatures. The first is Ahmed (2010) and associated work in affect theory, which helps us to see promises in relational terms driven by desire. The promise has no inherent power, but works because it resonates with some already existing orientation of the subject to the promised object as good. The second is literature from technology studies on the on the “mythologies” (Mosco, 2004) and “imaginaries” (Jasanoff, 2015) that animate techno-utopianism. In these historical and contemporary accounts, visions of technological futures offer escape from mundanity and messiness of the present with the promise of transcendence. Each of these literatures helps us to see planning as operating not just rationally, but affectively.

This paper engages and extends recent theorizations of affect in geography (Anderson, 2014) and planning (Marotta & Cummings, 2019) to examine the “promising” work of new mobility plans. Specifically, I examine the role of the promise a mechanism for ordering the future and reducing the discomfort of uncertainty as well as the resulting bracketing of politics and difference. I find that plans, like many sociotechnical imaginaries, have an inherent conservatism in that they are most charismatic when they affirm pre-existing values and worldviews. I conclude by arguing that to realize radical transformation requires turning to the mess of the present rather than the promise of the plan.

## RE:CODE L.A.: RE-ZONING THE DEMOCRATIC-CAPITALIST CITY?

Abstract ID: 987

Individual Paper Submission

MAHAFFEY, Nathan [University of California Irvine] nmahaffe@uci.edu, presenting author

Los Angeles presents a critical case for studying the political economy of urban development to understand the politics and practices of re-zoning the democratic-capitalist city. Although zoning codes are intended to regulate urban development to produce a ‘good city’ for all, empirical research explains how zoning can create or reinforce a system of social and economic inequality. The forces that shape urban development have been explained from the perspective of economics (Harvey, 1985) and governance regimes (Stone, 1993). The role of city planners in this process has been described as mediating the public and private interests (Foglesong, 1986; Friedmann, 1987), however, less is known about how they mediate the tensions between economic and democratic interests in practice. Debates around zoning are centered on historically negative outcomes of zoning such as redlining, racial segregation, gentrification, and urban sprawl (Rothstein, 2017; Stein, 2019). Scholars also study zoning innovations and disagree on the potential for improved outcomes (Carmona, 2009; Moroni, 2010). What is currently understudied is the blurring of public and private sector planning practices in producing zoning codes. More research is needed to understand how these evolving practices are influenced by contemporary forms of democratic governance and the changing role of planning expertise and discretion.

The research approach is an in-depth case study of “Re:Code L.A.,” the City of Los Angeles’ reform of its zoning code. The project began in 2013 and is the first comprehensive redesign of the zoning code since 1946. Los Angeles is a complex and diverse city with a history of urban development influenced by powerful political forces. From financial and business interests to homeowner associations, these powerful coalitions influence zoning and urban development that produces benefits for some while excluding or marginalizing others. This research examines the social and technical process of creating the new zoning code framework, addressing the critical need to understand the current politics and practices of zoning in Los Angeles. The case represents a multifaceted process, characterized by fuzzy boundaries between the phenomenon and its social context. Therefore, the study is conducted using a single embedded case study design (Yin, 2014) guided by a set of theoretical propositions and exploring the relevance of alternative explanations. The research is guided by scholarship suggesting how the role of planners is affected by the need to manage contradictions between economic interests and democratic legitimacy. However, the analysis will also respond by further analyzing how the new tools and practices of public-private planners are used to both mediate and affect the outcome based on professional norms and values.

Qualitative methods of semi-structured interviews, content analysis, and indirect observation are used to answer the following research questions: (1) How do governing coalitions influence the shaping of the Re:Code L.A. project? (2) How does the participatory planning mechanism frame citywide democratic representation? (3) How do public and private sector planners mediate competing interests while developing strategies for the new zoning code? Analytical techniques of process tracing and discourse analysis are used to understand how different actor groups contribute and interact throughout the process of creating the new zoning code. This methodology reveals how

individuals use language to produce spoken or written text, but also how individuals or groups then interact with and create new meaning with that text. Collectively, the analysis of the socio-political process and the planning content of the new zoning code seek to identify theoretically generalizable patterns from the literature and explain how they function in this particular case.

#### TOWARDS A MORE ENCOMPASSING INDIGENOUS PLANNING PARADIGM

Abstract ID: 1001

Individual Paper Submission

MILLS-BOCACHICA, WANDA [InFusion, An Indigenous Research Organization] wmbconsulting@gmail.com, presenting author

A Thousand Roads video production on Native American peoples reads: "Though we journey down a thousand roads, all our roads lead home." Conversely, a quote from C.S. Lewis in "The Pilgrims Progress" declares: "One road leads home and a thousand roads lead into the wilderness." Both quotes provide valid cosmological views: one is philosophical and the other is more practical. Both phrases, however, offer alternatives based on a range of needs and preferences. Notwithstanding the travel options, one road eventually leads to the destination, home. "Home," in this case, is the Indigenous Planning paradigm. Augmenting its umbrella function could ably support the coexistence of the various Indigenous Planning models. This includes establishing a toolbox of research methods that extend to the Humanities and the Arts fields. The success of the Medical Humanities inspires similar opportunities for Urban Planning theory and practice where Social Sciences, Arts, and the Humanities methods can coexist under the realm of the Indigenous Planning paradigm. Over the years, researchers have introduced a variety of Indigenous Planning models. Distinguished Professor Ted Jojola first articulated the term Indigenous Planning between 1975 and 1982 through his graduate research products at the MIT and the University of Hawaii. His interests in Environmental Design and Political Science led to his focus on land tenure, physical planning and design, and the formation of proactive development practices for disempowered land based indigenous societies by transmitting the Seven Generations model from the past to the future. In 1987, *Planning Magazine* featured the Buffalo Commons model by Deborah and Frank Popper with the subtitle, "A Daring Proposal for dealing with inevitable disaster." The latter phrase addresses to the "boom and bust" culture of the Great Plain regions where mostly Whites and Native Americans became active contributors to the Great Plains Restoration Council and the Intertribal Bison Collective, as inspired by traditionally sustainable environmental models. This 1980's movement coincided with the Creole Planning movement which was formed by a group of environmentalists and urban planners the French Antilles as they mitigated European development impositions on the local culture. An enduring manifesto of this movement is found in the award-winning novel, "Texaco." By 1992, a group of MIT graduate students best articulated the essence of the Indigenous Planning paradigm; as they focused on urbanized, but rooted urban people of color including Blacks, Asian Americans, Latinos, and others. Urbanist Clyde Woods addressed on poor rural populations in the Mississippi Delta region, and particularly African American populations,

as he interpreted the meanings of the longstanding protest traditions as found in song lyrics. Also emerging from the UCLA School, Professor Leonie Sandercock spearheaded a convergence between the indigenous lens of Australian people and the Native Americans in Canada. Some addressed environmental and identity politics, others mediated differences among hybrid cultures and belief systems in the face of modernization and historic preservation practice. Addressing housing, economic, social or health and healing challenges among diverse people could also be defined by the Indigenous Planning paradigm. Unfortunately, it taken more than a generation for the various Indigenous models to be fully recognized by Urban Planning profession, as anticipated. A more complex reading of historic migratory patterns and place; longstanding populations whose values and preferences may differ from the experiences of mainstream U.S. Americans; recent immigrant settlers and communities; and deciphering rooted cultural and spatial practices that are found among people of all races. Together, these could provide a broader range of tools under the Indigenous Planning paradigm for interpreting hybrid urban conditions and the interwoven nature of urban and rural ways of knowing in contemporary societies.

#### THINKING THROUGH NONHUMAN TO RE-THINK PLANNING

Abstract ID: 1005

Individual Paper Submission

BASNET, Vinisha Singh [University of Illinois at Urbana-Champaign] vbasnet2@illinois.edu, presenting author

The postcolonial-southern turn in planning exposed the hegemonic ways of seeing upon which the established traditions of planning are based. This has opened a fertile space of theorizing planning from the South. My argument is that although the southern turn has shifted the locus of planning from ‘some humans’ to ‘other humans’, it has not given sufficient attention to a fundamental coordinate of the postcolonial condition – the nonhuman. The paper reads the COVID pandemic as a symptom of the unsustainability of an economic rationality that historically emerged out of a distinctive alignment of the human with the nonhuman. It was the import of this economic rationality based on a specific arrangement between the human- nonhuman, that became the central premise for what we understand as colonialism, imperialism and globalization.

Given this, I propose that thinking through the question of ‘nonhuman’ in planning should be a key theoretical standpoint for the postcolonial-southern turn. After discussing a few traditions that have tried to address the nonhuman, I propose that one must learn to navigate through these multiple epistemologies, which may often be in conflict. I do this, by illustrating my 2.5 years of research work in central India with the indigenous communities. Through multi-sited ethnography and participatory action research my work inquires factors attributing to the vanishing insect population. Rearing *Kerria lacca* (an economically important species) is one of the main livelihood source of many indigenous, forest-dependent-communities in central India (Sharma et al., 2006), and its diminishing population from the nearby forest has been a serious threat to that source of livelihood. As a result of engaging with multiple epistemologies I propose an action plan, called Living Brood Lac Bank (an in-situ germplasm repository of *Kerria lacca*) to strengthen the livelihood source of the local communities. The paper concludes with the ethic of epistemological convergence on which the possibility of planning diverse sustainable future(s) holds, and which may

even help us rethink and replan our approach towards catastrophes like covid itself.

#### STRATEGIC FORESIGHT AND INNOVATIVE CODESIGN APPROACHES IN MUNICIPAL ORGANIZATIONS: TOWARDS A REGENERATION OF URBAN PLANNING ROUTINES?

Abstract ID: 1061

Individual Paper Submission

LAVOIE, Nicolas [Universite de Montreal] nicolas.lavoie@umontreal.ca, presenting author

ABRASSART, Christophe [Université de Montréal] christophe.abrassart@umontreal.ca, co-author

SCHERRER, Franck [Univiers] franck.scherrer@umontreal.ca, co-author

#### Central theme

Cities will face increasingly complex challenges (carbon neutrality, resource optimization and circular economy, governance of artificial intelligence, environmental inequalities). The practices of collaboration substantiated by urban planners have not been able to solve the problems of the last decades related to urban sprawl, the overuse of the private car, the degradation of living environments, etc. In this community of urban planners, there is a traditional routine of the “good urban project”, a dominant rule-based design applied in a similar way from one project to another. This traditional routine, however, may be insufficient to design urban objects in the cities of tomorrow. Moreover, the growing gap between contemporary issues and professional capabilities questions the methods and tools of collaboration and calls for a paradigm shift. In this respect, the way “urban planning” is driven in North America will be able to constitute a “new” mode of implication for better targeted effects in time and space.

Thus, everything suggests that these routines must be renewed. What could be the characteristics and effects of innovative design routines in municipal organizations and how do they complement existing rule-based design routines? This communication wishes to present a specific way to address this challenge from an experimentation conducted in Montreal, Canada.

## Methodology

This project was conducted as an intervention research (IR), a field-oriented methodology with an experimental logic. IR approach implies the involvement of researchers in exploring new problem-framing and surprising solutions with planners and stakeholders. Tangibly, the IR takes the form of concrete methodological tools, notably the Diagnostic-Knowledge-Concept-Proposition (DKCP) tool.

This disruptive design tool was used in Montreal, in order to bring out a completely renewed proposal of a vast underused park. This reflection aimed to regenerate the traditional identity of an urban park, within the framework of the implementation of a master plan, through the formulation of new development prototypes. We use this approach to preparing a master plan as an experimental ground to explore the implications of the use of the DKCP tool.

## Findings

The traditional planner's routine generally focuses on a single activity in the process, the formulation of propositions (Phase P), by slightly adapting former planning to the local context and rules. However, the future urban planners' routine should include new capabilities for managing upstream stages of planning in the form of a succession of DKCP phases.

Thus, traditional urban planning routines can be complemented by innovative design routines to create disruptive effects and explore unprecedented dimensions of urban projects. This will prove difficult in municipal organizations. Imagining new urban objects or designing new routines needs specific pilot projects and implies acceptance of uncertainty. However, municipal organizations rarely allow a right to error, even with regard to innovation.

It may also be necessary to step back from territorial and spatial constraints - a process we call "deterritorialization". This could help to better explore the "field of breaks and possibilities". Otherwise, spatial constraints act as cognitive fixations that limit the expansive thinking of urban planners – in the study case, the future uses of an urban park.

## Relevance of research

This communication provides a reflexive look at how urban projects are driven by a "researcher planner". This research offers the opportunity to review the scope of these practices in a real-life situation. Through the mobilization of new knowledge, disruptive and surprising concepts are produced. The need to tackle the complex challenges of the 21st century city opens the way to a new professional identity: the "innovative urban planner".

Participants will also discover the value of prospective and innovative codesign as a mechanism for co-designing solutions with stakeholders.

## COMPLEX SYSTEMS AND URBAN PLANNING, OR, THE PERSISTENCE OF TECHNOCRATIC PLANNING

Abstract ID: 1087

Individual Paper Submission

ZIGMUND, Stephen [University of Texas at Austin] stephen.zigmund@utexas.edu, presenting author

In a discipline marked by numerous specializations and antagonistic research approaches there is nevertheless a consensus that the rational planning model of the 1950s and 1960s was a dramatic failure. Contra rational planning, contemporary planning approaches now see cities as complex interacting systems generating wicked problems which resist prediction and general theorizing. Planning then should respect the capacity of cities and people to adapt to changes by removing undemocratic processes and other bureaucratic barriers preventing the emergence of great places and novel local solutions (Innes and Booher 2018). Yet rational planning persists, with popular contemporary planning strategies such as smart cities, urban scenario planning, and new urbanism all criticizing the top-down rigidity of rational planning as a major barrier to addressing urban problems today (Townsend 2013; Goodspeed 2020; Talen and Ellis 2002). But, if rational planning was a disaster and contemporary approaches overwhelmingly reject its assumptions, why has it persisted (even if just as something to be replaced)?

Taking this seeming paradox as a starting point, this research attempts to answer the following question: does this new, complex systems theoretic understanding of planning differ (epistemologically and ontologically) from the rational planning model that it explicitly rejects? At stake here is an attempt to determine whether a planning grounded in complex systems theory actually moves the discipline beyond technocratic, rational planning, or alternatively, facilitates it.

As an examination of the history of contemporary planning strategies will show, breaking with rational planning is not so simple as rejecting its rigid, “top-down” approach. A genealogy of the theories behind urban operating systems of smart cities, the techniques of urban scenario planning, the assumptions behind the form-based codes of new urbanism reveals that all developed out of the cybernetic systems thinking of the post-World War II period that gave rise to planning as a rational, technocratic activity in the first place (see Light 2004).

To explain how contemporary approaches rejecting rational planning could emerge from the same cybernetic paradigm, a more nuanced understanding of rational planning is forwarded, both to better account for the knowledge of cities and planning it produced, and how this knowledge was made actionable for planners. Through analysis of postwar publications in the *Journal of the American Institute of Planners*, early editions of *Urban Land Use Planning* (planning's first textbook), and major critiques of planning in the 1950's and 1960s (ex. Jane Jacobs and Ian McHarg), the points of contact and translation between cybernetics and urban planning are traced to account for the shared rationality that supports both rational planning and contemporary complex systems approaches. This understanding is necessary if we are to properly evaluate claims that complex systems theory provides planning with a transformative alternative to rational planning approaches to infrastructure, land use and transportation, and urban design (see Goodspeed 2020; Talen & Ellis 2002).

## **PATRICK GEDDES MEETS ELINOR OSTROM: URBAN AND REGIONAL INTERRELATIONSHIPS AS SETTINGS FOR COMMON-POOL RESOURCES**

Abstract ID: 1115

Individual Paper Submission

STERNBERG, Ernest [University at Buffalo, The State University of New York] ezs@buffalo.edu, presenting author

Elinor Ostrom's highly influential Nobel Prize winning on common-pool resources has vast consequence for environmental policy and even, as is more recently being recognized, to various branches of urban physical planning. Ostrom built legitimacy for her idea in a prolonged debate with microeconomic theories of market failure.

She explains her concept in ongoing challenge to concepts of public goods originally defined by economist Robert Samuelson as "goods" (like national defense) that are non-excludable, in that beneficiaries cannot be excluded from it, and non-rival, in that many beneficiaries could consume it at the same time. "Common-pool resources" are also non-excludable, in that users or land owners cannot be excluded from taking advantage of it, but also rivalrous, in that one's use of the resource can reduce others' value from it. For example, landowners (in the absence of public regulation or community pressure) cannot be excluded from covering their land with impervious surfaces, but excess imperviousness will ultimately create rivalrous, harmful mutual effects through deterioration of surface water flows. Since Ostrom's work begins with traditional microeconomic concern with goods, it does not sufficiently address a critical question: what is it about certain resources that determines their relative excludability and rivalry? This paper seeks the answer in the classical planning tradition that starts with Patrick Geddes, and continues through Jaqueline Tyrwhitt, Ian McHarg, and more recent planners. They have sought to explicate the territorial, ecological, and urban infrastructural interrelationships that degenerate through dispersed, atomized interferences. Whereas Ostrom's work has generally been used to propose institutional frameworks for regulation and management of resources, the classical comprehensive planners have instead sought ways of making regional interrelationships intelligible, to facilitate planning, understood as the search for comprehensive insight. This paper will seek a fruitful conversation between Geddes' and Ostrom's seemingly contrasting, yet highly compatible, intellectual legacies.

An understanding of community resilience can lead to better policies and decisions that are designed to achieve community resilience goals. The Interconnected Networked Community Resilience Modeling Environment (IN-CORE) is an open source platform developed by the Center for Risk-Based Community Resilience Planning, a National Institute for Standards and Technology (NIST) funded Center of Excellence (COE). The COE strives to improve community resilience to natural hazards through planning. Tools, such as IN-CORE, help to understand how hazard events impact communities. Communities achieve resilience when individual and household needs are equitably met through functioning physical and social systems. NIST (2016, 14) defines social institutions as “a complex, organized pattern of beliefs and behaviors and can include family, education, government, religion, or economy, each of which is overlapping and interdependent. The purpose of social institutions is to meet the basic individual and household needs.” Social institutions at the community level may include healthcare, education, business, and government which are dependent on the performance of physical infrastructure systems. The inclusion of social institutions within complex systems models will improve the assessment of policies considered in resilience planning. To develop models grounded in theory, this poster presents findings of a systematic literature review and theory construction that contributes to unifying the theoretical constructs of community capitals (Flora, Flora, and Gasteyer, 2016), Maslow’s hierarchy of needs, resilience, disaster phases, event trees, and social vulnerability within a theory of social institution resilience.

Our approach focuses on three case studies that highlight the role of healthcare and education for community resilience. While education and healthcare play an important role, the proposed theory transcends these two social institutions and should apply to other social institutions, whether an individual organization, a network of organization, or a network of networks. A systematic literature review, guided by Xiao and Watson’s (2019) eight steps, was conducted for each case study. The systematic literature review process emphasized efficiency and replicability in order to improve the quality, reliability, and validity of the findings. Innovative tools to search, collect, review, and analyze the literature were utilized along with the qualitative content analysis software Atlas.ti and python coding in Google Colab notebooks (Rosenheim et al., 2020).

The proposed theory of social institution resilience will help planners recognize the “signal in the noise” of data. Findings suggest that the significance of community capitals depends on disaster phases. Models of social institutions that meet basic needs may include fewer community capitals and less complex event trees and models of social institutions that meet higher needs require more community capitals and complex event trees. Additionally, findings reinforce the importance of longitudinal data that follows the social vulnerability theory of community resilience after a disaster. Models of social institution resilience that help organizations understand the disproportionate impacts to and slower recovery of socio-economically marginalized populations will support equitable decisions relevant to community partners. This research reinforces the importance of planning theory for understanding complex systems and the value of theory to direct research and guide decisions about model assumptions.

## ROUNDTABLES

### 14.54 ROUNDTABLE - BEYOND THE LOCAL: A CALL-TO-ARMS FOR PLANNERS TO DRIVE NATIONAL URBAN POLICYMAKING

Abstract ID: 54

RANDOLPH, Gregory [University of Southern California] grandolp@usc.edu, moderator  
STORPER, Michael [University of California, Los Angeles] storper@ucla.edu, participant  
CURRID-HALKETT, Elizabeth [University of Southern California] currid@price.usc.edu, participant  
FAINSTEIN, Susan [Harvard University] sfainstein@gsd.harvard.edu, participant

Planners tend to think and work at the scale of the neighborhood and city. Yet a wider analytical lens, focusing on extra-local forces, is essential to understanding contemporary urban problems. For example, over the past four decades, globalization and deindustrialization have produced new forms of inequality in our cities and regions—leading to highly polarized labor markets in “superstar cities” and chronic decline and disinvestment in many former industrial hubs. These patterns shape the political and policy contexts for economic development, housing, transportation, and many other urban planning domains. Similarly, while climate change, financialization, racial inequality, incarceration, and the Covid-19 pandemic all manifest locally in communities and cities, they are challenges that are difficult, if not impossible, to address through local policy alone.

Planning rightly embraces local, community-based action, and many academic planners call attention to systemic roots of local and regional problems. Yet in practice, planning rarely seeks to change extra-local forces through policy activism at higher levels of government. Planning, we argue, has ceded much of this ground to other fields, primarily economics. As a result, planners are largely absent from national policy conversations around issues that directly implicate cities. Not only does this reduce planning to a “fire-fighting” role, reacting to policy decisions from higher levels of authority; it also deprives national urban policymaking of the holistic, place-based approach to human development, where planners have great experience and expertise. This situation, of course, is neither an accident nor a strategic misstep by planners; it is the result of decades of federal government disinterest in comprehensive urban and regional policy, abetted by the broader neoliberal retreat of the state. However, the present moment of crisis, alongside a renewed focus on governance in Washington, D.C., may offer a once-in-a-generation opportunity for planners to reassert themselves in national policymaking. The challenge is a big one, because so much of the policy that affects and constrains cities and regions comes from agencies other than the Department of Housing and Urban Development, and the federal government is an extremely complex structure. Moreover, planning departments are no longer turning out large and effective cadres of future national policymakers, implying a major curricular effort.

Against this backdrop, this roundtable discussion will engage its speakers and the audience in the following questions:

How do we inculcate an appreciation for extra-local forces in planning research, practice and education? How do we inspire urban planning students to act in, but also beyond, the city?

To what extent are planners at the table in designing national policy solutions to our most difficult urban and regional challenges? How can we enhance the role of planning in policy design and implementation at the federal level?

What are the issues on which the planning field could most effectively assert a more prominent role in national policymaking?

## **INDIVIDUAL PAPER SUBMISSIONS**

### **ARE "DESIRABLE" CITIES REALLY SO DESIRABLE? METROPOLITAN CHARACTERISTICS, LIFE SATISFACTION, AND SUBJECTIVE WELL-BEING IN THE U.S.**

Abstract ID: 52

Individual Paper Submission

MORRIS, Eric [Clemson University] [emorri7@clemson.edu](mailto:emorri7@clemson.edu), presenting author

This paper examines the links between subjective well-being (specifically life satisfaction) and indicators of U.S. metropolitan area (MSA) "quality." These include population density, a leisure/cultural opportunities index, the violent crime rate, an index of climate favorability, racial/ethnic diversity, median metropolitan income, a cost of living index, an index of air and water quality, spending on the school system (reflected by the student/teacher ratio), the quality of the healthcare system (reflected by physicians per capita), and political affiliation (percent voting Republican in the last presidential election, which I take to be a proxy for local government policies such as environmental regulations, tax levels, and the extent of the social safety net). It uses well-being data from the American Time Use Survey married to data on metropolitan area characteristics drawn from two compendia of statistics on MSAs: *Cities Ranked and Rated* and the *Places Rated Almanac*. In addition to controlling for individual demographics, the analysis uses mixed-effects linear regression to reflect the impact of unobserved metropolitan area characteristics. A number of findings are of note. First, very little of life satisfaction is explained by the MSA in which one lives. Compared with a model which includes only individual demographic characteristics, the addition of 10 MSA-level variables raises the r-squared statistic only from .152 to .155. Further, the intraclass correlation coefficient (ICC) shows that there is almost no particular correlation of life satisfaction scores within MSAs, again suggesting that MSA characteristics have very limited association with life satisfaction. Theory and empirical evidence on MSA location decisions suggest that self-selection and sorting are unlikely to have caused the finding that life satisfaction largely evens out across MSAs. Second, despite a large sample size, only three of the MSA characteristics are significant in my preferred model. The most significant is median MSA income, which has a negative association with life satisfaction. Racial/ethnic diversity is significantly and negatively associated with life satisfaction, and a favorable climate is positively and significantly associated with it. Prior literature establishes that all three of these relationships are highly plausible: being surrounded by those with higher incomes makes people feel poorer; places with more diversity often have less sense of community and social capital; and prior empirical evidence establishes that people are happier in places with a better climate. In another exploration, I performed a principal components analysis to reduce dimensionality and multicollinearity among the independent variables. The results show that a package of characteristics associated with large, coastal cities (such as New York, Los Angeles, and San Francisco), including high density, high diversity, Democratic politics, high incomes and cost of living, good aesthetics, and greater use of alternate travel modes (e.g., walking, transit) are associated with significantly, if modestly, lower life satisfaction. At the same time, a package of characteristics typical of California's Central Valley and the Texas-Mexico border, including high diversity, low incomes, a favorable climate, high crime, poor aesthetics, and a high student/teacher ratio is associated with significantly higher life satisfaction. This counterintuitive result suggests that, all else equal, people may be somewhat less satisfied with life in highly "desirable" MSAs than might be supposed, and, conversely, may be more satisfied than expected in MSAs many might consider less desirable. While clearly we should not strive to make our cities poorer and less diverse, policy recommendations include

reducing income inequality to lessen feelings of deprivation resulting from people comparing themselves to wealthier others, and educational and cultural programs to increase appreciation of the merits of diversity.

#### **REGIONAL GOVERNANCE IN THE OREGON COAST TRAIL: IDENTIFYING METAGOVERNANCE CAUSAL MECHANISMS IN PRACTICE**

Abstract ID: 154

Individual Paper Submission

GRISHAM, Cole [FHWA] grishamn@gmail.com, presenting author

This paper is an investigation into the causal mechanisms of metagovernance formation and operation in the context of the Oregon Coast Trail regional planning process. Oregon has considerable experience with regional governance as well as a long history of planning for bicycle and pedestrian modes. But these experiences are primarily concentrated in urban contexts, such as the Portland metropolitan area, and focused on land use and growth management. The Oregon Coast, by contrast, is a mixture of rural public lands and small communities, linked together by their primarily tourist, recreation, and ocean resource economies.

The Oregon Coast Trail is a collection of trail systems linking these lands and communities. While declared 'fully hikeable' in the late 1980s, the reality has been that around 30 trail segments throughout are incomplete, unsafe, or underwater at high tide. No individual city, county, or agency is capable of completing the entirety of the trail but each see the value in a coordinated response to their regional infrastructure. How then can these diverse agencies address what is essentially an infrastructure collective action problem? To address the Oregon Coast Trail collective action problem, a coalition of local agencies, tribes, state agencies, the federal government, and other key stakeholders are pursuing a regional collaborative governance framework for long-term trail wide management. This represents a 'metagovernance' challenge, whereby specific actors coalesce to develop new norms and practices for organizing long-term governance institutions.

In this paper, I examine these questions and issues in three parts. First, I provide the recent history of the OCT Action Plan development, including the key actors, utilizing primary documents from local, state, and federal agencies. Second, I examine relevant literature to identify governance characteristics that may help explain policy processes for multijurisdictional planning issues. Lastly, I craft a causal story based on the governance characteristics identified that helps explain the OCT Action Plan development process. Within the causal story, I identify actors that serve as 'metagovernors' in the regional planning process, or those individuals steering, shaping, and informing regional governance processes. The intent of the causal story is to both develop a theoretical framework for understanding multijurisdictional governance and inform future research. In closing, I reflect on the original metagovernance questions and offer possible avenues for future research.

The implications for future scholarship and practice of this paper are primarily emphasizing the role of ‘orders’ of metagovernance systems and how they influence one another in practice. First order governance refers to the day-to-day operations of a governance system (such as regular trail maintenance). Second order governance refers to the institutional structures managing the first order (such as memoranda of agreement on which agency will maintain which part of the trail). Third order governance refers to the development of governance norms in abstract that inform how second order governance systems form. For both scholars and practitioners, recognizing which actors is operating in which order and at what time is imperative for understating how policy is developed, by whom, and to what effect. Similarly, the metagovernance dynamic described enables both scholars and practitioners to better articulate where institutional power resides, how it is used, and where equity-based improvements to our planning system might occur.

#### **PUBLIC POLICY AND THE FATE OF HISTORIC TOWNS IN DYNAMIC METROPOLITAN PERIPHERIES**

Abstract ID: 164

Individual Paper Submission

ADHIKARI, Sarin [L. Douglas Wilder School of Govt. and Public Affairs, Virginia Commonwealth University]  
sadhikari@vcu.edu, presenting author

ACCORDINO, John [Virginia Commonwealth University] jaccordi@vcu.edu, primary author

Historic towns on the periphery of US metropolitan areas face existential threats from sprawling growth and increasing concentration in the retail sector, especially internet retail. They may be able to avoid becoming subsumed in sprawl and play new roles in the regional economy (e.g. as telecommuting centers), if they can strike a balance between the spatial demand of new uses and preservation of the town’s historic fabric, and if regional growth does not undermine their distinctiveness. Indeed, some observers (e.g. Wagner, 2020) see in the current COVID pandemic an opportunity for such towns to assume roles in the digital economy. Others (e.g. Simon, 2020) see primarily only retail decline. Regardless of the impact of COVID, metropolitan expansion and retail restructuring are likely to continue.

How will state, county and local policy help to shape the outcomes of structural change for historic towns in the metropolitan periphery? Critical analyses of the implementation of smart-growth policy in Maryland by Lewis et al. (2009) and Ali (2016), for example, suggest that a strategic vision that is consistently implemented by the state, counties and towns may be an optimal way to concentrate development and limit sprawling growth. Such a regime may also enable historic towns in the metro periphery to retain both their character and economic viability. Yet growth management through multi-level policy alignment and implementation is not the norm in the US. (See Downs, 2007, for example.) What other combinations of state, county and town policy might effectively promote both the economic viability and historic character of towns in the metro periphery?

In this paper, we present the results of an exploratory study of this question. First, we show the results of qualitative case studies of several historic towns that led us to posit three ideal typical scenarios: (a) Subsumed in Sprawling Growth, (b) Self-Contained Historic Oasis, and (c) The Cool and Connected Historic Town. We used these ideal types to construct a national survey of historic towns in US metropolitan peripheries. Second, based on the 133 responses we received to this survey (conducted January through March 2020), we examine the impact of town, county, and state policies on the economic viability of, and threats to, these historic towns, as perceived by their Main Street program directors. Third, for 15 of these cases, we report our analyses of state and county land-use and strategic plan documents relevant to, and interviews with selected public officials on, the roles and potential of historic towns in the metro periphery, as reflected in public policy.

We conclude by identifying the economic, spatial and policy factors that may determine the direction of change for historic towns in metro areas – toward Subsumed in Sprawling Growth, Self-Contained Historic Oasis, or the Cool and Connected Historic Town.

#### RESEARCH ON THE EVOLUTION OF URBAN FORMS IN CHINESE METROPOLITAN AREAS : BASED ON THE COUPLING PATTERN BETWEEN BEIJING'S TRANSPORT NETWORK AND LAND-USE

Abstract ID: 243

Individual Paper Submission

YAN, li [School of Architecture, Tianjin University] 630427791@qq.com, presenting author

REN, Lijian [School of Architecture, Tianjin University] renlijian@126.com, co-author

WEI, Shuang [University of Southern California] shuangwei@usc.edu, co-author

In the past 20 years, China's urbanization has entered a stage of rapid development ,—got extraordinary achievements. Some researches have shown that China's urban built-up area has increased from 22,000 km<sup>2</sup> to 60,000 km<sup>2</sup>, the total mileage of graded highways has increased by nearly four times, and the total length of urban rail transit has increased from 150 km to 7,000 km. The rapid expansion of urban built-up areas and the continuous growth of various transportation networks have enabled large cities to rapidly develop into metropolitan areas. However, due to the inconsistency between transportation and land-use in the metropolitan area, waste of land resources, insufficient utilization of public transportation, energy waste, environmental pollution, and urban congestion have been caused. The land expansion of major metropolitan areas in the world is not synchronized with the innovation of transportation technology. The development process often focuses on land expansion and ignores the impact of transportation. The results of research are difficult to apply to today's planning practice. Therefore, it

is of great practical significance to study the rapid evolution of urban morphology in China's metropolitan area in the past two decades.

Firstly, this research summarized the characteristics of construction land expansion and transportation network evolution in some metropolitan areas of China in the past 20 years, integrated transportation and land-use, two variables that characterize urban space expansion, and explored the laws and patterns of urban morphology changes caused by the interaction between them. The study collected and organized the diachronic data of the transportation network and construction land in the metropolitan areas, and constructed a basic spatial data base reflecting the evolution of transportation and land-use. Based on the analysis of the interaction characteristics between the transportation network and construction land, the relationship values of the two in each growth unit were obtained from the three aspects of dominant factors, form coordination degree and expansion rate, and the multi-dimensional interaction characteristics of the transportation network and construction land were analyzed.

Next, starting from the multi-dimensional analysis of the interaction characteristics between the growth of the transportation network and the expansion of construction land, the typological method was used to accurately identify the coupling modes of the two, and the evolution and interaction of the coupling modes on long-term series and multiple spatial scales are explored. The coupling mode of each unit in each period is dynamically investigated in a long-time sequence, and the spatio-temporal evolution characteristics of the coupling mode are analyzed from multiple dimensions such as the change of growth unit, the replacement of dominant factors, the conversion of coupling speed, and the change of coupling quality. Then summarized the generation logic and interaction mechanism of urban morphology in the multi-scale spatial organization of the metropolitan area, deeply understood the reasons for the evolution of the urban morphology caused by the two and applied these experiences to promote the continuous optimization of the urban morphology of the metropolitan area.

The research comprehensively uses methods such as Typology, Spatial Morphology Analysis, System Dynamics and Cellular Automata, and explores the "multi-scale urban morphology generation mechanism and optimization method of metropolitan areas" around the "transportation network and construction land coupling mode" of metropolitan areas such as Beijing and Shanghai. It is of scientific significance to clarify the multi-scale urban morphological evolution mechanism of metropolitan areas and to enrich the spatial organization theory of metropolitan areas. It can provide not only technical means for urban space delineation and pattern optimization but also a scientific basis for resource conservation and environmental protection.

#### WHAT FACTOR CONTRIBUTES THE MOST TO REGIONAL CONVERGENCE? AN EXPLORATORY ANALYSIS ON US MEGAREGIONS

Abstract ID: 360

Individual Paper Submission

LIU, Ziqi [the University of Texas at Austin] zqliu212132@utexas.edu, presenting author  
ZHANG, Ming [the University of Texas at Austin] zhangm@austin.utexas.edu, co-author

Megaregion refers to the city clusters containing more than two metropolitans and their hinterlands with highly intensive transportation connectivity and economic collaborations. The increasing attention on megaregion as the economic engine attracts people and capital swarm into this new urban morphology. Study has found that global megaregions habitats with 18% of the world's population, accounts for more than 66% of the global economic activity and 85% of the technological and scientific innovation (Florida et al., 2008). In the US, megaregions hold more than 85% of the economic activities, more than 90% of Fortune 500 companies and 80% of the patents (Ross et al., 2014). However, debates remain on whether the investments can bring an overall accelerate growth or lead to an uneven impact on the national economy.

The hypothesis of Kuznets curve claims that the economies will experience an increase in inequality and then decrease as the wealth accumulated, where the first phase is called the economic divergence, and the second phase refers to the economic convergence. Regional convergence is one way to measure how spatial inequality changes by economic growth over the years where alpha-convergence describes the general reduction of disparity across economies while beta-convergence, also called the catch-up theory, happens when poor economies grow faster than the rich. The conditional beta-convergence refers to the circumstances where there are other indicators, for example, investment rate or population growth rate, affect the converging process, while unconditional beta-convergence happens when the growth rate declines or reaches the steady point (Rey and Janikas, 2005).

From national perspective, studies have found that determinants of regional convergence include development, resources, openness, mobility, institutions, education and ethnic. Besides, labor productivity by sectors and social stratification have an influence on the convergence (Goubin and Hooghe, 2020; Kinfemichael and Morshed, 2019; Lessmann and Seidel, 2017).

In terms of the megaregion, few studies have provided an overall review of the determinants on megaregional convergence. In one of the few studies for convergence in US megaregion emphasizing on the transportation investment, while the discussions on other determinants remain to be enriched (Woo et al., 2015). This study starts with a generation question, what determinant contributes to the convergence in the megaregions and how does it relate to national convergence process. Moreover, the study would be interested in 1) whether advanced professional services (APS), especially the high-tech industry, contribute to the convergence process as it contributes to the economic growth and megaregion competitiveness and 2) what is the backbone industry in the process of convergence and whether is it differentiated among megaregions.

This study applies the beta convergence function with spatial autocorrelation to analyze both megaregion and national level convergence with determinants of overall economic productivity, labor productivity by sectors, social stratification, federal expenditure, transportation infrastructure, etc. Considering the limited geographic unit in the megaregion, the study utilizes zip code level aggregated data for both national and megaregion level convergence analysis. The study expects a result that although high-tech industries promote the economic growth in megaregion, the manufacturing is still the main factor in the convergence process. besides, better transportation connectivity within the megaregion will help and thus enhance the megaregional convergence.

## **A BI-DIRECTIONAL, INTEGRATED MODEL OF REGIONAL GROWTH AND STORMWATER RUNOFF: SPATIOTEMPORAL PROJECTIONS THROUGH A COUPLED MODELING SYSTEM**

Abstract ID: 371

Individual Paper Submission

KWAK, Yoonshin [University of Illinois at Urbana-Champaign] yk23@illinois.edu, presenting author  
DEAL, Brian [University of Illinois at Urbana-Champaign] deal@illinois.edu, co-author

One of the major challenges in plan-making for urban resilience is dealing with the deep uncertainty inherent in coupled human-natural systems. For example, while regional growth plans are intended to manage or minimize a wide array of negative urbanization impacts, they many times fail to achieve their intended goals due to an inability to assess the complex interactions in regional systems. These complex interactions vary over both time and space with climate change and other dynamic forces adding to the uncertainty. The result is often a slew of unintended consequences.

Cross-scale and cross-disciplinary approaches that promote resilient planning solutions are required in order to strategically and adaptively address these uncertain futures (Deal et al., 2017). The success of such efforts improve when they can be tested with simulation and quantified assessment of the dynamic interactions between human and natural functions (Alberti, 2017).

Stormwater runoff is one critical issue that exemplifies the complexity of human natural systems coupling. It is directly related to both socio (urban growth) and physical (climate change) system changes (Abdulkareem et al., 2019). Innumerable studies have described and assessed the hydrological responses that result from land-use changes. Most (if not all) of these studies explore one-directional impacts – the effects of changing land use on hydrological systems. Complex systems theory however, suggests that these urban /eco - systems are interconnected and operate as an intertwined whole (Alberti, 2017; Batty, 2007). This means that typical one-directional analysis can miss critical components of the interrelations between land-use change and hydrological responses. More specifically, as patterns of regional growth affect runoff occurrence and severity, spatial configurations of runoff also affect the location-choices of land development. To date, little work has been done that illustrates how ‘bi-directional’ impacts proceed both spatially and temporally to support growth and water resource management planning.

In this research, we simulate bi-directional impacts between regional growth and changes in surface runoff in a northern Illinois watershed, where both urbanization pressures and flooding have been notable. We use this region as our case study to examine the following questions: Q1) What are the complex and nonlinear interrelations between runoff and land-use change? Q2) How do the interactions operate at multiple scales under different scenarios in response to socioeconomic and sociophysical changes? Finally, Q3) what are the bi-directional implications of regional growth and flooding given a changing climate?

To address these questions, we develop an integrated, finely scaled, sociohydrological modeling system, coupling the Gridded Surface Subsurface Hydrologic Analysis (GSSHA) with the Land-use Evaluation and Impact Assessment Model (LEAM). The system operates using iterative feedback processes where outputs from each model are plugged into the others as input variables. We then examine the relationships between the probabilities of future development and hydrological variables, including runoff depth and proximity to water, to illustrate the effects that

regional hydrology has on patterns and trends of land development. We also spatially compare the results across cities/towns in the study region to explore their contextual dependency.

Our results show how location-choices of land development differ across areas and across scenarios. It shows that simple dose-response approaches to managing stormwater may not be as effective as bi-directional approaches. We also found that residential and commercial land uses exhibit different responses to hydrological variables. Not unexpectedly, spatial comparisons also reveal the necessity of locally-scaled strategies in dealing with spatial inequities. For example, some fringe areas are found to be more vulnerable to runoff due to sprawling patterns of developments.

This research will contribute to efforts to move toward more robust and resilient regional planning and climate preparedness that takes into account changing environmental and social conditions.

#### **TOWARD COMPARATIVE POLYCENTRICITY SCORES: ASSESSING VARIATIONS IN REGIONAL DELINEATION AND SUBCENTER IDENTIFICATION**

Abstract ID: 462

Individual Paper Submission

THOMAS, Ryan [Cornell University] [rmt235@cornell.edu](mailto:rmt235@cornell.edu), presenting author

SCHMIDT, Stephan [Cornell University] [sjs96@cornell.edu](mailto:sjs96@cornell.edu), co-author

SIEDENTOP, Stefan [TU Dortmund University] [Stefan.Siedentop@ils-forschung.de](mailto:Stefan.Siedentop@ils-forschung.de), co-author

As development patterns have become more fragmented, polycentricity has become a useful lens to interpret and measure the spatial structure of urban regions (Kloosterman and Musterd, 2001). There are an increasing number of valid methods for urban geographers to assess polycentricity, but little guidance on how to choose between them. Assessing polycentricity is a complex operation comprising three stages of analysis—regional delineation, subcenter identification, and scoring. Due to the variation in approaches, a growing body of research has emerged to evaluate and improve the methodologies for calculating polycentricity (See for example Green, 2007; McMillen, 2004; Zhang and Derudder, 2019). These studies often attempt to reconcile conceptualizations of polycentricity (such as inter- or intra-city, morphological or functional, and economic or cultural) with quantification techniques. Most of these methods have been developed through their application to regions that analysts have intuitively predefined as polycentric, an approach that may limit the suitability of polycentricity as a generic measure of urban spatial structure, like density, compactness, and sprawl. Furthermore, most methodological studies have only varied one or two of these stages.

This paper contributes to this discussion by assessing the effects of methodological choices on functional

polycentricity scores, using Germany as a case study. We calculate functional polycentricity scores for all regions in Germany using five different regional delineations (four of which are administrative, and one that results from a network clustering algorithm applied to inter-municipal commuting patterns) and three different methods of subcenter identification (geographically weighted regression, local indicator of spatial autocorrelation (LISA), and a simple threshold). This results in 15 methods of operationalizing regional polycentricity. We illustrate the findings using regions that are paradigmatically monocentric (Berlin), polycentric (Cologne), and ambiguously mono- or polycentric (Munich). Following Zhang and Derudder (2019), we report the results in a stepwise fashion that incrementally varies the number of subcenters.

We find that the choice of regional delineation and subcenter identification methods greatly affect the polycentricity score. Specifically, regions that are intuitively polycentric at a large scale may appear monocentric on a small scale, but the same is not true for intuitively monocentric regions. Network clustering approaches and metropolitan regions appear to identify regions of moderate size that are suitable for measuring polycentricity. Also, geographically weighted regression appears to be a promising subcenter identification method for comparing multiple regions at different scales. Finally, we demonstrate how the multi-stage, comparative method we developed can be applied to urban regions on a national scale, again using Germany as an example. Our findings suggest that regional development policies and economic geographers should consider the implications of methodological choices at each of the three stages before promoting any particular method.

#### **TACKLING THE BROADBAND GAP: THE ROLE OF CITIES AND REGULATION IN ENSURING UNIVERSAL ACCESS**

Abstract ID: 503

Individual Paper Submission

BRAVO, Natassia [Cornell University] nb576@cornell.edu, presenting author

The global pandemic has spurred the migration of everyday activities online – from remote work to online schooling, telehealth to commerce – and with them, increasing pressure to close the digital divide between urban, suburban and rural areas. The FCC estimates that about 14.5 million Americans lack access to fixed broadband service with at least 25/3 Mbps. Broadband Internet behaves as a natural monopoly, and deployment is largely driven by economic gain and led by private service providers. Planning for network growth is fragmented, contributing to a widening gap across demographic and socioeconomic groups – part of a larger phenomenon that Graham and Marvin (2001) identified as ‘splintering urbanism’.

Acknowledging that upfront costs already represent a risky investment for last-mile deployment, service providers and policymakers have sought to ease regulatory barriers that might discourage entry to rural markets or competition with incumbents – taxes, use of the rights-of-way, access to public infrastructure (poles) and permits.

Successful industry lobbying has led to increasing preemption of local authority in broadband (Bravo, Warner and Aldag, 2020).

At the same time, lack of competition has allowed incumbents to refuse to expand or improve their speeds, prompting a growing number of cities to consider investing in their own approaches. Municipally owned networks have drawn criticism as a risky move for post-pandemic economies (Oh, 2021) and as unfair competition. Nevertheless, public delivery opens up the opportunity of inter-municipality cooperation: When Wilson, NC, adopted their own fiber optic network, interest emerged from the neighboring town of Pinetops to hire their services – an expansion which was preempted by the state of North Carolina (Gonzalez, 2018). I will explore the impact of state and local policies on local broadband expansion. Do they stimulate or discourage infrastructure deployment? What avenues can localities pursue when private providers are unable or unwilling to expand service? Can local governments move beyond relieving regulation and subsidizing subscription to direct service provision?

This paper will present three different local approaches, of varying scales, that will shed light on some the challenges and opportunities faced by government when pursuing public delivery and universal access. Case studies will include service supplied by 1) a municipal network, 2) a rural cooperative 3) a public facility (such as a school or library) acting as an access point. In these cases I will identify 1) current state policy barriers at the state level using data from the Pew Charitable Trusts; 2) regulatory financial barriers, such as costs for use of the state right-of-way and infrastructure access in each state, which will be extracted from publicly available data from state departments of transportation, and 3) local policies and barriers, which will be identified from representative case examples. These policies may be specific to each individual area's characteristics and resources, but there are similar policies across the case studies.

I seek to explore the future role of local governments and planners in expanding broadband access, including opportunities for cooperation across different levels of government, and between the public and private, where local governments continue to have an active role in infrastructure deployment and addressing the emerging demand for faster, better broadband – beyond simply giving up their regulatory power.

#### **DO MEGAREGIONS OUT-PERFORM NON-MEGAREGION IN ECONOMIC PRODUCTIVITY, AND TO WHAT EXTENT?**

Abstract ID: 574

Individual Paper Submission

GUO, Jiani [University of Texas at Austin] [jiani\\_guo@utexas.edu](mailto:jiani_guo@utexas.edu), presenting author

ZHANG, Ming [University of Texas at Austin] zhangm@austin.utexas.edu, co-author

With the continuous expansion of the urban area, the predefined geographic entities like cities and states are becoming less meaningful in the context of economic globalization. Benefited from the agglomeration, cities become the engines of economic development. With the expansion from cities and metropolitans, scholars realized that the “mega-regions not only define the economies of the advanced nations but play a central role in emerging economies as well.” (Florida et al., 2008). As a result, the concept of megaregion is gaining increasing attention (He et al., 2019; Todorovich, 2009). Many scholars argue that megaregions present the advantages of scale economy and play a central role in advancing economic productivity (Florida et al., 2008). Studies have shown that megaregions as new economic units perform agglomerating functions, for instance, attracting talents, fostering innovations, and enhancing production and market efficiencies. However, as scholars proposed the importance of the megaregional economy, there is little research to quantify the economic differences in megaregion and non-megaregion. More importantly, studies on national or regional convergence are voluminous, but few have explored the issue of megaregions.

This study answers the questions of 1) does and to what extent megaregions out-perform non-megaregions; 2) whether megaregions lead to convergence of economic productivity. This research performs two analytical tasks. First, it applies the framework of beta-convergence and sigma-convergence to assess the trends of economic productivity (measured by gross regional product per worker) for the 11 megaregions as well as the non-megaregion areas in the contiguous United States. Second, it models productivity variations across megaregions and non-megaregions and their relations to different investment strategies like capital investment and technology innovations. Data used for the research include the developed land area data from the U.S. Geological Survey as a novel proxy of capital investment from 2001 to 2016, apart from the social demographic and economic data derived from the U.S. censuses and patent data from the US Patent and Trademark Office.

The anticipated findings include: 1) megaregions lead to convergence of economic productivity over time; 2) megaregions significantly out-perform non-megaregions in a cluster manner regarding economic productivity; 3) the correlation between land investment and economic productivity is statistically significantly positive only in the Texas Triangle. The expected findings of the research contribute to the literature by highlighting the key roles of megaregions in regional economic development. Moreover, obtaining empirical evidence of economic productivity in megaregions can inform policymakers to initiative programs for achieving regional integration and reducing disparity.

#### SHRINKING CITIES IN URBANIZED CHINA: DYNAMIC TIME-SERIES CLUSTERING

Abstract ID: 638

Individual Paper Submission

XU, Yuanshuo [Zhejiang University] xuyuanshuo@zju.edu.cn, presenting author

Shrinking cities are now considered one of the most critical challenges in urban planning. However, the issue of urban shrinkage has not been explored much in the developing world, especially in rapidly urbanizing China. The “developing” character tends to divert the research focus to the growing and mega cities, masking the paralleled uneven development and the problem of shrinkage in other cities. In fact, the massive state-led urbanization in China has created different development trajectories for cities.

To fill the gap of shrinking cities in developing contexts, this paper contributes to the study of urban shrinkage in China both methodologically and theoretically. Instead of choosing two time points and calculate urban changes, this paper utilizes an innovative technique, Dynamic Time Warping (DTW) algorithms, to conduct time-series clustering analysis on urban growth and shrinkage. It groups all 290 prefecture cities in China into different urban trajectories from 2006 to 2018, such as continuous growth, recent growth, stabilized shrinking, recent decline etc. The typologies are further created based on the trend of time-series clustering results of urban population and economy dimensions.

Then, the paper further explores the factors that may affect urban shrinkage in China using a multinomial logistic regression. The impacts of state spatial selectivity, local responses to state rescaling, core-periphery neighboring effects and economic restructuring are examined across different urban trajectory typologies. In general, cities in the northern China, especially in the Middle Yellow River region and the Northeast suffer from population loss and economic decline due to not being privileged by the state for development, higher local economic share in resource-based sectors, lower natural growth rate, less competitiveness and attractiveness to the market and developers. In contrast, shrinking cities in the south-central China, especially in the southeastern coast and Middle Yangtze River, can be attributed to their proximity to state-selected high-level large cities that have a gravitational pull of people and economic activities. Since these middle and smaller cities are not favored by the state policies, they are likely to rely on debts to sustain local economic growth.

#### **TRANSIT-INDUCED COMMERCIAL GENTRIFICATION? BUSINESS OWNERS' PERSPECTIVES OF NEIGHBOURHOOD CHANGE IN KITCHENER-WATERLOO**

Abstract ID: 709

Individual Paper Submission

WEBBER, Kaitlin [University of Waterloo] kaitlin.webber@uwaterloo.ca, presenting author  
PARKER, Dawn Cassandra [University of Waterloo] dcparker@uwaterloo.ca, co-author

Over the last two decades in North America, there has been a resurgence in the use of rapid transit systems. When leveraged alongside transit-oriented development (TOD) planning ideals which encourage compact, mixed-use development in station areas, modern rapid transit systems are increasingly recognized for their ability to function

as a catalyst for neighbourhood revitalization and economic development. In response to the increased use of transit systems for their perceived economic benefits, a growing body of literature has emerged which connects rapid transit development to gentrification and displacement (Baker & Lee, 2019). Through the process of transit-induced gentrification, higher-income residents who value increased accessibility and living an urban lifestyle move into TOD neighbourhoods, putting those who rely on public transit, and who would be most likely to benefit from improved transit access, at risk of displacement.

Despite being central to the walkability and liveability goals of TOD, a fundamental component of neighbourhood change is missing from the narrative of transit-induced gentrification; the effects of rapid transit infrastructure and TOD planning on commercial businesses (Dawkins & Moeckel, 2016). In addition to withstanding disturbances associated with rapid transit construction (Ray, 2017), local businesses are also vulnerable to the effects of gentrification as they face changing consumer profiles and increased commercial rent prices (Meltzer, 2016). Although somewhat context specific and dependent on the identities and consumption patterns of the gentrifiers themselves, common signs of commercial gentrification include a higher presence of restaurants and cafés, personal service businesses, boutiques, chain stores, and the overall upgrading of businesses to meet the needs of a higher-income clientele (Bridge & Dowling, 2001; Meltzer, 2016).

In this research, we explore the concept of transit-induced commercial gentrification in the mid-sized cities of Kitchener and Waterloo, Ontario, which we argue has occurred alongside the development of their “ION” light rail transit (LRT) system. Since the project was announced in 2011, the transit corridor has seen more than \$2.6 billion in new construction value – materializing primarily in the form of luxury condominiums – and is beginning to show signs of gentrification as young professionals and empty nesters enter the area. This redevelopment and gentrification is concentrated in the cities’ urban cores, Downtown Kitchener and UpTown Waterloo.

This paper presents results from 18 semi-structured interviews with business owners in Downtown Kitchener and UpTown Waterloo. The aim of these interviews was to understand owners’ perspectives and experiences related to LRT development and neighbourhood change. First, we found that characteristics related to customer base, product offerings and personal values strongly impacted owners’ opinions of the LRT and redevelopment activity. For example, local businesses who offer general products and services (i.e., restaurants, barbershops) had more positive opinions, whereas those who identified as a destination business and/or offer niche products had negative opinions, especially associated with the loss of parking. Second, while the LRT’s construction (2014-2018) was disruptive to all, businesses located directly on the line were more heavily impacted by reduced accessibility. While customer traffic increased once construction ended, most businesses reported that their sales numbers still have not returned to pre-LRT levels. Third, we find that trends occurring in both Downtown Kitchener and UpTown Waterloo point to commercial gentrification, as participants frequently reported the loss of “legacy” businesses, an increase in upscale and chain businesses, and higher commercial rents since the LRT was approved. The results of this study contribute to the limited body of transit-induced commercial gentrification scholarship, add to the limited qualitative research on transit’s role in gentrification and are relevant to planners and policymakers in other mid-sized municipalities considering LRT.

**WHERE ARE NEW BUSINESSES LOCATED MORE? APPLICATIONS OF MULTILEVEL GROWTH CURVE MODELING TO THE RELATIONSHIP BETWEEN URBAN COMPACTNESS AND NEW BUSINESS ESTABLISHMENTS AMONG METROPOLITAN STATISTICAL AREA IN THE U.S. BETWEEN 2000 AND 2018.**

Abstract ID: 847

Individual Paper Submission

KIM, Keuntae [University of Utah] kimprins@hotmail.com, presenting author

Given that there have been growing concerns over the long-term, sustainable, and equitable economic developments of urban areas across the U.S., creating and maintaining a better physical environment for new business attraction and growth are keys to fulfill agglomeration economies and economic innovation while continuously providing sustainable job opportunities. From the urban planning standpoint, urban planning strategies and guidelines for new business creation are supported by recent evidence of the relationship between overall urban development patterns and new business establishment birth rates across MSAs or regions. Despite spatial variations in new business establishments in response to differences in urban form or development patterns across MSAs or regions over time, we do not know much about how change or difference in urban development patterns among MSAs affects the dynamics of new firm formation. Most of the existing literature focuses on investigating either interregional or intraregional differences in the creation of new business establishments in their analyses.

Using the Census Business Dynamics Statistics (BDS) by establishment ages from 2000 to 2018, this study aims to analyze differences in new business creation among MSAs over time regarding the overall index score for urban development patterns—urban compactness index by Ewing and Hamidi (2014). To establish several important factors, this study addresses both interregional and intraregional differences in new firm formation among MSAs by using a modeling approach called growth curve modeling with a multilevel modeling framework. A total of 3,838 records of the proportions of new business establishments to the total number of businesses were collected for 202 Metropolitan Statistical Areas (MSAs). To address fixed and random effects on the slope and intercept of the growth trajectories of new business entry rates, twelve time-invariant and three time-varying covariates are used to control for demographic and socioeconomic aspects of each MSA. Given differences in the percentages of new business establishments within and between MSAs during the study period, this study particularly uses a spline growth model with the multilevel modeling framework—the measurement occasions of new business birth rates nested within each MSA.

Based on the new business birth rates for each MSA from 2000 and 2018, this study first conducts exploratory data analysis to identify differences in the growth trajectories of new business birth rates among 202 MSAs. As we expected, exploratory data analysis results confirm variations in growth trajectories among MSAs and identify a rapid decrease in the new business birth rates during the Great Recession between 2007 and 2009, suggesting the validity of using the spline linear growth curve modeling for further inferential statistical analysis. The multilevel growth curve modeling results show that urban compactness is significantly related to variations in the slope and intercept of the growth trajectories of new business birth rates among MSAs in this study. Particularly, interaction effects between urban compactness and change in the new business birth rates show that MSAs with compact development patterns tended to have lower slopes and intercepts before the Great Recession, but these MSAs were more likely to attract more new businesses after the Great Recession, suggesting a stronger economic recovery in terms of new business creation. From these findings, this study contributes to expanding the further discussion about the effects of compact development patterns on new business growth by predicting changes in the slopes and intercepts of the overall new business growth trajectories in response to demographic, socioeconomic, and physical aspects of MSAs.

## SUSTAINABLE COMMUNITIES STRATEGIES PLANNING IN CALIFORNIA

Abstract ID: 875

Individual Paper Submission

NATEKAL, Asiya [University of California, Davis] anatekal@uci.edu, presenting author  
WHEELER, Stephen [University of California, Davis] smwheeler@ucdavis.edu, co-author

The intent of the Sustainable Communities and Climate Protection Act (SB 375), passed in 2008, was to encourage California to achieve its greenhouse gas (GHG) reduction goals through the integration of land use, transportation, and housing. This bill directed the California Air Resources Board to set regional targets for its 18 Metropolitan Planning Organizations (MPOs) to reduce greenhouse gas emissions by 2035. Each region was then required to prepare a Sustainable Community Strategy (SCS) plan to reach these targets. Most California MPOs are now in their second or third iteration of SCS plans. The literature to date indicates that these SCSs have not been highly effective (Barbour, 2002; Barbour & Deakin, 2012; Niemeier et al., 2015; California’s Sustainable Communities and Climate Protection Act, 2018) We wanted to understand more specifically why this initial generation of Sustainable Community Strategies had or had not been effective, and how such plans might be improved in the future. To achieve this research objective we first analyzed SCS documents of the state’s four largest metropolitan areas—the Metropolitan Transportation Commission and Association of Bay Area Governments (MTC/ABAG), the Southern California Association of Governments (SCAG), SANDAG (the San Diego Association of Governments), and Sacramento Area Council of Governments (SACOG)—with attention to their handling of both GHG reduction and social equity, since the latter is a strong concern of members of the state legislature. We compared SCSs and related Environmental Impact Reports (EIRs) of the four jurisdictions according to how they presented GHG emissions goals, levels, and reduction progress; how they developed and presented policy alternatives; how they linked goals and policies to implementation; how they maintained continuity across generations of SCSs; and how they articulated and responded to social equity needs. We then conducted semi-structured interviews with MPO staff in the four metropolitan regions to provide further insight into SCS implementation challenges. Our preliminary findings are 1) that the plans across the MPOs are very different in nature and presentation, making it difficult to determine these regions’ progress toward GHG reductions from land use, transportation, and housing policy; 2) that from the available evidence these plans are currently not meeting their goals for GHG emissions related to vehicle miles travelled; 3) that plans lack continuity of data and analysis across their multiple interactions and do not develop a standard yardstick of GHG reduction progress which the public can understand; 4) that the SCSs make little effort to identify potential implementation processes likely to bring about GHG reductions; 5) that most plans never develop workable definitions of “sustainable community” or address important dimensions of “sustainable community” as agreed upon by the international literature and the United Nations’ Sustainable Development Goals; and 6) that social equity is not addressed in a consistent or policy-relevant way in any of the SCS documents. We develop specific recommendations for how the state’s Office of Planning and Research or the ARB might improve SCS

preparation guidance for MPOs to address these deficiencies. We also discuss potential elements of a more successful Sustainable Community Strategy planning framework for the state that might better meet the intent of the original legislation.

#### REVIVING THE CULTURAL DIMENSION OF RURAL REGIONAL PLANNING: LESSONS FROM HOWARD W. ODUM

Abstract ID: 1000

Individual Paper Submission

FRANK, Kathryn [University of Florida] kifrank@ufl.edu, presenting author  
HIBBARD, Michael [University of Oregon] mhibbard@uoregon.edu, co-author

In the 1990s, scholars and policy-makers in Europe and globally (the United Nations) recognized a “cultural turn,” whereby urban and regional planning, and international development, were no longer considered monolithic, a-contextual activities, and they were instead integrated into “local and regional traditions, practices and habits (intellectual, emotional, moral and spiritual routines)” (Knieling and Othengrafen 2009, p. xxv). In the U.S., no such cultural turn in planning has yet to gain comparable prominence. As a result, the planning field has remained oblivious to, and in denial of, glaring cultural differences between places, such as between urban and rural regions, and their implications for practice. The neglect of culture in understanding and defining regions, especially rural regions, has been to the field’s detriment, enabling an urban bias and leaving American planners out of touch with the needs and practices of rural communities.

Our study seeks to strengthen the cultural lens in rural regional planning by picking up where these ideas were last left off, with the work of sociologist Howard W. Odum in the 1930s and 1940s. We qualitatively analyze Odum’s writings on regional culture, and cultural regionalism for social planning, such as in *American Regionalism: A Cultural-Historical Approach to National Integration* (Odum and Moore 1938), as well as secondary sources on Odum’s contributions (e.g., Kantor 1978), to draw insights for rural regional planning theory and practice in the 21<sup>st</sup> century. In our paper we ask, How have rural regional cultures been identified, and how might this be updated for today’s planning? What planning principles reflect rural regional cultures? What have we lost in rural regional planning by neglecting culture and Odum’s views on integrated social planning? Further, we consider possible reasons Odum’s ideas have been neglected in the intervening years, despite Odum’s guidance for applying his social science to planning. The criticisms Odum’s work received in the post-WWII years were in part culturally-based, including questions surrounding racism, and thus responsible application of his lessons must take them into account.

This study is a step towards operationalizing our previous argument in favor of incorporating rural culture (i.e., rurality) into rural planning (Hibbard and Frank 2020). Our study complements Stephen Ramos’ (2020) ongoing historical research into the legacy of Odum’s Southern regionalism in American planning. Through these efforts, we hope to restart and refresh Odum’s deeply American discourse on cultural regionalism, in order to raise awareness

of the potential of a cultural turn in planning in this country, and especially for the benefit of rural regional planning.

### **ARE NJ'S REGIONAL PLANNING PROGRAMS SUCCESSFULLY REIGNING IN SPRAWL IN THE FIERCELY HOME-RULE STATE?**

Abstract ID: 1012

Individual Paper Submission

HASSE, John [Rowan University] hasse@rowan.edu, presenting author

MCCARTHY, Katrina [Rowan University] shand@rowan.edu, co-author

New Jersey is the nation's most densely populated state and under continued growth pressures due to its location wedged between NY City and Philadelphia. At its current trajectory the Garden State will be the first to reach buildout sometime in the midcentury (Lathrop & Hasse 2020). The "home-rule" state delegates land use zoning control to each of the 565 local municipal governments exacerbating sprawling development patterns. In an effort to coordinate and manage growth on a regional level, three different approaches for coordinating regional-scale goals: 1) the State Development and Redevelopment Plan (i.e. State Plan), 2) the Pinelands Comprehensive Management Plan (CMP) and 3) the Highlands Regional Master Plan(RMP). Each planning initiatives has a different backstory, different inception date, different implementation mechanism and different degree of legal enforceability. Together New Jersey's three main regional planning systems provide, in essence, a natural experiment for comparing various approaches to regional planning in a state that lies in one of the most significant growth corridors in the nation. A decade ago Burchell & Dolphin (2009) projected the potential impact of the state plan to the year 2020. Walker and Solecki 1999 explored the potential outcomes of the Pinelands on land use. By analyzing three decades of land use change data we are able to assess the on-the-ground outcomes. We employ GIS assessment of highly detailed digital land use mapping data produced by the state between 1986 and 2015. The findings indicate the successes and limitations of New Jersey's regional planning systems.

The State Plan Planning Areas PA1 Urban and PA2 Suburban as well as Designated Centers are the intended smart growth areas of the plan. Nevertheless, 32% of development acres occurred in the rural and sensitive planning areas intended to receive minimal growth. The preponderance of the growth in these planning areas was attributable to a large lot low-density housing. For three decades, large-lot single-unit housing was responsible for consuming the majority of state's most sensitive lands. However, the most recent land use data reveals a major departure from the sprawling trends of the previous decades in favor of the delineated smart growth zones. Land use change and development growth in the Pinelands over the three decades since the Pinelands CMP implementation occurred at half the rate of the rest of the state relative to the proportion of the land area that the Pinelands occupies within the state. The development that did occur was more compact and less land consumptive than the state as a whole and generally occurred in areas designated as growth zones, which generally have the

infrastructure to accommodate growth. The slower development rate in the conservation zones has maintained the majority of rural lands over the decades and thus given more time for conservation actions to occur. Development patterns in the Highlands have shifted significantly since the implementation of the Highlands RMP. The rate of land developed has been substantially reduced from the pre-2007 era of rapid growth. A greater proportion of subsequent development was in the planning zones with an increasing portion of residential land occurring in a compact form while large-lot sprawling residential housing experienced an observable downturn. While the study provides compelling evidence that all three plans have had a measure of success mitigating sprawl compared to earlier unconstrained development, each regional planning program impacts have been distinct with the Pinelands being most effective at mitigating sprawl followed by the Highlands and the State Plan. The study provides insight into the efficacy of the regional planning program strategies for what has worked and what has been ineffective in fostering compact development in New Jersey.

#### **A PLANNING SUPPORT SYSTEM FOR METROPOLITAN AND REGIONAL LEVEL COMPREHENSIVE PLANNING ACTIVITIES AND POLICYMAKING**

Abstract ID: 1013

Individual Paper Submission

ANJOMANI, Ardeshir [University of Texas, Arlington] anjomani@uta.edu, presenting author

This paper presents a planning and support system (PSS) that helps with a multitude of problems in urban areas, including the effects of future developments on the environment, economic development, stakeholders' input, ease of use for decision-makers, and better integration with other regional planning efforts and MPO's transportation planning process. The PSS utilizes all the relevant information that facilitates the analyses and processes institutions need to go through when preparing a metropolitan or subregional area's plan or demographic analysis for a variety of planning and policymaking purposes. The open framework can be tailored to different settings and is helpful for comprehensive plan-making, economic development, and policy decisions of all types at the local, city, county, or regional levels. It introduces innovative approaches to planning an urban area—including a variant of a geographic information system-based land-use and environmental suitability analysis in deriving development potential for a small-cell grid of the study region. This approach enables public and stakeholder input into the process, facilitating micro-level consideration of different attributes inside the land-use demographic analysis.

These features allow the planning process to be open to human interaction, making it possible to input social and political aspects and decisions into the easy-to-work and easy-to-understand approach. The input is accomplished by the inclusion and participation of representatives of the decision-making bodies, stakeholders, and the public in various aspects of the planning process. This inclusiveness would involve multiple voices in the process from the outset, which makes it more open and understandable by the public and the decision-makers.

The PSS, structure, and the analysis process's openness allow input from stakeholders and decision-makers during

the process. Such information is critical in decision-making, economic development, land-use planning, and resource allocation, which helps to achieve results in line with stakeholders' development perceptions, local economic activities, and jurisdictional plans and visions. This input allows the derivation of development potentials in the suitability stage, and more importantly, in the land-use activity allocation process, allotting commercial activities and households to their most appropriate locations.

A significant point and opportunity in the land use activity allocation step of the process involve the stakeholders, public and private parties, decision-makers, and local expert representatives to elicit their input and intimate local knowledge in this critical step and continue during the land-use allocation process. This is possible in PSS because of its open structure, contrive use of land suitability analysis variant, economic base framework, and the other model attributes. Through this involvement, the stakeholders' views and reflections are part of the process from the outset, and it is more so during the land use allocation process. Therefore, there are no surprises when the projected plan results become public. Usually, issues and disagreements arise between jurisdictions and regional planning agencies over the region's perceived future growth decline and MPO projections activities. The inclusion of the public and stakeholders in such a process is new and is not possible in other planning support systems or modeling outfits.

## THE LONGER-TERM POTENTIAL OF LAND VALUE UPLIFT: INSIGHTS FROM GREATER LONDON AND GREATER SHANGHAI

Abstract ID: 1017

Individual Paper Submission

YANG, Tianren [University of Hong Kong] tianren.yang@hotmail.com, presenting author

The study aims to address two well-known gaps in the evidence base supporting land policies that are relevant to value capture. First, in most metropolitan areas, the value of land is expected to increase over time. The prospects and rates of the increase have direct implications on the approach and timing of value capture, but such knowledge is far from complete, and thus value capture tends to benefit little from the later, higher value phases of property development. Second, spatially coordinated and balanced development for all urban land uses, activities and infrastructure provision is shown to increase the value of land significantly, but only in a small number of metropolitan areas over a few periods of development is well-coordinated and balanced, e.g., between land use and transport. This is in large part because analytical tools capable of understanding the longer-term prospects of land value changes have not always been widely available.

In this study, we developed a recursive spatial equilibrium model to understand and measure the land value uplift potential under various planning interventions (i.e. jobs, housing and transport). We have chosen Greater London

and Greater Shanghai for our study not only because there are intense interests in land value capture (LVC) in both areas, but also because both cities now have access to well-developed advanced analytical models that can track and measure the degree of coordination and balance of spatial development over a few decades. This facilitates the in-depth comparison of land and related urban policies, pinpointing the causes and effects in terms of land values and their implications for value capture and future growth. Both city regions also have a rich typology of development (from historic conservation to urban regeneration, brownfield infill and greenfield expansion) which may be relevant to many other metropolitan areas. Shanghai is also a considerably younger city region which can learn from London's longer development cycles.

Furthermore, both the UK and China are keen to decentralize their business activities and populations from overheated cores to the periphery, and in both cases, knowledge about LVC in the periphery is particularly deficient. In the UK, the long-term potential of land value uplift tends to be the most uncertain for large-scale urban projects especially when an investment is made in less developed areas (see e.g., UK2070 Commission, 2019). In Chinese metropolitan areas, the seriously overheated central business districts (CBDs) provide a stark contrast with low expectations in peripheral towns even under a persistent effort of activity decentralization. Such imbalanced growth could result in a 'lose-lose' situation as the CBDs suffer from rising welfare losses, whereas the peripheral areas in spite of massive investment fail to exploit their economic potential in the long run.

#### **COOPERATION OR COMPETITION? AN EMPIRICAL STUDY OF STATE RESCALING AND GOVERNANCE IN GANJIANG NATIONAL NEW AREA, CHINA**

Abstract ID: 1021

Individual Paper Submission

YAN, Simin [Institute of Geography, Heidelberg University] simin.yan@stud.uni-heidelberg.de, presenting author  
GROWE, Anna [Institute of Geography, Heidelberg University] anna.growe@uni-heidelberg.de, co-author  
WANG, Xiang [College of Earth and Environmental Sciences, Lanzhou University & Institute of Geography, Heidelberg University] xwang@lzu.edu.cn, co-author

Although originating from western discourse, the State Rescaling Theory has been well practiced by authoritarian Leninist political economies such as China. This paper places emphasis on the emerging geographies of National New Areas (NNAs), typically planned as "Regional Growth Pole" through reterritorialization—and, thus, changing the original administrative areas and/or spatial units—in recent decades. This paper seeks first to understand how the rescaling process is organized and realized in a socialist planned economy and, secondly, to discuss how well the cross-jurisdictional cooperation worked in the subsequent planning and governance reality?

For a deeper look into the procedure of cross-jurisdictional governance, we select the representative Ganjiang National New Area (GjNNA) as an example, which is complexly reorganized by several districts from prefecture- and county-level cities. The analysis is based on a qualitative database that includes—but is not limited to—important meeting memos, protocols, published works, and a series of interviews with relevant government officials and urban planners, which are drawn to decode the governmental structure and working mechanism within the new-built

area.

The analysis suggests that the spatial reorganization and the formation of functional departments run smoothly through top-down interventions. Major projects and regional plans are carried out through a consultation mechanism by a multi-level government, comprised of provincial governments, a new management committee (focus on economic function), and the local ones. However, the rescaling area is not appropriate to describe as an integrated agglomeration-the wildly assumed concept in recent policy documents-or at least far from being it. The paper critically argues that there are overlapping functions and conflicts of interest among local governments, and processes within NNA can be understood as rather as economic competition than cooperation. Those findings are further supported by comparing socio-economic indicators of temporal (before and after establishment) and spatial (In and out of the area) dimensions. Firstly, competing measures for attracting investment such as tax incentives and large-scale infrastructure construction have been recorded more frequently in neighboring regions than ever before, which has caused waste of public finances and has a negative impact on long-term governance. Moreover, villages and towns without strengths in manufacturing or tourism are becoming "unattended" during rounds of administrative boundary changes. This was related to the fact that economic performance is the primary evaluation factor for government cadres. Last but not the least, cooperation among local governments still leans strongly on authoritative policy initiatives and/or the participation of senior officials. In other words, instead of acting as a member of the NNA, most of the participants made a "guest appearance" in the actual governance process. Hence, we can say that the existing geographical boundaries are still in the policy sense rather than in the consensus of all participants, and partnerships among the local governments in the re-adjusted region-Ganjiang NNA-are still in the early stage of integrated governance. Ultimately, we further discuss the modification of the consultation frameworks in such new political actors and suggest that actual cooperation requires full participation by multi-level governments, especially the local governments, which means a new way of benefit distribution and assessment of cadres.

#### LIMITS AND POTENTIALS OF GEODESIGN FRAMEWORK IN THEORY AND PRACTICE

Abstract ID: 1043

Individual Paper Submission

HAN, Soyoung [Virginia Tech] syhan@vt.edu, presenting author

KWON, Yoonku [Chonnam National University] ykkwon@chonnam.ac.kr, primary author

While the Geodesign term is widely used, research on the concept and its application is quite limited (Batty, 2013). As noted earlier, Geodesign can easily be considered an outflow or evolution of earlier decision support and participatory geographic information system (GIS) applications. Looking back even further, it can be characterized as

an evolution of McHarg's (1969) Design with Nature approach characterized concisely as the "stack of layers" predecessor to current GIS (Dangermond, 2010; Goodchild, 2010, p. 8). Regardless of the particular genesis of the term, Geodesign can be characterized by three facets. First, geography within Geodesign is illustrated in its relationship to processes and forms on or near the Earth's surface, accomplishing what Steinitz (2012) calls "geography by design." Second, design in Geodesign is about "sketch" and "simulation," accomplished through the "technology of design" (Goodchild, 2010, p. 8). Third, Geodesign is characterized by social and process dimensions, as it incorporates scientific knowledge, integrates with human decision-making, and allows decision makers to enact the pattern-process-design relationship (Dangermond, 2010; Goodchild, 2010; Nassauer & Opdam, 2008). This last facet reveals a key prospect for application and further development. In particular, Geodesign is acknowledged as a means of simulating impacts within geographic contexts (Flaxman, 2010) and decreasing the cycle time of participatory design processes (Dangermond, 2010), by facilitating an efficient process of proposition-disposition for design ideas (ESRI Press, 2013; Lyle, 1985).

However, as researchers point out, the definition of Geodesign is still not clear and is interpreted differently from various angles. Steiner explains that this is because Geodesign is a new concept, but it is fundamentally because of the ambiguity inherent in design (Steiner, 2016). Even if the concept of design is limited to the spatial domain, the area covered by Geodesign practice is wider than the scope of any planning/design theory, and the subject is not limited to a specific object or discipline. This study attempts to reveal the differentiation of Geodesign, which has not yet been clearly identified, and to grasp the possibilities and problems that Geodesign presents as a methodology for new planning and design. To this end, this study analyzed the projects of IGC (International Geodesign Collaboration) to grasp the most recent practical trend of Geodesign. At what level and in what way the theoretical differentiation of Geodesign appears in planned projects, and analyzes the differentiation and its causes that are not clearly revealed in practice.

The major characteristics of Geodesign can be summarized as four: synthetic process, digital technology, scale shifts, and participatory approach. Theoretically, the framework of Geodesign goes through three iterations of the set of six models of Representation, Process, Evaluation, Change, Impact, and Decision. The results of analyzing IGC projects, the case studies of recent Geodesign practice, are as following: 1) Geodesign seems to be most useful in dealing with urban issues in planning and larger scale projects. 2) Most of the IGC projects applied the synthetic process of Geodesign and recent digital technologies while working in multi-scales. 3) However, it is hard to say that the participatory approach was well integrated into the projects. Despite of some limitations, Geodesign has great potential in providing universal planning methods that can applied to different planning contexts while being useful in finding out new site-specific solutions for local problems.

#### PLANNING CAPITAL CITIES: A CULTURAL DISTRICT AS THE HEART OF CANADA'S CAPITAL REGION

Abstract ID: 1093

Individual Paper Submission

REDAELLI, Eleonora [University of Oregon] redaelli@uoregon.edu, presenting author  
CHIASSON, Guy [Université du Québec en Outaouais] Guy.Chiasson@uqo.ca, co-author

Planning federal capital cities raises the question: how can they represent the complexity of national identity while involving in the planning different layers of government? This paper investigates issues of national identity representation and multi-level governance of the heart of Canada's National Capital called Confederation Boulevard (CB). Designed by the National Capital Commission (NCC), we argue that CB has the features of a cultural district displaying national representations and enabling a multi-level governance. We focus our analysis on NCC's plans from the 1980s to the 2000s using a framework that combines the literature on cultural districts with the one on multi-level governance. This analysis reveals the value of planning the heart of the capital as a cultural district (1) for a pluralistic national representation and (2) for enhanced collaboration among national, regional, and local actors. These results also confirms that planning documents are a precious source for unraveling this process.

CHOI, Inyoung [University of Seoul] ciy2771@gmail.com, presenting author

WOO, Myungje [University of Seoul] wksw1972@naver.com, co-author

Since the 1960s, South Korea has built many national industrial complexes, starting with the Guro Industrial Complex and the Ulsan Industrial Complex. The first Comprehensive National Territorial Development Plan (1972-1981) focused on regional development for economic growth with several growth poles. Major national industrial complexes were created with export-oriented economic development policies contributing greatly to the economic development of Korea. However, the initial industrial complex creation left many side effects, such as severe environmental pollution, widening gaps between regions, and a lack of infrastructure. In addition, in the 2000s, the emergence of new industries and the pursuit of innovative growth centered on knowledge and information. To solve the problems of such reckless industrial complex creation and promote regional development along with the growth of new industries, the emphasis has been on fostering clusters. It is to deliberately develop the existing manufacturing and industrial-centered industrial complexes and convert them into clusters or develop new clusters.

As such, it is known that the creation of clusters has positive effects such as creating jobs and revitalizing the region through employment and population growth. For this reason, local governments continue to propose to create major industrial bases in the capital region of South Korea. Clusters established in the current metropolitan area

have played a key role in the regional economy, and cluster-based policies have become an important means of regional industrial and spatial policies for regional development.

While the role of clusters has been highlighted these days, the conceptual distinction between 'accumulation' and 'cluster' is not clearly in existing studies, and the terms of established industrial complexes and clusters are also used interchangeably. Convergence occurs between concepts and theories, and there is a problem of loss of its identity. Therefore, it is necessary to eliminate ambiguity among theories and establish a logical concept for clusters that are emphasized socially, economically and politically. In addition, there are various studies on the economic ripple effect of the region due to the establishment of industrial clusters. However, little is known about the effect of the clusters on their surrounding areas.

Therefore, in this study, first, the concepts are organized by classifying clusters and industrial complexes, and industrial complexes and clusters located in the metropolitan area are categorized and presented by industry and type. Second, the overall ripple effect of the currently formed cluster area is identified, and the effect of the cluster composition on the surrounding area is analyzed through multiple regression analysis. As a result, while an industrial complex refers to a simple integration of work, a cluster is a concept that includes a network of industry-academia-research centers related to technological innovation, and has an aspect of emphasizing the interactions between innovation subjects. The results also show that the clusters by industry type, knowledge industry-oriented clusters such as Pangyo Techno Valley, located in Gyeonggi-do, generally increased employment, population, and housing prices in the surrounding area. However, it was found that the cluster centered on the manufacturing industry did not have a significant impact on the surrounding area. The knowledge industry-centered cluster had a positive effect on the overall regional development, but differs from the manufacturing industry-centered cluster, indicating that a differential ripple effect appears depending on the type of clusters. This study is meaningful in that it can provide implications for the cluster creation policies by providing objective evidences on the effect of cluster formations on their nearby communities.

#### THE IMPACTS OF SUBURBAN NEW TOWNS DEVELOPMENT ON THE OLD TOWNS

Abstract ID: 416

Poster

CHA, Seungyeon [University of Seoul] cktmddus08@gmail.com, presenting author  
MYUNGJE, woo [University of Seoul] wksw1972@naver.com, co-author

It is known that the development of new towns in the suburbs solved the housing shortage problems in a short period of time, but caused the decline of old towns in cities. This is because residents and employees in the old towns and city halls in some cases moved along with the development of the new towns. However, there is an argue that some new towns induce the development of old towns depending on their urban development stages and

urban characteristics. In this way, depending on the characteristics of the city, the old town may not decline due to the development of the new town. However, existing research focuses only on the patterns and causes of decline in the old towns due to the development of the new town without a comprehensive consideration of urban patterns.

In this line, this study attempts to analyze the effects of the development of new towns on the old towns by reflecting urban characteristics. To this end, first, cities across the country are categorized according to city characteristics. Second, using multiple regression models, it is analyzed how the development of new towns affects the old towns based on the city characteristics of growth.

The analysis results are as follows. According to urban growth patterns, economic characteristics, and physical characteristics, the effects of new towns on the decline of the old towns was different. In particular, while the development of new towns caused the decline of the old town in declining cities, in a growing city it did not cause the decline of the old town.

The following implications can be given through the results. Currently, the development of new urban areas in Korea is proceeding regardless of the characteristics of cities. However, in order for the old town and the new town to grow together, urban characteristics must be reflected in the development of the new town.

SHIN, Jaeun [University of Seoul] wodms0307@naver.com, presenting author

WOO, Myungje [University of Seoul] wksw1972@naver.com, co-author

Since urban competitiveness is directly related to national competitiveness, many countries around the world are making great efforts to strengthen urban competitiveness in line with the rapidly changing globalization trend. Accordingly, discussions on strengthening regional competitiveness are being actively conducted, leading to research on regional living areas and regional bases. There are various methods for enhancing regional competitiveness, but the method through regional networks is receiving the most attention. In addition, the necessity of a strategy for developing a functional network between cities as a way to secure regional competitiveness is also mentioned. And the network formation between cities and regions is a close relationship with the overall competitiveness.

As the problems of individual urban planning and policies centered on physical scale and space are continuously

raised, the importance of interregional networks taking into account interactions between cities and regions is emerging. In addition to this, "Resilience" has been discussed as an element of recent urban competitiveness. In Korea, research has been conducted to improve resilience from the perspective of local communities that can cope with uncertain future changes, to strengthen resilience in terms of the Fourth Industrial Revolution and disasters and safety. In recent years, as the concept of resilience for overcoming Corona 19 has been re-examined, discussions have been increasing in the international community and governments to examine resilience capabilities and prepare response strategies. As such, interest and efforts to realize a city with socio-economic resilience capable of responding to unpredictable crises and risks around the world are continuing. However, although resilience is a major growth factor for urban competitiveness, research on domestic land and regional planning taking this into account is insufficient. In particular, resilience is not considered in the recent discussion of regional hub cities and the type of network, although various factors within the region must be considered to strengthen urban competitiveness. In other words, it is necessary to study the type of regional bases and networks that reflect urban resilience.

Therefore, this study aims to empirically analyze the correlation between regional bases and resilience by network characteristics and type. This is different from the existing studies on network analysis in that the study focuses on analyzing the differences in Degree of resilience according to the network characteristics and type. The analysis includes four steps. First, the base city is identified using the interdependence and centrality index for the whole country. The second is to use the Markov-chain model to establish an urban area with a network function similar to the base city derived earlier. Third, the resilience is calculated using the indices suggested by existing studies, such as the population growth rate and the degree of financial independence. Finally, the network characteristics for each urban area are identified, and the correlation with the Degree of resilience calculated for each network characteristic is analyzed. As a result of the study, cities with strong interactions with metropolitan areas (metropolitan areas, special cities, and special autonomous cities) in both the metropolitan area and regional cities showed strong resilience. In addition, the degree of resilience was stronger in the metropolitan area network than the local network.

#### **ANALYSIS OF THE CURRENT STATUS AND CHARACTERISTICS OF POPULATION INFLOW FROM THE METROPOLITAN AREA TO THE "INNOVATIVE CITY": FOCUSING ON THE RELATIONSHIP WITH LARGE-SCALE CITIES AROUND THE INNOVATIVE CITY**

Abstract ID: 436

Poster

ROH, Soyoung [University of Seoul, South Korea] yoolha1210@gmail.com, presenting author

The problem of regional imbalance due to the concentration of population in the Seoul metropolitan area is being discussed as a continuing social problem in Korea(ROK). To solve this problem, the Korean government has implemented various countermeasures, the most representative of which is the construction of "innovative cities" and relocation of public institutions. One of the main objectives of this policy is to relocate the population to provinces that suffer from population reduction problems. Previous studies on its effect consisted of a number of negative opinions. They point out that, contrary to the intention of the policy, more populations from small and medium-sized cities around the innovative city flow into the place developed as a new city than from the Seoul metropolitan area, resulting in problems such as urban communalization. On the other hand, they collide with some positive evaluations. Among them, the result is impressive that this policy had a significant effect on the outflow of the population from the Seoul metropolitan area. It seems that there has not been an accurate analysis of which region the population who has left the Seoul metropolitan area is heading to under the influence of the policy. At the same time, the innovative city policy is planned to continue until at least 2030 with a lot of criticism.

Therefore, this study will make an accurate diagnosis of the effect of the policy so far by grasping the movement and settlement of the population who have left the Seoul metropolitan area since the policy was implemented. This will be analyzed by visualizing the moving-in and moving-out data between administrative districts using a geographic information system. In addition, it will analyze the difference in the proportion of the population that flows from the Seoul metropolitan area among the total population that flows into the innovation city according to the characteristics and relationships of the innovation city and the surrounding large-scale cities. This study will perform multiple regression analysis, suggesting that existing urban infrastructure and population size of neighboring metropolitan cities can play an important role in preventing side effects such as urban communization, which was pointed out as a policy issue.

Through this, this study can not only supplement the limitations of previous studies that evaluated the effect of population dispersion of innovative city policies, but also provide an analytical basis for supplementing policies to be implemented in the future. In addition, this study is meaningful in that it reveals the importance of large-scale cities in mitigating the side effects of developing new towns for balanced development of national territory.

JUNG, Meen Wook [Iowa State University] mjung@iastate.edu, presenting author

HADDAD, Monica [Iowa State University] haddad@iastate.edu, co-author

MOURA, Ana Clara [Federal University of Minas Gerais] [anaclaramoura@yahoo.com](mailto:anaclaramoura@yahoo.com), co-author

The urban environment has been threatened by the interaction of global climate change and local urbanization, especially global temperature annually increased by 0.18 °C since 1981. Urban Heat Island (UHI), in which urban areas are warmer than their surrounding, are included in urban and regional planners agendas because mitigation strategies need to be implemented to counteract UHI negative effects. Given 68 % of the world population will reside in urban areas in 2050, preparing for a sustainable urban environment is an important goal. Various empirical studies found positive relationships between UHI and health risks (Jr, 2005; Wong et al., 2013). Therefore, studying UHI as a spatial phenomenon that can affect the most vulnerable population is important.

Previous studies linking UHI to socio-demographic have targeted cities located in the Global North (see Madrid Sánchez-Guevara Sánchez et al., 2017; see Philadelphia Johnson & Wilson, 2009). However, only a few attempts have been made to investigate the spatial relationship between UHI and vulnerable social groups in metropolitan regions located in the Global South, despite their rapid urbanization and high poverty rate. To fill this gap in the literature, we will explore the spatial distribution of UHI in a Global South metropolitan region and compare this distribution with hotspots of poverty and green areas. Our research hypothesis follows: UHI is more likely to be close to areas of high concentration of poverty and low green areas per capita, where the most vulnerable people live.

Our study area will be the Belo Horizonte Metropolitan Region (BHMR), located in the State of Minas Gerais, in Brazil. BHMR had a population of around 6 million in 2019, of which 1.5 million residents reside in poverty. BHMR is one of the few metropolitan regions in the country that has a metropolitan body of governance, and adopted a Regional Master Plan, which includes planning for greening initiatives. We will collect Landsat 8 TIR imagery data to develop the Land Surface Temperature (LST) spatial layer, using remote sensing techniques. This LST layer is the dependent variable of our spatial regression models. We will have the following independent variables of interest: (a) hotspots of poverty, calculated using Local Indicators of Spatial Association; and (b) an Euclidean distance surface using all the green areas as the sources. Our spatial unit of analysis will be 30 m by 30 m cells corresponding to the LST layer. The control variables to be included in our spatial regressions will be impervious surface fraction, building fraction, and water proportion.

#### CHANGES IN TRAVEL PATTERNS AND SELF-SUFFICIENCY IN THE SEOUL METROPOLITAN AREA BY INTRODUCING THE GTX(GREAT TRAIN EXPRESS; REGIONAL RAPID RAILROAD)

Abstract ID: 630

Poster

PARK, Seunggwon [University of Seoul] parksg182@gmail.com, presenting author  
MYUNGJE, Woo [University of Seoul] wksw1972@naver.com, co-author

In the last period, the Seoul metropolitan area has undergone rapid urbanization and population growth, and the urbanized areas have been continuously expanded in the use of land in the metropolitan area. The development of new cities in the metropolitan area and large-scale housing site developments had a profound effect on the movement of the population, and it was confirmed that the flow of population movement stretched out throughout the metropolitan area and the commuting traffic patterns changed accordingly. With the expansion of the spatial range of the metropolitan area, the new transportation method introduced in the metropolitan area is the "Great Train eXpress (referred to as GTX)". The introduction of GTX is expected to significantly shorten the travel time of the region. Also, it would bring many changes to the spatial structure and movement patterns of the metropolitan area. This is one of the solutions to improve the low expression speed of existing railways, and it has a different status from existing interregional railways and metropolitan railways.

It is analyzed that the emergence of a new form of transportation that is different from the existing one will bring positive results in the existing research. With the result that a new concept of transportation, such as high-speed rail, relieves the population concentration in the metropolitan area and has a positive effect on the balance of the regional spatial structure. With the opening of GTX, the metropolitan area is expected to be improved in accessibility along the GTX line. In addition, research on new spatial structures has been conducted, such as predicting that the opening of GTX will dramatically improve accessibility with a radius of 20-50 kilometers in Seoul and emerge as a new commuter area.

On the other hand, other studies have mentioned negative effects such as a new form of regional imbalance that improved accessibility through the opening of new transportation means. In other words, concerns have also been raised that the straw effect will appear. There is a concern that GTX, which enables rapid movement to Seoul, weakens the competitiveness of suburbs of Seoul and accelerates the concentration of the central city. However, while studies on a national scale such as KTX (Korea Train eXpress; high speed railway of Korea) have been conducted, and studies related to GTX are still insufficient. In addition, studies related to GTX are mostly about its economic effects and changes in spatial structure, but studies on movement patterns of people and movement by purpose, and studies on predicting changes in spatial structure and self-sufficiency based on this are insufficient.

Therefore, this study aims to analyze and predict how the opening of GTX affects the movement patterns in the metropolitan area, based on the purpose of movement, and to evaluate the self-sufficiency of local governments in the metropolitan area. To this end, an urban transport modeling system is used for the transport demand measurement modeling. After assuming a situation suitable for each situation through the Four-Step Travel Demand Model method, changes in movement patterns in the metropolitan area after the opening of GTX are examined. In addition, after analyzing the spatial structure change according to the change in the movement pattern, the degree of self-sufficiency in the outskirts of Seoul is evaluated using the self-sufficiency index. The analysis framework suggested in the study is expected to be applied for analyzing and predicting how the rapid railway system affects other metropolitan areas in the future. In addition, the study can provide implications for transportation policies to enhance regional balanced development.

# Track 15 – Transportation & Infrastructure Planning

## PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

### 15.1 PRE-ORGANIZED SESSION - TRANSPORTATION BEHAVIOR, EQUITY, AND TECHNOLOGY CHANGES AFTER COVID-19

Pre-Organized Session 1 - Summary

Session Includes 115, 116, 117, 118, 353

PALM, Matthew [Worcester State University] mpalm@worchester.edu, organizer

COVID-19 has changed how North Americans travel, but the evidence does not indicate which of these changes will persist after the risks of COVID-19 subside and social distancing policies end. It is also unclear to what extent crisis-induced societal changes, from corporate telework policies to street space reallocations and public transit service reductions, will be reversed in a post-COVID recovery. This session presents results from multiple studies that document the how and why behind recent travel behavior changes in North America. Questions in these studies include: How has COVID-19 impacted people's ability to reach essential destinations? To what extent do travelers plan to return to prior travel patterns when COVID ends? Have attitudes towards new forms of mobility changed in response to the pandemic? How do these outcomes vary by place and person? The session will provide a forum to synthesize evidence addressing these questions. It will support planners who seek to advance equitable and sustainable transportation as communities recover from the pandemic.

Objectives:

- After attending this session, a planner will be able to incorporate latest research insights into the temporary vs. longer-term impacts of the pandemic on travel demand in their plans and models
- After attending this session, a planner will be able to synthesize the evidence on the impact of COVID-19 on travel behavior.

### INVESTIGATING THE TEMPORARY VS. LONGER-TERM IMPACT OF THE COVID-19 PANDEMIC ON MOBILITY

Abstract ID: 115

Abstract within Pre-Organized Session 1

CIRCELLA, Giovanni [University of California, Davis] gcircella@ucdavis.edu, presenting author

YOUNG, Mischa [University of California, Davis] mwyoung@ucdavis.edu, co-author

The COVID-19 pandemic has led to many changes in household activities and mobility patterns. With offices and non-essential activities temporarily shutdown there has been a surge in the adoption of telecommuting and a reported increase in internet-based shopping. The pandemic has also caused huge disruptions to the transportation sector. Mass transit and shared mobility services have seen a stark decline in ridership, whereas walking and cycling for recreational purposes has reportedly increased. With the risk of a large economic recession and the likely scenarios of social distancing measures extended over time, there is reason to believe that at least part of the observed temporary changes might extend in the longer term, and into the new "normal". Accordingly, this research examines whether the new habits developed during the various phases of the pandemic as individuals adapt their activity patterns to their new reality will persist during and beyond the pandemic.

Using a unique longitudinal dataset, spanning from before and at two time periods during the pandemic (Spring and

Fall 2020), we compare the short- and longer-term impacts of the COVID-19 pandemic on household activities and mobility patterns. Attitudinal questions are further investigated to understand how people are adjusting to the COVID-19 pandemic and learn more about their changes in individual attitudes towards future travel choices. Findings from this research will prove valuable to transportation planners and policymakers seeking to understand how the COVID-19 pandemic has impacted mobility across various segments of the population, and will in turn enable them to enact effective policies and reign in transportation in the “post pandemic” society.

 KARNER, Alex [The University of Texas at Austin] alex.karner@utexas.edu, co-author

Public transit provides essential mobility options for transportation constrained populations, allowing them to fulfill their daily needs (Taylor & Morris, 2015). The Covid-19 pandemic has decimated public transit service across the United States and caused significant decreases in ridership (Liu et al., 2020; Vock, 2020). Adapting to the pandemic has been challenging for transit riders, and in particular for vulnerable and transportation constrained populations. Previous studies have evaluated which populations have remained on transit (Liu et al., 2020), however little is known about the reasons for pandemic-era transit mode shifts and the impacts of pandemic-related transit reductions on transit riders’ day-to-day lives.

Using a national survey of U.S. transit riders (n=500), this study examines changes in transit use since the pandemic began (number of trips conducted using all modes of public transit), reasons for transit reductions (due to changes in destinations, concern about the risks of contracting Covid-19, transit service changes, expense, concerns about harassment, and concerns about interacting with police and immigration officials), and the effects of reduced transit use and transit service on transit riders’ ability to meet their travel needs (accessing work, grocery, healthcare, and pharmacy). Results of the negative binomial model indicate that vulnerable populations (people earning under twice the poverty threshold, Hispanic and Latinx, and people with a physical disability) and constrained transit riders (people without vehicle access and people who reported that they rely on transit to meet their travel needs) are using transit more frequently than their counterparts during the Covid-19 pandemic. Additionally, transportation vulnerable populations are more likely to experience difficulty reaching essential destinations during the Covid-19 pandemic due to changes in transit service. The findings also reveal that concerns about interacting with police and immigration officials on transit are a greater deterrent for Hispanic and Latinx riders than for non-Hispanic White riders. The findings of this study characterize the impact of Covid-19 on transit riders on vulnerable and

transportation constrained populations, pointing to several policy recommendations that can protect transit service for these groups as we recover from the pandemic.

### **COVID19 STREETS: USING A MOBILITY JUSTICE FRAMEWORK TO EVALUATE SAFETY AND UTILITY OF RAPID ROLLOUT ACTIVE MOBILITY INFRASTRUCTURE**

Abstract ID: 117

Abstract within Pre-Organized Session 1

COMBS, Tabitha [University of North Carolina at Chapel Hill] [tacombs@live.unc.edu](mailto:tacombs@live.unc.edu), presenting author

With the COVID19 pandemic came a rapid increase in demand for safe, physically distant space for walking and cycling. Cities around the world responded by rolling out temporary active mobility infrastructure in existing roadways. Where active mobility infrastructure projects previously took years to plan and build, 2020 has seen them go from inception to installation in a matter of days. These rapid rollout infrastructure projects (RRIs) have been widely praised by advocates and have led to dozens of efforts aimed at propagating and cementing them. Their popularity also suggests we may be entering a new era of transport planning characterized by innovation and in situ experimentation rather than strict adherence to conventional practices.

However, RRIs have been critiqued for being arbitrary and out of touch with the communities' needs. Observers have noted that transportation planning's history of poor public engagement has been further entrenched by a crisis planning mentality engendered by the pandemic. Furthermore, preliminary evidence from the Shifting Streets database—a global crowdsourced database that tracks RRIs—suggests the majority of RRIs involved little public consultation, were not called for in relevant adopted plans, and were not aligned with on-going planning efforts.

There are clear benefits to shortening timelines and increasing flexibility in implementation of active mobility infrastructure. Yet the unlinking of RRIs from public processes suggests a widespread failure of procedural justice that could translate to inequitable distribution of impacts, raising critical questions about the effectiveness of RRIs and whether cities' newfound appetite for rapid, experimental infrastructure implementation is consistent with mobility justice.

#### Research questions and methods

This research evaluates the planning processes behind and impacts of RRIs in twelve North American cities. Our overall objective is to identify and develop new best planning practices that support more timely, just deployments of active mobility infrastructure in a post-pandemic future. We focus on two specific research questions:

What factors influenced the decision to implement RRIs? Specifically, what was the role of local planners in RRI decisions, and how were RRI decisions influenced by existing plans, public engagement, or advocacy efforts? We address this question through structured interviews with staff, elected officials, advocates, and community representatives in our study cities. Interviews focused on consistency of RRIs with adopted plans; how cities engaged with the public in deciding whether and how to implement RRIs; and whether the use of temporary

materials created opportunities for in situ public engagement. Interview responses are analyzed using a generalized inductive content analysis.

What were the impacts of RRI with respect to objective and perceived non-car travel behavior?

We address this question via a multimethod approach combining quantitative data on changes in walking and bicycling behaviors with secondary data on public perceptions about RRI's impacts on behaviors. We use ped/bike count data from 2016-2019 and 2020 in our study cities vs. a set of peer controls to analyze travel behavior change. Data on public perceptions of impacts come from surveys and listening sessions conducted by local planning staff in our study cities.

Anticipated outcomes and implications for planning

We expect to find that RRI shaped by robust public engagement and/or consistent with adopted plans are associated with greater use and more positive public perceptions. We are hopeful that by evaluating the planning processes behind RRI, our research will uncover potential new best practices that both shorten timeframes for implementation of active mobility infrastructure and ensure more just distribution of costs and benefits of that infrastructure.

## **EVIDENCE ON THE STICKINESS OF PANDEMIC-ERA BEHAVIOR CHANGE: INSIGHTS FROM THE COVID FUTURE PANEL SURVEY**

Abstract ID: 118

Abstract within Pre-Organized Session 1

SALON, Deborah [Arizona State University] [Deborah.Salon@asu.edu](mailto:Deborah.Salon@asu.edu), presenting author

CONWAY, Matthew [Arizona State University] [mwconway@asu.edu](mailto:mwconway@asu.edu), co-author

Disruptions in our lives present opportunities to learn and practice new ways of doing things, as well as re-evaluate our choices and habits. The COVID-19 pandemic has been perhaps the largest disruption event in modern human history. Nearly every human on the planet has been forced to modify their habits to adjust to the reality of the pandemic, making this historical moment a tremendous opportunity for long-term change at both the individual and collective levels. Importantly, the pandemic has coincided in time with the widespread availability of new technologies such as broadband internet service and videoconferencing, as well as many new app-based services

available through mobile phones.

The COVID Future Panel Study ([www.covidfuture.org](http://www.covidfuture.org)) is collecting national survey data in the United States that will help to identify and understand key changes in behaviors and habits, both during the pandemic period and beyond. The first wave sample size includes nearly 8,000 adults, while the second wave includes over 3,000. Both are weighted to be representative of the national adult population. The choices of main interest in this research are those about remote work, online shopping, restaurant dining, air travel, transit use, car commuting, non-motorized transport use, and household relocation – all of which are highly relevant to the planning profession.

Three waves of this pandemic-era survey have collected and will collect information about respondents' pre-pandemic and current choices, as well as expectations about their own future behavior, i.e. their intentions for the post-pandemic period. Many respondents indicated that the pandemic experience has led to new personal realizations and changes in employer policies that will lead to long-term behavioral changes, such as increased telework. We also asked about aspects of pandemic life that respondents would like to continue, and more than 70% selected at least one.

We focus here on remote work and commuting during the pandemic, and identify the extent to which our data suggest that changes are likely to “stick” for the long term. Preliminary results based on the first wave of survey data indicate large increases in remote work frequency that are likely to persist even after the threat of the pandemic has subsided. These results are accompanied by substantial and similarly persistent decreases in car commuting as well as transit commuting. These changes, however, are not evenly distributed across the population; workers with bachelor's degrees are about twice as likely to have adopted new commuting habits during the pandemic, compared to workers without bachelor's degrees. The post-pandemic “new normal”, therefore, may exacerbate existing societal disparities.

At the conference, we will be able to report results from the full three-wave panel, including how both behavior and expectations for the future have evolved during the pandemic, and more nuanced explanations of why.

WIDENER, Michael [University of Toronto] [michael.widener@utoronto.ca](mailto:michael.widener@utoronto.ca), co-author

Millions of people across North America began avoiding public transit at the onset of the COVID-19 pandemic, pushing transit ridership down to 30% of 2019 levels (Liu et al., 2020). Ridership has since recovered to roughly 40% of pre-pandemic levels (Transit and APTA, 2021). In a prior study, we surveyed over 3,000 regular transit users in Toronto and Vancouver who stopped riding in the first two months of the pandemic (Palm et al., In press). We found that women, people with disabilities, car-less travelers, and those with health problems were more likely to experience difficulties reaching essential destinations without transit.

This paper presents results from the second wave of this survey, which ran in Toronto and Vancouver in March 2021. We sought to answer three questions. First, who returned to transit before vaccines became widely available, for what purposes did they start riding again, and why? Second, who among riders avoiding transit purchased a bicycle or an automobile during the pandemic? Third, what factors are associated with riders' intentions to return to transit when the pandemic ends?

Our results will help planners and policymakers who seek to build more equitable transportation systems in cities emerging from lockdowns. Specifically, we aim to illuminate the equity implications of who is planning to return to transit when the pandemic ends, and who is not. Finally, our results will provide early insights into the long-term ridership implications of the pandemic, and how long-term impacts might vary across cities with diverse ridership.

### 15.10 PRE-ORGANIZED SESSION - PUBLIC TRANSIT CHALLENGES AND OPPORTUNITIES IN A POST-PANDEMIC WORLD

Pre-Organized Session 10 - Summary

Session Includes 600, 601, 602, 603, 604

BARAJAS, Jesus [University of California, Davis] [jmbarajas@ucdavis.edu](mailto:jmbarajas@ucdavis.edu), organizer

Even before the COVID-19 pandemic cut transit use by up to 90 percent in some places, public transit ridership in the US had been on a long decline since its peak around the mid-2010s. Travelers have more transportation choices than ever before; to meet sustainability and equity goals, cities and public transit operators must innovate to ensure service provides critical access to those who rely on public transit and to encourage those who have other transportation choices to choose transit first. This session brings together five papers that explore the challenges and opportunities that transit agencies face in boosting ridership from the perspectives of potential transit users. The papers identify barriers to transit use before, during, and after COVID-19, examine why people stop riding transit, describe complications and innovations in fare payment for underbanked passengers, and explore the ways micromobility and environmental design can create more accessible transit systems.

#### Objectives:

- Attendees will identify barriers to transit use before, during, and after COVID-19
- Attendees will understand how transit agencies are developing equitable fare payment systems

- Attendees will evaluate how environmental design near transit stations plays a key role in the integration of shared micromobility for transit access

## **ENVIRONMENTAL DESIGN CONNECTING MICROMOBILITY WITH PUBLIC TRANSIT**

Abstract ID: 600

Abstract within Pre-Organized Session 10

FERGUSON, Beth [UC Davis] bferguson@ucdavis.edu, presenting author

This paper will focus on the environmental design of first and last mile connections between micromobility and public transportation stations. Shared micromobility (bikes, e-bikes, and e-scooters) has the potential to reduce greenhouse gas emissions, traffic congestion, and air pollution, particularly when replacing private vehicle use and integrating with public transit. The design of the built environment in and around transit stations plays a key role in the integration of shared micromobility for first and last mile travel, by facilitating access to shared vehicles, protected bike lanes, and parking and charging for docked and dockless bikes, e-bikes, e-scooters. This paper will present a case study of nineteen Bay Area Rapid Transit (BART) rail stations in the California Bay Area, which are served by seven shared micromobility operators. Results from site surveys, stakeholder interviews, and bicycle and transit maps will be discussed.

## **ASSESSING THE NEEDS OF THE UN- AND UNDERBANKED IN INTEGRATED FARE PAYMENT FOR TRANSIT**

Abstract ID: 601

Abstract within Pre-Organized Session 10

PIKE, Susan [University of California Davis] scpike@ucdavis.edu, presenting author

D'AGOSTINO, Mollie [University of California Davis] mdagostino@ucdavis.edu, co-author

California's transit network is fractured and disjointed. Moving between cities on public transit, and in many cases within regions, requires moving between operators with different payment mediums and scheduling specifications. This is a major obstacle, especially for the most disadvantaged passengers. Following the passage of 2004 legislation to establish integrated payments for California transit, the state initiated the California Integrated Travel Project (Cal-ITP) which developed a multi-phased approach for studying and implementing integrative solutions for transit. The goals of Cal-ITP include identifying and implementing a single payment medium across all transit operators in the state of California.

Cal-ITP has identified the Europay, Mastercard, Visa (EMV) payment system as the most viable option for this effort, since it is already used for huge numbers of transactions worldwide. EMV systems are open-loop, meaning any credit or debit card may be used. As early as 2015 these systems were planned, or already underway in several

areas of the US, including Salt Lake City, UT, Chicago, IL, and Philadelphia, PA (Tavilla 2015).

However, for those without a credit card or debit card, the un/underbanked, EMV-based transit payment systems may not be accessible. In the most recent household survey of the Federal Deposit Insurance Corporation (FDIC), in 2019 5.4% of US households were unbanked, that is without a bank account (FDIC 2020). The top two reasons for not having a bank account are not having enough money to meet a minimum balance, and a distrust of banks (FDIC 2020). Although the use of cash is decreasing in general, cash continues to be used more by lower income individuals, and more by those without credit or (non-prepaid) debit cards (Green 2020). Typically transit systems implementing open-loop payment systems continue to provide cash payment options to serve un/underbanked passengers. But cash payments are slow, require extra steps, and can be costly for transit operators.

Working with Cal-ITP and a small set of transit operators, this study identifies barriers for un/underbanked passengers to use an EMV payment systems for transit. A key question we address is, "What can be done to make EMV systems a viable option for transit operators by making it an acceptable and accessible means of payment for all of their riders; specifically, those that are un/underbanked?"

Data will be collected in late spring of 2021, using intercept-based recruitment to reach transit riders and un/underbanked populations in a small sample of California transit systems. The survey focuses on participant's transit use, and preferences for payment options and financial services. We will present survey results, highlighting key challenges for un/underbanked passengers to use an EMV based payment system.

The results of this phase of our study will inform a larger scale, statewide investigation into how Cal-ITP can be accessible to the un/underbanked. Our work will also enable Cal-ITP with important insights into how to serve the un/underbanked with the Cal-ITP, and what they can do to make Cal-ITP accessible to all travelers in California. Further Cal-ITP could be a model for transit operations across the US, so the outcomes of this and future phases of this study will provide important insights throughout the country.

#### **CAR DRIVERS' PREFERENCES AND ATTITUDES TOWARDS PUBLIC TRANSPORTATION AND OTHER MODES IN A POST-PANDEMIC CONTEXT**

Abstract ID: 602

Abstract within Pre-Organized Session 10

SOZA-PARRA, Jaime [UC Davis Institute of Transportation Studies] jsozaparra@ucdavis.edu, presenting author  
ELDER, Mikayla [UC Davis] melder@ucdavis.edu, co-author  
CIRCELLA, Giovanni [UC Davis Institute of Transportation Studies] gcircella@ucdavis.edu, co-author

The negative externalities and heavy resource consumption associated with the high levels of private car use in urban areas have prompted cities around the world to seek ways of encouraging a shift towards more sustainable transportation modes. This is more important and challenging in a highly car-dependent context, which is produced by the urban structure, limited transit availability and level of service, unequal income distribution, among many other factors. This is not an easy task though. To date, many research and planning efforts have gone towards

understanding people's behavior and attitudes towards the use of public transportation and new mobility trends, such as the adoption of smartphone app-based services including ridehailing or micromobility. However, not enough efforts are spent in understanding what makes a car driver shift to a more efficient mode of transportation possible, and likely to happen. This is important as car drivers perceive public transportation attributes differently to day-to-day transit passengers (van Exel & Rietveld, 2010, Beirão & Cabral, 2007).

This objective gains a new dimension when considering the implications of COVID-19 over vehicle ownership and willingness (or, better say, lack of willingness) to share a vehicle, as in public transportation. Individuals' concerns about contracting the virus, combined with various measures implemented to contain the contagion during the various stages of the pandemic, have caused huge modifications in activity organizations and travel choices. Among other transportation impacts, car travel heavily dropped during the early stage of the pandemic, but has rebounded since then, while the use of other means of travel (in particular, shared modes of transportation) remains substantially below the pre-pandemic levels.

Our research team is leading a large data collection to investigate the temporary vs. longer-term effects of the pandemic, with a combination of quantitative (detailed behavioral and attitudinal surveys) and qualitative (in-depth phone interviews) approaches. We resampled respondents from previous surveys in 2018 and 2019 creating a unique longitudinal dataset with information from before and during the pandemic (with new waves of surveys in Spring and Fall 2020), and we will continue to collect data during 2021 and beyond. More than 10,000 respondents, primarily located in 17 metro regions in the United States and Canada, have participated in the data collections in 2020.

Thus, this research focuses on understanding to which extent any behavioral or attitudinal change triggered by the pandemic may continue over time. It might be the case that when the pandemic is over, people might return to their typical routine from before COVID-19 impacted their lives. However, it is also possible that these attitudinal changes and alternative mobility options might be perceived as better matching individual needs and preferred to those that were used in the past. Potential new bike riders, people stopping using transit, people driving more frequently, among others, are key to be identified and studied, as these changes have substantial sustainability implications, in terms of formation of new travel habits, changes in vehicle miles traveled (VMT), and impacts on traffic congestion, greenhouse gas emissions and active lifestyles/health impacts of transportation. Through a better understanding of private car commuter attitudes in combination with longitudinal behavioral surveys' responses, we expect to be able to identify what set of attributes and conditions makes a car driver overcome inertia and consider other sets of more sustainable mobility options.

#### HOUSEHOLD ATTITUDES AND BARRIERS REGARDING TRANSIT USE IN MID-SIZED CITIES

Abstract ID: 603

Abstract within Pre-Organized Session 10

MERCK, Amanda [University of Illinois Urbana-Champaign] merck2@illinois.edu, presenting author  
HUTCHINSON, Emily [University of Illinois Urbana-Champaign] eahutch2@illinois.edu, co-author

BARAJAS, Jesus [University of California Davis] jmbarajas@ucdavis.edu, co-author  
LEE, Bumsoo [University of Illinois Urbana-Champaign] bumsoo@illinois.edu, co-author  
BRAUN, Lindsay [University of Illinois Urbana-Champaign] lmbraun@illinois.edu, co-author

Transit ridership has been declining across the U.S. since around 2014, with varying rates by population size. In metropolitan statistical areas (MSAs) with less than 1 million residents, for example, ridership fell 7% between 2014 and 2018. Suggested reasons for transit decline across the country vary, including: service reduction, population decline, demographic shifts, displacement, telecommuting, changes in non-work travel, vehicle ownership, and shared mobility (Boisjoly et al., 2018; Manville et al., 2018; Graehler et al., 2019; Watkins et al., 2019). Most of this research has examined transit ridership trends in large metro areas; because mid-sized cities have been largely understudied, the extent and determinants of ridership decline there are not well understood. Moreover, despite the immediate transit ridership losses as a result of the COVID-19 pandemic, projections of longer-term and even post-pandemic ridership trends are unclear. Understanding the extent and determinants for declining ridership in mid-sized cities pre-COVID-19, together with the lingering effects of the pandemic on future ridership, can help transit agencies respond through planning, policy, and service changes. Essential workers—generally lower-income workers and people of color—who have continued to comprise the bulk of transit ridership stand the most to gain from these changes (Transit Blog, 2020).

The purpose of this study is to identify the extent and determinants of declining transit ridership in mid-sized cities. The research draws from an analysis of transit ridership trends and a household survey conducted in seven Illinois MSAs located outside the Chicago region, each of which have one or more transit agencies that serve at least 1.5 million passengers annually. This research is part of a broader mixed-methods study on transit ridership in mid-sized Illinois cities. First, to contextualize the study, we will briefly present descriptive findings from practitioner interviews and an analysis of route-level ridership trends from 2013 to 2017 across all agencies. Preliminary results suggest that there is no common cause in ridership decline as a result of demographic or employment changes; other broader macroeconomic trends coupled with structural changes unique to each city are more likely causal factors.

Second, we will share findings from a household survey conducted in each of the seven mid-sized MSAs. The purpose of the household survey is to identify the characteristics of transit riders compared to non-riders, the barriers to transit use among non-riders, the ways evolving transportation technologies influence transit ridership, and the strategies that would encourage more frequent transit use. A secondary purpose of the survey is to understand potential long-term consequences of COVID-19 on transit use. A questionnaire will be distributed by mail to a stratified random sample of 80,000 potential transit riders, defined as households who live within one-half mile of fixed-route transit service in each of the MSAs, in early April. The survey asks questions in multiple categories, including travel frequency both currently and prior to COVID-19 stay-at-home orders; the extent to which respondents rode transit in the past; why former transit riders stopped riding transit; attitudes, barriers, and preferences regarding transit; travel expectations after COVID-19; and sociodemographic characteristics. We will present both descriptive analyses and comparisons across key variables.

This study will offer new insights into the barriers to transit that non-riders face, how emerging and evolving transportation technologies influence transit ridership, and how the COVID-19 pandemic may continue to influence transit ridership. Primary data collection will help us draw new conclusions that are unavailable in studies that use secondary data to analyze transit ridership trends. The setting of the study will also offer novel information about transit use in mid-sized U.S. cities. We expect the study to contribute to short-term and long-term transit system and service improvements.

Nationwide transit ridership has been declining since 2014, when many transit agencies across the United States recorded peak numbers (Grisby et al., 2018). This trend was exacerbated by the COVID-19 pandemic. While a plethora of quantitative work has examined the likely factors causing transit ridership loss (Boisjoly et al., 2018), little qualitative work has explored barriers to transit use specifically for former transit riders (e.g. Lowe and Mosby, 2016). Descriptive analyses of transit ridership, though often outdated, have been criticized for failing to address causal links between transit conditions and ridership (Taylor and Fink, 2013). For example, as Boisjoly et al. have found, increasing car ownership rates are thought to be contributing to downward ridership trends. However, quantitative data alone cannot explain why a household decides to replace the bus with a car. Less research yet has examined these barriers in mid-sized US cities, which are characterized by differences in spatial form, funding levels, and socioeconomic conditions compared to larger metro areas.

The purpose of this study is to explore the characteristics and experiences of people who previously used transit on a regular basis, known as lapsed riders. We define lapsed riders as people who consistently rode transit for a sustained period within the past five years but have since stopped or significantly reduced their use. The research will address three questions: (1) What are the characteristics of lapsed riders (e.g., sociodemographic attributes and general travel behavior)? (2) What are the key barriers to transit use among lapsed riders? (3) What types of strategies do lapsed riders think might encourage more frequent transit use? This research is part of a broader mixed-methods study on transit ridership in mid-sized Illinois cities.

We are conducting interviews with approximately 50 individuals who live in areas served by one of eight transit agencies in mid-sized Illinois cities and who report having previously taken transit on a regular basis. We are recruiting individuals via direct social media campaigns, online communication channels of community services organizations, and a follow-up question on the household survey administered as part of the larger study. The semi-structured interviews ask participants about their transit ridership history, their experiences riding transit, their transit needs, solutions that might encourage them to ride transit again, and their perceptions of service in their city. Our interview method candidly probes for causal links by inviting interviewees to share specific stories about why they stopped riding. Interviews are recorded and transcribed for qualitative analysis. We are following the

flexible coding approach to analysis advocated by Deterding and Waters (2018), a departure from grounded theory in which researchers begin with large index codes and end with smaller analytic codes. These methods help improve construct validity when analysis is distributed across a team.

As part of a larger mixed-methods research approach, by engaging directly with lapsed riders we hope to gain insights about for whom transit becomes an unfit mode choice and why. Exploring the extent of and reasons for ridership decline can help agencies accurately respond to trends without putting riders at risk of reduced mobility. The results of this work can contribute to strategies for local and state agencies in Illinois as they respond to ridership decline, including that resulting from the COVID-19 pandemic. For the field of transportation research, our paper will show how exploring the qualitative knowledge and experiences of lapsed transit riders can strengthen analyses of determinants of transit ridership.

#### **15.19 PRE-ORGANIZED SESSION - NEW MOBILITIES, TRANSPORTATION EQUITY, AND SPATIAL JUSTICE (SESSION 1/2)**

Pre-Organized Session 19 - Summary

Session Includes 510, 511, 512, 513

JAMME, Hue-Tam [Arizona State University] hue-tam.jamme@asu.edu, organizer

Driven by new transportation models and technologies, new mobilities such as ride-hailing, car- and bike-share systems, and other forms of “mobility-as-a-service,” have constituted a disruptive trend in the transportation sector worldwide. Scholars have found mixed results regarding the promise of new mobilities to generate a more sustainable and livable urban form. But what about the promise to shape more equitable cities? Do new mobilities contribute to transportation equity and spatial justice? These questions arise as new mobilities disrupt the transportation systems that have historically provided for the mobility of most vulnerable populations, including the disabled, the poor, the children, and historically disenfranchised populations for gender-, race-, or ethnicity reasons. This pre-organized session will gather scholars interested in the equity impacts of new transportation models and technologies. Empirical studies will be presented, using a range of qualitative and/or quantitative methods.

#### Objectives:

- Mobility-as-a-service (ride-hailing, car sharing, bike sharing, etc.)

- Public-private partnerships between transportation network companies and public agencies
- Mobility and accessibility of vulnerable populations

## **TECHNO-LOGIC: EVALUATING RELATIONSHIPS BETWEEN AUTO OWNERSHIP, TRIP-MAKING, AND NEW MOBILITY SERVICES**

Abstract ID: 510

Abstract within Pre-Organized Session 19

BLUMENBERG, Evelyn [UCLA] eblumenb@ucla.edu, presenting author

PAUL, Julene [UCLA] julenepaul@ucla.edu, co-author

New technology-based services and activities reduce the advantages of private vehicle ownership, potentially allowing households to live car-free or downsize their household vehicle fleets. Several promising alternatives to car ownership have emerged globally in the last decade. These new services include smartphone-facilitated ridehail (e.g., Uber and Lyft), carshare (e.g., Zipcar), and micro-mobility options such as scooters and bike share systems.

Previous studies in the U.S. show a negative relationship between ridehail use and automobile ownership. However, existing research has struggled to document any long-term substitution effects of ridehail services on household vehicle fleet size. Ridehail competes most heavily with non-auto modes such as transit, walking, and bicycling and with taxi service (Dong, 2020; Tirachini, 2019). Although this hypothesis is difficult to test, ridehail service may delay vehicle purchases among a subset of these households. Further, ridehail services and particularly shared services such as Lyftline provide auto access to low-income households who do not own automobiles (Tirachini, 2019; Wang & Mu, 2018).

Carshare services including Zipcar, Maven, and Car2Go also offer alternatives to private vehicle ownership. These services allow users to rent fleets of vehicles for short time periods, providing the benefits of vehicle ownership without the fixed costs. Some studies show that carshare users disposed of vehicles or were less likely to purchase vehicles (Cervero et al., 2007). However, many carshare programs at least initially cater to travelers who already lack vehicles (Martin & Shaheen, 2011).

Beyond ridehail and carshare, the capability to transact business online—for work and shopping—may affect mobility decisions. Online activities such as telework and online shopping have increased over time and have grown dramatically during the current COVID-19 pandemic. While the lasting effects of this abrupt shift are unclear, online activities may persist at elevated levels beyond the current COVID-19 crisis.

In this study we use data from the 2017 U.S. National Household Travel Survey and multinomial logistic regression to investigate the relationship between technology-based accessibility and vehicle ownership. We also examine whether these relationships are consistent among households that otherwise vary in the constraints they face related to automobile ownership. Finally, to interpret the findings, we assess whether technology-facilitated services provide varying levels of mobility for households with and without auto constraints.

The analysis indicates a positive relationship between the use of ridehail and carshare services and the likelihood of being a zero-vehicle household. We also find positive relationships between online shopping and working from home and the likelihood of having fewer household vehicles than adults. Finally, ridehail use brings the trip making of auto constrained households almost to parity with unconstrained households.

New technology-based activities may allow some households to eliminate or reduce their dependence on household vehicle fleets. For other households, new technology-based services may increase their access to opportunities while easing the financial burden of vehicle ownership. Agencies and organizations should explore opportunities to better connect households—particularly households with travel and financial constraints—to technology-based

services and activities that facilitate better access.

#### **RIDE-HAILING SERVICES TOWARDS AN INCLUSIVE FUTURE: THE IMPORTANCE OF LOCAL COLLABORATION**

Abstract ID: 511

Abstract within Pre-Organized Session 19

KIM, Sang-O [Cornell University] sk3322@cornell.edu, presenting author

Partnerships between public agencies and transportation network companies (TNCs) are an emerging trend in the United States to support the mobilities of those experiencing transportation disadvantages (Leistner and Steiner 2017, Palm et al 2020). The convenience and efficiency of ride-hail services promise to improve the socio-economic accessibility of its users. Addressing transportation disadvantages also has significant implications for creating a more inclusive community (Palm et al 2020, King et al 2019). However, it remains unclear what kind and how much responsibility public sector agencies should assume to ensure that new service is making progressive contributions to its intended users.

To address these issues, I present case studies of partnerships between the public sector and ride-hail companies in the US to tackle long-standing transportation disadvantages in each community. I examine three cases: the Jobs Access Program with Lyft in Philadelphia (PA), the Mobility on Demand with Lyft in Santa Monica (CA), and the MyRide program supported by Via in Montpelier (VT). My analysis draws on policy documents, evaluation of service performances, and interviews conducted with key stakeholders including sponsoring public agencies (i.e., transit agencies and housing authorities), ride-hail industry partners, and local community organizations.

I find that the public agencies have engaged in collaboration with local community organizations and advocacy groups to ensure that the new services are delivering mobility benefits to their target user groups. Local collaborations addressed both short-term challenges to service access (e.g., digital divide and service registration) and long-term goals of guiding the built environment towards a more sustainable and inclusive future (Warner and Zhang 2020). However, even with collaboration, the services still fail to cater to some of the most vulnerable and harder-to-reach user groups namely those requiring ADA access or door-to-door service (Fraade-Blanar et al 2021, Pangbourne et al 2020). Together, these case studies highlight that ride-hail services in themselves should not be treated as a solution for transportation inequality, despite their convenience and flexibility. Instead, the public sector and civil society should come together to guide the design and implementation of services enabled by new mobility technologies towards the goal of building an inclusive community (Warner and Zhang 2020).

## **RIDE-HAILING AND FIRST/LAST-MILE MOBILITY: ENHANCING TRANSIT ACCESS FOR DISADVANTAGED RESIDENTS OF A SUBURBAN COMMUNITY**

Abstract ID: 512

Abstract within Pre-Organized Session 19

JAMME, Hue-Tam [Arizona State University] [hjamme@asu.edu](mailto:hjamme@asu.edu), presenting author  
 EISENLOHR, Andrew [University of the District of Columbia] [andrew.eisenlohr@udc.edu](mailto:andrew.eisenlohr@udc.edu), co-author  
 BAHL, Deepak [University of Southern California] [bahl@usc.edu](mailto:bahl@usc.edu), co-author  
 BANERJEE, Tridib [University of Southern California] [tbanerje@usc.edu](mailto:tbanerje@usc.edu), co-author

Transportation network companies (TNCs), such as Uber and Lyft, may promote transit use by filling the gap for the first/last mile in accessing rail transit stations (Hall et al., 2018; McLeod et al., 2017; Rayle et al., 2019). Whether this holds true in suburban areas, as transit lines extend to these locations, remains to be investigated. The first/last mile issue is of particular significance in promoting transit ridership in these typically low-density and car-dependent localities. Furthermore, the first/last mile issue is critical to advance equitable access to opportunities in sprawled metropolitan areas (Boarnet et al., 2017). Yet, there has been no quantitative study assessing whether TNCs as a complement to transit can contribute to advancing transportation equity. This paper aims to examine the effectiveness of a municipality's partnership with a TNC to meet the first/last mile mobility needs of disadvantaged residents in a suburban community.

The paper draws on an in-depth case study of the GoMonrovia program through which the City of Monrovia, a suburban community connected to the Los Angeles Metro system since 2016, provides its residents with subsidized Lyft rides. What is the socioeconomic and demographic profile of the first/last mile users of the program? To what extent does the GoMonrovia program promote rail transit access to low-income and transit-dependent populations? These are some of the key research questions addressed in this paper.

Building on a trip database provided by Lyft, recent demographic and socio-economic information from the American Community Survey, and City's zoning and land use, we analyzed the spatial distribution of trip origins and destinations at the census block group level. This work will be supplemented by person-level data from a survey of users, to be completed in April 2021. The survey will be distributed via the Lyft app, the City's newsletter, and social media (Facebook, Twitter, and Instagram). At least 500 responses are anticipated. Regression analyses of both the Lyft travel data and the survey responses will identify the extent to which socio-demographic and land use factors predict the use of the GoMonrovia program as a first/last mile transit enabler.

More than one million Lyft trips were subsidized by the City of Monrovia between March 2018 and August 2020, out of which approximately 10% either began or ended near the Monrovia Metro station. Preliminary analyses indicate that neighborhoods with relatively high shares of low-income transit-dependent renters or young Latinx families

generate the bulk of these trips. Again, analysis of survey data should further illuminate whether the program is a reliable first/last mile option for disadvantaged populations. The findings can inform transportation researchers and policymakers by establishing the profile of suburban users most likely to rely on TNCs for the first/last mile of a transit station.

## EVALUATING THE EQUITY IMPLICATIONS OF RIDE-HAILING THROUGH A MULTI-MODAL ACCESSIBILITY FRAMEWORK

Abstract ID: 513

Abstract within Pre-Organized Session 19

FARBER, Steven [University of Toronto] steven.farber@utoronto.ca, presenting author  
 ABDELWAHAB, Bilal [University of Toronto] b.abdelwahab@mail.utoronto.ca, co-author  
 PALM, Matthew [University of Toronto] mattdpalm@gmail.com, co-author  
 SHALABY, Amer [University of Toronto] amer.shalaby@utoronto.ca, co-author

In metropolitan regions, it is crucial that transportation policies and services provide equal opportunity to participate in economic, social, and civic activities. As such, accessibility has emerged as the primary metric of transportation benefits researchers use in distributional analyses and equity evaluations (El-Geneidy et al., 2016). Despite the importance of incorporating accessibility into equity evaluations, and the many examples of examining ridehailing equity (e.g. Barajas and Brown, 2021), there have been few attempts to measure ridehailing benefits within an accessibility framework. One reason for this shortcoming is that most common accessibility measures rely on travel-time-based fields of interaction, which exaggerate the benefits of travel modes that have pecuniary costs based on travel time or distance, such as ridehailing. We address this challenge through the application of Accessibility Profile Analysis (APA) (Neudorf, 2014; Lee, 2019). APA is an analytical framework that can assess place-based accessibility using generalized costs (GC) of travel, rather than time alone. We deploy APA in a comparison of accessibility provided by ridehailing, public transportation, and an integrated mode with ridehailing serving as the ingress mode in a rapid transit trip. We apply an equity lens to our analysis of Toronto to uncover where and for whom ridehailing and integrated modes provide accessibility benefits over and above those offered by the public transportation system.

The base APA results consist of jobs accessibility scores for different modes of travel and increasing levels of generalized cost. We were quite shocked to see how closely the ridehailing profile tracked with the profile for public transportation, indicative of a concerning level of competition between the two modes. In general, ridehailing provided slightly higher levels of jobs accessibility at lower levels of generalized cost, and slightly less benefit for higher cost thresholds. The ridehailing benefit was higher farther away from the central business district, especially near the municipal boundary where cross-boundary job opportunities were cheaper and faster to reach by ridehailing compared to poorly integrated transit services and double-fare requirements.

Surprisingly, when analysing the integrated ridehail/transit mode, we found that it offered almost no accessibility benefits over transit alone, reaching a maximum neighbourhood-level benefit of just 3%. Presumably, the high fixed cost of ridehailing outweighs the time-savings provided over walking+bus access to rapid transit. This result may be tightly tied to the Toronto case study, where the Toronto Transit Commission operates one of the most extensive and frequent bus networks in North America.

For both ridehailing and integrated ridehailing/transit, their comparison to transit largely depends on the assumed value-of-time (VOT). In our paper, we selected a VOT near the minimum wage for the city of CAD14; using a higher VOT would increase the estimated benefit of ridehailing. This has two implications for equity. First, the benefits for ridehailing accrue to those with higher VOT, assumed to be wealthier. Second, the benefits of ridehailing are achievable only if the high out-of-pocket costs are affordable to equity seeking groups, many of whom are low wage workers or belong to low-income families (Young et al., 2019).

We compared all of our results between the general population of Toronto and those living within Neighbourhood Improvement Areas (NIAs). Notwithstanding affordability barriers to use, ridehailing was estimated to provide nearly twice the benefit for residents of NIAs compared to other neighbourhoods in Toronto for lower cost trips, and about 1.4 times the benefit for higher cost trips. Thus, targeted mobility subsidies NIA residents may result in the realization of ridehailing-based accessibility benefits by members of equity seeking groups. Nonetheless, job accessibility for carless households remains lower in disadvantaged areas – even after the introduction of ridehailing.

#### 15.45 PRE-ORGANIZED SESSION - OUTLINING A RESEARCH AGENDA FOR TRANSPORTATION GOVERNANCE

Pre-Organized Session 45 - Summary

Session Includes 653, 654, 655, 656

RAY, Rosalie [Columbia University] [rsr2150@columbia.edu](mailto:rsr2150@columbia.edu), organizer

A growing number of transportation planning scholars recognize that the institutional underpinnings of transportation policies can be just as consequential, or more so, than the technological and engineering solutions that often dominate the discourse. For the pursuit of sustainable transportation in particular, existing scholarship suggests that impediments are not technical but institutional--the decision to adopt, deploy or use a particular technology or policy tool, not the tool itself. While technical and operational barriers do exist, most are well understood and involve fairly routine actions for implementation. Decisions to do things differently, however, must

confront existing institutional landscapes and established governance systems. This session represents an opportunity to look across geographic scales--state, region, and municipal--to assess both what we know and what we still need to know about transportation governance and policy-making. This session aims to bring many of these research strands together into a single conversation to outline a research agenda around transportation governance moving forward.

Objectives:

- Understanding the state of practice of research on transportation governance

## **MAPPING THE RISE OF CITY TRANSIT PLANNING**

Abstract ID: 653

Abstract within Pre-Organized Session 45

RAY, Rosalie [University of Connecticut] [rsr2150@columbia.edu](mailto:rsr2150@columbia.edu), presenting author  
FISCHER, Lauren [University of North Texas] [Lauren.Fischer@unt.edu](mailto:Lauren.Fischer@unt.edu), co-author

Academics and practicing planners have long emphasized the import of regional transit planning (Weinreich, 2016). Planning at the regional scale ensures that transit is coordinated across the multi-jurisdictional commuteshed, and enables transit networks to serve a variety of travel needs (in theory). The regional focus, however, has the potential to obscure transit planning efforts at the city and neighborhood scale, including the responsibility municipal governments have over local streets that transit networks require to operate efficiently. Since the mid-2000s, an increasing number of cities have taken steps to enhance their transit planning capacity. This has happened along several fronts. A range of cities have taken responsibility for improving the reliability of buses on their streets (Ray, 2019) while multiple mid-size cities have pushed forward with neighborhood transit systems to facilitate economic development (King and Fischer, 2016), and as a means to overcome regional barriers to transit funding (Fischer 2019).

While Wachs (2003) has traced the devolution in funding and the rising role of the local option sales tax in California, there is a lack of research examining the corresponding devolution of planning for transit across contexts. This paper seeks to fill the current gap using a novel database of transit planning and governance in the 40 most populous US cities. Using website analysis and review of existing planning documents, our analysis indicates that local responses are mixed. Of the 40 cities examined, one-third had no transit plan, one-third had a mobility plan that deprioritized cars but was not specifically transit focused and one-third had a transit plan either completed or in progress. In this paper we present three cases studies drawn from each of these categories, to better understand the motivations behind local transit and mobility planning and to provide insights on how the 'devolution revolution' in transport finance (Wachs 2003) is playing out in the planning realm.

## **SUPPORTING REGIONAL TRAVEL THROUGH CROSS-BOUNDARY DECISION-MAKING: CASE STUDIES OF METROPOLITAN PUBLIC TRANSPORTATION SYSTEMS AS POLYCENTRIC GOVERNANCE NETWORKS**

Abstract ID: 654

Abstract within Pre-Organized Session 45

WEINREICH, David [Technion-Israel Institute of Technology] [dpwein@umich.edu](mailto:dpwein@umich.edu), presenting author  
 SKUZINSKI, Thomas [Northern Illinois University] [skuzinski@niu.edu](mailto:skuzinski@niu.edu), co-author

Some US MSAs have over 20 transit agencies in the same region (e.g. 23 in Miami and 21 in Los Angeles), while 16 US metro regions with over 1 million people lay in a state that allows local jurisdictions to opt out of a transit agency, creating the potential for “transit deserts” with no service (Weinreich & Bonakdar, 2020). This study examines the presence of fragmentation of transit agencies within a metropolitan region, as well as the contours of formal cross-agency linkages that provide opportunities for service coordination across transit agencies and municipal governments. We define a regional space for analysis of public transit that covers an entire region, rather than a single transit organization. Such regional units of transit service will clearly differ according to effectiveness, efficiency, and equity, but we do not know if and how the variation in outcomes links systematically and significantly to variation in metropolitan governance. Does the organization of decision-making authority—the number of decision-making centers in the system, and their independence and interdependence—matter to their ability to connect localities by transit, a longstanding question among scholars of planning, public policy, and public administration—requiring a valid and reliable method for measuring regional transit governance that could support large-sample quantitative and comparative analyses. However, the complexity of even one regional area’s transit governing system has hindered the development of such a measure, making it impossible to compare governing systems across regions, or tie governance methods with particular transit outcomes. This article is an attempt to overcome that obstacle. We draw together insights from polycentric governance and network theory to develop a conceptual framework for answering this question here, by measuring the fragmentation of a single region’s transit governance systems. We follow this with a network analysis of its formal methods for connecting transit agencies in order to provide coordinated or integrated transit service. The framework we develop includes two components that capture the independence and interdependence within the system: weighted nodes that represent semi-autonomous decision-making centers, and weighted edges that represent the formal and informal institutions (e.g., interagency agreements, conjunctions, and cross-jurisdictional funding sources earmarked for transit). These institutions provide the formal structure necessary to connect multiple transit agencies and municipalities in an integrated transit system. We describe the logics behind delineating and weighting nodes, review the possible cross-boundary mechanisms that comprise the inter-nodal edges, and apply the results in a single region in order to understand how the network of governing institutions impacts their ability to overcome fragmentation barriers and provide integrated transit services across the region.

## **TRANSPORTATION FUNDING, ENERGY TRANSITION, AND GOVERNANCE: THE ROLE OF STATE LEGISLATORS**

Abstract ID: 655

Abstract within Pre-Organized Session 45

SCIARA, Gian-Claudia [University of Texas at Austin] [sciara@utexas.edu](mailto:sciara@utexas.edu), presenting author

WAXMAN, Andrew [University of Texas at Austin] [awaxman@utexas.edu](mailto:awaxman@utexas.edu), co-author

BUCHANAN, Ross [University of Texas at Austin] [ross.buchanan@utexas.edu](mailto:ross.buchanan@utexas.edu), co-author

Absent coordinated national policy to guide the transition towards less carbon intensive energy use patterns, policies addressing energy transition have largely been left to subnational governments. Planning departments and local officials in many cities have embraced this challenge, particularly when it comes to promoting sustainable transportation. Yet sustainable cities need state partners as well.

State legislatures stand to substantially influence movement toward decarbonization in the transportation sector. State legislators and legislative committees play a key role in generating and directing public revenues to support transportation planning and investment in the U.S. Historically, the basic institutions of state transportation funding are tightly coupled with the transportation sector's dependence on fossil fuels. For instance, legislatures rely overwhelmingly on the per-gallon motor fuel excise tax to raise state transportation funds, making growth in transportation investment often dependent on increased gasoline and diesel fuel consumption. Further, many legislatures have adopted laws or constitutional provisions preventing use of state transportation revenues for public transportation and other non-highway modes, cementing the link between state resources and car-based transportation.

Given their responsibilities for transportation revenue, state legislators unavoidably confront policy choices that impact the prospects for and pace of transportation decarbonization. This is true as much in states with expansive sustainability and decarbonization policy commitments as in states with no such commitments. State legislation is needed, for example, to adjust the structure or rate of existing fuel taxes and other transportation taxes and fees or to adopt any new, non-carbon-based transportation revenue sources. Legislators also oversee the budgets and expenditures of state transportation agencies and the distribution of funds to metropolitan and local transportation planning bodies and divisions.

Informed by interdisciplinary perspectives from planning, political science, and public finance and economics, this research asks how statehouse lawmakers understand the connection between the energy transition underway in transportation and the state resources available for transport infrastructure and services. Changing options for transportation energy sources increasingly promise to reduce consumption of conventional motor fuels, underscored by General Motors' recent announcement that it would phase out petroleum-fueled vehicle production by 2035. The accelerating shift to electric vehicles promises to sink state fuel tax revenues, weakened already by increasingly fuel-efficient conventional cars and by newer hybrids.

As the transportation industry moves steadily toward low carbon energy sources, we examine how state lawmakers view the important transportation policy problems facing their states. When lawmakers consider energy transition or decarbonization, what concerns are important to them, and how do they discuss or frame the issues? To what stakeholders do they look for cues and information about this policy area? How do urban and rural concerns play in? We note for context that while over 30 states have increased their state motor fuel taxes since 2013, few have

made larger structural moves to address the dismantling of transportation revenues from energy changes.

This project surveys the roughly 1,700 statehouse lawmakers working at the intersection of transportation and energy policy across U.S. state legislatures. These legislators decide central questions about how to marshal and use resources for transportation investment in their states.

We explore legislators' perceptions of transportation policy problems and their connection to energy policy, the nature and salience of the challenges faced, perceived solutions, opportunities or constraints to enacting policy change, and relevant stakeholders. Our work promises to shed light on how state policy elites frame problems in this domain and to suggest the circumstances under which state lawmakers might facilitate energy transition in the transportation sector and local efforts to support that transition.

#### **AIRPORT COMPETITION AND MEGAREGIONAL IMPACTS: CHALLENGES AND OPPORTUNITIES FOR PLANNING INSTITUTIONS**

Abstract ID: 656

Abstract within Pre-Organized Session 45

RAHMAN, Mashrur [University of Texas at Austin] mashrur@utexas.edu, presenting author

RYERSON, Megan [University of Pennsylvania] mryerson@upenn.edu, co-author

SCIARA, Gian-Claudia [University of Texas at Austin] sciara@utexas.edu, co-author

Changing dynamics in U.S. aviation have significant reverberations across ground transportation systems within and beyond metropolitan regions. Yet, studies of regional and megaregional transportation planning in the U.S. have paid generally little attention to the influence of aviation trends on surface transportation demand in and among metro regions. Further, most studies on metropolitan planning organizations (MPOs)—the bodies responsible for federally required transportation plans and spending programs in urban regions—say very little about the role of airports or aviation representatives in regional transportation decision-making.

This research is the first of its kind to explore formal and informal relationships between airports and metropolitan planning organizations (MPOs). We observe that rapid change in U.S. aviation has significant impacts for ground transportation access to airports, affecting not only on-airport planning but also regional and megaregional travel flows and economic development. During the 2000s, seven major US airlines merged into three, concentrating flights in key hubs and reducing flights in smaller airports. These changes expand the geography of airport choice, resulting in the phenomenon known as 'market leakage.' Air travelers increasingly make longer distance trips, often in personal vehicles, to access key hub airports, substituting these for more proximate local airports (Fuellhart, 2007; Ryerson & Kim, 2018; Kim & Ryerson, 2018); such substitutions visibly impact surface travel between megaregional nodes.

This study explores the challenges and opportunities that aviation market changes present for existing transportation governance structures and institutions. In particular, we examine the capacity of existing planning

institutions—largely siloed in separate air and surface transport planning domains—to address the megaregional dynamics associated with aviation sector shifts. For instance, how do U.S. airport ownership and governance models enhance or hamper airport engagement in regional and megaregional transportation planning?

We draw on original data to characterize airport representation across MPOs nationwide. Next, we follow a case study approach to observe, in a single geographic context, how and to what extent airport sponsors engage in regional and megaregional transportation planning. We focus on Texas Triangle megaregion, one of the fastest growing megaregions in the country, and home to two large hub airports. Extensive review of planning documents and interviews with key informants allow us to report on the relationship between airport planning and planning by MPOs.

We find the incidence of airport-MPO institutional overlaps or formal coordination is limited. Further, where MPO-airport planning mechanisms exist, like the Regional Aviation System Planning (RASP), they may be underutilized, leaving important shifts like market leakage and their regional and megaregional impacts unaddressed. We also find ample scope for greater airport involvement in MPO planning, for instance through data collection and sharing at minimum, and through more expansive joint planning efforts. We conclude with lessons for policymakers, planners (particularly at airport authorities and MPOs), and planning scholars with an interest in aviation issues.

### **15.100 PRE-ORGANIZED SESSION - NEW MOBILITIES, TRANSPORTATION EQUITY, AND SPATIAL JUSTICE (SESSION 2/2)**

Pre-Organized Session 100 - Summary

Session Includes 525, 526, 528, 529, 561

JAMME, Hue-Tam [Arizona State University] hue-tam.jamme@asu.edu, organizer

Driven by new transportation models and technologies, new mobilities such as ride-hailing, car- and bike-sharing systems, and other forms of “mobility-as-a-service” have constituted a disruptive trend in the transportation sector worldwide. Scholars have found mixed results regarding the promise of new mobilities to generate a more sustainable and livable urban form. But what about the promise to shape more equitable cities? Do new mobilities contribute to transportation equity and spatial justice? These questions arise as new mobilities disrupt the transportation systems that have historically provided for the mobility of most vulnerable populations, including the disabled, the poor, the children, and historically disenfranchised populations for gender-, race-, or ethnicity reasons. This pre-organized session will gather scholars interested in the equity impacts of new transportation models and technologies. Empirical studies will be presented, using a range of qualitative and/or quantitative methods.

#### Objectives:

- Mobility-as-a-service (ride-hailing, car sharing, bike sharing, etc.)

- Public-private partnerships between transportation network companies and public agencies
- Mobility and accessibility of vulnerable populations

## **OLDER ADULTS AND RIDE-HAILING IN CALIFORNIA: ESTIMATING WILLINGNESS TO PAY FOR NEW SERVICE FEATURES ACROSS VARIOUS TRIP DESTINATIONS**

Abstract ID: 525

Abstract within Pre-Organized Session 100

MISRA, Aditi [University of Michigan] aditimis@umich.edu, presenting author  
 SHIRGAOKAR, Manish [University of Colorado Denver] manish.shirgaokar@ucdenver.edu, co-author  
 WEINSTEIN AGRAWAL, Asha [San Jose State University] asha.weinstein.agrawal@sjsu.edu, co-author  
 WACHS, Martin [University of California Los Angeles] mwachs@ucla.edu, co-author  
 DOBBS, Bonnie [University of Alberta] bdobbs@ualberta.ca, co-author

Recent scholarship shows that most ride-hailing users are young and educated individuals (Alemi et al., 2018; Conway et al., 2018; Vivoda et al., 2018). There is little research, comparatively, on how willing older adults are to adopt ride-hailing services. The limited research that is available suggests that few seniors use ride-hailing services to meet their mobility needs (Vivoda et al., 2018). On the one hand, individuals over 64 are more likely to age in place than move late in life. Studies also indicate that the senior population is growing faster in suburbs and rural locations than in city centers (Rosenbloom, 2012). Seniors who do not live in city centers are particularly at risk of being transportation deficient. On the other hand, ride-hailing has the potential to expand out-of-home mobility in some of these locations but we do not yet understand two crucial aspects of demand for ride-hailing among older adults. Are there ride-hailing service features currently not supplied by providers that can positively influence seniors' decisions to use ride-hailing services? How much are older adults willing to pay for ride-hailing in its current form and for these potentially helpful new service features?

To learn about the reasons why older adults might adopt ride-hailing, we collected 2,917 completed responses via an online survey of Californians 55 and older. We requested that the data vendor provide a sample that represented California adults 55 and older in terms of 2017 American Community Survey 5-year estimates for gender, race and ethnicity, employment status, annual household income, and age. The data were also sampled by Zip Code so that the sample would represent various types of communities found across California, including, urban centers, suburbs, and small town/rural areas. We designed the survey instrument to gather responses regarding ride-hailing service availability and use patterns under a variety of scenarios using a stated-preference experimental design. Specifically, we offered various combinations of service features and pricing across three categories of trip destination.

We estimated the willingness to pay for ride-hailing services to three trip destinations, namely, trips for errands like grocery/pharmaceutical needs, trips for social purposes (visiting family/friends), and trips for non-emergency medical purposes. We also investigated preference for service features such as ability to pay using paper bill, accessible vehicle, driver trained in elder care, and booking over phone. We estimated the willingness to pay for these service features using a nested logit model. We found that older adults (65+) are willing to pay for social purpose rides more than errand-type rides or medical rides, while the 55-64 year cohort is willing to pay for social and medical rides more than errand-type rides. Older adults are generally willing to pay less than \$20 for any trip purpose, while the 55-64 year cohort is willing to pay \$20 but less than \$30 for rides to social and medical destinations. Moreover, most riders are willing to pay an average additional \$5 for their preferred service feature. Our research provides an understanding of how ride-hailing services can be made more attractive for older adults as well as a foundation for the pricing structure that is acceptable for senior riders.

## RIDE-HAIL USE AND BARRIERS AMONG LOW-INCOME ZERO CAR HOUSEHOLDS

Abstract ID: 526

Abstract within Pre-Organized Session 100

BROWN, Anne [University of Oregon] [abrown33@uoregon.edu](mailto:abrown33@uoregon.edu), presenting author

KLEIN, Nicholas [Cornell University] [n.klein@cornell.edu](mailto:n.klein@cornell.edu), co-author

SMART, Michael [Rutgers University] [mike.smart@rutgers.edu](mailto:mike.smart@rutgers.edu), co-author

HOWELL, Amanda [University of Oregon] [ahowell3@uoregon.edu](mailto:ahowell3@uoregon.edu), co-author

In most US cities, cars remain the most effective mode to access economic and social opportunities. The large majority of American households own a car, and most zero-car households do not choose to be car-less, but rather face physical and economic constraints to car ownership (Brown, 2017). But car ownership is often unstable, with households moving in and out of car ownership over time (Klein & Smart, 2015). Despite not owning a car, zero-car households still make many trips by car, either by borrowing one, getting a ride, or hailing a taxi (Pucher & Renne, 2003). More recently, research suggests that ride-hail services like Uber and Lyft may provide car access to travelers and neighborhoods with lower levels of car ownership and filling an existing gap in automobility (Brown, 2019). Research has previously investigated ride-hail access among other groups with reduced car access, such as older adults and travelers with disabilities (see for example Shirgaokar (2018)); but research has yet to examine in detail how a third group of oft-marginalized travelers—low-income and zero-car households—may use ride-hailing to boost mobility. To this end, our research addresses three questions: First, how do zero-car, low-income households typically gain access to cars? Second, how do these households use ride-hail services? And third, what barriers do they face to accessing ride-hail services?

We answer these questions using a combination of survey and interview data. We administered an online survey to 1,000 adults and conducted interviews with an additional 40 adults, all of whom earn less than \$50,000 per year and do not own a car. In addition to background information on household, personal, and general travel characteristics, we asked if and how respondents use and access cars, including ride-hail services, for their daily travel. The surveys communicate issue and experience prevalence, while the interviews highlight the nuance and complexity of car access in America.

Our findings offer rich insights for planners and transportation professionals about the mobility challenges zero-car households face and their strategies to access the benefits of automobility. Findings reveal the share of zero-car, low-income households who use ride-hailing to gain car access, and the frequency and trip purposes for which they

hail a ride. Findings also yield understandings into the barriers that travelers face in accessing ride-hail services and offer policy imperatives for broadening car access to travelers with constrained automobility options.

### ASSESSING E-BIKES AS AN EQUITABLE AND SUSTAINABLE TRANSPORT OPTION

Abstract ID: 528

Abstract within Pre-Organized Session 100

DEAKIN, Elizabeth [University of California Berkeley] [edeakin@berkeley.edu](mailto:edeakin@berkeley.edu), presenting author

TATE, Andrew [University of California Berkeley] [andrewtate@berkeley.edu](mailto:andrewtate@berkeley.edu), co-author

REINHARDT, Karl [University of California Berkeley] [kreinhardt@berkeley.edu](mailto:kreinhardt@berkeley.edu), co-author

Many trips made in the United States are 2-4 miles long, a distance cyclists can cover in 10-20 minutes. Yet bike mode share remains below one percent nationwide. Barriers to cycling include not knowing how to ride a bicycle, not having one, costs of acquiring one, maintenance requirements; worries about theft, and a shortage of bike lanes and parking. Physical limitations, concerns about falls and crashes, and concerns about the comfort levels of riding pose additional barriers. Perceived mismatches with dress / grooming expectations and fear of disapproval of family members, friends and colleagues are also issues for some (Deakin et al., 2019.)

Electric bicycles (e-bikes) don’t entirely remove concerns about cycling, but they do overcome several barriers and reduce the impact of others (Dill and Rose, 2012; MacArthur et al., 2014). The battery-powered electric motor reduces the physical demands of riding and means that a wider range of trips can be accomplished. E-bikes cost more than conventional ones but are far cheaper than a small automobile and can cost less than a transit pass. In addition, e-bike rental options are often available.

This study identifies target markets and factors to build into e-bike demonstration projects for California. We analyze the California Add-on to the National Household Travel Survey (CA-NHTS) and conduct focus groups, interviews and a survey to assess market potential and program design alternatives. We focus on e-bikes’ ability to 1) increase mobility and access for low income and minority households, and 2) reduce auto use.

Our analysis shows that over 40% of trips in California are 3 miles or less, with most made for shopping, personal business, school and social-recreational purposes. A significant portion of work trips are also short. Most trips made by members of disadvantaged groups are shorter than average.

About 10% of focus group and interview respondents expressed enthusiasm about trying e-bikes, primarily for social-recreational trips or short errands. An additional 20% would be “interested but concerned” (Dill and McNeil, 2013; Haustein and Moller, 2017). Enthusiasts are predominantly young and many are current cyclists. The

“interested but concerned” included car drivers and a small number of pre-pandemic transit riders.

Of those who expressed interest in e-bikes, anticipated advantages were less physical effort, somewhat higher speeds, and the ability to carry cargo or passengers. A few cited the lure of “new technology” as an attraction. For those uninterested in e-bikes, the main barriers are 1) not having ridden a bike in many years - concerns about their ability to ride safely, 2) concerns about a lack of public infrastructure separating bikes from cars, 3) not having a secure place to park an e-bike at home, 4) concern about the durability of e-bikes and resulting costs, and 5) concern that riding an e-bike would make them seem unprofessional, un “lady-like”, or otherwise foolish.

Our survey confirmed these findings and revealed that members of carless households thought an e-bike would allow them to expand their range of activities. However, respondents revealed a reluctance to bike or e-bike in bad weather or after dark and underscored concerns about e-bikes’ cost and the lack of secure parking for them (cf. Jones et al., 2016).

The findings of the study indicate that e-bikes have potential for increasing mobility and access for transportation-disadvantaged households in California and a small, but real potential for reducing auto trips. In order to encourage e-bike use, planners should press for safe bike lanes and secure parking at both residential and commercial locations. E-bike demonstration projects should be conducted in both summer and winter seasons to evaluate changes in use as a function of weather.

#### **MICROTRANSIT FOR SUBURBIA: CAN ON-DEMAND MICROTRANSIT IMPROVE ACCESS**

Abstract ID: 529

Abstract within Pre-Organized Session 100

KING, David [Arizona State University] David.A.King@asu.edu, presenting author

On-demand and shared transport services have blossomed in the past decade, from scooters to ridehailing to microtransit. To date, the overall effect of these services on improving accessibility as part of integrated transport systems is unclear, though the potential of benefits through integration remain. This research examines how microtransit can be incorporated into Transportation Demand Management (TDM) policies in Tempe, Arizona to improve non-car accessibility in suburban locations. For neighborhood transit service, Tempe currently operates a multi-route transit circulator system called Orbit, which offers fare-free transit at 15-minute headways to and from downtown Tempe, next to the Arizona State University campus in north Tempe. The Orbit system is financed through the city, and as part of the overall budget consequences of COVID-19, service has been reduced. Starting summer 2021, the city will pilot a program to replace the southernmost Orbit line (named STRN) with privately

operated microtransit that will operate under the umbrella of the city's TDM program. Specifically, the microtransit services will operate under a mobility hub model where on-demand service is offered to a small number of activity centers in south Tempe in an effort to improve access to communities currently underserved by non-auto modes. This research consists of analyses of the development, deployment and evaluation of the microtransit pilot. The governance of targeted microtransit systems, constraints and opportunities from city-financed programs, influences on ridership, evaluation of mobility hubs, and the role the new mobility technologies can play in TDM programs.

#### **BIKESHARE DESTINATION CHOICES AND ACCESSIBILITY AMONG DISADVANTAGED COMMUNITIES**

Abstract ID: 561

Abstract within Pre-Organized Session 100

QIAN, Xiaodong [University of California, Davis] [xdqian@ucdavis.edu](mailto:xdqian@ucdavis.edu), presenting author  
JALLER, Miguel [University of California, Davis] [mjaller@ucdavis.edu](mailto:mjaller@ucdavis.edu), co-author

Disadvantaged populations are not highly represented in bikeshare users' profiles (1), due to physical, financial, and cultural barriers (2–4). However, for disadvantaged populations, bikeshare may represent an affordable option to travel from one place, thus improving access to basic needs, services, and opportunities. A previous theory paper by the authors has already shown that bikeshare systems could significantly improve accessibility, especially for disadvantaged communities, provided that users have the capability to access and use bikeshare services (5). However, there is a lack of research exploring whether individuals from disadvantaged areas actually experience improved accessibility by using bikeshare as a transport mode. Moreover, a greater understanding of the destination choices of bikeshare trips among disadvantaged populations is needed, which would help confirm the connection between bikeshare and accessibility, and the extent to which bikeshare is used to access desired places and opportunities. To help fill this gap, this study concentrates on analyzing bikeshare destination choices for disadvantaged populations. Analyzing these choices enhances our understanding of the spatial dimension of accessibility and the equality of opportunities.

This study uses Chicago as a case study given its large urbanized area (2,443 square miles), the number of disadvantaged areas (approximately 10% of census blocks are in disadvantaged areas) in the southern and western parts of the city, and its large bikeshare system (Divvy bikeshare system, with 611 stations and around 6,000 bikes). The authors created a 400-meter buffer for every bikeshare station, and compiled demographic data (e.g., percentage of minority populations and median income data) and other socio-economic information (e.g., job opportunities and points of interest) for each buffer area based on the Census and American Community Survey (ACS) data. Then, this study uses historical bikeshare trip origin-destination (OD) data to calibrate a competing

destination model (CDM). All OD pairs were classified into four types, based on originations and destinations observed in disadvantaged areas and other areas, to capture different travel patterns of bikeshare trips.

The results show that improved accessibility (more desired opportunities) between origins and destinations plays an important role in attracting disadvantaged populations to bikeshare. It is also interesting to note that disadvantaged users tend to make longer trips to other areas to reach greater accessibility, e.g., to access better grocery stores and more job opportunities. Job opportunities (typically the most important outcome in accessibility studies) will attract more bikeshare trips in disadvantaged areas, which can be verified by mapping the employment rate against OD trips. This indicates that commuting is an important trip purpose for bikeshare usage, especially for people living in disadvantaged areas. However, these users are more sensitive to the extra charge levied after the free trip time threshold (30-minute grace period). In the end, this study conducts a sensitivity analysis to further show the influence of improved accessibility on bikeshare destination choices, particularly in disadvantaged areas.

This study also offers practical applications for bikeshare operators and local governments. First, the CDM provides a reasonable estimation of distributions for bikeshare trip distance. This can inform local governments and service providers in siting bikeshare stations to cover bikeshare trip demand within the most frequent trip distance/time range. Second, bikeshare planning processes should include accessibility metrics when choosing bikeshare station locations in disadvantaged areas. This will steer bikeshare development in the direction of maximizing social benefits with distributive justice and equity considerations for disadvantaged populations. Third, increasing the grace travel time limit could promote more bikeshare demand in disadvantaged areas (hopefully, while opportunities are also being increased within those areas). Overall, this study provides insights into equity issues and travel behaviors for bikeshare systems in disadvantaged areas.

STEINER, Ruth [University of Florida] rsteiner@ufl.edu, participant

This round table discusses critical topics related to transportation planning and policies for older adults in a technology era. The rapidly aging cities and communities in the United States call for planners' efforts to accommodate older adults' residential and mobility needs. Based on the Census Bureau's projections, the nation's 78 million older people (those aged 65 and over), primarily Baby Boomers (born between 1946 and 1964), will outnumber those under 18 for the first time in U.S. history in 2035. Places with rapidly increasing older adults are mainly located in low-density areas in the Southern and Western states, such as Florida, California, and Texas. In the short run, the private vehicle is still the dominant travel mode for older adults in the U.S. (Rosenbloom, 2009). Car dependence adds to the travel difficulties for older adults who have medical conditions resulting in asking others for a ride or giving up driving and those who could not afford cars.

However, transportation technologies and Information Communication Technologies (ICT) may redefine future transportation for older adults. The ride-hailing services have redefined "car access" and have enabled those who have difficulties owning a car or driving with more convenient access to daily destinations. Other technologies, such as online shopping, e-health, have also redefined older adults' lifestyles. Older adults benefit less from these technologies than younger people. Poor and less-educated older adults benefit even less (Agrawal et al., 2020; Brozen et al., 2019). However, policymakers may help mitigate the age disparities in technology use. For example, in Florida, the local government subsidizes low-income people in using ride-hailing services for healthcare trips and connect with public transit (Leistner & Steiner, 2017).

The COVID-19 aggravated inequities of technology use and vehicle access among older adults. Technology use is more important than ever for older adults during COVID-19 as older people have more limitations in travel and have more health threats than ever than their younger counterparts. Therefore, those who have more readily access to technologies during COVID-19 and those who have more technological knowledge are easier to offset their loneliness and depression during the pandemic.

As transportation planners aiming for more age-friendly communities and cities, we will discuss three questions intersecting aging and transportation in an era of technology through this round table: (1) What could urban planners do to retrofit the built environment and transportation systems in the U.S. to reduce older adults' car dependency? What are the obstacles and opportunities? (2) Will ride-hailing and other new technologies among older adults relieve the travel difficulties of the transport disadvantaged older adults? To what extent do poor, less-educated, or otherwise less privileged older adults benefit from these technologies? How can programs or policies be structured to make these options accessible to all older adults? (3) What does the COVID-19 say about the inequity of technology use and transportation planning for older adults? What are the implications for transportation planning for older adults in the post-COVID time?

## 15.85 ROUNDTABLE - MOBILITY-AS-A-SERVICE IN THE US: THE CURRENT STATE OF PRACTICE

Abstract ID: 85

RENNE, John [Florida Atlantic University] jrenne@fau.edu, moderator  
MERLIN, Louis [Florida Atlantic University] lmerlin@fau.edu, participant  
RIGGS, Billy [University of San Francisco] wriggs@usfca.edu, participant  
DAUS, Matthew [International Association of Transportation Regulators] mdaus@windelsmarx.com, participant  
CONRICK, Amy [National Center for Mobility Management] conrick@ctaa.org, participant

Mobility-as-a-Service or MaaS is the concept of a platform that offers integrated access to a full suite of public and private transportation modes. The benefit of a MaaS system is that it allows individuals to easily understand the full complement of transportation services available to them and then to book and pay for their transportation -- all through one platform. This easy-to-use access to transportation services also facilitates the move away from single-occupant-vehicle trips. The MaaS concept has been much more developed in Europe, with leaders such as Ubigo in Sweden, Qixit in Germany, Whim in Finland and Smile in Austria.

The purpose of this session is to understand the current state-of-the-art in of MaaS-oriented planning practice in the United States. This includes the major players working towards MaaS concepts in the U.S., whether in the public sector, among consultants, and among technology firms; the performance of various pilot projects working towards multimodal integration; how different MaaS thinkers are approaching governance and regulatory issues; and the role that technology can play or has played in offering greater transparency and choice in multimodal travel planning, booking, and payment. Challenges to implementation will be identified and addressed, including duty of care (municipal liability), data and privacy standards and management, and the path from MaaS to automated and connected mobility.

We will also discuss the relationship between MaaS and public transit, including the issue of whether public transit agencies should be trailblazers at the forefront of MaaS implementation, or whether such agencies are better suited to be partners with the private sector leading the charge for change and innovation.

## 15.777 ROUNDTABLE - TRANSPORTATION BARRIERS TO HEALTHCARE ACCESS: WHAT HAVE WE LEARNED DURING COVID-19

Abstract ID: 777

MCDONALD, Noreen [University of North Carolina at Chapel Hill] noreen@unc.edu, organizer, moderator  
WOLFE, Mary [UNC Chapel Hill] mary\_wolfe@med.unc.edu, participant  
COCHRAN, Abigail [UNC Chapel Hill] acochran@unc.edu, participant  
BROZEN, Madeline [UCLA] mbrozen@luskin.ucla.edu, participant  
PALM, Matthew [Worcester State University] mpalm@worchester.edu, participant

Transportation has been widely recognized as a major barrier to health care access (Syed et al., 2013). Nearly 5.8 million Americans in 2017 reported the delay of medical care because of a lack of viable transportation options (Wolfe et al., 2020). Transport and healthcare system changes during COVID-19 provide a new way to understand barriers and facilitators of medical care access. Transit system disruptions combined with health concerns from shared vehicles greatly reduced transit supply and likely increased barriers. However, the pandemic also brought policy changes to make telemedicine more accessible and reduce transport barriers.

This roundtable will review how the pandemic impacted transport supply particularly for public transit. We will bring in user perspectives by sharing survey work with transit riders, health care providers, and individuals with high healthcare needs. The group will reflect on

1. What COVID-19 clarified about transport barriers to care, and
2. How what we have learned can be applied in the post-pandemic period to reduce transport barriers.

## **INDIVIDUAL PAPER SUBMISSIONS**

### **QUANTIFYING THE IMPACT OF CORRIDOR MANAGEMENT INTEGRATING TRANSPORTATION AND LAND USE**

Abstract ID: 21

Individual Paper Submission

YANG, WOOKJAE [University of Utah] wookjae.yang@utah.edu, presenting author  
EWING, Reid [University of Utah] ewing@arch.utah.edu, primary author

The primary goal of conventional corridor management has been centered on maintaining road conditions or improving traffic flows in the face of legal, environmental, and economic constraints on the corridor system itself (Démare et al., 2017). However, this narrow focus on travel speed and efficient moves has ignored significant

interactions between transportation corridors and the areas they serve, mainly trip generation by serving areas. This study investigates the interaction between the corridor highway system and surrounding land use, developing a methodology for predicting the traffic impacts by the surrounding corridor impact area.

We collected household travel survey data with XY coordinates and computed built environment characteristics in terms of D variables of corridor impact area in 30 metropolitan regions. In the planning field, land use characteristics are often denoted in terms of D variables: words beginning with D, including density, diversity, design, destination accessibility, and distance to transit, as well as demographics that are not part of the built environment (Ewing & Cervero, 2010). We defined the corridor impact area to examine the association between new highway investments and built environment change, creating a 2-mile buffer area distancing from the centerline of the corridor using ArcMap10.7.1 (Funderburg et al., 2010).

A multilevel regression modeling (MLM) is employed as statistical analysis for estimating the probability of trips captured as internal trips within corridor impact area and external trips with different travel mode choices. The multilevel regression modeling allows us to explain the hierarchical data structure, which is nested at different levels: individual, corridor, and regional levels. In addition, models were estimated separately by trip purposes (home-based work (HBW), home-based other (HBO), and non-home-based (NHB)) to distinguish peak hour trips from non-peak trips.

We expect the research results that those corridor impact areas with good access to the destination, employment, and transit services will have a higher level of walking, biking, and transit mode shares, which result in lower vehicle miles traveled on the corridor highways. In addition, the mode share of internal trips of corridor impact area will decrease with larger household size and higher vehicle per capita.

While transportation and land use integration are often associated with best planning and engineering practices, this is the first study to establish empirically based methods to understand and improve corridor management in order to provide decision-making tools for planners and engineers. We need to move away from a paradigm of defining a corridor simply by vehicle throughput to include notions of the best land uses that are attractive for development. This research will develop new performance measures that demonstrate the trade-offs between corridors function and remaining attractive for development.

## STRENGTHENING THE RESILIENCE OF INTERDEPENDENT INFRASTRUCTURE SYSTEMS THROUGH TRANSFORMATIVE CLIMATE ADAPTATION PLANNING

Abstract ID: 38

Individual Paper Submission

MITSOVA, Diana [Florida Atlantic University] dmitsova@fau.edu, presenting author  
ESNARD, Ann-Margaret [Georgia State University] aesnard@gsu.edu, co-author

Climate hazards can cause widespread loss of infrastructure assets and services. Floods, storm surge, and recurrent tidal flooding continue to threaten road networks and other infrastructure assets, thereby increasing repair and maintenance costs. Persistent saltwater intrusion puts drinking water supplies at-risk in many coastal communities. Droughts and wildfires continue to ravage large parts of the American Southwest and elsewhere. Climate change is expected to exacerbate extreme weather events, which will add stress to the nation's critical infrastructure and increase the risk of cascading failures.

The devastating impacts of Hurricane Maria on Puerto Rico's utility networks in 2017, the trail of destruction left by the California wildfires, and the massive blackouts in Texas during the 2021 winter extremes highlighted the vulnerability of interdependent infrastructure systems. In addition to major cities, rural areas and low-income communities prone to climate hazards may experience more widespread and prolonged power outages and disruptions of the transportation and communications networks that can further reduce social services availability that supports their health, cultural, and social well-being (Mitsova et al. 2018). Recovery from extreme events by returning to a pre-event "normal" may not be sufficient to help communities adapt to the impacts of climate change

This paper will detail a study that explored a scenario-based tabletop exercise approach to probe the decision-making process related to infrastructure restoration and prioritization during a catastrophic tropical cyclone. The tabletop exercise involved experts in emergency management, power and water utilities, transportation agencies, Metropolitan Planning Organizations (MPOs), cell service providers, and other stakeholders. The tabletop exercise served multiple purposes, including (1) collection of data on practices and decision criteria for prioritization of infrastructure restoration using a simulated scenario embedded in the TEST software system; (2) provided opportunities for roundtable discussions to deepen the understanding of the issues within the simulation scenarios; (3) delivered a product that can be used by agencies, professional planners, and researchers in conducting such exercises in other areas or sectors. The exercise was organized in two modules (pre- and post-event), each containing questions in the following categories: damage assessment, no notice or short-notice (no warning) events, prioritization criteria, cross-function coordination, cross-function interdependencies, decision support tools and workflow, and viable alternatives and innovations when priorities cannot be met. The roundtable discussions allowed the participants to interact with their colleagues from other agencies and sectors and discuss the decision-making processes used in each sector to identify needs and prioritize infrastructure resilience decisions.

Our paper advances the premise that transformative climate adaptation planning must address interdependent infrastructure systems and related restoration, adaptation, and resilience priorities in areas exposed to climate hazards. To strengthen the resilience of infrastructure assets located in floodplains and vulnerable coastal areas, transformative actions embedded in future land use plans should consider exposure to hazards, susceptibility to damage, required levels of service, and future demand (Solecki et al. 2015). Additional factors include potential buyouts in high-risk areas or repurposing for renewable energy deployment (Fazey et al. 2018). Transformative adaptation (Fedele et al., 2019) also requires building capacity for effective community and stakeholder engagement (Moser and Pike, 2015). We highlight the value of collaborative decision-making and scenario planning with allied professions and sectors to assess and identify viable resilience pathways that account for socioeconomic disparities and variability across geographies, including the urban/ rural divide. There are multiple intersections with various planning pedagogy domains, including planning for hazards, disasters, and extremes, planning for resilience in urban and rural communities and planning for climate adaptation (including retreat and population displacement).

Although the scope of climate change is global, reducing its threat will require the cooperation of a large number of small, local actors. In recent decades, many institutions, corporations, and municipalities have committed to reducing their respective greenhouse gas (GHG) emissions, which has necessitated the development of methods to account for disaggregated GHG emissions allocated them at a fine spatial resolution. Since a substantial share of global GHG emissions are generated by transportation emissions, this requires accounting for GHG emission resulting from site-generated vehicle travel.

Vehicle-generated GHG emissions are a function of fuel efficiency and distance traveled. National and regional measures of total distance traveled, in units of vehicle miles traveled (VMT), have been collected and reported since the mid-twentieth century. However, the need to produce sub-regional and site-level VMT estimates has recently emerged in connection with efforts to account for GHG emissions. A common method for estimating VMT at the site-level has not been established.

In this paper, we summarize three climate policy initiatives that require site-level VMT estimation. The first of these is the adoption of the Greenhouse Gas Protocol by private corporations (Hickmann 2017; Green 2010); the second is the American College and University Presidents' Climate Commitment (Dyer and Dyer 2017); and the third is the implementation of Senate Bill 743 in cities and regions throughout California (Volker, Lee, and Fitch 2019; Elkind, Lamm, and Prather 2018, 743). We describe the role site-level VMT estimation plays and the VMT estimation methods that have been used in connection with each of these initiatives.

Next, we develop a set of fifteen possible methods that could reasonably be used to estimate site-generated VMT for office buildings and corporate campuses. We apply these methods to each of eleven sites located in the Wasatch Front Region of Utah and the San Francisco Bay Area.

We find that estimates site-generated VMT vary widely among the identified methods. Moreover, there was no consistent ranking of methods across sites: no method produced estimates that were consistently higher or lower than all others.

Based on these findings, we discuss the relative importance of accuracy and consistency. If institutions are likely to select a method to minimize the apparent climate impacts of developments, is it preferable to sacrifice accuracy for consistency in order to create a useful basis for comparison among sites? We conclude with a recommendation that planning institutions mandate consistent methods for estimating allocating land-use-generated VMT.

#### **ANALYZING TRANSIT SERVICE AND RIDERSHIP CHANGES DURING THE COVID-10 PANDEMIC: INSIGHTS FROM BOSTON, HOUSTON, AND LOS ANGELES**

Abstract ID: 50

Individual Paper Submission

PAUL, Julene [UCLA] [julenepaul@ucla.edu](mailto:julenepaul@ucla.edu), presenting author

TAYLOR, Brian [UCLA] [btaylor@g.ucla.edu](mailto:btaylor@g.ucla.edu), co-author

The COVID-19 pandemic has upended urban life as we know it. To protect residents and stem the spread of the pandemic, public agencies have instituted policies that have indirectly reduced travel for many. In the U.S., the effects of the pandemic on public transit -- and its sharp ridership declines in 2020 -- have generated particular concern. Many former transit commuters are unemployed, work from home, or have switched to commuting in private vehicles. But for those who work outside the home and cannot drive -- and who are more likely to have low incomes or be people of color -- public transit remains an important means of mobility (TransitCenter, 2020).

However, most transit agencies have reduced transit service during the pandemic, reflecting reduced ridership demand, increasing costs of providing service, and shrinking or uncertain budgets. This downward spiral of falling ridership and declining service is particularly worrisome in neighborhoods with many so-called "constrained" riders, who have little or no use of automobiles (Beimborn et al., 2003).

The COVID-19 pandemic has unfolded within urban contexts rife with social inequities and in many cases compounded them. As one example, higher rates of coronavirus infection and mortality have occurred in neighborhoods with large proportions of African American residents (Price-Haywood et al., 2020). Additionally, certain jobs require workers to continue to commute to their workplaces, even when public officials recommend limiting travel.

Use of public transit itself also reflects the unequal nature of access in the U.S. Low-income and BIPOC have historically owned fewer automobiles and used transit at higher rates, often substituting bus services for driving (Taylor & Morris, 2015). The disadvantages faced by transit users also depend on regional factors. Cities host different built environments, urban spatial patterns, and population densities. These may position some agencies as better (or worse) suited to offer high-quality transit service. Such complexities of transportation access and attendant equity issues have become more salient in today's uncertain public health environment.

To analyze the effects of the COVID-19 pandemic on transit systems and their users, we examine local bus ridership changes by neighborhood in Boston, Houston, and Los Angeles from 2019 to 2020. Combining stop-level ridership and passenger survey data from three major transit agencies with U.S. Census data, we identify associations between travel patterns and neighborhood demographics. We find that early in the pandemic, neighborhoods with larger BIPOC populations and lower socio-economic status levels lost proportionally fewer riders when compared with 2019 levels. However, gaps between high-ridership-loss and low-loss neighborhoods diminished as the pandemic continued into late 2020.

We also use logistic regression to model ridership change while simultaneously controlling for many factors. While ridership in Houston and Los Angeles outperformed that in Boston during the early and middle parts of the pandemic, differences in the built environment and demographics account for some regional differences. Urban centrality proved a significant negative predictor of ridership change, with neighborhoods located further from downtowns faring better (in relative terms) than central ones. Additionally, neighborhoods with high shares of African American residents performed better in the early part of the pandemic. By fall 2020 that race effect disappeared, replaced by an ethnicity one, as neighborhoods with large numbers of Hispanic residents fared better. Ultimately, as pandemic wore on, demographic and built environment factors less systematically predicted observed changes in bus ridership.

Our analysis suggests important roles for neighborhood demographics and the built environment in determining public transit demand during the pandemic. It also highlights the importance of public transit for those with limited mobility options, and for considering equity and travel constraints as communities recover from the COVID-19 pandemic.

#### HOW DO BABY BOOMERS TRAVEL DIFFERENTLY FROM THE SILENT GENERATION?

Abstract ID: 57

Individual Paper Submission

LI, Shengxiao (Alex) [University of Pennsylvania] [lsx@design.upenn.edu](mailto:lsx@design.upenn.edu), presenting author

Known as car lovers, the travel preferences and behavior of Baby Boomers in the U.S. will inform transportation infrastructure and policies for older adults in the future decades. Born between 1946 and 1964 amid rapid suburbanization and interstate highway construction, Baby Boomers have life-long experiences of living in the suburbs and depend on automobiles in their daily travel. Probing into the generational difference in vehicle travel helps urban planners to understand how the needs of aging Boomers' daily travel differ from their previous generation.

At least three research gaps remain in the existing literature. First, many previous studies have documented that Boomers have more vehicle trips than other generations (McGuckin & Lynott, 2012; Newbold & Scott, 2017; Siren & Haustein, 2013). However, current literature does not tell whether Boomers' travel patterns are due to their middle age or unique generational characteristics. Second, the current study needs a better understanding of how the residential built environment relates to travel behavior differently for Boomers and their previous generations. A majority of Boomers are willing to stay in their homes and communities, a large share of which are in low-density areas, where they were born and raised (Joint Center for Housing Studies of Harvard University, 2019). This trend implies that today's older adults rely more heavily on automobiles due to their residential built environments. However, some other Baby Boomers may have fewer vehicle trips than before if they live in denser environments. Third, Boomers are more demographically and socioeconomically heterogeneous than the previous generation. As the number of non-Whites, low-income people, females, and people who live alone has increased since 2011, when the youngest Boomer enter 65 years, it is also relevant to examine whether they have more disadvantages daily travel.

In this study, I ask: How do Baby Boomers' vehicle travel frequency and distance differ from their older cohort-the Silent Generation? To what extent are these two generations' residential location, demographic and socioeconomic attributes, and employment status associated with their vehicle travel changes? In answering these questions, I use the 2001 and 2017 National Household Travel Survey to examine the vehicle travel characteristics of those aged 56-71 in 2001 (Silent Generation) and 2017 (Baby Boomers) with descriptive analysis and some regression models.

Descriptive analysis and regressions show that Boomers aged 56-71 had fewer vehicle miles traveled than those in the same age of the Silent Generation, controlling for other factors. However, Boomers aged 65-71 in 2017 had more vehicle miles but fewer non-work vehicle travel than the Silent Generation. One reason is that Boomers delayed retirement and had more working trips. Boomers who retired or were unemployed had less vehicle travel but more non-work vehicle travel than the Silent Generation. Boomers who lived in metropolitan areas with population sizes between 250,000 and 1 million, where a larger share of Boomers lived, had more vehicle travel than in 2001. Females and non-Whites took a larger share of Baby Boomers than the Silent Generation, and they generated more vehicle miles traveled among Boomers than among the Silent Generation. However, racial, income and gender disparities in vehicle travel still exist.

This study has several important policy implications for planning practices. First, it shows the needs for planners to better understand older Boomers' increasing non-work travel after retirements. Second, it shows the possibility to promote sustainable transportation among younger Boomers as they have less vehicle travel than the older cohort. Third, it shows that as the increasing of racial minorities, females, and low-income people among aging Boomers, planners need to pay more attention to transportation for transport disadvantaged groups among older adults.

## INEQUITABLE INEFFICIENCY: A CASE STUDY OF RAIL TRANSIT FARE POLICIES

Abstract ID: 59

Individual Paper Submission

MALLET, Zakhary [University of Southern California] [zmallett@usc.edu](mailto:zmallett@usc.edu), presenting author

Research on the equity and efficiency of transit fare policy was popular during the 1980s, following the “public takeover” of transit and many operators substituting flat-rate fares for time- and distance-based fares. This evolution in fare practice and operational inefficiency was largely driven by federal transit subsidy policies that prioritized population over ridership (Meyers and Gomez-Ibanez, 1981; Wachs, 1989), led to the cost-per-rider of peak period service being 45% more than off-peak (Parody, 1990), and has produced regressive impacts wherein lower-income and minority persons who tend to travel shorter distances pay disproportionately more for services received (Cervero, 1981; Taylor et al., 2000). Yet, these studies are outdated, so may not explain contemporary fare policies and their impacts.

While there has been a renewed interest in this subject matter (e.g., Brown, 2018; Rubensson et al., 2020; Yang and Tang, 2018), little new has been methodologically developed and applied to United States transit systems, and there remains little, if any, fare policy equity and efficiency research that focuses principally on United States rail transit or the spatial distribution of equity and efficiency. How do cost-recoveries of rail transit service through fares (i.e., farebox recoveries) vary by time and location of travel on the network, and what, if any, sociodemographic impacts does this generate?

In this research, a cost allocation model is developed from rail transit agency data to allocate capital and labor costs of rail transit service to different times of the day and segments of the rail network. Costs are then contrasted with fare revenue generated at different times of the day and across different areas of the network to evaluate the temporal and spatial parity of fare policies. The sociodemographic make-up of riders who travel at different times or across different locations is studied to test for sociodemographic disparities. Three regional rail transit providers, each with a different fare structure, are evaluated to estimate if different fare policies lead to different results.

Findings suggest that the marginal additional costs of serving peak travel are greater than the marginal increase in peak fare revenue when capital costs are accounted for, that this difference is reduced with peak-period (congestion) fare pricing, but often offset by base fare structures that reward longer distance travel. Additional findings indicate that distance from the urban core more so than rider travel distance increases costs per rider and reduces farebox recovery, and these patterns produce disparate impacts that facilitate lower-income riders paying disproportionately more of the costs of their travel. These findings support that, to the extent distributional and benefit principles of equity are important in transit planning, temporal and spatial cost-recoveries warrant consideration in the evaluation of transit capital projects, service provision, and fare policies.

## EXPLORING THE HETEROGENEOUS NONLINEAR EFFECTS OF BUILT ENVIRONMENT ATTRIBUTES ON DRIVING, TRANSIT USE, AND ACTIVE TRAVEL

Abstract ID: 60

Individual Paper Submission

CAO, Xinyu [University of Minnesota] Cao@umn.edu, presenting author

TAO, Tao [University of Minnesota] taotao@umn.edu, primary author

Urban sprawl has been criticized for its contribution to auto dependence and associated problems, such as traffic congestion, obesity, and climate change. To address these problems, policymakers have adopted various planning policies to modify the built environment. To substantiate the efficacy of these policies, some studies have employed advanced modeling techniques to uncover the complex nonlinear relationships between built environment attributes and travel behavior (Christiansen et al., 2016; Ding, Cao, & Næss, 2018; Wang & Ozbilen, 2020). These studies improve planners' understanding of the relative importance of built environment attributes to travel behavior compared with other correlates such as demographics and identify the threshold effects of built environment attributes (Tao et al., 2020). However, they focus on one type of travel behavior and seldom explore the heterogeneous nonlinear and threshold effects on different types of travel behavior.

Automobile, transit, and active travel (i.e., walking and biking), the most frequently used travel modes in daily life, have been extensively examined by planning scholars. The literature suggests that planning policies that modify built environment attributes may influence different modes of travel differently. For instance, built environment attributes at the regional level (e.g., distance to downtown) contribute more to auto use and transit use whereas those at the neighborhood level (e.g., intersection density) contribute more to active travel (Ewing & Cervero, 2010). Examining their relative importance while relaxing the nonlinear assumption will substantiate the validity of this conventional understanding. Furthermore, the nonlinear effects of built environment attributes on travel, particularly their effective ranges (i.e., thresholds), may differ by behavioral type. Urban planners must consider these differences so that they can choose effective and efficient policies and built environment interventions in planning practice.

In this study, we will apply gradient boosting decision tree to analyze the 2018 regional travel data collected by the Metropolitan Council in the Twin Cities metropolitan area. The objectives are to (1) explore the nonlinear and threshold effects of built environment attributes on respondents' use of automobile, transit, and active travel; (2) compare the differences and similarities of these effects in terms of their relative importance and thresholds; and (3) use the results to optimize planning interventions to discourage automobile use and promote transit and active travel.

This study contributes twofold to the literature. First, it enriches planners' understanding of the complex nonlinear connection between the built environment and travel behavior. This new empirical study will provide additional evidence to assess the efficacy of using land use and transportation policies to alter travel behavior. It will further identify the differing thresholds within which built environment attributes affect auto use, transit use, and active travel. Second, with these findings, policymakers can design specific land use and transportation policies to achieve targeted travel behavior goals. For example, if built environment attributes at the regional level play a more important role in influencing auto use, planners can use the effective ranges of these attributes as planning

guidelines to reduce auto dependence.

#### WHAT THE HECK IS A CHOICE RIDER? A THEORETICAL FRAMEWORK AND EMPIRICAL MODEL

Abstract ID: 67

Individual Paper Submission

GUERRA, Erick [University of Pennsylvania] [erickg@design.upenn.edu](mailto:erickg@design.upenn.edu), presenting author

As local, state, and federal agencies begin investing substantial resources into subsidizing transit in the 1960s and 70s, public documents argue that transit agencies should focus on attracting choice riders instead of dependent riders, who have no alternatives and use transit regardless of service quality. After six decades, the definitions, uses, and implications of the terms choice and dependent rider have remained consistent in the academic and professional literature. These definitions, however, lack a strong theoretical grounding or empirical evidence.

Using travel diary data from the Philadelphia region, I estimate discrete choice models to identify choice riders, who I define as those who have close to a 50% probability of choosing between a car or transit for a given trip. The Philadelphia region, which has a diverse range of transit users and transit services, is an ideal place to develop and fit an empirical model of choice ridership.

Attributes assumed to be associated with dependent riders, such as a lack of a car, low income, and being a racial or ethnic minority, are much more prevalent among choice riders than the general metropolitan population. Choice riders are also diverse, with a mix of racial backgrounds, income levels, educational attainment, and access to private cars. Transit dependency, by contrast, is rare. The lowest and highest income residents generally only choose transit when service quality is high, and transit is cost- and time-competitive with the car.

Practitioners and academics should avoid under-theorized and empirically unsupported descriptions of choice and dependent riders. Moreover, the debate between using transit to reduce automobile use or increase accessibility for low-income transit users is likely misplaced. Improving urban bus service into low-income neighborhoods almost certainly attracts people out of cars.

## REVISIT COMMUTE TRIP REDUCTION PROGRAM, WHAT WORKS AND WHAT DOESN'T WORK?

Abstract ID: 80

Individual Paper Submission

CHEN, Peng [University of South Florida] pengchen@usf.edu, presenting author

Commute trip reduction (CTR) programs have been implemented for decades in the US, while a systematic evaluation of CTR's performance is missing. This study assesses the effectiveness of CTR tools by examining vehicle trip rates (VTR) and vehicle miles traveled (VMT). The results suggest: (1) among various CTR tools, a collective bargaining process helps reduce vehicle trip rates (VTR) led by governmental agencies; (2) distributing transit passes to employees outperforms providing subsidies to decrease VTR; (3) the compressed workweek is a favored tool to reduce VTR; (4) free rides, no matter employer-provided vehicles or emergency rides, both contribute to increments in VTR. To inform practice, when rewarding employees, distributing transit passes is the preferred strategy. Free employer-provided goods, such as transit subsidies, vehicles, and emergency rides, are not recommended. Governmental agencies should lead other employers to better advertise CTR programs and engage employees for collective bargaining.

## RIDE-HAILING COMES TO GRANDPARENTS IN LOW-DENSITY AREAS: WHO, WHERE, WHY, AND HOW

Abstract ID: 81

Individual Paper Submission

CHEN, Yefu [University of Texas at Austin] chenyf56@utexas.edu, presenting author

LI, Shengxiao [University of Pennsylvania] lsx@design.upenn.edu, primary author

JIAO, Junfeng [University of Texas at Austin] jjiao@austin.utexas.edu, co-author

The United States is rapidly aging, and most older adults in the United States age in their own homes or communities and rely heavily on automobiles in their daily travel. However, older people face more driving difficulties as their physical and cognition levels deteriorate. Ride-hailing can be a promising travel mode providing mobility to older adults, especially for those living in low-density regions with bad levels of public transit. Besides, with ride-hailing, older adults might also relieve the dependence on their immediate social networks, like children and neighbors, and improve their self-esteem and sense of independence.

Studies on how ride-hailing services change people's travel behavior and mitigate the travel difficulties among the transport disadvantaged groups have increased over the past decade, but previous studies disproportionately focus on the big cities and young adults. Only a few studies have explored ride-hailing usage among older adults (Agrawal et al., 2020; Mitra et al., 2019). Also, it remains rare that to which extent ride-hailing services change the travel behavior of those who live in low-density areas (Rieland, 2017; Shirgaokar et al., 2020).

This study aims to fill up these research gaps by asking: Who are the ride-hailing users among those aged 55 and over in low-density areas in the United States? Where do they live? How and why do they use ride-hailing services? We answer the above questions using the data on four Southwestern states in the 2017 National Household Travel Survey of the United States and a survey on 1,000 ride-hailing users in this region's four major metropolitan areas. We find that ride-hailing users older than 55 years tend to be wealthier, whiter, and younger males without medical conditions. Nevertheless, ride-hailing services serve those living in relatively low-density areas and secondary cities and live in zero-car households. Our Texas ride-hailing survey further shows that many older adults use ride-hailing in the evenings, and ride-hailing users tend to use it for connecting other transportation modes. Older adults regard convenience as the primary reason for using ride-hailing against other travel modes.

The results have three implications for transportation planners and service providers for older adults. First, this study shows ride-hailing services' potentials in reducing travel difficulties of older adults who live in low-density areas. Second, this study finds that ride-hailing services are not distributed equitably across social groups and places. We suggest that private companies and governments work together to improve of the usage of ride-hailing services among disadvantaged groups and more distant areas.

Additionally, our study finds the potential of ride-hailing services as a connector to other transportation modes, especially public transit. We suggest that developing more efficient and affordable public transit systems may help encourage transit usage among older adults with ride-hailing services as feeder services. Local governments may also consider collaborating with TNCs to encourage the integration of ride-hailing and transit where public transit is available using subsidies.

## **SHIFTING GEARS: CYCLING INFRASTRUCTURE DEVELOPMENT DURING COVID-19**

Abstract ID: 82

Individual Paper Submission

REBECCA, Mayers [University of British Columbia] [rfallonmayers@gmail.com](mailto:rfallonmayers@gmail.com), presenting author  
MAYERS, Rebecca [University of British Columbia] [rfallonmayers@gmail.com](mailto:rfallonmayers@gmail.com), co-author

The widespread "stay at home" orders, closure of indoor exercise spaces, and risks of exposure to the novel Coronavirus in public transit have prompted a significant uptake in cycling. With more cyclists on the road, the pandemic has renewed focus on the lack of safe cycling infrastructure within our cities (Hertel & Keil, 2020). Although cities are improving their cycling infrastructure during the pandemic, this infrastructure remains inequitably distributed. This unequal distribution is inextricably linked to issues of race, class, gender, and cultural capital (Stehlin, 2019; Yasin, 2020). Uneven development inhibits access to safe cycling infrastructure in "low-growth" and underprivileged neighbourhoods, whereas "high-growth" and privileged neighbourhoods receive most of the attention and resources (Hoffman, 2016). This presentation investigates these inequities by detailing the process the City of Vancouver uses to allocate cycling infrastructure and policies, with a focus on the impact of COVID-19. Through qualitative semi-structured interviews in the City of Vancouver, Canada, this article presents a largely unseen narrative that is crucial to research on cycling. In particular, its findings suggest that development cost levies and a lack of representation in the decision-making process result in an inequitable distribution of safe cycling infrastructure. This presentation offers insight into the cycling infrastructure planning process and how researchers and practitioners can work to develop an equitable distribution of infrastructure.

## **ABRUPT CHANGES, INSTITUTIONAL REACTIONS, AND ADAPTIVE BEHAVIORS: AN EXPLORATORY STUDY OF COVID-19 AND RELATED EVENTS' IMPACTS ON HONG KONG'S METRO RIDERS**

Abstract ID: 107

Individual Paper Submission

ZHOU, Jiangping [The University of Hong Kong] zhoujp@hku.hk, presenting author  
WU, Jiangyue [The University of Hong Kong] jiangyue@connect.hku.hk, co-author  
MA, Hanxi [The University of Hong Kong] mhxi18@connect.hku.hk, co-author

Abrupt changes caused by economic and financial crises, social movements, terrorist attacks, and outbreak of pandemics/epidemics have become increasingly commonplace. In face of these, both institutions and individuals must adapt and have adapted. Against the backdrop of the COVID-19 pandemic, suddenness, scale, and impacts of which are unprecedented as compared to its counterparts in history, this paper first proposes transferable measures and methods that can be used to quantify and geovisualize COVID-19 and subsequent events' impacts on metro riders' travel patterns/behaviors. Then it operationalizes and implements those measures and methods with empirical data from Hong Kong, a metropolis heavily reliant on transit/metro services, quantifying and geovisualizing the above impacts. It maps out where those impacts were the largest and explores its correlates. After that, it uses the best publicly available data to assemble probable explanatory variables and to examine quantitatively whether those variables are correlated to the impacts and if so, to what degree. It finds that both macro- and meso-level external/internal events following the COVID-19 outbreak significantly influenced travel patterns/behaviors of metro/transit riders, including their changes. These events' impacts and their changes varied from one station to another where the provision of recreational facilities around a metro station area could well predict those impacts. Besides, certain socio-demographic characteristics (e.g., median age of the population and average age of households in metro-served communities) can mediate or moderate the impacts. The changing rate of incoming and outgoing trips of a metro station also can well predict the impacts and their changes. The above findings indicate that the COVID-19 and subsequent events could have spatially and socially heterogeneous impacts on transit/metro riders. New methods and data can/should be exploited to examine those impacts. Quantification/geovisualization of the impact heterogeneity and its possible determinants can ensure that we know where and who the most disadvantaged and/or vulnerable are.

#### **A GENDER-BASED STUDY OF DRIVING BEHAVIOR IN A SIMULATED VIRTUAL ENVIRONMENT OF ABU DHABI**

Abstract ID: 108

Individual Paper Submission

MAGHELAL, Praveen [Khalifa University] praveen.maghelal@ku.ac.ae, presenting author  
LARA, Juan Carlos Flores [Khalifa University] 100052977@ku.ac.ae, co-author

The 2018 Global Status Report on Road Safety reports that the traffic death in the eastern-Mediterranean region reached 18 deaths per 100,000 population, the third-highest in the world after Africa (26.2 per 100,000) and South-

east Asia (20.7 per 100,000) (WHO, 2018). Furthermore, the Eastern Mediterranean Status Report specified that these fatalities were the leading cause of death between the ages of 15 and 29, followed by the age-group of 30 to 44 years.

In the 2019 RoadSafetyUAE report, 45% of all road accidents UAE-wide were caused by young drivers aged between 18 and 30. This age group reported the highest among the victims of road fatalities (34%) and road accidents (63%) in the Emirate of Abu Dhabi. They also concluded that the novice driver segment of 18 to 24 years reported twice the death rates of the older drivers (RoadSafetyUAE, 2019).

It is well-documented that the primary cause of road accidents is human-error related to inappropriate driving behavior or fatigue and drowsiness. However, real-world experiments to test the proposition involve risk to users, hindering and limiting the research focused on road traffic crashes. Conversely, virtual environments (VEs) have been validated and extensively used by transportation researchers because they do not result in participants' physical injury during experimentation (Maghelal et al 2011). Virtual reality (VR) devices also offer affordable driving simulation with a high degree of immersive feeling, allowing opportunities to measure the drivers' physiological responses (Maghelal 2012).

Forty participants (13 females, 27 males) completed the pre-test driving behavior survey to report their personal driving experience in Abu Dhabi. The average age of respondents was 22 years of age with an average driving experience of about three years, representing young drivers with limited driving experience from multiple nationalities. A post-test survey evaluated their experience of driving in the simulator and its comparison to real-world driving.

Participants drove through six blocks of a semi-immersive simulated driving environment with distractions such as a mobile call, pedestrian and vehicular interception, signal change, construction zone, and car accidents introduced in the simulated environment representative of peak hour traffic of downtown Abu Dhabi.

Driving data from the simulator and the eye-tracking (using Tobii glasses) were used to evaluate the hotspot and focus of the participants during the distractions and also its impact on driving speed, braking, and signaling. Male drivers were less adhering to safe driving behavior than female drivers. Although both males and female drivers drove above the designated speed limit, on average, the male participants drove at higher speeds above the limit and did not use signaling during the lane changes. However, hotspot analysis reported higher distraction among female drivers during the phone calls and during car accidents in the adjoining lane.

This study's outcome provides implications for additional training requirements for driving education (theoretical and practical test). Also, recommendations to reduce or mitigate the accidents among the adolescent age groups are discussed to help achieve the UAE National Committee's goals on Sustainable Development Goals (NCSGD 2021) and global objectives of the World Health Organization (WHO).

## **THE DETERMINATION OF FAULT IN URBAN PEDESTRIAN CRASHES: ASSESSING THE ROLE OF THE BUILT ENVIRONMENT AND NEIGHBORHOOD INEQUALITY**

Abstract ID: 125

Individual Paper Submission

STILES, Jonathan [The Ohio State University] jonathan.stiles@rutgers.edu, presenting author

MILLER, Harvey J. [The Ohio State University] miller.81@osu.edu, co-author

This paper explores the built environmental factors and neighborhood inequities that are related to the outcome of who, if anyone, is determined to be at fault by reporting officers for urban traffic crashes involving pedestrians. The initial determination of fault in traffic crashes can be a judgment of individual responsibility but can also point to collective responsibility and the need for design or policy interventions to prevent further crashes. However, when fault is neatly assigned only to one or more individual participants in a crash, it limits possibilities for such collective action, representing part of what Lee (2015) denotes as a “cumulative irresponsibility” towards road safety. Furthermore, street designs may be distributed unevenly contributing to inequalities in outcomes of not just injury, but also blame. Finally, the assignment of fault in pedestrian crashes has taken on new importance with the growing adoption of Vision Zero policies, which should aim to explicitly broaden responsibility for crashes to include system designers (Belin et al. 2012).

Research on pedestrian safety has largely sought to understand the environmental and behavioral factors that determine outcomes of injury severity and crash frequency to inform road policies and street design. Urban environments with narrower and slower roads, have better traffic safety outcomes, including for pedestrians, while wider and faster arterial roads, accompanied by large scale “big box” retail are associated with more crashes (Dumbaugh and Rae 2009). Particular urban form characteristics such as longer blocks with driveways make some areas less safe for pedestrians (Loukaitou-Sideris et al. 2007). Research on perceptions of fault in crashes is recently growing. For example, Goddard et al. (2019) consider how driver-oriented media coverage of crashes that tends to blame pedestrians, shapes individual perceptions and contributes to a wider societal bias.

The goal of our research is to connect and inform these literatures on safe urban design and perceptions of crashes through an analysis of the determination of fault for pedestrian crashes in a US metropolitan area. For our data, we examine ten years of pedestrian crashes in Franklin County, Ohio, the site of its state capital and largest city, Columbus. For our methods, we first fit a multinomial logistic regression model to indicate the factors associated with different fault outcomes, with an interest in those related to the built environment such as road class, speed limit, and number of retail outlets, as well as the location of the pedestrian at the point of the crash. We then conduct a spatial analysis and case study of arterial road segments in four high crash communities—Downtown Columbus, South Linden, University District, and Hilltop.

Our findings indicate that the built environment influences the determination of fault in pedestrian crashes on two levels. Firstly, better provision of signalized and marked intersections on arterials in some neighborhoods leads to a higher proportion of marked intersection crashes, which are less likely to be blamed on pedestrians, as well as less severe. Secondly, independent of pedestrian location, pedestrians are more likely to be found at fault in areas with wider, faster roads, less density of retail, and more drivers. We interpret our findings through the lens of equity and in light of the recent launching of a Vision Zero initiative by the City of Columbus.

## RACE, CLASS, AND THE PRODUCTION OF AND EXPOSURE TO VEHICULAR POLLUTION IN LOS ANGELES

Abstract ID: 157

Individual Paper Submission

BOEING, Geoff [University of Southern California] boeing@usc.edu, presenting author, primary author  
LU, Yougeng [University of Southern California] yougengl@usc.edu, co-author  
PILGRAM, Clemens [University of Southern California] pilgram@usc.edu, co-author  
MANNINO, Peter [University of Southern California] pmannino@usc.edu, co-author

Vehicular air pollution presents an ongoing public health crisis. Despite growing knowledge of racial injustice in exposure to vehicular particulate matter emissions (PM<sub>2.5</sub>), less is known about the sociodemographics-mediated relationship between the production of pollution and exposure to pollution (Bell and Ebisu, 2012; Schweitzer and Valenzuela, 2004). This study addresses this gap by linking the production of and exposure to vehicular PM<sub>2.5</sub> in a unified indicator assessing local exposure (to PM<sub>2.5</sub>) adjusted by local production (of vehicle kilometers traveled [VKT]). It analyzes this indicator through a case study of Los Angeles that examines: (a) how production-adjusted exposure to vehicular PM<sub>2.5</sub> relates to race/ethnicity and socioeconomic status, (b) how this relationship varies across the region.

This study integrates tract-level on-road PM<sub>2.5</sub> emissions estimates with VKT estimates and census data. Using ordinary least squares (OLS) regression and geographically weighted regression (GWR), it explores relationships between local production-adjusted exposure and sociodemographics (Gilbert and Chakraborty, 2011). This reveals a strong negative relationship between VKT and PM<sub>2.5</sub> exposure: people who drive more tend to be exposed to less vehicular pollution, whereas people who drive less are burdened with disproportionately high air pollution at their home location. In our base model, a 1 percentage point (pp) increase in VKT production is associated with a 1.6 pp decrease in home-based exposure to vehicular PM<sub>2.5</sub> emissions, and a 0.6 pp reduction when including a complete set of demographic and socioeconomic controls. Though standard in the literature, global OLS regression conceals local variation in relationships essential to environmental justice analysis. Our GWR model instead reveals how relationships between PM<sub>2.5</sub> exposure and explanatory variables vary across Los Angeles. People in the 17% of tracts in which VKT production and PM<sub>2.5</sub> exposure are significantly negatively associated tend to be whiter and wealthier, and only 9% of tracts have a significant positive relationship between VKT production and emissions exposure.

To augment this regression analysis, we simulate commutes using LEHD LODES block-level origin-destination data and the OSMnx Python package to estimate commuting patterns across Los Angeles. We compare the sociodemographics of the commuters to the sociodemographics of the tracts they drive through. Compared to

others, commuters from majority-white tracts disproportionately travel through majority non-white areas to get to work. This highlights the role that decades of racialized freeway infrastructure planning and residential segregation play in today's disparities between who produces vehicular pollution versus who is exposed to it. This entails urgent policy and planning implications. Moving beyond just the racialized placement of infrastructure, we probe justice and equity dimensions to suggest constructive paths toward racial justice at the nexus of urban transport and environmental planning, including identifying "worst offender" communities and in turn possible interventions such as VKT taxes, tolls, emissions standards, and electrification.

## EXPLORING HOUSING PROGRAMS AND MARKET RESPONSES TO CAR-LITE POLICIES WITH EMERGING MOBILITIES USING LUTI MICROSIMULATION

Abstract ID: 160

Individual Paper Submission

BASU, Rounaq [Massachusetts Institute of Technology] rounaq@mit.edu, presenting author  
FERREIRA, Joseph [Massachusetts Institute of Technology] jf@mit.edu, primary author

Emerging mobilities like automated vehicles, mobility-on-demand, and micromobility are motivating discussions on the future of cities. Domain experts agree that there is great uncertainty about their net effects on cities. While short-term travel time and cost savings are possible, the induced travel demand will likely cancel out those benefits in the long-term. There is less uncertainty and more agreement about accessibility benefits, which can increase worker welfare but might also result in larger travel distances and urban sprawl. Several megacities are actively planning 'car-lite' strategies to reduce private car ownership and use with the help of these emerging mobilities (and supporting transportation and land use policies). Car-lite policies are likely to be first piloted at a neighborhood scale instead of the entire city because it stands to reason that planning agencies will test out the policy in a limited capacity first before rolling it out to their entire jurisdiction. How will such pilots impact neighborhoods? Will they be successful in reducing vehicle ownership and use? To what extent will they induce undesirable but consequential side-effects such as gentrification?

This study attempts to address these questions using SimMobility - a state-of-the-art agent-based land-use transportation interaction (LUTI) microsimulation model. We use the Long-Term (LT) component that involves the creation of a synthetic population, followed by household-level residential location and mobility holdings choices, and individual-level job location choices, at the temporal scale of days to years. This study uses the SimMobility calibration for the city-state of Singapore, which makes for a particularly interesting study area for testing housing and mobility policies owing to the tightly regulated markets. We construct car-lite policies that improve accessibility locally in selected neighborhoods as a representation of the localized impacts of emerging mobilities. Various scenarios are designed based on hypotheses about market responses to car-lite policies – (a) baseline (no reaction), (b) minimal effect (awareness only), (c) increase in buyer valuations, and (d) increase in both buyer and seller valuations.

We find that the increased accessibility from the car-lite pilot does make most neighborhoods significantly more

vehicle-free. However, the in-mover households are found to be comparatively higher-income than both the households they displace as well as the original study area population. The vision of a car-lite community is adversely impacted in such circumstances where higher-income households, who are more likely to have private mobility holdings, refuse to reduce their mobility holdings after outbidding lower-income households for housing in the study area. Thus, the gentrification side-effect significantly reduces the potential vehicle-free gains from the car-lite policy. In certain neighborhoods, as much as 90% of the expected reduction in vehicle ownership can be offset by the housing market-driven effect. These neighborhoods turn out to be only marginally more vehicle-free than they were initially without the car-lite pilot.

Our results suggest that it might be possible to counter the gentrification side-effects with new housing development and reduction of minimum parking requirements. Possible configurations of new housing development include (a) market-rate housing of all types (both public and private), (b) market-rate public housing, (c) mixed-rate public housing, and (d) affordable public housing. We are exploring targeted housing supply that can make the study area differentially attractive to lower-income vehicle-free households, in addition to the price points at which they are being offered. Additionally, we operationalize reducing minimum parking requirements by restricting car ownership for residents of selected units in the study area. This is still research in progress, and we hope to have the results ready by the conference. Our preliminary results suggest that a mix of market-rate and affordable public housing can be quite successful in attracting households with car-lite travel behavior.

## ASSESSING THE USE OF TWITTER BY TRANSIT AGENCIES FOR COMMUNICATION WITH RIDERS DURING THE COVID-19 PANDEMIC

Abstract ID: 162

Individual Paper Submission

BARCHERS, Camille [University of Massachusetts Amherst] cbarchers@umass.edu, presenting author

ZHANG, Wenwen [Rutgers University] wenwen.zhang@ejb.rutgers.edu, co-author

SMITH-COLIN, Janille [Southern Methodist University] jsmithcolin@mail.smu.edu, co-author

Public transit agencies are increasingly using social media platforms to communicate with riders. These platforms provide a cost-effective, reliable, and timely mechanism for sharing information with passengers and other travelers (Chan and Shofer, 2014; Cottrill et al., 2017; Schweitzer, 2014;). Increasingly, these platforms have become critical parts of transit agencies' communication infrastructure and strategy during times of crisis, disruption, or other emergency conditions (Chan and Shofer, 2014). We examine the use of Twitter by transit agencies during the COVID-19 pandemic, specifically the content of disseminated messages and the responses to these messages, to

categorize the type of tweets and the impact of these tweets. This research combined a machine learning model and a set of case study interviews to examine the role of transit agency communication during disasters via social media. We collected and analyzed tweets associated with the tweet handles of the top 40 largest transit agencies in the U.S. based on the National Transit Database (NTD). The collected tweets included the original tweets, associated characteristics of tweets (e.g., time of creation, number of likes, retweets, etc.), as well as the conversations initiated by the original tweets. We developed and verified an effective machine learning classifier (at an accuracy of 90%) to filter tweets and replies that are associated with COVID pandemic communication. We then examined the patterns of COVID-related tweets using metrics, such as the number of tweets, the similarity of content, the structure of online conversations, etc. We also applied topic modeling (i.e., Latent Dirichlet Allocation topic model) and sentiment analysis to characterize COVID pandemic communication patterns on Twitter. Following a review of Twitter and marketing literature, we developed a list of relevant metrics to produce an integrated framework for measurement. We applied the framework to measure users' interactions using tweet-likes, retweets, and conversation patterns. The results revealed different communication strategies across transit agencies and the relationship between user interactions and specific content.

Based on the typologies generated in our analysis, we conducted interviews with three representative transit agencies to better understand motivations and objectives for social media engagement and to obtain practitioner input on future research design. This research informs planners and transit agencies on how to craft public messaging that resonates and is shared-- thereby potentially increasing brand loyalty, rider engagement, and awareness. A robust and resilient transit network requires ample financial support. As the largest share of revenue for transit agencies is generated by transit ridership, maintaining and increasing transit ridership is one of the keys to ensuring that public transit persists and provides critical mobility support, especially during disruptions & crises. We identified opportunities & challenges for enhanced engagement online and found that transit agencies are using the tools of corporate marketing to measure their success, but that these measures could be expanded to include sentiment, content, and conversational pattern analysis. Future opportunities for research include establishing a causal link between social media engagement, ridership, and trust.

#### HOW THE COVID-19 PANDEMIC CHANGED OLDER ADULTS' CYCLING BEHAVIORS IN TALLAHASSEE, FLORIDA

Abstract ID: 167

Individual Paper Submission

GLADWIN, Kristin [Florida State University] [kss07c@my.fsu.edu](mailto:kss07c@my.fsu.edu), presenting author

## Central Theme or Planning Issue

Although older adults account for a small share of the U.S bicycle trips (0.5%), the existing literature indicates that age itself does not prevent older adults from bicycling. Thus, it is realistic to assume that U.S. cycling levels could increase among this cohort. However, the existing literature is limited related to how to encourage bicycling among older Americans.

The COVID-19 pandemic caused a disruption to many aspects of our lives, including our transportation behaviors. Recent reports highlight mobility changes across the globe (Chinazzi et al., 2020), where use of some modes decreased and others, such as bicycling, increased. The “50+ Cycling Survey”, indicates that the COVID-19 pandemic has motivated older adults to start cycling again, and to ride more (Kachadoorian, 2020). However, it is not known whether these changes occurred primarily in places with strong cycling cultures and in places that normally see high cycling levels. Further, the survey did not seek to investigate whether older adults plan to maintain these habits post-pandemic.

Voluntary travel behavior change (VTBC) programs has been shown to be an effective and affordable way to alter travel behaviors among the general population (Cairns et al., 2008). Similarly, after a short period of “trying it out”, cycling can become the normal mode of transportation (Strömberg & Karlsson, 2016). However, the TDM literature is limited when it comes to older adults, and due to older adults’ reluctance to use other modes (Rosenbloom, 2009), VTBC measures might prove more important for this cohort than for the general population.

## Approach and Methodology

Using the COVID 19-pandemic as a “naturalistic” intervention, or a naturalistic “try it out” period, to travel behaviors, this explanatory sequential mixed-methods case study seek to explore: Are there things that can encourage older adults to cycle more in an environment lacking a strong cycling culture and where no changes have been made to the cycling infrastructure?

For the purpose of this study, the specific research questions are:

- \* How did the COVID 19-pandemic change older adult’s bicycle habits?
- \* Do older adults intend to maintain these habits post-pandemic? If so,
  - \* In what ways do older adults intend to maintain these habits post-pandemic?
  - \* What is the underlying reason for maintaining these habits post-pandemic?

Quantitative data was gathered using a self-reported cross-sectional online survey (n= 146). In addition, the locally gathered quantitative data will be contrasted to a larger national data set, comprising of roughly 600 responses. Qualitative data gathered from in-depth phenomenological phone interviews with older adults 65+ will be used to further explore the initial quantitative results.

## Findings, Relevance, and Implications

The findings from this study could help set the course for how to promote cycling among older adults. Furthermore, the findings from this research might serve as proof of concept that changing incentives can lead to changed travel behavior among older adults. Such findings could then be turned into planning policies that seek to replicate these change behaviors on a more permanent basis. For example, the findings would point to aspects that might prove useful when designing VTBC programs aimed at encouraging active transportation among older adults

## **DISENTANGLING TRANSPORTATION AND THE CRIMINAL JUSTICE SYSTEM: COERCING MONETARY SANCTIONS WITH DRIVER’S LICENSE SUSPENSIONS**

Abstract ID: 187

Individual Paper Submission

PINSKI, Miriam [University of California Los Angeles] mpinski@ucla.edu, presenting author

A driver’s license serves two broad purposes: primarily, as a tool to filter and enforce who is eligible to drive legally, and secondarily as a general form of official identification. When a driver loses their driver’s license, they not only lose their right to drive legally, but also risk their livelihoods, ability to participate in elections, and easy access to various public institutions and services (Schneider, 2020, Hershey, 2009). A person can lose their driver’s license for endangering others on the road - such as for reckless driving or speeding. But a driver also can lose their license for reasons unrelated to road safety, such as for child support delinquency, not paying court fines and fees, failing to appear in court, graffiti, or not attending school. This study aims to better understand the relationships among driver’s license suspensions and race-based discrimination in transportation policy and enforcement, criminal justice related to monetary sanctions, and mobility among low-income people. In the face of shrinking city budgets, local governments have increasingly turned to fines and fees to pay for public goods and services (Garrett and Wagner, 2009). However, not all drivers are equally likely to be stopped and ticketed, or to face driver’s license suspensions for unpaid fines and fees. Traffic laws disproportionately target low-income people of color, whose traffic fines generate revenue for city governments (US Department of Justice, 2015). And when low-income drivers are unable to pay for traffic tickets, they can face escalating fines, and may risk losing their driver’s license. Consequently recent political uprisings over racial injustice and disparate law enforcement in the US are intertwined with issues of transportation.

The purpose of this study is to answer the questions: how does license policy compound existing income and race/ethnicity-based disparities in accessibility, and to what extent have recent policy reforms ameliorated these disparities? I use an interrupted time series analysis to estimate the effect of the policy change on suspensions following legislative reforms to suspension policy in California in 2017. The California legislature has increasingly used license suspensions to discourage certain behaviors unrelated to driving, including graffiti, school truancy, failure to appear in court and failure to pay court fines and fees. In 2017, with AB 103, the state stopped suspending licenses for failure to pay fines and fees. I analyze whether this policy reform affected suspensions in low-income and minority areas. I rely on annual California Department of Motor Vehicle suspension data aggregated at the zip code level by type between 2013 and 2020 to measure spatial and temporal variations in driver’s license

suspensions before and after 2017. To account for differences in police prevalence, I use police stop data that the state began to make publicly available after the Racial and Identity Profiling Act (RIPA) in 2015. I find higher rates of suspensions in low-income and minority areas and in places with higher rates of police stops. I also find that the state issued fewer non-driving-related suspensions following policy reform in 2017.

This study adds to the literature on monetary sanctions, impediments to mobility, and racial profiling in law enforcement. It also highlights the ways states such as California use driver's licenses for purposes other than driving and, in so doing, disenfranchise minority populations. In some states, again like California, these types of policies have prompted reform efforts. This study, therefore, informs current policy debates on license suspension reform.

## USING REAL ESTATE MARKETS TO EVALUATE TRANSIT STATION AREA DEVELOPMENT OUTCOMES

Abstract ID: 188

Individual Paper Submission

NELSON, Arthur [University of Arizona] [acnelson@email.arizona.edu](mailto:acnelson@email.arizona.edu), presenting author  
HIBBERD, Robert [University of Arizona] [rhibberd@email.arizona.edu](mailto:rhibberd@email.arizona.edu), co-author  
CURRANS, Kristina [University of Arizona] [curransk@email.arizona.edu](mailto:curransk@email.arizona.edu), co-author

The primary purpose of fixed route transit (FRT) systems is to move people to, from and between nodes or areas. This is advanced when land uses near transit stations maximize access to them. In turn, this depends mostly on private real estate investment but real estate developers will make investments near transit stations only if rents meet investment targets. Rents are affected by the amenity benefit of transit station proximity but can be offset by such negative externalities as noise, traffic, and simply poor urban design of stations and their surroundings. If amenity benefits exceed negative externalities, rents will rise the closer real estate development is to transit stations. If negative externalities exceed amenity benefits, rents will fall. The spatial relationship between real estate rents and transit station proximity reveals how the real estate market internalizes transit station proximity (Li and Brown 1980; Nelson and McClesky 1990). We identify four theoretical outcomes of transit station proximity effects on real estate rents that can be used to evaluate transit station area development outcomes:

1. Rents rise with respect to station proximity signaling that being near stations is an amenity benefit;
2. Rents fall with respect to station proximity signaling that being near stations is associated with negative externalities;
3. A convex form is revealed wherein rents fall from the station outward but then rise signaling that proximity is an amenity benefit to some point after which negative externalities prevail; and
4. A concave form is revealed wherein rents rise from the station outward but then fall signaling that negative externalities give way to accessibility benefits.

Real estate rent slopes with respect to station proximity consistent with **1** and **3** advance transit objectives while rent slopes consistent with **2** and **4** do not.

We apply this theory to the study of office, retail and multifamily rental real estate markets in more than 30 metropolitan areas where more than 50 FRT systems operate. We are guided by two questions:

1. Is there an association between real estate rent and proximity to transit stations?
2. If so, what is the form of that relationship?

We use cross-section quasi-experimental research design. Our time period is 2019 for office and 2018 for multifamily and retail real estate. Using CoStar and census data, we test for the association between transit station proximity and real estate rents per square foot within and across multiple metropolitan areas. Although not causal, associations can be used as guidance for transit and land use planning nonetheless. Ordinary least squares regression is used where rents (the independent variable) are logged and dependent variables are binary or linear. Coefficients may be interpreted reasonably as the percent change in rent with respect to a unit change in the independent variable.

For the most part, we find that transit station areas do not advance transit station area objectives with respect to attracting real estate investment because rents are mostly upward/concave sloping away from transit stations, or ambiguous (Nelson, Hibberd, Currans 2021). However, we identify individual systems with downward/convex sloping rent gradients that are worthy of case study analysis to draw lessons for transit station planning, station area land use planning and urban design for other systems to emulate.

#### **WHERE THE CROSSWALK ENDS: MAPPING CROSSWALK COVERAGE VIA SATELLITE IMAGERY IN SAN FRANCISCO**

Abstract ID: 209

Individual Paper Submission

MORAN, Marcel [University of California Berkeley] moranm@berkeley.edu, presenting author

Marked crosswalks are the primary means of safeguarding pedestrian travel at intersections in American cities. In the face of decades-high pedestrian fatalities nationwide, the provision of adequate sidewalks is highly salient. However, the policies in place which guide where crosswalks are implemented often follow faulty logic, in that they are only recommended where pedestrian crossings *already occur*. In addition, how crosswalks are spatially distributed across a single city, and vary by neighborhood, density, or income, has drawn little academic scrutiny.

Given that, this study employs satellite imagery to map every crosswalk in San Francisco, a dense, walkable city that has struggled to reach its pedestrian-safety goals. Crosswalks are categorized by design type, condition, number of traffic lanes, and the presence of automobile and/or pedestrian signaling. For the first time, this allows for the calculation of 'crosswalk coverage,' which indicates what percentage of overall intersections feature crosswalks. Citywide, crosswalk coverage is less than 50%, and varies significantly across San Francisco neighborhoods, which possibly contributes to disparities in pedestrian safety, as well as signal public under-investment generally. On a three-point scale, roughly three-quarters of all crosswalks received the highest rating (meaning they were highly visible), and the two most common crosswalk design types were continental and ladder. Of the intersections with at least one painted crosswalk, the vast majority featured full treatment, meaning that each possible pedestrian choice (block A to block B, etc.) included a crosswalk. Overall, satellite imagery provides a low-cost and scalable way of identifying marked crosswalks, and evaluating their quality. The creation of this dataset also allows for further analysis in terms of comparing the spatial distribution of crosswalks to socio-economic patterns and pedestrian-safety outcomes. Planners should consider the ways in which crosswalks are present across entire cities — and where notable gaps exist — in their pursuit of Vision Zero goals.

#### ENVIRONMENTAL CONTRIBUTIONS TO THE PEDESTRIANS' PERCEPTION AND CROSSING BEHAVIOR: AN EXPERIMENTAL STUDY IN VIRTUAL REALITY

Abstract ID: 230

Individual Paper Submission

KWON, Jaehong [Ulsan National Institute of Science and Technology] [kjh623@unist.ac.kr](mailto:kjh623@unist.ac.kr), presenting author  
CHO, Giyoung [Ulsan National Institute of Science and Technology] [gicho@unist.ac.kr](mailto:gicho@unist.ac.kr), co-author

Pedestrian safety turn into one of the important issues in most cities (Rankavat & Tiwari, 2016), and whereby it becomes crucial to provide pedestrians with safe, accessible, and comprehensive facilities to reduce pedestrian crashes. Many of the solutions as a reaction to the emerging crash risk of pedestrians are within the range of the modification of the road environment primarily based on post-accident analysis. Although the traditional crash-based methods have been largely successful, more recently the surrogate safety measures (SSMs), including subjective evaluation of road users and their behavioral indicators, have been proposed as an alternative for studies in the consideration of the fact that reported accidents are rare and difficult to observe requiring years of data collection for a robust analysis (Johnsson, Laureshyne, & De Ceunynck, 2018). Despite this increasing importance of

investigation of the SSMs, existing studies suffer from the methodological shortcomings of field-based techniques related to the consistency and reliability. Within this reasoning scheme, we proposed to leverage the advantage of virtual reality (VR) tool for the scrutinization of risk perception and behavior of pedestrian in more controlled and immersive environments.

The purpose of the present study is primarily to investigate how environmental features incorporated into the shared space have a role in determining the risk perceptions and crossing behaviors of pedestrians. Our study particularly compared the impact of environments attributes including visibility, road design, pavement symbol, vehicle speed and lighting conditions on risk perception in shared streets from that in non-shared streets. This study further addressed the question of whether the perceived risk of pedestrians influences their crossing behaviors. For the purpose, we were based on “situational awareness theory” (Endsley, 1995) to support our hypothesis. The theoretical model describes that human perception of the relevant elements in the environment forms his or her situation awareness, followed by action selection and performance phase.

To accomplish this, an experimental setup for analyzing pedestrians’ crossing perception and crossing behavior was developed using a highly immersive virtual reality (VR) simulation involving a wireless head-mounted display (HMD). In these experiments, 200 participants who were facing 31 traffic scenarios including changes in environmental conditions in the context of the 8-meter-wide segment within residential area were instructed to cross the road whenever they felt it was safe to cross and then evaluate the crash risk perception. From the data recorded by VR system, participants behaviors were also measured by 4 variables indicating waiting time, reaction time, crossing time, and gait variability. For a first sight into the comparison of effect of design features on perceived risk of pedestrian between the contexts of shared space and street with sidewalk, we developed two regression models with random intercept which capture individual differences. Secondly, we used multi-level structural equation model (MSEM) to analyze the relationship among environmental attributes, perceived risk, and behavior in road crossing scenarios.

The findings suggest that all environmental variables used in this study (i.e. visibility, road design, pavement symbol, vehicle speed, and lighting conditions) have a significant influence on risk perception of pedestrians. However, the results of analysis presented the significance of the effect is dependent on the road types (i.e. shared or non-shared space). Therefore, we could discuss implications of this study focused particularly on planning interventions required for each type of road. Specifically, this study recommended to enhance risk awareness through securing visibility and increase feeling of safety through restriction on vehicle traffic in, respectively, shared and non-shared space. From the evidence of behavioral analysis, the present study could also shed light on role of pedestrian’s perceived risk in encouraging their risk-averse behavior when it comes to crossing the road.

#### **SPATIO-TEMPORAL PATTERNS OF TRAFFIC FATALITIES AND ECONOMIC DEVELOPMENT IN THE US**

Abstract ID: 249

Individual Paper Submission

XU, Xingjing [University of Florida] axuxinjing@ufl.edu, presenting author

BEJLERI, Ilir [University of Florida] ilir@ufl.edu, co-author

Traffic crashes have been a severe transportation safety problem in the United States for decades. Though traffic fatalities in the US have experienced a continuous downward trend with small fluctuations since 1970s, there are still more than 30,000 annual traffic fatalities in recent years. What is worse, the numbers are estimated to jump even higher in 2020.

Roadway safety studies have been extensively focusing on crash frequency modeling which interprets the relationship between crash counts and various explanatory factors. Among these factors, economic indicators usually play a supplementary role since the economy's impact is not direct and always associated with the travel demand. Kopits & Cropper (2005) proposed that traffic fatality risk increases as the economy grows, and when the GDP per capita reaches a high level, the traffic fatality risk starts to decline. Several studies have been searching for a variety of economic indicators as predictors for traffic crashes. However, only unemployment rate has shown a strong association with fatality changes. The higher unemployment rate indicate less fatalities. While other indicators were either not examined, or have not had consistent associations with fatalities.

Another issue of the existing studies is that traffic crashes occur randomly in space and time, as well as the explanatory factors. Since crashes cluster in certain areas, the neighboring unit would have similar geographic, environmental, and social-behavioral characteristics. As for the temporal pattern, crashes may occur more in some specific years. The causes of the increase or decrease become essential in associating the trends with policy decisions. Omitting the spatial, temporal, and their interactive variations could lead to biased estimation of variability, inaccurate interpretation of the rest of explanatory factors, or model misspecification.

This study examines the relationship between fatalities and economic activities and explores the spatio-temporal patterns of traffic fatalities in the US as related to economic indicators.

We used county-level panel data in the US from 1990 to 2017, including traffic fatalities, economic, demographic, travel demand, and other infrastructure related and land use related indicators. Three models were developed to study the relationship between fatalities and economic activities - the Poisson lognormal spatio-temporal model (PLN-ST), the generalized additive model (GAM), and Random Forests (RF). All these models considered the spatial, temporal, and spatio-temporal dependencies. GAM and RF models are frequently used to capture the non-linear relationship among explanatory variables. PLN-ST applies the assumption that fatality counts follow a Poisson distribution, which could be modeled according to the Besag-York-Mollie method. The spatial effects were specified using the conditional autoregressive structure.

The RF method outperformed the rest and had the best fit in the analysis. The results suggest that the economic indicators play a significant role in traffic fatalities and fatality risks. Specifically, the raise of personal income could lead to the increase of fatalities, while the drop of unemployment rate could lead to the decrease of fatalities. The results also showed that the fatalities have spatial, temporal, and spatio-temporal effects.

This study contributes to the expansion of the existing knowledge in transportation planning. It provides new findings in understanding the association of economic development and traffic safety issues. The study finds that there is an endogenous relationship between traffic safety and economic development, and that differentiates at time stages and geographical locations. This is why a spatio-temporal view of the traffic safety problem is essential to develop a better understanding of the interplay between economic development and traffic safety. This study provides transportation policy makers, transportation planners, and economic development practitioners a better understanding of the effects of economics on traffic safety.

During the COVID-19 pandemic government-imposed lockdowns as well as increases in remote working, learning, and shopping resulted in a sharp drop in overall travel. However, the number of trips made by bicycle seems to have increased in 2020 compared to 2019. This study examines the impact of COVID-19 on bicycling in Europe and North America. Based on information from automated counters, app-based data, and city level evidence we trace changes and variations in bicycling in 2020 compared to 2019 by time of day, time of year, and geographic location. We also explore trends in bike-friendly measures implemented in response to the pandemic.

Available bicycle industry data point to an increased interest in cycling with growth in bicycle sales in 2020 compared to 2019: +17% in Germany, +20% in the UK, and +39% in the United States. Based on data from permanent bicycle counters, overall bicycling levels in 2020 were greater than in 2019: Europe (+8%), the United States (+16%) and Canada (+3%). There was great variability among European countries ranging from +24% and +20% increases in Portugal and Sweden to net declines in Austria (-3%) and Ireland (-9%). Similarly in Canada, the western part of the country reported overall growth in cycling, while the eastern part of the country reported a net decline in cycling. In the USA, the Southwest saw the strongest growth in cycling and the Southeast the smallest.

In all countries and all regions of countries studied here, cycling increased on weekends: Europe (+23%), USA (+28%), and Canada (+28%). Even those countries and regions that reported net declines in cycling saw bicycling increases on weekends. During the week, cycling increased at a lower rate or even fell: Europe (+3%), USA (+10%), Canada (-8%). The diverging trend in cycling on weekdays is likely explained by a reduction in bicycle commuting due to a greater share of the populations working or learning from home. This is supported by data from traffic counters and tracking apps that show strong declines in bicycle trips during the weekday morning commute hours in 2020 compared to 2019.

The app-based data from Streetlight shows overall declines in bicycling in U.S. cities where the commute traditionally had accounted for a high share of bicycle trips, such as Washington, DC—while other cities report net increases in cycling. However, according to Streetlight data, even in places where cycling decreased, its mode share likely increased because overall trip making declined at a fast rate.

Cycling levels also varied throughout the year with strong declines in cycling in 2020 compared to 2019 during lockdown periods in countries like France, Italy or Spain—where lockdowns restricted almost all non-essential out-

of-home activities. For example, in France cycling fell by 70% when the first severe lockdown was instituted in March 2020, only to rebound five-fold to 144% of pre-lockdown levels once travel restrictions were lifted.

To date, little is known about individual motivations for more cycling. In 2020, People for Bikes asked new cyclists for their top reasons for cycling: stress relief and mental health (58%), exercise and physical fitness (57%), socializing with friends and family (43%), relaxation (37%), and getting outdoors (33%).

Based on data from the European Cyclist Federation, People for Bikes, initial published research, and data obtained directly from planners and policy makers, countries and cities supported bicycling during COVID-19 through bikeway infrastructure and facilities, street closures or speed reductions for motorized traffic, and increased funding. Many cities have plans to make temporary COVID-19 measures permanent to promote cycling in the future.

Community participation is vital to health, well-being, self-determination, and quality of life. COVID-19 has negatively impacted individuals' ability to participate in their community (Pfefferbaum & North, 2020). In addition, people with disabilities are simultaneously dealing with existing social disadvantages. This combination can heighten vulnerability and lead to disproportionate effects (Armitage & Nellums, 2020; Constantino et al., 2020; Pineda & Corburn, 2020). Yet, there is limited evidence documenting the extent to which activities of daily community living (ADCL) for people with disabilities have been impacted. Consequently, there is a lack of appropriate interventions and evidence-based decision-making to address challenges related to employment, housing, community services, planning/transportation, recreation, social engagement, and education.

This study aims to assess people with disabilities' ADCL during COVID-19 pandemic conditions compared to the general population. We ask four research questions. First, to what extent has the number of trips changed? Second, if trip reductions have occurred, have people with disabilities made a more significant reduction on certain modes? Third, are changes in travel behavior and community living different between people with and without disabilities by

place type? Last, do socio-economically disadvantaged people with disabilities show an even more significant reduction in their daily travel and community living? Our hypothesis was greater relative trip reduction for people with disabilities as well as a disproportionate reduction for socio-economically disadvantaged people with disabilities.

To answer those questions, we conducted a web survey using Qualtrics' online panel data. The final sample includes 161 people with disabilities and 232 people without disabilities across the United States. We collected data on the frequency of weekday trips, frequency of modes, and places visited. Each participant was asked to estimate their activities "pre-COVID" (2019), "during COVID" (2020 after the COVID-19 outbreaks), and "post-COVID" (the time when COVID-19 is no longer a concern in the U.S.). We ran bivariate inferential statistics such as t-test and Chi-square test of independence to see if the mean differences are statistically significant. Then, multiple regression models were developed for different hypotheses that explain travel behavior outcomes by internal and external factors. To model moderating effects of socio-demographic factors, interaction terms were added between disability status and personal income variable.

Our survey data shows people with and without disabilities have reduced their daily travel across all transportation modes and destination types during COVID, compared pre-COVID. And as hypothesized, those with mobility disability reduced their travel to a greater extent than other groups when socioeconomic status is equal. By travel mode, walking trips decreased further among individuals with mobility and sensory disabilities, and taxi trips (including ride-hailing services) were reduced more significantly among those with cognitive and sensory disabilities.

By place type, we observed more significant trip reductions to grocery stores, community service providers, and outdoor recreation facilities among people with disabilities during the pandemic. Regression models show that cognitive disability is most associated with a trip reduction in multiple destination types. Lastly, we found more negative impacts of COVID-19 on travel behavior and community living among low-income people with disabilities. Our results indicate lower-income people with disabilities may still rely on public transit during the pandemic, as they have less access to alternative forms of transport.

This study shows that COVID-19 impacts were more negative among people with disabilities, an already disadvantaged population. Our findings could contribute to evidence-based decision- and policy-making during the remainder of the COVID-19 pandemic and for consideration of future public health crises. More importantly, its practical implications would also be relevant post-COVID because the adjustments in travel behavior and community living might be longer-term during the "new normal."

## CHALLENGES AND OPPORTUNITIES OF TRANSPORTATION PLANNING FOR DISADVANTAGED COMMUNITIES IN SOUTHERN CALIFORNIA BEFORE AND DURING COVID-19 PANDEMIC

Abstract ID: 267

Individual Paper Submission

LU, Tianjun [California State University Dominguez Hills] tilu@csudh.edu, presenting author

DONG, Hongwei [California State University, Fresno] hdong@csufresno.edu, co-author

HAMDAN, Kamal [California State University Dominguez Hills] khamdan@csudh.edu, co-author

Transportation equity has been a hot topic over decades (Karner, 2016). Disadvantaged communities are often faced with great transportation barriers to employment, education, healthcare, and other essential social services (Kaufman et al., 2017). These barriers motivate the study of transportation accessibility, affordability, and reliability (Litman, 2008; Fan & Huang, 2011). However, there is a lack of assessment on the challenges and opportunities of traditional and emerging transportation options before and during the unprecedented COVID-19 pandemic for disadvantaged communities.

Our study area includes 382 neighborhoods (census block groups) from 11 communities in the greater Los Angeles region (e.g., Carson, Compton, and Los Angeles) with a total population of ~ 630,000 residents. Most of the studied neighborhoods are identified as disadvantaged neighborhoods according to CalEnviroScreen 3.0 (OEHHA, 2018). In this study, we conducted both neighborhood-level analyses and individual-level surveys to uncover the transportation challenges and opportunities before and during the pandemic.

We developed four groups of indexes to describe the socio-demographic characteristics of the study area and to quantify their transportation accessibility, affordability, and reliability. Specifically, we used seven indexes to characterize socio-demographic features (e.g., racial/ethnic composition, household income) and vehicle ownership and eight indexes to measure the transportation accessibility for opportunities (e.g., employment, healthcare, and parks) via different travel modes (e.g., auto, transit, and biking/walking). We measured neighborhood affordability (housing and transportation costs) and reliability (transit on-time performance and travel time). We designed a resident survey to gather individual-level information regarding parking availability, transportation costs, familiarity and use frequency with different transportation modes before and during COVID.

We found most of the studied neighborhoods are socioeconomic disadvantaged (e.g., predominantly minority with low or moderate income and poor education attainment). However, car ownership in the neighborhoods is slightly greater than the regional average suggesting limited non-auto transportation options. In general, there is a huge disparity in transportation accessibility and reliability for residents who have access to cars and those who rely on other transportation options. Accessibility to opportunities (e.g., jobs, healthcare, education, food, and parks) varies by mode choice, distance to center, and facility availability. The bikeability and walkability are generally worse than the regional averages. The residents are burdened with transportation and housing costs and suffer from poor transportation reliability (e.g., much longer travel time and out-of-vehicle time).

We have received 430 complete survey responses currently. These respondents are mostly female (77%), 18-34 year old (69%), Hispanic or Latino (62%), and full-time employed (41%). In general, more than 82% respondents have at least two cars in the household and half of the respondents do not own bicycles, which echoes the auto-dependent status of the study area. There are 6% more respondents who find parking difficult and public transit unsafe while more than 53% respondents find the transportation costs decreased during COVID. For emerging transportation options, more than 90% never use car-share, bike-share, scooter-share, or micro-transit before COVID; this rate has climbed to 97% during COVID. Similarly, there is an increase of respondents who never use carpool service, public transit, nor bikes during COVID (from 64% to 85%) as well as ridehailing or taxi services (from 35% to 76%). Finally, respondents will consider using carpool and non-auto modes (e.g., bus/light rail, bike, walk, and scooters) if they are readily available and affordable.

The neighborhood-level analyses and individual-level survey focus on assessing how disadvantaged neighborhoods have been hindered by mobility challenge in terms of accessibility, affordability, and reliability before and during COVID pandemic. Our work could help overcome transportation barriers and improve opportunities to emerging mobility options, thus facilitating transportation planning and developing equitable, resilient, and healthy cities.

#### **PUBLIC TRANSPORT FOR ALL? MIGRANTS' VIEWS ON ONE OF EUROPE'S TOP PUBLIC TRANSPORT CITIES**

Abstract ID: 290

Individual Paper Submission

TEOMAN, Denis Can [Virginia Tech] [dteoman@vt.edu](mailto:dteoman@vt.edu), presenting author

BUEHLER, Ralph [Virginia Tech] [ralphbu@vt.edu](mailto:ralphbu@vt.edu), co-author

Vienna, Austria, has been consistently ranked among the world's most livable cities by several different quality of life indices. Factors often cited for Vienna's top rankings include an extensive public transportation system, a robust public health system, low crime rates, and a large supply of public housing. Several studies have identified public transport in Vienna as exemplary in Europe based on its geographic coverage, cost, and ridership levels.

However, quality of life indices and available studies heralding Vienna's public transport system do not differentiate the quality of life and public transport quality for minority groups such as migrants. In 2020, migrants who were born abroad or have at least one parent who was born abroad, accounting for 41 % of Vienna's population--one of the highest migrant population shares for a city world-wide. Research from the United States and other OECD countries has shown that migrants are more likely to ride public transport than non-migrants--similar to the travel behavior of individuals with lower incomes.

Treating public transport in Vienna as an integral part of daily life, this paper investigates if migrants in Vienna ride public transport more than non-migrants and if migrants perceive the quality of public transport differently from non-migrants. Also, we examine differences between migrant sub-groups by region of origin. Understanding the travel behavior of migrants can help understand the conditions and constraints in which migrants master their daily life (Smart, 2010). Reduced mobility in terms of access and frequency of migrants can lead to reduced participation in everyday life

After describing Vienna's public transport system, the paper utilizes the 2019 Austrian Mikrozensus (Microzensus) to analyze public transport ridership and perceptions among migrants and non-migrants. Logistic regressions compare

frequency levels of public transit usage and perceptions regarding six aspects of public transit: cost, travel time, coverage, condition of the interior, headways, and safety.

We find that migrants are more likely regular public transport riders than non-migrants--in particular migrants from Turkey. Turkish migrants are not only the second largest migrant group in Vienna but literature confirms that the travel behavior of Turkish Migrants is more different than non-migrants compared to other migrant groups (Harms, 2007; Kasper et al. 2007; Welsch, 2018).

Regarding the perception of six different aspects of public transit, similar trends are discovered. While non-migrants and migrants as a whole do not seem to have any statistically significant differences in perception of public transport, these differences become substantial when looking specifically at Turkish migrants. Turkish migrants seem to be significantly less content about public transit in all of the six categories compared to non-Turkish migrants and non-migrants, especially regarding costs and safety. This aligns with the literature that finds that Turkish migrants face more financial hurdles than other migrant groups and non-migrants as well as more discrimination and racist encounters.

#### RACE, INCOME, AND AUTOMOBILE DEBT

Abstract ID: 304

Individual Paper Submission

SIDDIQ, Fariba [UCLA] [fsiddiq@ucla.edu](mailto:fsiddiq@ucla.edu), co-author

WASSERMAN, Jacob [UCLA] [jacobwasserman@ucla.edu](mailto:jacobwasserman@ucla.edu), co-author

Households across America regularly take on debt to purchase or lease automobiles. The vast majority of low-income households own and travel by automobile, and a growing number of studies link automobile ownership to a host of positive outcomes including employment, wages, and access to high-quality neighborhoods. However, automobiles are expensive to own and operate. Consequently, many households struggle to repay the auto loans taken out in order to finance these vehicles.

The geographic and demographic contours of auto loans, debt, and delinquencies are uneven. The COVID-19 pandemic has likely exacerbated these disparities, as its economic fallout has been hardest on low-income and non-white families. In this paper, we examine the effect of the COVID-19 crisis on the geographic distribution of automobile indebtedness and delinquency, across neighborhoods in California by income and race/ethnicity. We use a new dataset, the University of California Consumer Credit Panel, which contains anonymized credit data with information on all individual loans in California from 2004 to 2020, allowing analysis of debt both before and during

the current crisis. The dataset includes outstanding debt, credit scores, and delinquencies. It also includes a census-tract identifier, enabling us to link the data to the characteristics of the neighborhoods in which consumers live. Our research analyzes approximately 300 million loans in California's 8,057 census tracts (neighborhoods) over eleven years, which we group into two categories: pre-pandemic (2010-2019) and pandemic (2020).

In the pre-pandemic analysis, our preliminary findings have uncovered trends in auto debt that correlate with a number of existing inequities. We find that although auto and overall debt balances grew in tandem in the top income quintile of neighborhoods from 2010 to 2019, auto debt balance growth has far outpaced overall debt balance in the bottom income quintile of neighborhoods, where overall debt has remained largely constant. Additionally, we find that while auto debt is increasing across all neighborhoods with a race/ethnicity majority, Latino neighborhoods have seen the greatest growth and prior to the pandemic held the most auto debt per capita.

During the pandemic, the relative standings of per-capita auto debt balance remained roughly constant among neighborhoods with race majorities. However, we find big effects during the pandemic in the changes to debt balance in the bottom income quintile of neighborhoods as compared with the top quintile. In February 2020, cumulative auto debt in wealthier neighborhoods grew by three percent, while in poorer neighborhoods, auto debt grew by less than one percent. However, by May, the month-over-month growth rates had swapped: auto debt in poorer neighborhoods continued to grow (by 0.2%), while declining in wealthier neighborhoods (by 0.5%). Auto debt in both neighborhood types grew again in June, but more rapidly among consumers in the bottom quintile; it peaked at four percent growth—more than double the growth rate in early 2020. Consequently, low-income neighborhoods held more per capita auto debt than wealthier neighborhoods by year's end, a reversal from prior to COVID-19. We also see potential effects from federal economic relief payments in April and the lapse of unemployment benefits in July.

Our research places auto debt and inequities therein in a transportation context and highlights the effects of the pandemic on indebtedness. The findings suggest that automobile ownership became more important for low-income households during the pandemic, yet this crisis likely saddled low-income and non-white families with untenable debt, which for some households may result in the loss of household vehicles. The analysis suggests the importance of policy efforts to ease racial disparities in auto finance as well as to address barriers to transit use, many of which have been elevated during the COVID pandemic.

#### INCORPORATING EQUITY PRINCIPLES TO ASSESS MODAL MISMATCH IN THE SAN FRANCISCO

HAN, Mengjie [University of Florida] mengjih@ufl.edu, presenting author

Last few years, a variety of social and political movements around the world have spotlighted the equity issues in many areas. It gains the momentum and provides the opportunity for everyone including scholars to engage in the conversation of this particular topic. Although the term equity is multi-disciplinary and widely used in politics, economics, public health, environmental science, etc., it shares a common meaning that benefits and risks are distributed proportionally among different groups of people in a way favoring those in disadvantage due to social, historic, geographic, or other influencing factors (Pereira et al., 2017; Litman, 2021).

In the field of transportation planning, equity is an essential component in most plans or strategies (Karner & Niemeier, 2013). It is multidimensional in considering mobility and accessibility, safety, traffic-related pollution, health, and other system and individual goals (Creger et al., 2018). Among these different perspectives, our main focus of this study is accessibility which is the most representative indicator of transportation system's main function – to move people around and to provide access to opportunities by various means, such as car, public transit, shared mobility, biking, and walking (Geurs & van Wee, 2004). As our travel behavior gradually shifting from highly car-dependent to multimodal, we are enthusiastic to understand the degree of job accessibility gap distributed between car users and transit-dependent population, as we define it as accessibility-based modal equity.

Most studies discussing transportation equity did not pay enough attention to the difference between equality and equity and often used them interchangeably. The lack of clarity of concepts directly results in the confusion of methods used to assess equity or equality. One of the most common mistakes is that studies used approaches (Gini index, Lorenz curves, Palma ratio) that normally evaluate equality – the equal distribution of a subject but claimed to evaluate equity. Meanwhile, methods that truly assess equity are rare to find and usually more complex. In order to operationalize equity analysis, we synthesized two main equity principles – basic needs and equitable difference, and developed a 6-step framework based on a variety of social and philosophical theories regarding equity as well as multiple studies that incorporated equity principles in accessibility-related analysis. We selected one of the most transit-rich cities in the U.S. – San Francisco as our study area. We firstly computed two critical indexes for each spatial analysis unit (block group). One is transit-dependent index that is based on socioeconomic data and represents the level of transit dependency for people living there, the other one is mismatch index that demonstrates the difference of job accessibility provided between car and transit. Based on the two indexes, we were able to know how the job accessibility gap is distributed among different places with various transit demand level. Then by utilizing the two synthesized equity principles, we can evaluate how equitable the transit resources are distributed across the city.

## EXPLORING THE FACILITATORS OF E-SCOOTER USE: HOW DIFFERENT FACTORS AFFECT VARIOUS SOCIAL GROUPS?

Abstract ID: 309

Individual Paper Submission

OZBILLEN, Basar [The Ohio State University] ozbilen.1@osu.edu, presenting author

AKAR, Gulsah [The Ohio State University] akar.3@osu.edu, co-author

Docked and dockless shared electric scooters (hereafter e-scooters) have been adopted in many countries since their first appearance in California in 2017. Recent statistics show an exponential increase in their use, particularly in the U.S. (NACTO (National Association of City Transportation Officials), 2019). E-scooters have the potential to contribute to sustainable mobility. A recent study from San Francisco, CA shows that e-scooters replace existing private automobile trips and induce new transit trips that would have not occurred if scooters were not available (San Francisco Municipal Transportation Agency, 2019). Additionally, e-scooters can play a key role in providing mobility options for disadvantaged communities by solving their first and last mile problems (Shaheen et al., 2019). Recent research shows that we have limited empirical evidence on currently evolving e-scooters and the factors affecting their use (McQueen et al., 2020). Empirical studies that investigate how different factors affect various social groups' e-scooter use are essential to develop planning policies that can promote their use as a complementary sustainable mobility option.

This study contributes to the literature by analyzing the facilitators and deterrents of e-scooter use. It uses data collected from The Ohio State University's (OSU) main campus in Columbus, OH. Data were collected through an online survey by OSU's Transportation and Parking Services in conjunction with our research team in November 2019. Invitation emails including the link to the survey were sent to a sample of 47,822 members of the university community including faculty, staff, undergraduate students, and graduate students (about 50% of the total campus population). After checking for early dropouts, responses with considerably incomplete information, etc. the study sample comprised of 4,170 respondents that equal to a response rate of 9%. The survey includes detailed questions on socio-demographics, travel mode preferences, travel frequencies, satisfaction levels with various transportation modes as well as e-scooter related attitudes, perceptions regarding the impacts of built environment factors on e-scooter use, and frequency of e-scooter use for different trip purposes.

Considering the potential impacts of built environment characteristics on individuals' e-scooter use, it is crucial to account for these factors in the analysis. For that reason, we merge the campus transportation survey dataset with the United States Environmental Protection Agency (EPA)'s Smart Location Database (SLD) using Census Block Group level geocoded household locations. SLD is a nationwide geographic data resource summarizing more than 90 different indicators associated with the built environment and location efficiency (for details see U.S. EPA, 2014). Using the aggregated dataset, we explore the facilitators and deterrents of e-scooter use among campus population controlling for socio-demographics and life-style related factors through a generalized structural equation modeling (SEM) approach.

As a novel transportation technology and mobility option, our knowledge about e-scooters is limited. This study adds to the existing knowledge on the factors affecting e-scooter use. It provides scholars and policymakers an understanding of how different factors, particularly those related to built environment characteristics and individual attitudes, affect various social groups' e-scooter use. The major findings present some guidelines for authorities in integrating e-scooters into the existing transportation networks and promoting their use through built environment interventions.

## CAN NEW FRAMES HELP OVERCOME OPPOSITION TO AUTOMATED TRAFFIC ENFORCEMENT?

Abstract ID: 310

Individual Paper Submission

Speed and red-light cameras have been shown to improve traffic safety, offer consistent general deterrence, and avoid undue police discretion. Despite the promise of these schemes and their successful implementation in other countries, automated enforcement is rare in the United States and many states have banned speed cameras. The U.S. public is deeply skeptical about the credibility and legitimacy of speed cameras as tools for traffic enforcement. The lack of automated enforcement in the U.S. is a serious problem. Nationwide, 33,000 people die each year in traffic crashes and over one quarter of these violent deaths are caused by excessive speed. Enforcement is exceedingly rare; the average U.S. driver has only a 1% chance of being pulled over in a given year. Sporadic enforcement is an ineffective deterrent and has low credibility as a safety tool. Finally, Black and Hispanic communities are disproportionately targeted for enforcement and, far too often, traffic stops escalate, leading to serious injuries or death.

To overcome public opposition and build support for this important policy tool, road safety scholars have called for research on the messaging surrounding automated enforcement. In short, they ask, could we increase support for automated traffic enforcement by framing the problem differently?

Frames are “diagnostic/prescriptive stories story” about “what needs fixing and how it might be fixed” (Rein & Schön, 1996). These are known alternately as problem characterizations (Jones & Baumgartner, 2005) or problem definitions (Rochefort & Cobb, 1994), but regardless of their name, each of these stories highlights some aspects of the issue while de-emphasizing others, which in turn profoundly shape how problems are addressed.

To assess the efficacy of alternative frames, we conducted a survey experiment with a representative sample of the U.S. public (n=2,000). Respondents were randomly assigned to read one of three different messages about traffic cameras, each with a unique problem frame. The first message focused on traffic safety and the risks of high speeds. The second emphasized drivers’ frustration with speed traps and their belief that enforcement is primarily for raising revenue. The third focused on racial bias in traffic enforcement. After introducing the unique problem frame,

each message presents automated enforcement as a reasonable solution. Each message is of similar length (~180 words) and reading level (Flesch-Kincaid Grade Level of 12 or lower).

The results of this work clarify the potential benefits and risks of each alternative message. They will assist practitioners—who are currently “flying blind”—to lay the groundwork for widespread implementation of this important safety and equity tool.

#### DO ENGINEERS AND THE PUBLIC SHARE PLANNER’S CANONICAL VIEWS ABOUT TRANSPORTATION?

Abstract ID: 312

Individual Paper Submission

RALPH, Kelcie [Rutgers, The State University of New Jersey] [kelcie.ralph@ejb.rutgers.edu](mailto:kelcie.ralph@ejb.rutgers.edu), presenting author

BROWN, Anne [University of Oregon] [abrown33@uoregon.edu](mailto:abrown33@uoregon.edu), co-author

THIGPEN, Calvin [Lime] [calvin.thigpen@li.me](mailto:calvin.thigpen@li.me), co-author

Among urban planners, many ideas enjoy near universal support. In transportation these canonical ideas include promoting walking, biking, and transit. Despite the consensus among most planners, it is unclear whether the public or transportation engineers share those views. Identifying points of consensus and divergence is essential because the public and engineers play an outsized role in shaping the transportation planning process.

To explore these issues, we surveyed a representative sample of 599 U.S. adults, as well as 592 transportation students enrolled in transportation planning and engineering courses in the United States. We asked respondents for their views on the goals of transportation and their preferred approaches for dealing with congestion and transportation finance.

First, the good news. Many of planning’s canonical views enjoyed broad appeal. For instance, 95% of planning students supported expanding transit service to combat congestion, a view supported by 91% of engineering students, and 88% of the public and. When it came to using gas taxes to fund non-auto travel modes, 93% of planners and over three quarters of the public and engineers agreed that it was fair to do so. Ninety-seven percent of planners, eight in ten members of the public, and nine in ten engineering students agreed that safety and environmental regulations should go farther. Finally, when it came to having drivers share their historic right to the roadway with other road users, 97% of planners, 81% engineering and 71% public were supportive.

Now, for the bad news. Several policies that planning students favor enjoyed far less support from engineering students and the public. Whereas 83% of planning students say that the central goal of transportation planning should be to reduce driving, just 52% of engineering students and 30% of the public agreed. Similarly, 83% of planning students preferred to raise the gas tax rather than divert money from the general fund, but only 59% of engineering students and 45% of the U.S. public approved. The starkest differences materialized with respect to building our way out of congestion. Ninety-three percent of planning students opposed this approach, just 59% of engineers and 30% of the public did. This pattern of opposition closely mirrored knowledge of induced demand, which was nearly universal among planning students (93%) but was lower among engineers (70%) and lower still among the public (39%).

These results have to implications for planning practice and pedagogy. Practitioners and educators alike should be aware of the false consensus effect, whereby people overestimate the extent to which their views are shared by others. Students may be in for a rude shock when they encounter public opposition for the first time. Planning pedagogy should help students recognize public preferences and prepare them to work across ideological differences.

#### **TITLE: DRIVE UNTIL YOU QUALIFY: EXPLORING LONG COMMUTES IN A HIGH HOUSING COST REGION**

Abstract ID: 313

Individual Paper Submission

WANG, Bonnie [University of Southern California] wangbonn@usc.edu, presenting author  
 RODNYANSKY, Seva [Occidental College] srodnyansky@oxy.edu, co-author  
 BOARNET, Marlon [University of Southern California] boarnet@usc.edu, co-author  
 COMANDON, Andre [University of Southern California] comandon@usc.edu, co-author

Policy analysts and planners have begun to link extreme commuting with a lack of housing affordability in the urban core. The assumption being that low-income persons, priced out of the city center, move to the fringe but continue to commute long distances (Kakar and Grossman, 2018). Supercommuting has increased by 1.8% annually from 2005 to 2016, comprising nearly 3 of every 100 U.S. commuters in 2016 (Bennet, 2018). Following existing literature, supercommuting in this paper is defined as one-way commutes longer than 90 minutes or at least 50 miles (FHWA, 2018). California’s Central Valley has several metropolitan areas within the top ten of the highest shares of supercommuters in the U.S. Based on ACS data, the San Francisco Bay Area, has seen rapid increases in its

share of super-commuters, growing from a 2.3% share in 2005 to a 4.8% share in 2016 (Bennet, 2018). Several areas of the Central Valley surrounding the Bay Area have even higher proportions of super-commuters: San Joaquin and Stanislaus had 10.2% and 8.6% share of supercommuters (ACS, 2015-2019).

Researchers have suggested that the imbalance between affordable housing in the Central Valley and thriving job opportunities in the Bay Area increase the need for long-distance commuting (San Joaquin Council of Governments, 2011). The restrictive housing supply in San Francisco metro forces workers to migrate out of the Bay Area. However, there has been little evidence of such an association. Past literature fails to explain the mixed results between two types of supercommuters: 1) the lower-income workers who live in the metropolitan area's periphery and travel frequently to the workplace and 2) the higher-income workers who live further away but tend to have more flexible schedules and travel less frequent to work. This paper aims to fill the gap by answering the following questions: 1) Does migration from adjacent regions increase the share of supercommuting? 2) Who bears the burden of increased supercommuting? 3) Do commute patterns vary between different industries?

This paper focuses on studying the combined Bay Area and the Central Valley region, but the research methods and results are generally applicable to other regions since supercommute has become a growing trend nationally and globally. We look at the three best available data sources on commuting (travel surveys, ACS, and LEHD) to statistically understand the incidence of supercommuting over time. We run a trip-level regression analysis across the Central Valley and the Bay Area using variables in the travel diary. COVID 19 has altered commutes substantially since the survey and census data were available. We also use Streetlight data to explore how pandemic patterns have changed from past trends.

All data sources show that the Central Valley counties, especially El Dorado, Merced, and San Joaquin county, generate more supercommutes than the Bay Area counties. The results point out an imbalanced commute flow between the Central Valley and the Bay Area. Workers who commute from the Central Valley to the Bay Area are ten times more than workers who commute from the Bay Area to Central Valley. In the Bay Area, the wealthiest group (>\$3333 / month) has the lowest share of supercommuters; while in the Central Valley, the wealthiest group has the highest supercommuter share. Also, the youngest group (Age <30) has the highest share of supercommuters in all counties in both the Bay Area and the Central Valley. Results from the analysis also indicate that household characteristics play an important role in commuting. Commuters with jobs in manufacturing and farming travel the longest to work. Neighborhoods with a higher share of renter-occupied housing also produced more supercommuters.

#### LOCATION-ALLOCATION MODEL BASED ON SIMULATIONS OF PUBLIC FACILITY CHOICE BEHAVIOR: A CASE STUDY ON NURSING HOME PLANNING IN SHANGHAI, CHINA

WANG, Can [College of Architecture and Urban Planning, Tongji University] wangcan1213@gmail.com, presenting author  
SONG, Shan [Nagoya University] crystalshanshan@sina.com, co-author

As an essential task of public facility planning, facility location problem has received continuous attentions for many years. A number of models are developed to rationalize location decision-making process, among which, location-allocation (LA) models are widely acknowledged. Classical LA models mainly apply distance-based principles, such as p-center and p-median algorithms, to generate optimal solutions which minimize the average or the most unfavorable distance from public facility to its potential users. However, two oversimplified assumptions make these principles less convincing: only distance-to-home is considered when modelling users' choices of facilities, and this single factor determines in an all-or-nothing way. In contrast, it's obvious that choosing facilities are influenced by various preferential attributes and should be better regarded as probabilistic spatial behavior, with unobservable attributes counted as random errors. Therefore, we propose a new LA model which is based on analysis of users' preference on public facilities and probability-based simulations of their choices. For preference modelling, Logit model under Random Utility Theory is employed by assuming that one would choose the facility with the largest utility. Furthermore, utility-based indicators are maximized to generate optimal solutions using Genetic Algorithm, which is a generalization to classical LA models that just minimize distance-based indicators. As an application, we adopt the proposed LA model in the planning of 5 new nursing homes (NH) in Shanghai, China. A stated preference study is implemented on 293 respondents to show how the elderly people make tradeoffs among several attributes when choosing NHs, including distance to home, distance to hospital, accessibility to metro station, air quality, monthly cost, and level of service. This enables the proposed LA model to simulate the complicated choice behavior in a much more reasonable way, comparing with simply allocating all the elderly people to the nearest NH. Meanwhile, our model maximizes the mean utility over all simulated people, which comprehensively considers all the NH attributes stated above as well as their relative importance according to preference analysis. The results show that the solution suggested by the new LA model outperforms those by classical LA models. Finally, a simulating and optimizing tool with geographic user interface is developed to support decision making process of public facility planning.

**PUBLIC TRANSPORTATION, AGGLOMERATION ECONOMIES, AND EQUITY: THE EFFECT OF TRANSIT-INDUCED AGGLOMERATION ON LOW-SKILLED JOB ACCESSIBILITY IN PORTLAND, OR.**

Abstract ID: 343  
Individual Paper Submission

OH, Seunghoon [University of Cincinnati] ohs2@mail.uc.edu, presenting author  
CHEN, Na [University of Cincinnati] chennn@ucmail.uc.edu, co-author

The spatial mismatch hypothesis states that the decentralization of jobs undermines socially disadvantaged group's job accessibility. One potential solution is the promotion of transit-induced agglomeration economies which could enhance job accessibility for low-wage or low-skilled workers by centralizing jobs to urban areas with relatively high-density surrounding transit stations. However, the gentrification through Transit-Oriented Development (TOD) could limit jobs available to the underrepresented workers in the urban central area. In this case, agglomeration may not help these workers have better access to matching jobs. To unravel these relationships, this research investigates the effect of transit-induced agglomeration on gravity-based job accessibility by transit in Portland, OR. Furthermore, this study compares the agglomeration impact on low-skilled job accessibility to the overall job accessibility. Effective density is proxy for transit-induced agglomeration economies in the analysis. The relationship is estimated with spatial econometric models to evaluate the direct effect as well as the spillover effect of agglomeration. Overall, transit-induced agglomeration brings a positive effect on job accessibility. However, agglomeration economies of one location reduces the job accessibility of their neighbors, implying that concentrating economic activities beyond a certain spatial scale may absorb jobs from the neighboring areas. Decision-makers and urban planners should set an upper limit in the spatial scale of TODs to avoid a zero-sum game. The agglomeration effect on job accessibility for low-skilled workers is not as strong as the accessibility for all workers, calling for decision-makers' attention to the importance of "redistributing" the agglomeration effect through progressive land use and transportation policy efforts for underrepresented workers.

#### COMMUTE KNOWLEDGE: HOW TRANSIT USERS LEARN AND ALTER TRAVEL PATTERNS

Abstract ID: 356  
Individual Paper Submission

DAVIDSON, Joshua [University of Pennsylvania] jdavids@design.upenn.edu, presenting author

This paper investigates the ways that transit users learn about, make decisions around, and ultimately change the ways they commute via public transit. The setting for this research is the newly instituted Southeastern Pennsylvania Transportation Authority (SEPTA) bus Route 49 in Philadelphia – the first new bus route added to SEPTA's network in a decade. Using a mixed-methods research design that incorporates quantitative survey data collected onboard, as well as qualitative data from semi-structured interviews with select users, I address the following research questions: 1) How do users learn about the ways they travel to work via public transit and

thereby gain “commute knowledge”? 2) What role do communications from formal versus informal actors play in the “commute knowledge” acquisition process? 3) How did users commute before the new bus came on line? 4) How did users ultimately decide to change their commute to a new route? Users of the new Route 49 appear to gain substantial levels of “commute knowledge” from informal mechanisms, such as conversations with coworkers, or merely from seeing the bus go by. Respondents often discuss the new route with their peers, signaling robust communication networks when it comes to making transit choices. Overwhelming numbers of Route 49 users switched to this route from another public transit mode. Users often make decisions around whether or not to use the Route 49 day-of or even during the commute itself. I conclude the paper by synthesizing these various pathways into a theoretical model of “Commute Knowledge Acquisition” that can inform future transportation planning around new route developments. Together, these findings describe a universe of social and informal communications and sometimes spontaneous actions that shape commute knowledge and, ultimately, change.

#### COMMUTE DISTANCE AND JOBS-HOUSING FIT

Abstract ID: 357

Individual Paper Submission

SIDDIQ, Fariba [University of California Los Angeles] [fsiddiq@ucla.edu](mailto:fsiddiq@ucla.edu), presenting author

BLUMENBERG, Evelyn [University of California Los Angeles] [ebumenb@ucla.edu](mailto:ebumenb@ucla.edu), primary author

Anecdotal evidence suggests that the growing affordable housing crisis in major metropolitan areas, such as Los Angeles, is forcing households to seek lower cost housing in the outer reaches of metropolitan areas, helping to explain the recent increase in commute distances (Dougherty & Burton, 2017; Holder, 2018). In the Los Angeles metropolitan area, the number of jobs near the average resident decreased by 7.4 percent from 2000 to 2012, with high increases in commute distance in high-poverty and majority-minority neighborhoods (Kneebone & Holmes, 2016). At the same time, housing prices—both home and rental—have continued to climb, even in the midst of the current COVID-19 pandemic (Joint Center for Housing Studies, 2020). High housing costs may limit the ability of lower-income households to act on their preferences for living in close proximity to where they work (Levine, 1998).

Despite suggestive evidence of the relationship between housing costs and commute distance, there are relatively few studies that document this association and its magnitude. We use spatial regression to examine this relationship between the availability of affordable housing in close proximity to jobs (jobs-housing fit) and commute distance in the Los Angeles metropolitan area controlling for several locational, employment, and housing characteristics of workers’ workplace census tracts. The analysis draws on 2015 Longitudinal Employer-Household Dynamics (LEHD) Origin-Destination Employment Statistics (LODES) by workplace supplemented with data from the 2017 5-Year American Community Survey on affordable housing units.

We find substantial variation in jobs-housing fit across Los Angeles neighborhoods. The imbalance is greatest in higher-income neighborhoods located along the coast and in Orange County, south of Los Angeles. Overall only four percent of low-wage workers work in neighborhoods where cost-appropriate housing units exceed the number of workers. In comparison, 58 percent of medium wage workers and 77 percent of higher-wage workers work in neighborhoods where cost-appropriate housing exceeds the total number of jobs.

Controlling for other determinants of commute distance, higher ratio of jobs to affordable housing is associated with longer distance commutes. These findings suggest that the lack of reasonably priced housing options near employment locations likely force low-wage workers to live far from job locations and, consequently, lead to longer commutes. The character and affordability of housing may not adequately meet worker demand—particularly demand from low- and medium-wage workers.

Longer distance commutes can be detrimental to families as well as to the environment—adversely affecting economic mobility, activity participation, health, and air quality. The results of this study underscore the importance of available and affordable housing in enabling workers to live close to their jobs, if they so choose. To address increasing commute distances, policymakers must greatly expand and protect the supply of long-term rental housing particularly in job-rich neighborhoods.

#### INFRA-STRUCTURAL CHANGE: 20 YEARS OF TRANSPORTATION INVESTMENTS AND THE IMPLICATIONS FOR POLICY

Abstract ID: 364

Individual Paper Submission

LEE, Amy [University of California, Davis] [aelee@ucdavis.edu](mailto:aelee@ucdavis.edu), presenting author

A critical strategy for both mobility justice and climate mitigation is a transportation system that provides people with viable transportation options besides the automobile. In a given year 13 percent of families in the US are carless (Klein & Smart 2017); even in autcentric California that figure is nearly 8 percent (ACS 2019). Car access is neither static nor uniform: poor families, immigrants, and people of color (particularly Black people) are “considerably more likely to transition into and out of car ownership frequently” than affluent, US-born, or White people (Klein & Smart 2017). Further, “involuntarily carless” households tend to live in neighborhoods with poor transit and active transportation options (Mitra & Saphores 2017). Simultaneously, the transportation sector is the largest source of carbon emissions in the US with nearly 30 percent of total emissions (EPA 2018). To meet climate targets, the transportation sector needs “not just technological-focused measures” such as vehicle electrification but also “structural changes that avoid or shift transportation activity” (Rogelj et al. 2018). A requisite for a just and low-carbon transportation system is alignment between accessibility needs, climate goals, and the significant sums that governments invest in transportation each year.

Much of the power over transportation funding resides at the regional scale. Regional transportation plans lay out a regional vision that spans a 20-year planning horizon. Plans are implemented by near-term transportation improvement programs (“TIPs”). That is, TIPs put actual dollars towards projects and programs that physically create access and barriers to opportunities, many of which endure for generations. Questions of justice are thus particularly relevant to transportation investment decisions, but “analyses of transportation investment programs are relatively uncommon in both academic literature and professional practice” (Karner & Golub 2019). Does infrastructure spending in TIPs enhance multimodal access or entrench automobility? Have investments like highway expansions that attempt to reduce auto congestion for peak-hour drivers – people who are disproportionately wealthy (Manville & Goldman 2017) – been funded faster or more frequently than transit or pedestrian safety projects? This case study of the Sacramento metropolitan region helps answer these questions, using ten cycles and 20 years of TIP data.

This study codes and analyzes projects included in Sacramento Area Council of Governments’ (SACOG) regional transportation plans and TIPs from 2000 to 2020, during which SACOG programmed over 2,000 projects that sum to hundreds of billions of dollars. The 20-year timeframe is key to more accurately capture investment priorities – projects often span multiple TIPs, and infrequent but large projects can skew single TIPs (e.g. high-speed rail).

While plans may show recent increases in high-profile transit projects in areas with high economic activity, we hypothesize that investment has consistently and overwhelmingly prioritized automobile infrastructure and roadway capacity despite innovation in the climate policy arena that brought about state goals to increase multimodal transportation and reduce driving. This study tests that hypothesis. And practically, this study offers insight into policy implementation and a useful methodology for agencies to analyze transportation investments longitudinally.

#### PLANNING FOR POST PANDEMIC PUBLIC TRANSIT

Abstract ID: 394

Individual Paper Submission

NEOG, Dristi [Westfield State University] neog.dristi@gmail.com, presenting author  
 SHEKARI, Elham [Florida State University] es18m@my.fsu.edu, co-author  
 BROWN, Jeff [Florida State University] jrbrown3@fsu.edu, co-author

Leading into 2020, U.S. transit ridership had declined for 6 straight years (National Academies of Sciences, Engineering, and Medicine, 2020). Then, the pandemic arrived, travel demand declined significantly as cities locked

down, and transit agencies in many communities were left reeling as they struggled to adapt.

The pandemic has introduced significant uncertainty into an already challenging transit landscape (National Academies of Sciences, Engineering, and Medicine, 2021). The greatest uncertainty has to do with ridership, namely will riders return in the numbers needed to maintain service at pre-pandemic levels. While there is a significant body of research on the factors associated with ridership (Chen et. al. 2020; Taylor et. al. 2019; Driscoll et.al. 2018), the pandemic is a new phenomenon that is relatively understudied and has few close analogues. By exploring how agencies were impacted and responded to the pandemic's onset, and how its consequences have influenced their thinking about their own futures, this study seeks to shed light on a critically important issue and thus help to advance our knowledge.

The study uses interviews with officials at selected bus-only agencies that were performing well prior to the pandemic. Using data from the National Transit Database, the authors identified agencies that experienced ridership growth (unlinked passenger trips) year over year leading to the last quarter of 2019. The authors then selected 12 bus-only agencies located in a diversity of locations around the country (urban, suburban, college towns) to approach for an in-depth semi-structured interview. Through the interviews, the authors sought to understand how the pandemic impacted ridership (and when), the strategies employed to respond to the pandemic and adapt to it, and how the ongoing public health situation has impacted thinking about longer-term planning and operational strategies. Interview responses were subject to content analysis to identify key themes. All interviews took place over zoom.

The results indicate that the selected agencies were impacted negatively by the pandemic and their ridership declined dramatically. The challenges varied somewhat across agencies and included driver shortages, loss of fare box revenue, and loss of community partners, but all the agencies rose to these challenges to provide the service to the essential workers in the first phase, and transit dependent riders in the subsequent phase. Most agencies relied heavily on peers and the CDC, as well as state level guidance, to recover and carve their path forward. While all the agencies were quick to adopt mask wearing, social distancing guidelines, frequent sanitizing, protective barriers and PPE in the short term, these agencies have very varying approaches for setting their long term plans and policies that depend a great deal on their context. The lessons from their experience can inform practice and scholarship around post-pandemic transit in the U.S.

#### DO MULTI-NUCLEI SPATIAL STRUCTURE POLICIES ACCOMPLISH COMMUTING EFFICIENCY? THE CASE OF SEOUL METROPOLITAN AREA IN KOREA

Abstract ID: 402

#### Individual Paper Submission

SEO, Jeemin [Incheon Institute] jimni0508@naver.com, presenting author  
LEE, Sugie [Hanyang University] sugielee@hanyang.ac.kr, co-author

Since the 1960s, the Seoul metropolitan area (SMA) has been rapidly urbanized and population concentration has been accelerated. These trends led to various urban problems such as traffic congestion, inefficient travel patterns, and surge in real estate prices. To address these urban problems, Korean government has initiated multi-nuclei decentralization policies including large-scale new town development and transportation infrastructure investments in the SMA. The development of new towns so far can be divided into the first new towns announced in 1989 (5 towns), the second new towns announced in 2003 (12 towns), and the third new towns announced in 2020 (4 towns). In addition, the SMA is more likely to be expanded by proposed Great Train Expresses (GTX) system and additional metropolitan express bus routes.

However, little studies have evaluated the impacts of multi-nuclei decentralization policies on commuting efficiency in the SMA. From the point of view of commuting patterns, some studies argued that commuting distances have been reduced due to the new town developments. On the contrary, some studies indicate that new town developments exacerbate commuting efficiency. Therefore, this study analyzes whether the changes in urban spatial structure by multi-nuclei decentralization policies accomplish commuting efficiency in the SMA. To do so, we utilize the 'Household Travel Diary Survey Data' conducted since 1996 and the 'Smart Card Data' accumulated since 2010.

Analysis results indicate that the changes in urban spatial structure have no significant effect in reducing commuting time in the SMA. The reasons for this result are as follows. First, although commuting time and distance are the main factors in deciding the location of residence, other important factors such as house price, the possibility of development of the neighborhood, and the level of the school district play crucial roles in longer commuting time and distance. Second, the commuting inefficiency in the SMA is related to not only the lack of jobs in the new towns, but also job-housing mismatch between the new towns and the parent city of Seoul. Furthermore, continuous provision of the metropolitan transportation system to the major employment centers of Seoul lowered the self-sufficiency of the new towns, leading to inefficient commuting patterns.

#### RACIAL AND DEMOGRAPHIC PREDICTORS OF TRANSPORTATION-RELATED POLICING DEATHS

Abstract ID: 405

#### Individual Paper Submission

SHIRGAOKAR, Manish [University of Colorado Denver] manish.shirgaokar@ucdenver.edu, presenting author

MISRA, Aditi [University of Michigan] aditimis@umich.edu, co-author  
DANTZLER, Prentiss [Georgia State University] pdantzler@gsu.edu, co-author  
TROY, Austin [University of Colorado Denver] austin.troy@ucdenver.edu, co-author

Researchers argue that there is inherent racial bias in policing against minority groups in the United States. More persons of color, relative to their percentage in the larger population, are subject to everyday violent policing actions. Policing actions are disproportionately higher in locations with predominantly non-White populations as well as in locations with a large percentage of White populations. Fatalities from policing actions have gained primacy in the national consciousness, with many people arguing for reimagining police departments. Systematic nationwide analyses of policing violence data, however, are lacking to guide any such efforts. In this paper, we ask two questions: How do majority non-White locations systematically differ in policing-related deaths from majority White locations? Which age, gender, race, or ethnicity cohorts are at a higher risk of death in policing actions due to gunshots, transportation incidents, and various other causes?

Using online data ( $n \approx 10,000$ ), we focus on records from January 2012 to September 2019. Our unit of analysis is the incident level, where each event is a death resulting from a policing action within the United States. We group the records into three categories, namely, deaths from violent means including gunshots, deaths from transportation-related events, and deaths from other causes. We use a series of multinomial logistic specifications to study the full national sample, and incidents that occurred in the top and bottom quintile of locations with White populations. We find that there are significant impacts along cohorts by age, gender, race, and Hispanic identity. Specifically, women are far more likely to die in policing actions in the transportation sector than has been reported in the popular press. People aged 25 and older are much less likely to die in transportation-related policing events than the younger cohort (age <25), relative to death by violent means. The lowest likelihood of death by a transportation-related policing event is associated with the age group 55-69 years. People of Hispanic identity are more likely to die in transportation-related policing actions than non-Hispanic individuals relative to death by violent means, and so are people who identify as non-White.

Planning scholarship and practice is yet to confront the phenomenon of policing and fatalities. Our findings provide guideposts to think about how policing-related deaths are an indicator for location-based policymaking, specifically between transportation issues and biases across gender, racial, ethnic, and age groups.

**INVESTIGATING BARRIERS TO INTEGRATING MULTIPLE PATHS WITH GREEN TRANSPORTATION SYSTEM IN GREATER CINCINNATI, OHIO**

ROGERS III, William [University of Cincinnati] rogerswp@mail.uc.edu, presenting author  
CHEN, Na [University of Cincinnati] na.chen@uc.edu, co-author  
LOOYE, Johanna [University of Cincinnati] Johanna.Looye@uc.edu, co-author

Bicycles have become more than recreational equipment and bike sharing has given people an even more convenient and inexpensive way to take both recreational and utilitarian trips. The benefits bike sharing offers to help solve inequity in accessibility increase when it is used as a solution to the first/last mile (FLM) issue with respect to public transit (Shaheen & Chan, 2016; Zou, Wei, Chen, & Zhang, 2020). Even though barriers to FLM, such as the distribution of stations and trips between bike sharing and transit, safety, weather, etc., have been frequently studied (Venter, 2020), few incorporate people's individual-level perceptions of their barriers and/or the integration of multiuse paths into the network of bike sharing and public transit.

This paper uses a survey that was conducted in the eight counties of the Ohio, Kentucky, Indiana (OKI) region (Greater Cincinnati) to examine individual-level perceptions of integrating bike sharing (Red Bike) and public transit (Go Metro) with a focus on barriers to using multiuse paths. The survey which was designed and implemented by our research team addressed three major research questions: 1) What are people's major barriers to using (or using more frequently) multiuse paths to solve the FLM issue? 2) To what extent does the built environment around people's residential location affect their integration level? 3) Which improvements would mostly likely encourage people to integrate green modes (e.g., cycling, walking, and riding transit) more often? Statistical comparison and geographical mapping were employed to investigate two groups defined as "Integration" (those who have taken at least two green modes together in one journey) and "No Integration" (those who have not).

The major barrier to integrating multiuse paths into the usage of green transportation system was their lack of connection to transit and bike sharing. Results reveal that more than half of all respondents in both groups would use multiuse paths or do so more often if an integrated green transportation system could be provided or improved. Geographical mapping results of 400-meter catchment areas around green transportation facilities based on respondents' residential locations indicate that a person's living environment is spatially related to their integration level: the more connected green transportation facilities they are near, the more likely they are to integrate them. These findings suggest the potential for incorporating multiuse paths to address the FLM issue.

In addition, the results from phone interviews based on the agreement in the survey contribute even more evidence that decreasing the distance between active transportation networks will lower the impact of barriers on people who have to incorporate them into their daily lives. If these green modes are planned and designed as a well-connected system from the start, most people, especially those who have been already using green modes, will be more likely to use them. This implies that better coordination should take place among local government, transit agencies (both bus and streetcar), bike-sharing programs, and trail management organizations in planning and implementing plans and investing in relevant facilities. Specifically, building and connecting more multiuse paths to transit stops through extensions and/or signage will give bike-sharing riders easy and safe access to jobs, healthcare, and more. In a post-pandemic world, keeping the new wave of cyclists, as well as current cyclists, on the road will partly depend on the improvement in active transportation integration.

## **DOCKED VS. DOCKLESS EQUITY: COMPARING THREE MICROMOBILITY SERVICE GEOGRAPHIES**

Abstract ID: 424

Individual Paper Submission

MENG, Sian [University of Oregon] sianm@uoregon.edu, presenting author

BROWN, Anne [University of Oregon] abrown33@uoregon.edu, primary author

Docked bikeshare used to be the primary mode of micromobility, but studies show that docked stations' distribution is geographically unequal and disproportionately located in white and affluent communities (Dill & McNeil, 2020). Since 2017, dockless programs, such as e-bikes and scooters, have proliferated across US cities, which may offer marginalized communities a more flexible, convenient and efficient transportation solution (Zheyen Chen, van Lierop, & Ettema, 2020a). In 2019, people took 96 million trips on dockless modes in the US, accounting for almost 70% of micromobility trips (NACTO, 2019). However, it remains unclear if and how dockless systems address inequities present in docked systems. While a limited number of studies compare docked and dockless use patterns, existing research typically examines a single city case study. Thus, a holistic examination comparing docked and dockless programs' service geographies is pressing to promote equitable policy.

This study asks three questions: 1) How do docked service geographies differ from dockless service geographies across the US? 2) Do service areas of dockless systems equate with vehicle accessibility? And 3) What are the equity and policy implications of docked versus dockless micromobility? To answer these research questions, we gathered data from all 32 US cities with docked and dockless programs, including real-time dockless vehicle location data and docked station location data. Specifically, we created three indicators of service geographies (SG) to compare docked versus dockless equity, including: 1) "docked" SG, docked stations' catchment area; 2) "designated" SG, the area where dockless vehicles are allowed to operate; and 3) "actual" SG, the area where dockless vehicles are deployed and parked. We utilized Lorenz Curve and Gini Indexes to investigate the overall horizontal equity, which shows the distribution of service geographies at the census tract and city levels. We also ran logistic and Tobit regression models to examine what neighborhood-level characteristics are related to the presence and coverage of micromobility service geographies in the census tracts, respectively.

Consistent with previous studies, docked SG is unevenly distributed across US cities and disproportionately service white and affluent communities. Lorenz Curves and Gini Indexes show that dockless systems can primarily ameliorate geographic inequalities, but the actual SG is less equally distributed than the designated SG. The regression analysis reveals the neighborhoods with a higher percentage of young people, males and zero-car households, high population and transit density, and high-income levels are related to all three service geographies. Additionally, designated and actual SG yield different racial equity outcomes.

This study suggests that policymakers should compare docked versus dockless service geographies to differentiate these two systems' roles in addressing transportation inequities when implementing new micromobility programs. Place-based policies and incentives may apply to areas with a specific combination of different service geographies. Additionally, policymakers need to pay attention to the gaps between designated and actual SG in dockless systems. Cities should develop performance metrics that measure the unbalanced deployment of vehicles within designated SG. Current deployment levels suggest that designating micromobility service areas do not guarantee access to micromobility vehicles, and some vehicles parked outside of designated SG reflect latent demand for these services.

CHANCEY, Bahij [MIT] [bahij@mit.edu](mailto:bahij@mit.edu), co-author

As demand for walkable cities increases due to their environmental, economic and quality of life benefits, there is a rising need for pedestrian traffic models in planning practice and academia. This paper offers an activity- and network-based pedestrian flow model at a property-level resolution in the City of Melbourne, which we calibrate on hourly observed pedestrian counts from automated sensors. Data on Melbourne's urban form, land-uses, amenities and pedestrian walkways as well as climatic conditions are used to train a multi-level model and six machine learning techniques on observed pedestrian counts. Updating the built-environment data annually, we (1) test the accuracy of each technique for predicting foot-traffic on the city's streets in subsequent years; (2) assess how closely the variations in land uses and urban form explain the distribution of foot-traffic; (3) analyze the extent to which each pedestrian trip type (e.g. home to transit station; transit station to workplace etc.) contributes to foot-traffic at AM, Lunch and PM weekday periods; and (4) assess the frequency at which such a model should be updated to maintain accuracy. We find that annual changes in the built environment have a highly significant impact on the spatial distribution of Melbourne's pedestrian flows and find that the model explains over 90% of foot-traffic variations in the calibration year, and predicts the effects of land use changes on pedestrian flows with over 70% accuracy in a following, out-of-sample year. Overall, the distribution of walking activity during different peak periods in Melbourne is well explained by estimated trips that result from land-use interactions. The model is well suited for conducting "pedestrian impact assessments" of proposed land use changes and developments. It can be used to guide where public investments or developer contributions to pedestrian infrastructure can benefit most constituents.

DURST, Noah [Michigan State University] durstnoa@msu.edu, co-author  
NUBANI, Linda [Michigan State University] nubanili@msu.edu, co-author

With work-from-home and the arrival of autonomous vehicles, more than 60 million American garages may lose relevance and be the focus for mass redevelopment (Bick et al 2020, Fagnant & Kockelman 2015, Kramer & Kramer 2020). The simple structure first incorporated into American housing by Frank Lloyd Wright over a century ago and now found in two-thirds of residences may soon lose its purpose, value, and use (Erlanger & Govea 2018, Henley 2008). Garages are more than a place to store vehicles, however, they also house the accoutrements of suburban living, are home to invention and music, an occasional bargain emporium, and container of items no longer needed but too good to discard. One aspect of the transition to autonomous vehicles will be the impact on housing and the implications of repurposing the 400 square feet of space consumed by the average two-car garage.

The research combines an understanding of the link between disruptive technologies and land use that is then applied to the case of the suburban garage. The presentation starts with national trends associated with work from home, autonomous vehicles, and the stock of garage space that is then assessed in terms of potential impacts. We analyze the possible land use scenarios that a transition in mobility will bring to our cities, encompassing perspectives such as engineering (reuse of space, toxic material removal, building codes, domicology), architecture and design, and urban planning (zoning, expanded housing size, conversion to second living spaces, property tax implications). The result is a taxonomy of potential end uses for suburban garages and the factors associated with each use.

## **HOW DOES THE TRANSJAKARTA BUS RAPID TRANSIT REDUCE PRIVATE MOTORCYCLE USE IN JAKARTA, INDONESIA?**

Abstract ID: 453

Individual Paper Submission

CHIU, Bing-Yu [University of Pennsylvania] bychiu@design.upenn.edu, presenting author

Reducing the use of private motor vehicles (PMVs) generates environmental and public health benefits: less greenhouse gas (GHG) emissions, less air pollution, less traffic accidents, and more physical activity. Large metropolitan areas could contribute much to PMV use reduction because they are big in population and land area, and they also provide preferred settings for investments in high-capacity transit systems normally operated in fixed guideway form, such as the metro system or mass rapid transit (MRT) and bus rapid transit (BRT). Asia is particularly concerning because a large portion of its PMVs are motorized two-wheelers, or motorcycles, whose per-vehicle GHG emission and fatality rate is higher than automobiles (Nugroho et al, 2011). Large Asian cities have been aggressively establishing and expanding their high-capacity transit systems since the turn of the 21<sup>st</sup> century.

However, high-capacity transit investments in large Asian cities may or may not result in considerable modal shift from the PMVs. Jakarta, Indonesia did not have a metro system until 2019, and after its first BRT system TransJakarta opened in 2004, despite some initial shift from cars and motorcycles to the BRT (Nugroho et al, 2011), the PMV modal share in the Jakarta metropolitan area was still a high 78% (motorcycle 67%) in 2019 as opposed to public transportation and non-motorized transportation.

To evaluate how high-capacity transit investments in large motorcycle-dependent Asian cities influence travel behavior in favor of sustainable transport, this research explores this research question: How do high-capacity transit investments influence private motorcycle use for passenger transportation? This research proposes: high-capacity transit investments do reduce private motorcycle use, controlling for sociodemographic variables that are considered explanatory of private vehicle use; such travel behavior changes differ in magnitude across high-capacity transit station catchment areas (800 meters, or half mile) due to different conditions in terms of land use and/or the supply of other transportation options; those station catchment areas that undergo Smart Growth planning interventions experience the greatest reduction in private motorcycle use; and the stations in these areas also experience a growth in passenger boarding that is commensurate with local population growth and is faster than the growth in system-wide passenger boarding. (Guerra, 2014)

This research confirms these hypotheses by identifying sociodemographic and land use and transportation options supply predictors of private vehicle use, performing regressions of motorcycle use on high-capacity transit proximity controlling for sociodemographic variables, determining whether high-capacity transit investments have influenced private motorcycle use, investigating land use-related and transportation options supply-related potential causes of the disparity in supposedly transit-induced private motorcycle use reduction across traffic analysis zones (TAZs), reperforming regressions of motorcycle use on high-capacity transit proximity controlling for sociodemographic, land use, and transportation variables, and determining whether high-capacity transit use changes have been commensurate to population growth (Guerra, 2014). The study context is the Jakarta metropolitan area. Data from travel diary surveys are used to measure changes in travel behavior after the BRT investments.

The findings of this research are new empirical insights on how high-capacity transit investments influence travel behavior in favor of sustainable transport in a large motorcycle-dependent Asian city. Despite the differences in the history of transit investments and economic development, the experience of Jakarta can provide useful lessons for other large, densely populated, motorcycle-dependent cities in Asia, Latin America, and Africa that have strived to establish or expand their high-capacity transit systems. The research enriches the currently small research literature that uses travel diary survey data, tests transportation and land use theories in an Asian context and augments the research literature on the relationship between transit investments and travel behavior with new empirical findings based on data rarely used.

# **ARE PEDESTRIAN AND CYCLING INJURIES UNDER-REPORTED IN DISADVANTAGED COMMUNITIES? EVIDENCE FROM AN ILLINOIS DATA LINKAGE PROJECT**

Abstract ID: 455

Individual Paper Submission

EDWARDS, Mickey [University of Illinois Springfield] [edwardhj@mail.uc.edu](mailto:edwardhj@mail.uc.edu), presenting author

LEONARD, Daniel [University of Illinois Springfield] [dleon01s@uis.edu](mailto:dleon01s@uis.edu), co-author

On March 24<sup>th</sup>, 2017 a four year old boy darted into a busy street in a Midwestern American city where he was struck by a passing car. Upon witnessing the violence, the boy's father pulled the driver from the car and assaulted him; the driver was eventually shot to death in the aftermath at the scene – though it remains unclear by whom. The father phoned police to report the incident while transporting his son, who had non-life-threatening injuries, in a private car to the hospital. Yet as tragic as this event was, it could have been worse. It is well documented that pedestrian and cycling crashes do not affect all people and communities equally. Those in communities with high rates of poverty, carelessness, and racial/ethnic minorities are disproportionately hit by motor vehicles while walking or cycling compared to members of other communities (Loukaitou-Sideris et al., 2007). Minority children are especially over-represented as victims. Children were victims in greater than one-fifth of hospital visits resulting from motor vehicle crashes that involved either a pedestrian or cyclist in Illinois throughout 2019. Of those children, twenty-two percent were Hispanic/Latino and twenty-three percent were Black. This is true even though the Hispanic/Latino population represented a relatively smaller proportion of all pedestrian and cycling crash victims who visited hospitals at sixteen percent. Meanwhile, Black children were under-represented compared to the overall proportion of the Black population of pedestrian and cycling crash victims at twenty-nine percent. Yet the true burden borne by the disadvantaged communities of Illinois may go under-reported to police. Previous studies conducted elsewhere have found a relationship between under-reporting and road user group (pedestrian, cyclist, motorcycle), victim identity (age, race, ethnicity), region (urban, rural), and injury type and severity. Crashes involving Blacks, men, children, cyclists, those resulting in a less severe injury, and those in rural areas have been found to disproportionately go unreported (Langely et al., 2003; Sciortino et al., 2005; Watson, et al., 2014).

This research uses statistical linkage methodology and software to match crash records provided by the Illinois Department of Transportation with hospital records provided by the Illinois Department of Public Health. Hospital records coded as an injury sustained by a pedestrian or cyclist involving a motor vehicle that fail to match with a crash record are singled out and further analyzed. Anonymized patient information is further analyzed, which include home zip code, gender, age, race/ethnicity, and hospital charges among others. The aim of this research is to better understand whether crashes involving pedestrians and cyclists go un-or under-reported to police – and if they do, by whom. Findings have implications for study focus areas, allocation of public funds, identification of high risk communities, and road safety interventions.

## **WHO SERVES TRANSIT-DEPENDENT RIDERS BEST? INTERMETROPOLITAN COMPARISON OF TRANSIT-HOUSING MATCH**

Abstract ID: 468

Individual Paper Submission

GRENGS, Joe [University of Michigan] [grengs@umich.edu](mailto:grengs@umich.edu), presenting author

Poor people benefit when public transit agencies give priority to providing high-quality service to neighborhoods where many people are dependent on transit. And poor people who are dependent on transit gain transportation benefits when they are able to reside in transit-rich neighborhoods. Which metropolitan areas in the United States allow high proportions of transit-dependent people to live where transit service is best? This study develops a region-level indicator to assess the extent to which transit-dependent people live in transit-rich areas in metropolitan areas of the United States. High scores reflect a spatial match between carless people and high transit accessibility. A region that allows for increases in supplies of affordable housing in transit-rich areas will demonstrate a better match than one that enforces exclusionary zoning. Examples of regions that perform best in the match between transit-dependent households and neighborhoods of high public-transit accessibility include New York and San Francisco. By contrast, regions including Los Angeles, Houston, and Cleveland perform less well. The indicator focuses policymaking attention on the location of public-transit lines, on housing-stock constraints, and on other barriers impeding the location of transit-dependent households in transit-rich areas.

## **IMPROVING PUBLIC HEALTH WITH WALKING: THE EFFECTS OF A WALKING BOUT AND BUILT ENVIRONMENT ON HEALTH OUTCOMES**

Abstract ID: 474

Individual Paper Submission

PAE, Gilsu [The Ohio State University] [pae.23@osu.edu](mailto:pae.23@osu.edu), presenting author

Walking can be easily integrated into daily routines, and is an accessible physical activity for both leisure and transportation. World Health Organization (WHO) recommends at least 150-minute moderate-intensity physical activity throughout the week for better health with bouts of at least 10 minutes (World Health Organization, 2010). Thus, increasing walking durations can improve public health efficiently. However, studies report majority of walking trips take less than 10 minutes (for instance: Buehler, Pucher, & Bauman, 2020).

Walking decisions are affected by various built environment characteristics. Among these characteristics, density, diversity, and design are widely used in studies measuring the effects of the built environment (Cervero & Kockelman, 1997). Density is frequently used among these variables because it is not only easy to obtain and quantify, but also represents various household characteristics (Ewing & Cervero, 2001). Although many studies have shown that density variables have significant relationships with walking amounts, we hypothesize that not all density variables linked with daily walking trips are necessarily associated with long-bout walking trips. Within these considerations, we explore the health benefits and environmental determinants of long-bout (more than 10 minutes) and short-bout walking trips.

This paper relies on the California add-on survey data of the 2017 National Household Travel Survey (NHTS). The data set contains socioeconomic factors and extensive information on the travel behavior of each respondent. Also, the data set includes the self-assessed health status of respondents, home locations, and detailed built environment variables, such as intersection density. The analysis sample of this study consists of 31,562 individuals aged over 18. The present study consists of a two-step analysis. In the first step, we use a binary logistic model to estimate the relationships between self-assessed health status and the durations of walking trips. The dependent variable is the self-assessed health status. We include two groups of independent variables: 1) socioeconomic and major built environment characteristics, and 2) the durations of long-bout and short-bout walking trips. The socioeconomic variables include a various set of characteristics, such as age, race, and education. The built environment variables include population and housing densities. In the second step, we use a negative binomial regression model to explore which built environment variables are significantly associated with the durations of the different walking types (dependent variable). We add more detailed built environment variables, such as intersection and employment densities, as independent variables.

The binary logistic regression models show that walking trips with long-bouts (more than 10 minutes) are associated with significant health benefits, while those with short-bouts (less than 10 minutes) are not. This finding is consistent with the existing literature that each bout of physical activity should be at least 10 minutes for better health (Lee & Buchner, 2008). The negative binomial regression models show that while short-bout walking trips are statistically associated with all density variables, this is not the case for long-bout ones. Longer walking trips are only associated with housing and intersection densities. This finding suggests that the environmental determinants for long and short duration walking trips can be different and indicates we need a deeper understanding of various walking types and their environmental determinants. This understanding is essential to create sustainable urban environments that promote healthy lifestyles.

KWON, Kihyun [The Ohio State University] kwon.485@buckeyemail.osu.edu, presenting author

AKAR, Gulsah [The Ohio State University] akar.3@osu.edu, co-author

Participating in social activities is important for good physical and emotional health (Schmöcker et al., 2005; Ermagun et al., 2016). However, disabilities make it difficult for people to travel and participate in out-of-home activities. A recent study, for instance, argues that about 14 percent of people with a mobility related disability do not leave their home (Brumbaugh, 2018). Although people with disabilities have distinct travel patterns and assistance needs, insufficient research attention has been directed to understanding their unique circumstances (Daniels et al., 2005; Ermagun et al., 2016).

Empirical studies have shown that people with disabilities have different socio-demographic characteristics and travel patterns as compared to those without disabilities. For instance, people with disabilities are more likely to belong to low-income and zero-vehicle households. Moreover, only one-fifth of people with disabilities work full- or part-time (Brumbaugh, 2018). In terms of travel patterns, they make fewer trips and tend to travel longer distances to their destinations (Schmöcker et al., 2005; Farber and Paez, 2010; Bruker and Rollins, 2016).

People with disabilities in most cases prefer private vehicle (Stern, 1993; Schmöcker et al., 2008), and they are more likely to travel as passengers for a greater share of their personal vehicle trips (Bears et al., 2004). While this is the case, American adults with disabilities make more transit trips as compared to those with no disabilities (Brumbaugh, 2018). Public transportation helps increase activity participation levels for individuals with disabilities (Paez and Farber, 2012). While this is the case, there are not many empirical works investigating the use of transit among individuals with disabilities.

Based on the 2017 National Household Travel Survey (NHTS) data, about 77.8 percent of transit users access public transit by walking. People with disabilities are more likely to be concerned about their neighborhood walking environments in terms of infrastructure i.e., lack of nearby paths or trails, sidewalks, or poor condition of sidewalks (NHTS, 2017). However, most studies on the determinants of transit use have focused only on the walking distance to public transport stations (El-Geneidy et al., 2010). To fill this gap, this study is concerned with the role that the neighborhood-built environment plays in determining people's public transit use. This study identifies the links between transit use and built environment characteristics (particularly walkability) with a focus on the differences between disabled individuals and others.

This study uses walkability index as a proxy for neighborhood-built environment. Neighborhood walkability is an outcome of net residential density, street connectivity, and land use mix (Frank et al., 2006; Sundquist et al., 2011). The walkability index is measured within a ¼ mile radius around one's residential location. This study utilizes the detailed individual level data from 2017 National Household Travel Survey-California Add-on (2017 NHTS-CA). We employ negative binomial regression models in order to examine the factors associated with the number of public transit trips.

Preliminary results indicate, after controlling for various other factors, disabled individuals living in walkable neighborhoods use public transit significantly more than those that do not. The findings of this study provide empirical evidence on how walkable neighborhoods can help disabled individuals reach their destinations, not only

by walking but also by enabling their use of public transit.

#### **PUBLIC VIEWS ON THE REALLOCATION OF STREET SPACE AND WALKING DURING AND AFTER THE COVID-19 PANDEMIC**

Abstract ID: 486

Individual Paper Submission

NOLAND, Robert [Rutgers, The State University of New Jersey] [rnoland@rutgers.edu](mailto:rnoland@rutgers.edu), presenting author  
IACOBUCCI, Evan [Rutgers University] [evan.iacobucci@rutgers.edu](mailto:evan.iacobucci@rutgers.edu), co-author  
ZHANG, Wenwen [Rutgers University] [wenwen.zhang@ejb.rutgers.edu](mailto:wenwen.zhang@ejb.rutgers.edu), co-author

Many towns and cities throughout the US and the world have reallocated street space in response to the COVID-19 pandemic. This was done to allow more social distancing for those walking and using other active modes of travel, and also to provide space for restaurants to offer outdoor dining. Our research uses data collected via an online Qualtrics panel of New Jersey residents to evaluate how these street closures were viewed. Did people take advantage of the opportunity to dine outside? Was walking more attractive with more space? How did respondents feel about changes in traffic patterns due to the closures? Did people walk more frequently and longer distances, and how did this behavior correlate with views on street closures?

Results of our analysis, to date, suggest that there is broad public support for these types of interventions that allow for more walking and more lively town centers (about 40-45% of respondents). In New Jersey, many towns are considering making these changes permanent and there is broad support for this as well. A minority of respondents indicated disagreement with the street closures, believing that they increase congestion and that outdoor dining makes it more difficult to walk (about 35% of respondents). Additional work, not yet completed, will explore whether these views are correlated with demographic measures and residence location.

The New Jersey Department of Transportation is generally opposed to these changes, citing a 1955 law that requires streets to be maintained as throughways for vehicle traffic. Any permanent change requires a full traffic impact analysis and could likely lead to the removal of the street closure, despite public support. This suggests that the lack of traction in improving walkable environments has to do with deeply entrenched systems, politics, and institutional practices. Specifically, there is an overarching tradition of traffic forecasting that a) largely ignores modes apart from automobiles, and b) is accompanied by virtually zero consideration of public desires. We suggest that the current

groundswell of support for street changes represents a rare opportunity that could be harnessed to overcome these forces and implement street design changes that support pedestrians and outdoor activities.

#### **THE INDIRECT EFFECT OF TRANSIT ON VEHICLE MILES TRAVELED: ESTIMATING THE TRANSIT MULTIPLIER EFFECT USING HOUSEHOLD TRAVEL SURVEY DATA FOR 28 REGIONS ACROSS THE U.S.**

Abstract ID: 543

Individual Paper Submission

SABOURI, Sadegh [University of Utah] [sadegh.sabouri@utah.edu](mailto:sadegh.sabouri@utah.edu), presenting author

EWING, Reid [University of Utah] [ewing@arch.utah.edu](mailto:ewing@arch.utah.edu), primary author

YANG, Wookjae [University of Utah] [wookjae.yang@utah.edu](mailto:wookjae.yang@utah.edu), co-author

There is a growing body of research suggesting that transit investments have both direct and indirect effects on vehicle miles traveled (VMT), and the indirect effect (through more compact, dense and mixed land uses, especially in station areas) can be greater than the direct effect (through transit ridership alone). In other words, regions with comprehensive transit facilities and supportive public policies realize lower VMT that is not fully explained by mode shifts from driving to transit but in addition by shorter auto trips and more walking and bicycling. This means that public transit investments have a multiplier effect often expressed as the number of VMT reduced per passenger mile of transit (Ewing and Hamidi, 2014).

The transit multiplier is the ratio of the total VMT reduction associated with transit, including both direct and indirect effects on VMT, divided by the VMT reduction associated with transit use alone (i.e., direct effect). The literature on the transit multiplier has many gaps, including mixed results, lack of external validity or generalizability due to focusing only on one region or transit system, and lack of concrete results due to weak modeling approaches and failure to control for critical confounding variables.

As part of Transit Cooperative Research Program (TCRP) Report 226, this study uses geocoded household travel data for 28 diverse regions (in terms of population size, location, and built environment) and applies a multi-level piecewise Structural Equation Model (SEM) to explain household VMT in terms of sociodemographic, built environment, and travel variables. We then estimate a transit multiplier for the 28 regions and provide an equation that regions (transit operators) across the U.S. can use to compute their multipliers. In fact, this is the main contribution of the paper. The regions in our sample are as diverse as Boston and Portland at one end of the urban form continuum and Houston and Indianapolis at the other.

Our results suggest that transit-rich regions tend to have higher transit multipliers than transit-poor regions. The direct effect of transit accessibility on VMT is about the same in all regions. A transit trip is a transit trip that partially substitutes for an auto trip. It is the indirect effect that varies from region to region which causes variance in the transit multiplier. In transit-rich regions, the effect of transit is primarily through land-use changes, favoring density and its effect on travel variables other than transit passenger miles. In these regions, the main effect of transit is to boost walk trips and shorten auto trips, both indirect effects of transit service quality. The range of the multiplier is from 6.1 (Charleston, SC, and Indianapolis, IN) to 9.5 (Boston, MA) for the regions in our sample. Note that this is not the transit land use multiplier as usually defined in the literature, but a multiplier of total VMT reduction relative to VMT reduction directly due to transit passenger miles.

For urban planning and design practices, this study suggests that building rail lines with supportive local government land use policies, as well as local and even state investments around rail stations can promote the use of sustainable modes of travel and eliminate or slow down the growth of automobile use. This finding has important implications for policy and planning practice, where decision makers seek solutions to deal with VMT, air quality and emissions, energy, obesity, and other health and environmental concerns. It is good news for transit operators, who are often criticized for low transit mode shares.

#### **PARATRANSIT SERVICES FOR PEOPLE WITH DISABILITIES IN THE SEATTLE REGION DURING THE COVID-19 PANDEMIC: LESSONS FOR RECOVERY PLANNING.**

Abstract ID: 548

Individual Paper Submission

ASHOUR, Lamis [University of Washington] lamis21@uw.edu, presenting author  
DANNENBERG, Andrew [University of Washington] adannenberg2@gmail.com, co-author  
SHEN, Qing [University of Washington] QS@uw.edu, co-author  
FANG, Xun [University of Washington] xfang@uw.edu, co-author  
WANG, yiyuan [University of Washington] yiyuanw@uw.edu, co-author

The Americans with Disabilities Act (ADA) of 1990 obligates transit agencies to provide door-to-door paratransit service for riders with disabilities that hinder them from using fixed-route transportation. Many Americans with disabilities depend on this service to access their everyday needs, such as grocery or emergent health care needs (Burkhardt, 2010). As the COVID-19 pandemic is causing significant disruption in mobility, ADA riders emerge as one

of the most vulnerable groups with minimal access to alternative transportation modes. Like other public transit services, ADA paratransit experienced substantially reduced demand and an increased need to provide equitable services while protecting their clients' and staff's safety during the COVID-19 pandemic (Abdullah et al., 2020; Dixon, 2020). Paratransit services provide a lifeline for their clients' essential mobility needs, including access to medical appointments and grocery stores. Examining transit agencies' responses to provide paratransit services during the pandemic can help inform planning for post-pandemic recovery and future disruptive events.

In September 2020, the research team conducted semi-structured interviews with 15 decision-makers, planners, and drivers working for the primary transit agency in the Seattle region – King County Metro – and its paratransit contractors. Interview questions were designed to identify current services, policy gaps, and critical challenges for recovery planning and post-pandemic paratransit services. Interview transcripts were analyzed using NVivo software to obtain essential themes.

The interviewees provided insights about (1) paratransit service changes in response to the pandemic, (2) anticipated impacts of a returning demand on paratransit service efficiency, equity, and quality during the recovery period, and (3) innovative approaches for maintaining post-pandemic equitable paratransit services while balancing safety measures with available resources.

Study findings suggest that paratransit service providers should consider (1) developing guidelines for future disruptive events, (2) examining alternative methods for food delivery to clients, (3) planning scenarios for delivering equitable services in the post-pandemic recovery period, and (4) increasing resilience possibly by establishing partnerships with transportation network companies.

#### Takeaways for practice

Amid the significant disruption that COVID-19 has on the transportation sector, some groups are particularly vulnerable to the pandemic's downsides.

As non-motorized travel emerges to be the safest and most accessible option during the pandemic, especially to get everyday necessities such as medicines and groceries, it is worth examining groups that do not have access to that due to physical disabilities, climate conditions, or unique geographic or land use characteristics.

It is crucial to expand travel alternatives or service delivery options for these disadvantaged group, including food and medication delivery services and multi-modal paratransit.

The lack of a pandemic-plan has caused disruptions, delays, and uncertainties in responding to the pandemic-related challenges. Safe and dependable public transportation appears to be a significant gap that needs to be well-studied and incorporated in transit agencies' plans to address current and futuristic hazards and disrupting events.

#### TRACKING THE DOMESTIC IMPACTS OF TRANSPORTATION IMPROVEMENTS IN THE POST-PANDEMIC BELT AND ROAD INITIATIVE

Abstract ID: 562

## Individual Paper Submission

HUTSON, Nathan [University of North Texas] nathan.hutson@unt.edu, presenting author  
LU, Yougeng [University of Southern California] yougengl@usc.edu, co-author

Over the past year, the pandemic has largely distracted world attention from China's major diplomatic and domestic development priority – the Belt and Road Initiative (BRI). Despite a near total shift in global focus towards issues of public health, official Chinese announcements regarding the BRI and its ambitious development goals have not significantly changed. With the BRI now an official part of the constitution of the Chinese Communist Party, the Chinese leadership has little choice practically and politically but to press on. Yet, the vision of the BRI that will emerge post-pandemic will likely be substantially different from the version that was promoted and pursued in 2019.

Even before the emergence of the pandemic, the Chinese government had received criticism for the lack of a concrete definition of what constituted a “BRI project” versus an unrelated transportation infrastructure improvement.[1] This was particularly problematic in the Chinese domestic context in which the provinces that were the focus of the BRI were already the target of substantial preexisting transportation infrastructure expenditure. In one sense, the pandemic provides an opportunity to pragmatically reassess China's true long-term transportation infrastructure priorities related to the BRI and to develop a better mechanism for tracking the efficacy of transportation infrastructure projects labeled as part of the BRI from a domestic development perspective. This paper poses the following research questions

1. How has the pandemic shifted the definition, scope and timeline of BRI transportation projects?
2. How can we assess, from a Chinese domestic perspective, whether the projects identified as BRI-affiliated are impacting the economic development of target provinces?

As noted in a recent analysis in the *Diplomat* “the piecemeal realization of BRI projects is determined by local governments and their related political and economic interests via diverse and time-consuming bilateral interaction with Beijing.”[2] Thus, while the West frames the BRI as a centralized master plan, the reality is that its long-term realization increasingly relies on local government actors. Despite the top-down nature of China's political structure, projects without an identifiable benefit to the local economy are likely to face sustained resistance, lowering their likelihood of completion. This paper creates a framework for assessing these local benefits.

## Methodology

In this study, we first develop a set of stringent criteria to determine whether a transportation infrastructure investment should be classified as a BRI project. We then evaluate the extent to which identified BRI projects have measurable benefits in terms of trade, freight flows and firm performance.

This study integrates cross-province panel data from 2008 to 2020 to assess the impact of BRI transport infrastructure (railway and highway) on economic growth and firm performance in freight related industries in the BRI target provinces. Using both static and dynamic spatial models, it explores relationships between BRI transport infrastructure and economic growth. It relates to analogous studies of the economic geography of trade that have correlated specific improvements in transportation networks with induced trade flows.[3] Additional research has evaluated the impact of railway and road-specific BRI infrastructure on economic growth in a global context.[4] This study builds on prior efforts in that it focuses on domestic impacts and uses a firm level dataset.

The estimation results reveal the extent to which BRI transport infrastructure facilitates local economic growth and diversification. Moreover, this study measures the positive spatial spillover effects of economic growth in the geographical distance spatial weight matrices.

## Study Contribution

This study contributes to existing literature by developing a set of criteria to define BRI transportation infrastructure in a post-pandemic context. It also examines the impact of BRI transport infrastructure investment on local economic growth in the BRI target provinces.

#### EXPLORING THE IMPACT OF COVID-19 ON BIKE-SHARING IN TWO GLOBAL CITIES USING LSTM DEEP LEARNING TIME SERIES ALGORITHM SEUNG JUN CHOI<sup>A A</sup> URBAN INFORMATION LAB, THE UNIVERSITY OF TEXAS AT AUSTIN, TX 78712, USA

Abstract ID: 568

Individual Paper Submission

CHOI, Seung Jun [The University of Texas at Austin] [jun.choi@utexas.edu](mailto:jun.choi@utexas.edu), presenting author

The COVID-19 pandemic led to drastic changes in transportation usage patterns. One transit mode that received increased attention during the COVID-19 pandemic was bike-sharing because bike-sharing can help users travel by keeping their social distance and can replace other transportation modes during the crisis. Past studies individually identified the impacts of the COVID-19 on bike-sharing (Campisi et al., 2020; Jenelius & Cebecauer, 2020). However, broader knowledge is needed to understand bike-sharing in the context of COVID-19 further, for the COVID-19 pandemic is global, the responses to it are local (Tashiro et al., 2020). This study used multiple case studies to explore bike-sharing during the COVID-19 pandemic in two global cities, New York City, USA, and Seoul, South Korea.

This study collected bike-sharing data in both cities between January 2018 and December 2020. An LSTM (Long short-term memory) deep learning time series algorithm model was built to predict bike-sharing use throughout the year (2020) of the COVID-19 pandemic. LSTM is an RNN (Recurrent Neural Network) model algorithm that overcomes *Long-Term dependency* issues by using different gates to delete, update, and reflect the features (Nielson, 2019). We individually classified NYC and Seoul and created two LSTM models.

For bike-sharing ridership and COVID-19, the study confirmed that two cities' bike-sharing ridership decreased in both New York City and Seoul during high COVID-19 infection rates the pandemic, which led to a peak number of cases in each respective city. Nevertheless, the mean trip duration of bike-sharing ridership increased in both New York City and Seoul during the COVID-19 pandemic. Moreover, authentic bike-sharing use turned out higher than previous years and more prominent in numbers.

The LSTM models suggest that the high amount of COVID-19 confirmed cases have a noticeable impact on bike-sharing ridership. Comparing two LSTM models' predicted bike-sharing ridership counts versus the actual numbers

in the second half of 2020 reveals information about the continuing impacts of the pandemic on bike-sharing use. In NYC, the observed bike-sharing ridership counts were consistently higher than the predicted values. Similarly, in Seoul, the actual bike-sharing ridership counts were higher than the predicted values. However, in November and December of 2020, as COVID-19 cases heat the peak, the number of actual bike-sharing ridership decreased to below the prediction.

Comparing NYC and Seoul's changes in bike-sharing use during the pandemic suggests that events of exceptional COVID-19 cases within cities caused a decrease in bike-sharing rates. Nevertheless, people across the world who use bike-sharing are using it for longer. These findings recommend bike-sharing system operators ensure that their bike-sharing infrastructure is well maintained and available during pandemics. Furthermore, they should expect bike-sharing usage to increase in the time of pandemic and post-pandemic.

#### **“WOULD IT BE WEIRD TO LIVE HERE WITHOUT A CAR?”: USING SOCIAL MEDIA TO UNDERSTAND CAR OWNERSHIP DECISIONS**

Abstract ID: 573

Individual Paper Submission

IACOBUCCI, Evan [Rutgers University] [evaniacobucci@gmail.com](mailto:evaniacobucci@gmail.com), presenting author

Car ownership is a major predictor of automobile travel, presenting an attractive target for efforts to reduce negative externalities related to automobile dependence. While many people who live without cars do so out of constraint, e.g., because they cannot afford one, others live car-free by choice (Brown, 2017). A better understanding of the latter group could help to promote more people to adopt a car-free lifestyle.

Existing scholarship highlights certain predictors of car ownership, e.g., household attributes and income (Hess & Ong, 2002). Moreover, characteristics and travel patterns of households with at least one car differ sharply from those without (Blumenberg et al., 2020). Research on car ownership decisions, however, has been primarily quantitative. While extant literature tells us much about what factors predict car ownership, it tells us less about how these decisions are made or how people live with them. This project adds to this understanding by examining how people talk about their car ownership decisions, specifically in urban contexts where voluntarily living without a car is more likely to be possible.

This paper complements existing literature on car ownership by addressing two primary research questions:

- 1) How do people who choose to live car-free characterize their travel routines?

## 2) How do people who choose to own cars characterize their travel routines?

To understand how people talk about transportation decisions, I collected comments about car ownership posted on Reddit, an online social content-sharing site where people post in subject-specific forums ( $n = 42$  threads). These threads represent seven US cities, ranging from sprawling and auto-dependent (Houston) to compact, walkable, and transit-oriented (Boston). I included only comments where respondents shared first-person accounts of travel decisions and experiences ( $n = 437$  comments).

I analyze the data by combining directed and conventional content analysis techniques (Hsieh & Shannon, 2005). While directed content analysis begins with a set of codes derived from existing theory and scholarship, conventional content analysis is exploratory, with codes emerging organically as a researcher analyzes the data. This combination is appropriate, as it combines the coding of known travel behavior variables (e.g., car ownership, trip purposes) with structures that emerged through coding the data (e.g., the arrangement of commenters into categories based on the importance of the car in their travel lives).

I find that car-free travelers are highly multimodal, and report needing more planning, flexibility, and knowledge of contingencies than their car-owning counterparts. They also use ridehailing and carsharing services to fill occasional mobility gaps that accompany living without a car. Moreover, car-free travelers reported becoming habituated to their routines despite their added complexity.

By contrast, travel routines of car owners are extremely heterogeneous, ranging from people who drive on a daily basis to those who own a car but only use it occasionally. Beyond frequency, rationales for car ownership varied widely by degree of necessity, ranging from purposes of pure convenience (e.g., shopping at a preferred grocery store) to firm need (e.g., necessary to commute).

This paper contributes to scholarship by developing a first-person understanding of car ownership behaviors that complements extant knowledge of the antecedents and dynamics of car ownership decisions. For example, the fact that some drivers cite needing a car to get to work despite living in a walkable neighborhood illustrates how regional characteristics like location of employment opportunities inform personal travel decisions (Ewing et al., 2018).

This understanding can inform policy by identifying opportunities to a) convert certain driver subtypes (e.g., convenience-based) to car-free travelers, b) reduce driving among people who must own a car for one or more mobility needs, and c) help car-free travelers stick with their routines.

In recent years, transportation planners have focused increasing attention on new mobility options, including transportation network companies (TNCs) and microtransit. TNC customers use mobile apps to secure individual and carpooling rides from drivers who use their own vehicles. These so-called “ride-hailing” or “ridesharing” companies were primarily seen as competition with taxis, yet their connection with transit is also debated in the literature (Hall, Palsson & Price, 2018; Rayle, Dai, Chan, Cervero & Shaheen, 2016). Similarly, microtransit can be seen as a shared ride providing the first-mile, last-mile service to transit that operates along a predetermined route or assembled on-demand using sophisticated computer algorithms (Hall et al., 2018). Thus, passengers walk to a pick-up location and pay a flat-rate fare. Microtransit was initially provided by TNCs, such as Via, Chariot, and Bridj, in a limited number of markets. More recently transit agencies have begun to offer microtransit services as first-mile, last-mile service in highly dispersed areas that are not well served by conventional public transit (Schaller, 2018). Transit agencies have provided their own microtransit service or they have partnered with TNCs or other providers to operate it. While many urbanized areas are experimenting with microtransit, few studies have been completed on the effectiveness and opportunities for microtransit as a part of a transit system operation.

Beginning in January 2019, the City of Gainesville, Florida, Regional Transit System began to operate microtransit on two routes in East Gainesville. These routes support a low-income population that is geographically dispersed and not easily served by conventional public transit. Over time, the service was expanded to a third route and can get direct service to a greater diversity of destinations. Users can access the service through one of four methods: a phone app, phone (through a dispatcher), a website, and as walk-on at transit stops.

### Methodology

In this research, we evaluate the use of microtransit as a part of transit service. We collected, mapped and analyzed a variety of data on trips taken on microtransit from January through December 2020, including date and time of trips, the mode of access, and the origins and destinations. We also conducted interviews with community leaders and collected surveys from residents, both users and non-users, in the neighborhoods served by the microtransit.

### Findings

The service initially provided access from residential areas to the Downtown Rosa Parks Transit Transfer Center. Over time, service has been provided to a greater variety of destinations. The major destinations of the service include the Downtown Rosa Park Transit Transfer Station, which provides direct access to large parts of the system, a Walmart Super Center, schools, and churches. More customers ride in the morning than the afternoon. The COVID-19 pandemic resulted in a significant decrease in ridership on microtransit between March and September 2020; however, the decline was smaller than service declines throughout the system. Over time access to the service via the app increased while usage of the web system remained small and declined over time. Community leaders strongly support the microtransit service, but long-term sustainability of the service is not yet guaranteed.

### Implications of the Research

The microtransit service is providing service to a greater access to a greater number of destinations on a convenient basis for a relatively small number of passengers, yet it also confirms that microtransit has a place within the range of publicly-provided, new mobility options. The destinations served by microtransit service suggest an opportunity for the transit agency to partner with the school system to provide service for children, even those who live within

the two-mile “parental responsibility zone”.

### EXPLORING THE IMPACT OF BIKE INFRASTRUCTURE ON MODE CHOICE: A SIMULATION-BASED, ROUTE-LEVEL IMPACT ANALYSIS

Abstract ID: 577

Individual Paper Submission

HWANG, Uijeong [Georgia Institute of Technology] [uhwang3@gatech.edu](mailto:uhwang3@gatech.edu), presenting author

GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] [subhro.guha@design.gatech.edu](mailto:subhro.guha@design.gatech.edu), co-author

In the U.S., active mobility, particularly bicycling, has been promoted as an effective alternative to car-centricity in short-distance trips, and for its benefits to the environment, public health, and the economy. Accordingly, a significant amount of local, state, and federal budget is being expended for bike infrastructure development. Bike infrastructure is regarded as an effective tool that ensures the safety and comfort of bike users and encourages more people to ride a bike. There have been many studies supporting the hypothesis that more bike lanes are associated with more willingness to ride a bike. However, we still know little about whether better and more extensive bike infrastructure influences people’s actual travel mode choices (Aziz et al., 2018; Dill and Voros, 2007; Moudon et al., 2005; Schoner and Levinson, 2014; Zahabi et al., 2016). Furthermore, the empirical analyses in the previous studies have been conducted at an aggregate city or neighborhood levels and therefore limited in understanding individual-level choices given various alternatives.

This study seeks to understand how the level of bike infrastructure, as well as other active-mobility-related factors, affect individuals’ travel behavior based on their actual trip data and route simulations. Specifically, we simulate a hypothetical bike trip of tens of thousands of O-D coordinates using a path-finding algorithm and employ the resultant individual route information—such as the proportion of bike infrastructure, the average bicycle level of traffic stress, and terrain—as independent variables in a mode shift model. The spatial scope of this study includes Atlanta, GA, Chicago, IL, and Minneapolis-Saint Paul, MN. Although the area we are focusing on is Atlanta, the sample of bike users in a travel survey of Atlanta is not sizable enough to build a robust model. Thus, we identified a few metro regions that share similar characteristics to Atlanta in terms of the travel environment using cluster analysis and selected the two regions from where recent travel survey samples with O-D coordinates could be obtained.

This approach is expected to bring more in-depth and quantifiable information about how the improvement in bike infrastructure affects mode shifts. Moreover, by including variables associated with public transit as well, the model will help ascertain the efficacy of bike infrastructure in alleviating auto-dependency and encouraging both active and multi-modal transportation.

## ACCESSIBLE TRANSPORTATION: INVESTIGATING THE TRAVEL EXPERIENCES OF PEOPLE WITH DISABILITIES

Abstract ID: 589

Individual Paper Submission

OTOTIVO, RYANNE [University of Colorado - Denver] ryanne.ototivo@ucdenver.edu, presenting author  
SHIRGAOKAR, MANSIH [University of Colorado - Denver] manish.shirgaokar@ucdenver.edu, co-author  
MARSHALL, WESLEY [University of Colorado - Denver] Wesley.Marshall@ucdenver.edu, co-author

It has been more than thirty years since the Americans with Disabilities Act (ADA) was created to protect the rights of individuals with disabilities to access public and private spaces without facing discrimination. Since then, cities across the country have been working to create transportation systems that support the travel needs of people with disabilities. While progress has been made, many places still fail to provide a transportation network that all people can easily and independently navigate. How are the travel experiences of people with disabilities impacted by these incomplete environments? What are the biggest factors influencing travel decisions related to mode choice, trip making, and trip timing for people with disabilities? To answer these questions, we conducted a series of individual semi-structured interviews with people with disabilities to gain insights into the various factors considered before taking a trip. Thematic and content analysis of the notes from the interviews revealed how multiple factors – including policy, technology, zoning, and the built environment – act together to influence the safety and quality of mobility options for people with disabilities. Importantly, the impact of the different variables varied significantly across different types of disabilities. When working to create an accessible transportation network, it is critical for transportation professionals to consider the specific design needs of individuals with different types of disabilities.

## **EXAMINING THE ROLE OF BIKE-SHARE IN IMPROVING URBAN TRANSPORTATION SYSTEM'S RESILIENCE TOWARD COVID-19 PANDEMIC: THE CASE STUDY OF SEOUL, KOREA**

Abstract ID: 594

Individual Paper Submission

KIM, Minjun [Ulsan National Institute of Science and Technology] min2412@unist.ac.kr, presenting author  
CHO, Gi-Hyung [Ulsan National Institute of Science and Technology] gicho@unist.ac.kr, co-author

Recently, bicycling, which includes both private bike and public bike-share, has been highlighted as one of the most effective means to improve the urban transportation systems' resilience due to its mobility and economic feasibility (Clemente, 2020). In particular, bicycling has been regarded as a sustainable alternative when public transit systems become difficult to use. When the disastrous earthquakes occurred in Japan and Mexico, for example, the bicycle was utilized as the most efficient and safe transportation mode while private vehicles and public transit are physically restricted (Lubin, 2011). Also, the strikes of public transit service in London resulted in increased the city's bike-share use by 85% per day, suggesting that bike-share can thoroughly fill the gap in the public transit system (Saber et al., 2018).

More recently, worldwide spreads of the COVID-19 pandemic has also significantly restricted the citizens' travel mode choice. Previous studies showed that people tend to avoid public transit, including bus and subway, and instead prefer personal mobility such as a private vehicle, bike-share, and e-scooter to minimize unnecessary physical contact with others (Tirachini & Cats, 2020). The use of bike-share in Seoul increased by 23% after the outbreak of COVID-19, while public transit ridership decreased by 30% during the same periods. It is a notable case in that people voluntarily utilized bike-share to improve their mobility.

This study aims to examine the role of bike-share in improving urban transportation systems' resilience toward the current COVID-19 pandemic. To this end, we hypothesized that the bike-share ridership would be reduced for short-term trips as the bike-transit integration has been limited. For long-term bike-share trips, however, bike-share ridership would increased to replace public transit trips after COVID-19. Further, this study examines the effects of bike-share stations' surrounding built-environment, socio-demographic features on the degree of public transit use replacement by bike-share.

To this end, this study combines time-series forecasting methods and OLS regression models. First, we used bike-share ridership data in Seoul from 2018 to 2019 (Before COVID-19), and forecast the ridership in 2020 (After COVID-19) by utilizing Holt-Winters seasonal smoothing techniques. Forecasted values refer to the bike-share ridership in Seoul if the COVID-19 has not been occurred. Since we also have actual bike-share ridership in 2020, which has been actually affected by COVID-19, we further calculates the differences between predicted and actual ridership. We defined this value as the effects of COVID-19 on the bike-share ridership. We calculated it as monthly station-based panel dataset. And then, we developed the OLS regression models for five distance group (0~2km, 2~5km, 5~10km, Over 10km, Same OD), which has "Actual Ridership – Predicted Ridership" as dependent variable and surrounding built-environment and bike-transit infrastructure, socio-demographic features of bike-share stations as independent variables.

Our results showed that the number of bus stops within 500m radius from bike-share station is positively associated with bike-share ridership change before (2018) and after (2020) the outbreak of COVID-19. Also, the

number of subway stations within the service area of bike-share stations showed negative associations with the ridership change of bike-share. These associations were more clearer for short-term trips (less than 5km). It suggests that the first and last mile connection of bike-share to subway stations has been significantly discouraged after the COVID-19, while the substitution from bus to bike-share has been more preferred to people. Besides, the distance to nearest university and floating population of 20-30 years old showed positive relationships with bike-share ridership. Our findings imply that bike-share serves to increase the overall resilience of urban transportation system, by providing an alternative modes to people who are dependent on public transit system.

TOLFORD, Tara [University of New Orleans] tmtolfor@uno.edu, primary author

MOORE, Alahna [University of New Orleans] ammoore3@my.uno.edu, co-author

The success of a passenger rail transit is contingent upon the convenient provision of multimodal transportation facilities and services connecting the rail service to the surrounding communities. Planning for intercity passenger rail transit should begin with an assessment of community needs, including direction to guide development standards to ensure that outcomes match local goals (Kline et al. 2013, Feinsod et al. 2016). Stations and surrounding areas should be designed with the multimodal rider in mind, meaning that high occupancy infrastructure should be properly connected with active transportation routes supporting walkers and bikers, safe and sufficient bicycle parking should be provided, and surrounding blocks should be scaled to pedestrian use with complete sidewalks and pedestrian amenities (Suraci 2018). Bicycling in particular has been found to be an important first and last-mile connector, particularly in more suburban, auto-oriented locations where transit options are limited (Gatien and Baghaie 2019).

New Orleans and Baton Rouge, the most populous city and the state's capitol of the State of Louisiana, are less than 80 miles away from each other. However, there are few transportation options available to travel between the two cities that are practical and affordable for occupational commuters and those without vehicles. There is a growing interest in a passenger rail between Baton Rouge and New Orleans following the trend shifting towards multimodal and transit-oriented development within and between metropolitan regions.

By studying a proposed passenger rail connection between Baton Rouge and New Orleans and several proposed terminal sites in the communities among the connection, this research aims to investigate the success of the

planning process for a passenger rail transit by evaluating the connection between the proposed rail terminal sites and existing transportation networks and seeking potential passenger rail riders and their needs.

Through a comprehensive evaluation, this research found that recently completed station area plans and local transit/streets enhancement project have created a robust blueprint for future service. Implementation of these plans would position local jurisdictions to substantially improve multimodal accessibility and provide key connections for future rail service users to connect to and from their final destinations. The remaining challenge is to identify funding sources to implement these proposed plans.

Through a survey, which drew in over 4600 responses (primarily from the parishes along the proposed rail corridor), this research found strong support regionwide for passenger rail as well considerable interest in multimodal travel locally. However, corridor residents were not necessarily currently interested in using active modes of transport or public transportation to access the train, indicative of current deficiencies in these networks and reflecting the region's relatively dispersed, auto-oriented development patterns. Although interest exists among commuters who work across parish lines to use the train for work trips, most potential riders would not expect to utilize passenger rail for work trips. Instead, it was viewed as a vital means of accessing the region's many cultural, recreational, sporting, and entertainment events, as well as connecting families.

This research shows the process of planning passenger rail transit and multimodal transportation network. For a proposed rail service to be successful and meet revenue targets, it must be designed to meet the needs of those most likely to ride it. The implementation of such project needs to be advanced through outreach and technology transfer to local, regional, and state-level stakeholders and promotion of efficient and effective transportation investments.

#### **TRANSIT-ORIENTED DEVELOPMENT AND ITS LONG-TERM IMPACT ON LOCATION AFFORDABILITY: LESSONS FROM LOS ANGELES**

Abstract ID: 605

Individual Paper Submission

SONG, Qi [University of California, Irvine] songq3@uci.edu, presenting author

Location affordability, which integrates housing and transportation affordability, is critical to internalize the housing and transportation trade-off made by households and comprehend the real meaning of affordability for various income populations, especially for low-income households (Center for Transit-Oriented Development, 2009; Renne et al., 2016). There is a growing trend nowadays of combining transit-oriented development (TOD), with affordable housing by planners and policymakers to increase housing affordability while providing transit proximity (Boarnet et al., 2017). This study will contribute to a larger, emerging area of research on location affordability. On the one hand, the existing literature reveals a heated debate among housing affordability and social equity activists in

response to the higher costs of housing in TOD and the resulting gentrification and displacement. On the other hand, transit-oriented neighborhoods generate lower vehicle miles traveled (VMT) and more walk and transit trips (Ewing & Cervero, 2010), and thus reduce household transportation expenditures. The contradictory impacts of TOD on transportation and housing costs need to be integrated and analyzed as a whole. Given this, the study examines (1) how TOD influences the combined share of housing and transportation costs for households over time and (2) what TOD design characteristics such as density and connectivity contributes to increasing location affordability.

This study focused on analyses of two relatively new-established light rail transit corridors – Los Angeles Metro Exposition Line and Los Angeles Metro Gold Line – to explore the changing housing and transportation cost for residents living within a half-mile from 31 targeted rail stations by Census block group. The study identified four types of factors influencing location affordability from the literature, which are neighborhood characteristics, the local housing market, transit accessibility, and urban design. It first explored how the aggregated location affordability of these selected census block groups change across different phases of TOD, including the “planning phase,” the “construction phase,” and the “permanent phase.” Housing and transportation cost for each census block group in different TOD phases were calculated based on U.S. Census data, Location Affordability Index Model created by U.S. Department of Housing & Urban Development, and the Housing + Transportation (H+T) Index from the Center for Neighborhood Technology. The results from the comparison of means tests indicate that the average location affordability stayed relatively constant when rail stations were planned and constructed, but it decreased after their opening. Households in census block groups with a higher proportion of low-income minority populations located near the downtown area experienced the most significant increase in their combined housing and transportation costs.

Further, the study explored the impact of urban design features of TOD in the permanent phase on location affordability using a multivariate regression analysis. By controlling variables measuring neighborhood characteristics, the local housing market and transit accessibility, the study examined the association between location affordability and urban design features of TOD such as scale and density, public spaces for human use, variety and complexity, pedestrian and cyclist orientation, and vehicular movement and parking. The results indicate that mixed-use and pedestrian-oriented design promote location affordability, while increasing household density contributes to higher location affordability only within a certain threshold.

Overall, the study emphasizes the necessity of early intervention from the local level to prevent gentrification and displacement of low-income minority households and the prospect of building mixed-income transit-adjacent communities which are dense, mixed-use and pedestrian-friendly.

## **RIDE-HAILING, RIDESHARING, AND TRANSIT RIDERSHIP: A NATIONAL STUDY USING THE 2017 NATIONAL HOUSEHOLD TRAVEL SURVEY**

Abstract ID: 610

Individual Paper Submission

PILGRAM, Clemens [University of Southern California] pilgram@usc.edu, presenting author

BOARNET, Marlon [University of Southern California] boarnet@usc.edu, co-author

While launched with the promise of “car-sharing” reducing the need for private vehicle ownership, ridehail/TNC services such as Uber and Lyft have been in competition with transit agencies for riders ever since their emergence - prompting the question whether ridehail is a complement to or a substitute for transit. This study uses person-level data containing travel behaviors and home locations from the 2017 National Household Travel Survey (“2017 NHTS”) to evaluate to which extent the ridership of ridehailing services (such as Uber and Lyft) overlaps with that of public transit, and whether the degree of complementarity between modes varies across space.

Previous research on the complementarity between ridehail services and transit focused either on aggregate ridership, on tours or on individual trips. So far, findings on complementarity have been mixed: Overall transit ridership did not decline following the TNCs market entry (Hall et al., 2018), and many tours involving ridehail also involve transit trips (Conway et al., 2018; King et al., 2020). At the same time, surveys suggest that at least some share of ridehail trips would have been transit trips, if not for the availability of ridehailing (Rayle et al., 2016). This study addresses two gaps in the literature: No prior studies focus on people as the level of observation, or evaluate what role the availability of rail transit near a person’s home location plays in determining whether or not somebody uses transit, ridehailing, both, or neither.

Using data from the 2017 National Household Travel Survey (NHTS), a regression model of trip counts at the person-level suggest that ridehailing and transit usage are complements, but also that this complementary relationship is concentrated among people who live within proximity to rail stations: The degree of complementarity between services decreases with distance from stations. Further, it is greater in terms of trips for locations near commuter rail, but greater in terms of people for locations near frequent rail. However, a multinomial logit rider classification model sorting people into users of transit, ridehailing, both, or neither on the basis of demographic information and land uses near their homes suggests that proximity to stations is associated with an increase in the probability of using either mode (or both) versus using neither – implying that any observed complementarity might be the outcome of individual preferences and lifestyles, rather than about the modes themselves.

## **EFFECTS OF VARIANT HIGH-SPEED RAILS AND COMMUTER RAILS ON COMMUTING ACROSS BOUNDARIES: IMPLICATION FOR INTEGRATED TRANSPORTATION PLANNING IN THE CHINA GREATER BAY AREA**

LU, Daming [School of Urban Planning & Design, Peking University Shenzhen Graduate School] ludm@pku.edu.cn, presenting author

ZHANG, Wenjia [School of Urban Planning & Design, Peking University Shenzhen Graduate School] wenjiazhang@pku.edu.cn, primary author

**Abstract:** The development of high-speed railway, bullet train, and intercity commuter railway has played an important role in shaping coordinated development and transportation integration in the Chinese mega-regions, facilitating an increasing number of commuters across administrative boundaries. Only a limited number of empirical studies have investigated the effects of variant types of railway infrastructure on interregional commuting; few have fully considered the impact of land use contexts of both residential and workplace areas, as well as the infrastructural facilitation and administrative impedance between them. This raises two research questions in this study: (1) whether there are different significant roles of high-speed railway, bullet train and intercity railway in promoting cross-boundary commuting, as well as their synergistic effects; (2) whether the restriction of administrative boundaries on commuting could be moderated by different types of railway and transit infrastructure. Moreover, the direct and moderated influence of land use at both residence and workplace on intercity commuting needs to be further explored.

This study applies a cross-classified multilevel model to comprehensively estimate the above factors affecting intercity commuting at the sub-district scale (i.e., urban neighborhoods, small towns, or villages) in the Pearl River Delta (PRD), the mainland part of the China Greater Bay Area. The study relies on multiple sets of big data, including a 2018 mobile phone signaling dataset for estimating the commuting flows between 609 sub-districts, the passage travel-time dataset of different types of railways and the areal housing transaction data, both crawled online, along with traditional district-level census data. The results suggest that socioeconomic condition and land use in the workplace area has a greater impact on intercity commuting than the residential area, implying traditional research may overlook the impact from the workplace area. For high-speed railway, empirical findings reveal the high-speed railway connection can effectively reduce the impedance of city boundary on intercity commuting. And high-speed railway could produce synergistic effects in the residential area with high employment density, as well as the workplace area with high population and employment density. Also, bullet train and intercity railway are more helpful for improving cross-boundary commuting within cities. These findings demonstrate the merger of administrative units and the development of intercity railway would promote mobility across boundaries in the China Greater Bay Area.

This study has two major contributions. First, we develop a novel method for evaluating the comprehensive relationships, including residential area and workplace area, among traffic conditions, land use, sociodemographic attributes, and the number of intercity commuters. Second, the findings provide enlightenment for incorporating regional coordinated development and transportation integration planning to facilitate labor mobility in the China Greater Bay Area.

## TRAVEL BEHAVIOR OF UNBANKED, UNDERBANKED, AND ULTRA-LOW-INCOME TRANSIT RIDERS IN OHIO

CONRAD, Katherine [NEORide] katherinec@neoride.org, co-author

This research investigates the travel behavior of various transit rider groups, particularly unbanked, underbanked, and ultra-low-income people. Our main research questions are: which demographic characteristics are associated with membership in these groups? How have their travel patterns been altered under COVID? and Do unbanked and ultra-low-income people pay higher average costs per trip compared to other transit riders?

Many transit agencies are moving to cashless validator/mobile fare systems that have the potential to lower costs and increase operational efficiency compared with traditional payment systems. Our greater research project (a three-year grant, focusing on EZfare) focuses on cashless payment systems that have the capacity to promote more flexible and affordable fare structures, provide touchless payment that could be more attractive to riders concerned with COVID, and enhance the ease with which riders access transit, while addressing the social benefits to transit riders from using this system as measured by increased access to work, shopping and other destinations.

This study integrates survey data with smart card transaction data of transit riders to investigate the implications of cashless fare systems. The research team has already collected over 1,200 surveys from riders in eight transit agencies in Ohio, covering rural, suburban, and urban populations. Three more agencies are also in the queue. The 15-minute online survey is part of a panel study that has been designed to document several aspects of the self-reported travel behavior of transit riders in Ohio over a period of 18 months, starting just before the onset of the COVID pandemic.

To complement the survey data, the research team has also partnered with NEORide, Masabi and CALSTART to collate records of the smart card transactions of about 35% of the survey respondents who used EZfare. during the study period. The smart card data provides detailed information about the exact time and geographic location of boarding for each individual rider. Using data processing techniques that have been demonstrated in existing research, we are able to build origin-destination matrices at dynamic time-space scales for each transit rider who uses a smart card. We combine the demographic and self-reported trip information from the survey with the information gleaned from the smart card data to provide insights into the travel behavior of the unbanked and lower income study group, compared with the balance of transit users in our sample.

Our analytical strategy includes a series of descriptive statistics, discriminant, regression, and geostatistical analysis.

We perform discriminant analysis to determine whether there are significant differences between our classification of unbanked, underbanked, ultra-low-income, and other riders in the sample. Regression analysis is used to investigate the effect of being unbanked or underbanked and of low-income on trip outcomes such as trip frequency, distance traveled, social well-being, fear of COVID, and change in trip destinations before and during COVID, and travel costs. We employ geostatistical techniques including kernel estimation and cluster/outlier analysis to explore spatial patterns in the smart card data. The main rationale of this research is embedded in vertical transport equity, that is the strategic design of public transport policies and infrastructure that favor population groups that are of lower income and social class. Thus, the findings of the study will contribute to the existing body of research on transportation equity. Also, the geographic and temporal scope of our data will potentially provide new insights into travel behavior in different spatial and demographic contexts. Our research is a contribution to the body of knowledge in resource allocation planning for transit agencies.

#### IS INFORMAL TRANSPORT FLEXIBLE? PLANNING IN PUBLIC TRANSPORT IN THE GLOBAL SOUTH

Abstract ID: 623

Individual Paper Submission

KERZHNER, Tamara [UC Berkeley] [tamarak@berkeley.edu](mailto:tamarak@berkeley.edu), presenting author

Informal transport is often described as flexible, reactive, demand responsive, niche-filling and in-tune with passenger needs (Cervero, 2000; Grava, 1980; Kumar and Barrett, 2008; Mateo-Babiano, 2016). This paper interrogates the uses and meanings of these descriptors in planning and research, and argues that there is limited evidence to justify them, certainly as a universal characteristic.

This study is based on fieldwork in four African cities. Interviews were conducted with regulatory authorities and transport workers in Nairobi and Lilongwe, and interviews and extensive surveys of passengers and minibuss drivers carried out in Djibouti and Lubumbashi. This, alongside the available evidence in the informal transport literature, drawing from anthropology, planning, labour studies and economics, is used to make a different argument in contributing to theorizing the behaviour, operations and equity impacts of transport and accessibility in African cities.

Informal transport, in many circumstances, is slow and stubborn to change compared to the pace of growth of the cities it operates in, and the existing patterns are often limited in distribution, oriented to mass markets and serve relatively narrow slices of the population at a high cost of money, time, safety and dignity. These are captive audiences with little ability to influence service patterns, much less large sections of the population for whom

services are geographically irrelevant or financially out of reach (Nakamura and Avner, 2021; Quiros et al., 2019; Salon and Gulyani, 2010). Flexibility, where evinced, is often in short term, erratic search behavior that is inefficient in itself and shows little evidence at consistently keeping pace with passenger needs .

Informal systems do have mechanisms for changing their planning and routing. However, this is thanks to active and powerful association, organization, political engagement and institution building on the part of informal transport workers and operators, who, collectively, are acting as transport planners in the cities in which they operate. It is not through individual, laissez-faire competition guided by the invisible hand, nor through notions of intuitive operation according to formless and de-politicized 'local knowledge.'

This study examines the ways transport operators carry out route planning, and finds careful processes of demand mapping and management, with collective, firm- and association-level investment in data gathering, demand assessment and subsidization of operations. However, this does not necessarily lead to equitable outcomes, as limitations of profitability and interest in competition over existing, high-volume routes preempt the development of new destinations and the identification of fine-grained passenger niches.

Emerging shared micro-mobility services are quickly changing the traditional transportation landscape, especially on university campuses where cutting edge technologies are often incubated and tested. One of the recent shared micro-mobility services was the shared electric scooters (e-scooters). The rapid adoption of these e-scooters on campus and surrounding areas poses significant challenges for transportation planners and policymakers as there is limited information and data about how e-scooters may affect travel behaviors. Despite the increasing popularity, the impact of e-scooter service on travel behaviors remains largely uncertain.

This paper exams the role of e-scooters as the first/last mile mobility solution through two methods. One is a campus wide survey at Michigan State University (MSU) that addressed the adoption and utilization of e-scooters by faculty, staff, and students for their commuting and on-campus trips. The other is an analysis of one year's e-scooters route data on campus and surrounding areas. Findings from these two data sources are consistent with each other in the role of e-scooters as the first/last mile solution. First, while e-scooters is gaining popularity for

social and recreation purpose among young people, the usage of e-scooters as the connection to public transportation was minimum regardless of trip distance. Second, the free-fare bus on campus, however, was proven to be more attractive to students than taking e-scooters for short distance trips. Third, e-scooters were found to have a strong competing relationship with active transportation modes in that 60% of e-scooter trips would have been taken by active modes.

Perceptions of traffic safety and personal security are key indicators of resident physical activity and neighborhood satisfaction (Lovejoy et al. 2010; Thornton et al. 2016; Cao et al. 2020). Previous studies have assessed the perceptions of pedestrians (Adkins et al. 2019) or bicyclists (Winters et al. 2012). However, more information is needed from diverse neighborhood populations regarding perceived barriers to walking and bicycling. For example, scholars have found that Mexican-American and Non-Hispanic white participants emphasized different characteristics of walkability (Adkins et al. 2019) and that lower- and higher-income neighborhood residents rated pedestrian streetscape elements differently (Thornton et al. 2016). Our study provides further insight into perceived barriers to walking and bicycling and their distributions among population groups.

Working collaboratively with government, academic, and community-based organizations, we surveyed City of Milwaukee, WI residents to investigate following questions: How do residents perceive the traffic safety and personal security of walking and bicycling in their neighborhoods? What neighborhood and individual respondent characteristics are associated with negative perceptions of safety and security? Our survey was distributed by mail to randomly-selected addresses in all of Milwaukee's 15 council districts and by e-mail and social media networks in June 2020.

Qualitative themes across the 801 survey responses revealed that most residents enjoy walking and are concerned with reckless driving (particularly speeding). Multiple open-ended comments mentioned having friendly neighbors, but a lack of traffic safety prevents full enjoyment of neighborhood streets. Respondents from lower-income areas often mentioned personal security and neighborhood upkeep (e.g., overgrown lawns, vacant lots, homes in poor repair) as negative qualities of their streets.

At the neighborhood level, binary logistic regression models showed that respondents who perceived the traffic safety of walking or bicycling to be “unsafe” were significantly more likely than other respondents to rate traffic speeds and sidewalks poorly. Both traffic safety and personal security barriers were associated with neighborhood characteristics reflecting disinvestment (e.g., poor cleanliness, few places to walk to, few opportunities to exercise).

At an individual level, respondents in households without vehicles were significantly more likely to perceive traffic safety and personal security barriers. This is particularly troubling because these people are most likely to depend on walking and bicycling for transportation. Other factors associated with traffic safety and personal security barriers to walking included having disabilities and living in a low-income neighborhood. Self-reported poor health was associated with both traffic safety and personal security barriers to bicycling. Being Black, Hispanic, or  $\geq 35$  years old were also associated with personal security barriers to bicycling.

For comparison, we also asked about perceptions of safety and security when driving an automobile. Interestingly, perceived traffic safety barriers to driving also included neighborhood traffic speeds and neighborhood characteristics reflecting disinvestment. Further, Black and Hispanic respondents were more likely than others to perceive traffic safety barriers to driving. Disparities in the perceived safety and security of neighborhood streets are not confined to walking and bicycling.

Our results have practical implications. Reducing neighborhood traffic speeds through actions such as redesigning streets and lowering speed limits is likely to improve safety and security for pedestrians, bicyclists, and other street users. Yet, residents’ perceptions of traffic safety and personal security extend beyond design. Neighborhood investment, street cleaning, and recreational programming may also help reduce safety and security barriers to walking and bicycling. Finally, some groups perceive greater walking and bicycling barriers than others: planners should make special efforts to engage groups such as people of color, with disabilities, without automobiles, and/or in poor health about how to reduce the barriers they experience and make walking and bicycling accessible and attractive to the entire community.

#### **WHICH TRIP DESTINATION MATTERS? ESTIMATING THE INFLUENCE OF LAND USE ON MODE CHOICE FOR HOME-BASED COMPLEX TOURS**

Abstract ID: 666

Individual Paper Submission

FANG, Jia [University of Florida] jiafang@ufl.edu, presenting author  
YAN, Xiang [University of Florida] xiangyan@ufl.edu, co-author  
BEJLERI, Ilir [University of Florida] ilir@ufl.edu, co-author

#### Background:

In recent decades, considerable efforts have been made to investigate the link between land use and transportation using tour-based analyses. A complex home-based tour involves multiple out-of-home destinations, each of which may have distinct land-use patterns. Therefore, how to aggregate the land-use characteristics of various trip destinations to the tour level has been a measurement issue for land-use and travel-behavior studies that apply a tour-based approach. The majority of existing tour-based research simplifies this issue by only focusing on the most representative trip, which can be problematic (Frank et al., 2008; Ho & Mulley, 2013).

#### Study Design:

This study addresses this measurement issue by investigating how and to what extent different measurements of the land-use patterns associated with a complex home-based tour influence the estimation of individual mode choice. We compare three measurement approaches. First, we measure the land use patterns associated with a tour by only considering the main destination (i.e., the destination of the trip for the primary activity). Second, we measure land use by only considering the destination of the trip with the lowest probability for non-driving alternatives. The idea behind this approach is similar to the Liebig law of the minimum, which suggests that a bucket's capacity is determined by its shortest stave (Whitson & Walster, 1912). Finally, assuming that each trip of a tour plays a role in shaping an individual's mode choice, we compute the land-use indicators associated with all the trip destinations and take their average.

#### Findings:

For home-based non-work tours, more land use factors (i.e., design and diversity) are statistically significant in predicting non-auto use when they are measured at trip destination with the lowest walkability compared to the two other measurement approaches. These findings support the hypothesis that the “weakest link” of a tour, i.e., the trip without lowest probability for using non-driving modes, has a major impact on travelers' mode choice of the tour. For home-based work tours, land-use characteristics at the main tour destination have a determinant effect on the mode choice of an HBW tour. Transit use is strongly impacted by the built environment variables for both home-based work and non-work tours, regardless of them being measured at the trip destination with the worst walkability or measured by averaging land use characteristics at all trip destinations.

#### Contributions:

1. We conclude that how researchers measure land use of tour destinations makes a difference in estimating the strength of the land-use and travel-behavior connection: (a) For home-based non-work tours, when measured at trip destination with the lowest walkability, land use variables have the strongest impact on mode choice. (b) For home-based work tours, increasing density and walkability around the employment centers/school areas can potentially promote non-driving modes among commuters.
2. To increase transit use in these regions, planners may focus on promoting dense and mixed-use development within walking distance of transit centers (i.e., transit-oriented development). Thus, transit users can carry out different activities on foot in transit-adjacent areas instead of traveling distance destinations that may require driving.

## **PUBLIC TRANSPORTATION AND COMMERCIAL GENTRIFICATION: EVIDENCE FROM THE SURVIVAL RATES OF INDIVIDUAL BUSINESSES AFTER NEW OPEN OF SUBWAY LINE 9 IN SEOUL, KOREA**

Abstract ID: 682

Individual Paper Submission

YOON, Chaeyoung [Chung-Ang University] yyoonyoon1005@naver.com, presenting author

JIN, Jangik [Chung-Ang University] arcane03@cau.ac.kr, primary author

KIM, Danya [Sungkyul University] dskim82@sungkyul.ac.kr, co-author

The expansion of the public transportation network brings about positive effects on the regional economy, but it also has a negative influence on someone who cannot afford a rising land price. This is because increased economic activities from the expansion of the public transportation network causes a rise in housing prices and commercial rents due to the rise in land value. That is, the new public transport network is a great benefit for those who own land and buildings in the surrounding areas, whereas it can be negative for those who rent them. In general, people who cannot afford the increased rents may be forced to be displaced, which is defined as the commercial gentrification. Although the initial study on the gentrification has focused on the residential areas (Glass, 1964), gentrification research has been diversified because this phenomenon has occurred in a variety of regions such as industrial places, tourist destinations, and commercial areas. However, relatively few studies have been conducted on the commercial areas.

At the beginning stage, commercial gentrification has a positive effect on regional economies as well as business owners who start to open with low rents, which improves the unique characteristics of the neighborhoods and thus attracts more consumers and tourists. As the gentrification phase progresses, however, the inflow of investment and speculative capital leads to a rise in rents and a decrease in uniqueness of the neighborhoods due to excessive commercialization. Consequently, this process may lead to an increase in closing rates of original retail stores, restaurants, and small businesses. If new public transit opens in a nearby area, this process may occur much faster. That is, the construction of new public transportation is closely related to the commercial gentrification. However, our understanding of the relationship between commercial gentrification and public transportation is still limited because only a few empirical studies have been conducted so far.

With this perspective, we aim to explore how the new construction of public transit affects survival rates of individual business in surrounding areas. In particular, we attempt to empirically verify the impact of the expansion of subway line 9 on the closing rates of small businesses in Seoul by focusing on the changes in survival rates before and after the opening of the subway line 9. For doing this, we obtain individual business license data that contain information on the X and Y coordinates, opening and closing dates, and business types, and then select subsamples that are located within 500m from the each subway station. In order to estimate the effect of newly opened subway network on the survival rates of small business, we employ the nonparametric survival analysis model.

Our results show that opening of the new subway stations negatively affects survival rates of individual business located in the surrounding areas. Particularly, the survival rates of restaurants are much lower than those of other types of businesses. In addition, the survival rates of individual business are getting lower as the distance to the subway stations is getting shorter. Findings suggest that transportation planning should be carefully designed because the construction of new transit could have a negative influence on the small business owners due to rising rents. It is suggested that the unintended consequences can be minimized when transportation planners, urban planners, city governors, and community leaders make great efforts not only for economic development, but also

achieve sustainable and win-win development.

#### **STICKY TRAVEL DEMAND: EXAMINING VEHICLE TRAVEL IN TWO PERIODS DURING THE COVID-19 PANDEMIC**

Abstract ID: 684

Individual Paper Submission

ZOU, ZHENPENG [Urban and Regional Planning and Design, University of Maryland] zhenpengzouor@gmail.com, presenting author

LEWIS, Rebecca [School of Planning, Public Policy and Management, University of Oregon] rlewis9@uoregon.edu, co-author

YANG, Yizhao [School of Planning, Public Policy and Management, University of Oregon] yizhao@uoregon.edu, co-author

The unprecedented coronavirus disease (COVID-19) pandemic put the spurring U.S. economy on pause in early 2020. Not only did we observe a once-in-a-lifetime mandatory lockdown in most cities and states across the country, but we also dramatically altered our travel behavior to protect our very own life and avoid further spread of the epidemics. According to the Federal Highway Administration (FHWA, April 2020), the year-over-year total road traffic volume declined by 39.8% (-112 billion vehicle miles, -41.2% seasonal adjusted) in April 2020. A month after the initial lockdown, however, states started implementing their phased reopening plans to combat escalating unemployment caused by the economic shutdown. The unexpected policy interventions provide us a unique opportunity to look into the inertia in travel behavior, i.e., the “sticky” travel demand.

We hypothesize that the long-run built environment and employment sector factors significantly determine the sticky travel demand. In addition, due to the underlying differences in residential built environment and employment composition among different sociodemographic groups, such sticky travel demand could adversely affect certain socially vulnerable population. We use empirical evidence to test our hypotheses and we provide a policy discussion on transportation equity to address the issue of sticky vehicle travel demand. While emerging literature starts to focus on variations in mobility patterns for multiple transportation modes prior to and after the lockdown orders (Pan et al, 2020; Lee et al., 2020; Tirachini & Cats, 2020), we are primarily interested in studying the inertia in driving by taking advantage of the natural experiment setting from the lockdown (and reopening) orders.

We adopt a data-driven approach that establish the statistical relationship between shifting vehicle miles traveled in two phases (lockdown and reopening), the shifting trends in Covid-19 cases and the unemployment rate, as well as the long-range built environment, employment sector, and sociodemographic characteristics at the county level. Instead of dividing the observational periods by the exact lockdown and reopening dates, which were drawn either

arbitrarily or politically motivated, we separately examine two study periods between March and June 2020 divided by the date when a county reached the minimum 7-day average vehicle miles traveled (VMT). This allows us to objectively evaluate the magnitude of the sticky vehicle travel demand.

The empirical results suggest that both built environment and industry composition contribute to the inertia in vehicle travel. In particular, limited access to grocery stores, pharmacies, and Internet are significantly associated with less vehicle travel reduction during the lockdown. A diverse industry composition and a flexible working arrangement may also alleviate commuters' reliance on vehicle travel. In the long run, building a compact, job-housing balanced, multimodal urban environment would reduce car dependency. In addition, the "sticky" vehicle travel is more prominent among the disadvantaged sociodemographic groups, such as African Americans and the elderly population, especially those who live in the rural areas. Our findings reveal the needs to improve long range transportation and land use planning for the socially vulnerable communities.

#### **DOES TRAFFIC CONGESTION INCREASE AIR POLLUTION? EMPIRICAL EVIDENCE BEFORE/AFTER COVID-19 IN SEOUL, KOREA**

Abstract ID: 685

Individual Paper Submission

JIN, Jungkyu [Chung-Ang University] [jjk140424@gmail.com](mailto:jjk140424@gmail.com), presenting author

JIN, Jangik [Chung-Ang University] [arcane03@cau.ac.kr](mailto:arcane03@cau.ac.kr), co-author

Air quality is one of the important elements for human daily lives. However, developing countries have still struggled with the serious air pollution due to the expansion of hazardous industries. A number of studies have shown that there exist numerous factors (e.g., burning of fossil fuels from factories, car and truck, dust, human activities, wildfire, etc.) that have a negative influence on air quality. Among the various factors, emission from the vehicle is the major component related to the bad air quality of urban areas. Numerous previous studies have provided evidence that growing car usage increases air pollution (Bigazzi, et al., 2015; Coria, et al., 2015). However, relatively few empirical studies have been conducted to examine the relationship between traffic congestion and air pollution. Particularly, it is curious about how much we can reduce air pollution when we mitigate traffic congestion in a large city.

Hence, we attempt to explore how the traffic congestion affects air quality focusing on the city of Seoul, one of the largest cities that has been fighting severe traffic congestion. Since 2000, the average annual Particulate Matter (PM<sub>10</sub>, PM<sub>2.5</sub>) concentration in Seoul has decreased through various air quality improvement policies. However, since 2013 reduction rates of PM<sub>10</sub> have slowed, whereas occurrence of high daily PM<sub>10</sub> events has increased. The city of Seoul began to alert a warning for PM<sub>10</sub> on days when the concentration of PM<sub>10</sub> exceeds a standard level. In

addition, city governors encouraged commuters to use public transportation by providing free services in order to reduce vehicle usage. However, it is unclear how much particulate matter could decrease as traffic volume decreases. Although our belief is that reduction of traffic congestion may decrease air pollution and thus increase air quality, our understanding is still limited on how much we can improve air quality by reducing traffic congestion.

With this perspective, the objective of our study is to investigate the relationship between traffic congestion and PM<sub>10</sub> concentration with large data sets of air pollution and traffic speed by employing fixed-effects panel model that allows us to control for the time and spatial characteristics. As a form of the hourly dataset, we first collect traffic speed information consisting of total of 200 million observations, air pollution information consisting of 680,000 observations, and meteorological information consisting of 500,000 observations from the Korea Public Data Portal in 2018-2020. And then, we conduct data cleaning and processing based on 25 administrative districts that are our spatial units of Analysis. Particularly, it is expected that the amount of pollutants generated in Korea and neighboring countries (China and Mongolia) has decreased in 2020 (the period of COVID-19) than in 2018. Hence, we compare the effects of traffic congestion on air pollution in 2020 and those in 2018. After accounting for other factors, our results show that traffic congestion adversely affects air quality. That is, an increase in traffic congestion leads to an increase in PM<sub>10</sub> as well as PM<sub>2.5</sub>. By comparing with the effects in the periods of COVID-19 and pre-COVID-19, it is clear that traffic congestion is a significant factor associated with PM<sub>10</sub> and PM<sub>2.5</sub>. Our study suggests important implications for urban planners and transportation planners that reducing traffic congestion is important for improving not only transportation accessibility, but also air quality and human subjective well-being.

#### ECONOMIC IMPACT OF SMART CITY INVESTMENT: EVIDENCE FROM THE SMART COLUMBUS PROJECTS

Abstract ID: 696

Individual Paper Submission

CHEN, Zhenhua [The Ohio State University] chen.7172@osu.edu, presenting author

CHENG, Junmei [The Ohio State University] cheng.1359@buckeyemail.osu.edu, co-author

Smart city, as a new urban planning strategy, has received increasing attention in recent years worldwide. Many scholars also believe that the development of smart technologies through infrastructure investment may provide effective solutions to various challenges (Tan & Taeihagh, 2020). In December 2015, the U.S. Department of

Transportation (USDOT) launched the Smart City Challenge, which was an initiative focusing on smart city development to solve modern city challenges with an emphasis on transportation problems (USDOT, 2016). As the winner of this initiative, Columbus launched Smart Columbus (SC) Projects to facilitate smart city development with a focus on the following four main areas: connected transportation network, electric vehicle infrastructure, integrated data exchange, and enhanced human services.

While many studies have investigated the fundamentals of smart cities, such as concepts, characteristics, and dimensions (Tan & Taeihagh, 2020), there is a lack of in-depth understanding of the economic impact of smart cities, especially from the perspective of real-world practices.

This study addresses this issue by developing an assessment framework of the economic impact of smart city investment using a computable general equilibrium (CGE) model, which is an advanced approach to conduct economic analysis (Chen et al., 2021).

The objective of this research is to evaluate the economic impact of the SC project. The initial investment of the SC projects focuses on developing a pilot program and testbed for smart technology applications. While the infrastructure investment may generate a short-run economic impact through the increase of local public capital expenditure during the project development stage, it should be noted that a successfully deployed system is expected to have a long-run impact on the economy if the applications and adoption of smart technologies could lead to a large scale of behavioral change of urban mobility.

The study is implemented in three steps. First, SC projects were introduced in detail, especially how do these projects have been implemented practically. Second, an economic assessment framework of smart city investment was developed using the CGE model, which captures both short-term economic effects generated by capital and labor expenditures and long-term economic effects generated by productivity improvement and travel behavior changes. The economic performance was measured from three aspects: GDP, employment, and gross output/business revenue. Third, the economic effects of Smart Columbus projects were assessed using the established modeling framework.

The analysis shows that the short-run impact was generated through the investment in factor inputs of related sectors, such as transportation, information, and communication, during its implementation stage. It was found that the total capital investment implemented during the project development stage generated a GMP growth by \$173.39 million or by 0.098%, and a job increase by 2,366 or an increase by 0.195% as compared with the level in 2018. The long-term impact was primarily achieved through the changes in productivity of urban transportation sectors and the demand for mobility services. The successful deployment of the SC projects and utilization of the services is likely to generate a \$671.28 million or 0.538% increase in GMP, and 7,039 jobs or an employment increase of 0.3%. Overall, the multiplier of the SC investment was found to range between 1.77 and 2.58, with an average rate of 2.24, which suggests that each dollar investment in the SC project is associated with a 1.77 – 2.58 dollar increase in value-added GDP.

This research has important implications. First, it provides a useful assessment tool for the economic impact assessment of smart city investment. Second, it also improves the understanding of the economic benefits of a smart city strategy, which may provide implications for future investment decision-making both in Columbus and other cities.

## IDENTIFYING SPATIAL GAPS IN ALTERNATIVE TRANSPORTATION SERVICES FOR LOW-INCOME OLDER ADULTS BY AGE GROUP

Abstract ID: 705

Individual Paper Submission

NOH, Soowoong [University of Florida] [nswscott@ufl.edu](mailto:nswscott@ufl.edu), presenting author

BEJLERI, Ilir [University of Florida] [ilir@ufl.edu](mailto:ilir@ufl.edu), co-author

LEE, In Je [University of Florida] [injeelee@ufl.edu](mailto:injeelee@ufl.edu), co-author

### Background:

As older adults gradually lose the ability or become reluctant to drive, the provision of alternative transportation services for such populations, especially for those in low-income brackets, takes an important focus in transportation and aging studies. While previous studies have argued for the necessity of appropriate alternatives for such vulnerable population group, there has been little research in developing models to quantify the supply of these services and compare them to the travel needs of low-income older adults. This study aims to fill this gap but providing a methodology to quantify and visualize the gaps between transportation supply and older adult's transportation needs, particularly for low-income older adults.

### Study Design:

We implement a supply-demand approach to determine the spatial gaps between provision of alternative transportation services for low-income older adults and their needs. To quantify the supply, we construct a model that calculates an index at the census block group level which is the unit of analysis for this research. The supply model considers the accessibility to destinations for each transportation service based on user eligibility and special accommodation needs. We use a modified GIS-based gravity model by transportation service route type such as fixed or flexible route. To measure the travel demand for low-income older adults, we utilize a transportation needs index, which estimates the travel demand of low-income older adults using available socio-economic data. Finally, the gaps are determined by comparing the transportation supply to the demand. The model is applied to a study area in Orange County, Florida.

### Results:

Based on the resulting indices of supply and demand, the block groups are categorized into three groups - high, medium, and low - by applying a natural break classification to the supply and demand values. The results are visualized by combining a gap map to show the spatial pattern of service-deficient areas and a tabular matrix to compute the amount of affected older adult population. The gap areas identified for people 65 or higher, between 65 and 74, between 75 and 84, and 85 above (with the number of census block groups in parentheses) are 30,294 (22), 17,376 (20), 7,819 (16), and 2,659 (13), respectively. Overall, the spatial pattern generally shows that the gap areas are located outside of the city of Orlando and part of Apopka and Winter Garden by age groups. However, while the gap areas are located at the fringes of city boundaries for older adults age 85 or higher, the deficient areas of younger older adults (i.e., between 65 and 74, and between 75 and 84) are spread out toward unincorporated areas in Orange County.

### Conclusion/Contribution:

This study presents a geospatial method for identifying spatial gaps between transportation service provision for low-income older adults and their needs. While most older adults transportation accessibility studies look at the the

older adults as a monolithic group of 65 or older, our method applies a finer resolution unit by looking at this population in three age group categories 65 and 74, 75 and 84, and 85 above. The findings show differences in accessibility gaps by group which can help planners and decision makers to address the different needs accordingly when planning the various transportation options to reduce gaps in service and support the individual mobility needs of low-income older adult sub-groups.

## POWER OUTAGES AND RESIDENTIAL ENERGY USE PRIORITIZATION

Abstract ID: 713

Individual Paper Submission

LEE, Jee Young [The Ohio State University] [lee.8000@osu.edu](mailto:lee.8000@osu.edu), presenting author

AKAR, Gulsah [The Ohio State University] [akar.3@osu.edu](mailto:akar.3@osu.edu), co-author

Along with climate change, extreme weather events have led to an increase in power outages (Kenward and Raja, 2014). Recent winter storms in Texas caused severe power outages that impacted over 4.5 million homes and businesses. Between 2003 and 2012, most power outages in the United States (80%) were climate-related, the result of severe weather, ice storms, and hurricanes (Kenward and Raja, 2014). Annually, weather-related power outages cost the US economy anywhere from \$20 billion to \$55 billion (Campbell, 2012).

Vehicle-to-home technology is a new process that exchanges power between an electric vehicle (EV) and home. Since EVs have a sizeable capacity for energy storage, they can be a valuable energy source during power outages, supplying electricity for basic needs such as lighting, heating, and charging telecommunication devices. EVs are becoming more popular; according to BloombergNEF (2020), it is expected that by 2040, nearly 500 million EVs will be on the road, representing approximately 31% of the passenger cars in the world. In addition, due to the COVID-19 pandemic, more people are working from home via computers and the internet. This employment trend may be the dominant paradigm in the near future. If so, this will increase energy consumption in residential buildings, and uninterrupted supply will become even more important. Although vehicle-to-home concepts have been studied for electric load leveling and storage purposes, EVs' potential role during power outages and how best to utilize EVs' energy storage capabilities are newly emerging topics of interest.

The objective of this research was to identify how residential building occupants use energy-intensive appliances

during power outages and what they do to prepare back-up energy sources. We conducted an online survey through Qualtrics to analyze residential energy demand and blackout preparation. The study population was comprised of students, faculty, and staff at Ohio State University. From 2003 to 2012, Ohio was one of the top 10 states most suffering from frequent weather-related power outages (Kenward and Raja, 2014). Our survey consisted of questions regarding energy consumption priorities (e.g., heating, air conditioning, washers and dryers, refrigerators) during power outages in summer and winter, back-up sources for power and light, current electricity service and usage, and housing and household characteristics. The results highlight the different patterns of energy use priorities between summer and winter. As expected, the most frequently selected activity was “keeping the fridge running” in summer and “heating” in winter. The results also show that the usage patterns depended upon certain household characteristics.

The results of this study will contribute to expanding our understanding of what activities are considered top priority, and assist with addressing how much energy is needed to be more resilient during unexpected outages. This is in contrast to earlier studies, which focused on residential energy consumption behavior during normal times. This study will serve as a baseline for decisionmakers seeking to improve the energy infrastructure and make their cities more resilient, as well as provide guidelines for mitigating the damage and failures that result from sudden outages.

#### **WALKING BY DESIGN: INTEGRATING STREETSCAPES INTO A PEDESTRIAN ROUTE CHOICE MODEL**

Abstract ID: 717

Individual Paper Submission

HARVEY, Chester [University of California Berkeley] [chesterharvey@gmail.com](mailto:chesterharvey@gmail.com), presenting author

Urban design research finds that streetscapes influence whether urban environments feel comfortable and attractive for pedestrians. As such, we expect walkers to prefer routes along more pedestrian-friendly streetscapes with characteristics such as spatial enclosure, transparent facades, and human-scale architectural features (Ewing & Handy, 2009). Nonetheless, streetscapes are not commonly accounted for in pedestrian travel models and there is limited evidence of relationships between streetscape design and pedestrian decisions. This study, a component of my doctoral dissertation, examines the role of streetscapes in explaining revealed pedestrian route choices in San Francisco. It aims to substantiate (1) the direction and magnitude of relationships between streetscape characteristics and preferred walking routes and (2) the degree to which accounting for streetscapes improves route predictions, compared with more conventional factors such as route distance, number of turns, and sidewalk availability.

A primary obstacle to accounting for streetscapes in travel models is collecting spatially precise measures of them across large street networks. Research evaluating link-level pedestrian environments has traditionally used auditing procedures that are inefficient to scale, limiting analysis to a small number of trips within a focused geographic

context (Rodríguez et al., 2015). City-scale pedestrian models have tended to either externalize streetscape design or represent it coarsely with measures such as commercial land use adjacency (Lue & Miller, 2019) or business density (Clifton et al., 2016). These studies substantiate the importance of pedestrian environments either in general terms or specific contexts, but do not provide evidence of how individual design characteristics relate to walking across diverse contexts.

This study makes progress in addressing these limitations by using link-level streetscape design measures derived computationally across the entire city of San Francisco, and pairing them with detailed pedestrian route data from a large-sample smartphone travel survey. Streetscape measures indicating qualities identified by Ewing and Handy (2009)—enclosure, human scale, transparency, and complexity—are derived from citywide geospatial datasets representing building footprints and heights, parcel-level land uses and building characteristics, retail locations, and tree canopy. These measures are then attached to links along more than 50,000 actual pedestrian routes that were captured by the 2019 Bay Area Transportation Study

Route choice modeling traditionally compares entire routes and, therefore, requires constructing choice sets of unobserved alternatives. Developing appropriate choice sets for network routes is, in itself, a complex and resource-intensive undertaking, as different choice sets may produce substantially different parameter estimates. Partial overlap between alternative routes can also bias estimates due to lack of independence between alternatives. To ameliorate these issues, this study instead uses recursive logit (RL) models, which evaluate choices between alternative links at sequential nodes along observed routes. These models have been applied previously for predicting vehicular and bicycle routes (Zimmermann et al., 2017), but not yet for pedestrians. They may be particularly suitable for pedestrian modeling, however, because they better approximate progressive routing decisions based on options at each intersection rather than assuming that routes are preplanned. Estimating ML models can also require substantially less computational time than choice set-based models it more feasible to apply them with large samples of routes.

Preliminary results indicate that models with streetscape variables provide additional power in explaining pedestrian route choices compared with null models based only on distance, turns, and sidewalk availability, though the marginal effects of streetscape variables are small compared with distance. Nonetheless, robust evidence of how streetscapes contribute to real-world pedestrian preferences and decision making may help position pedestrian-oriented streetscape design as an integral component of walking infrastructure and a useful tool for promoting sustainable transportation.

## **POLARIZED PATHS: 'SELLING' CYCLING IN CITY AND SUBURB**

Abstract ID: 742

Individual Paper Submission

MCDougall, Emma [University of Waterloo] edmcDoug@uwaterloo.ca, presenting author

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, co-author

The integration of cycling infrastructure into mid-sized cities has been positively received by politicians and bike enthusiasts alike, who present cycling as an environmentally friendly way to engage in physical activity via an individual's daily commute or through recreational rides (Li & Joh, 2017). Cycling infrastructure has also been linked to an increase in property values, especially in core urban areas that offer a connected cycling network (Krizek, 2006). Despite extensive research illustrating the positive implications of cycling, new infrastructure is still met with considerable resistance. Concern about housing – that bike lanes will either lower property values or spur gentrification – is central to this 'bikelash' (Stehlin, 2015; Wild et al., 2018). Our research explores and analyses the ways that cycling infrastructure contributes to the production and consumption of housing and real estate in a growing mid-sized region that is implementing new cycling infrastructure, guided by two research questions. The first, to what extent does cycling infrastructure play a role in the buying, selling and developing of residential real estate? And the second, to what extent does this vary between core urban areas and automobile-oriented suburban neighbourhoods?

This paper seeks to contextualize current perceptions of cycling infrastructure at the neighbourhood level through a case study of three mid-size cities in Southern Ontario: Cambridge, Kitchener and Waterloo, or the Tri-Cities. All three cities are experiencing widespread development and densification in their downtown cores, which has in part been motivated by a new light rail transit line that became operational in 2019, and Kitchener's growing position as one of Canada's major technology hubs. This widespread growth means that the region which houses the Tri-Cities regularly ranks as Canada's fastest growing census tract. At the time of this research, Kitchener and Waterloo are testing separated bike lane pilot projects in their downtown cores, motivated by larger changes ongoing within the Tri-Cities to each city's Trails Master Plans (TMP).

Our research explores the spatial divides that exist within these cities, how individuals perceive these differences, and what this means generally for equitable planning for the integration of cycling infrastructure in neighbourhoods with different built forms. Harnessing a qualitative methodology, issues of spatial division, public perception and planning for cycling were collected through 22 semi-structured interviews with realtors and developers working in the Tri-Cities. We focus on realtors and developers for their privileged insight and experience (McCormack, et al., 2020).

Through an analysis of the perceptions, experiences and opinions of real estate agents and developers, this article provides new insights into how cycling is 'sold' and marketed in both the home-building and -buying process. Our research reveals key differences between core urban areas, where the built environment is more conducive to cycling, and automobile-oriented suburban neighbourhoods. These differences are furthered through demographic trends, affordability and the overall lifestyle associated with each form. We also argue for the active role that realtors and developers play in marketing cycling as location, age of clients and personal bias all play into selling cycling as transportation, culture or recreation.

Overall, our article contributes necessary qualitative research to a field largely dominated by quantitative approaches. Harnessing realtors and developers, we offer a privileged look into the home-buying experience necessary in understanding why resistance towards cycling still exists, and further how planners and overlapping professions should consider the urban/suburban when approaching integrating new cycling infrastructure in mid-sized cities.

## COMMUTE DISTANCE, LOW-WAGE WORKERS, AND RESIDENTIAL LOCATION IN HIGH-COST AND LOW-COST HOUSING MARKETS

Abstract ID: 746

Individual Paper Submission

WANDER, Madeline [UCLA Luskin School of Public Affairs] mwander@ucla.edu, presenting author

BLUMENBERG, Evelyn [UCLA Luskin School of Public Affairs] eblumenb@ucla.edu, co-author

America's suburbs now house more people living below poverty than do urban areas. While cities continue to have higher rates of poverty, in 2000, the suburbs bypassed cities in terms of both number and pace of growth (Kneebone 2019). Research shows that the search for affordable housing in increasingly expensive metropolitan regions contributes to the changing demographics—particularly the increase of low-income people of color—in suburbs over recent decades (Howell and Timberlake 2014; Kneebone 2019). Moreover, coastal areas, like those in Southern California, have geographic constraints that limit housing supply and so have higher housing prices compared to inland areas (Glaeser, Gyourko, and Saks 2006; Saiz 2010).

Commute distances have increased over time. The growing affordable housing crisis in high-cost metropolitan areas may force households to seek lower cost housing in the outer reaches of metropolitan areas, and help to explain the increase in commute distance. To test this, we explore the association between the availability of affordable housing near low-wage jobs, or jobs-housing fit (Benner and Karner 2016), and commute distance of low-wage workers in two diverse metropolitan areas in Southern California: Los Angeles-Orange (a high-cost, coastal, more urban MSA) and Riverside-San Bernardino (a lower cost, inland, more suburban MSA). We developed multivariate regression models drawing on data from the 2015 Longitudinal Employer-Household Dynamics (LEHD) Origin-Destination Employment Statistics (LODES) by residential location of workers supplemented with data from the 2017 5-year American Community Survey.

As expected, we find that commute distances are longer for workers living in inland counties with more suburban neighborhoods than those living in coastal counties with more urban neighborhoods. Specifically, median commute distance for workers living in Los Angeles-Orange is about 12 miles and for those in Riverside-San Bernardino is about 20 miles. We also find that neighborhoods in coastal counties have higher ratios of low-wage jobs to affordable housing, suggesting that low-wage jobs continue to concentrate in traditional job centers on the coast rather than in inland areas to which low-wage workers are moving. Also not surprisingly, the coastal region has higher median home values than those in inland counties.

Controlling for other determinants of commute distance, we find that the effect of the low-wage jobs-housing fit varies across the two metropolitan areas: A higher ratio of low-wage jobs to housing is associated with longer

commute distances for low-wage workers in Los Angeles-Orange, but has no effect in San Bernardino-Riverside. Moreover, higher median housing value is associated with shorter commute distances, supporting the notion of more affordable homeowner opportunities in suburban inland areas far away from the more urban coast.

Zoning and sentiments favoring single-family over multi-family development restrict housing supply, including affordable housing, in more urban and coastal metros like Los Angeles-Orange. The findings from this study underscore the importance of protecting and expanding the supply of affordable housing particularly in job-rich neighborhoods located in the more expensive urban coastal areas. The findings also contribute to the growing body of work considering the travel behavior implications of the suburbanization of low-wage workers and their families.

#### **TECH, EQUITY AND THE CITY: PROMISES AND PITFALLS IN REGULATING, DEPLOYING AND MANAGING TECHNOLOGICAL CHANGE TO PROMOTE EQUITABLE AND EFFICIENT OUTCOMES IN URBAN AREAS**

Abstract ID: 754

Individual Paper Submission

CHATMAN, Daniel [University of California, Berkeley] dgc@berkeley.edu, presenting author

What technological trends in transportation and land use are the most important and influential in US cities? How are city planners responding to rapid technological changes, and what future challenges will they need to respond to? To what extent do planners' responses to technological trends promise to improve the efficiency of cities, focusing particularly on outcomes for their least advantaged residents? In this paper I address this trilogy of research questions by reviewing historical documents, scholarly literature, institutional reports, municipal planning documents, and conference presentations, and by interviewing planners at municipal agencies and nonprofit groups in some of the major metropolitan areas in the US.

Taking an historical approach, the paper discusses bases for many of the disruptive technologies of today, such as the rise of smartphone and GPS technology and high rates of smartphone and data plan ownership across income classes. Relevant technological developments in transportation include app-based ridesharing, bus information systems, point-to-point car sharing, micromobility options such as scooter and bike share systems, and electric and alternative fuel vehicles. The paper also addresses construction and development innovations (e.g., building information management (BIM) systems, construction techniques like modular housing), space-sharing innovations (e.g., Airbnb, WeWork) and innovations in retail, warehousing and freight (e.g., e-commerce trends, rapid warehousing and delivery), though the conference presentation will focus primarily on transportation.

The second part of the paper begins by contextualizing these changes given demographic, economic, workforce, travel and housing trends in the US over the past 20 years, and relating these trends to the technologies discussed

in the first part of the paper. It then discusses the planning sector responses to date to these trends, including greater involvement in transit data provision to patrons, regulatory management of intracity freight delivery, public involvement in electrification infrastructure, and municipal charges on private transportation firms, as well as a discussion of existing planning regulations and standards that influence the adoption and use of technology.

The third and final part of the paper evaluates these responses with a focus on equity concerns. Planners, particularly at the municipal level, report efforts to regulate technology in order to positively influence broad social welfare related goals such as road congestion, alternative mode use, accessibility, urban form, and safety. They also report more parochial but highly relevant concerns with the municipal fisc, transit agency ridership and revenue, and parking revenue. In particular, in this section I address which demographic groups are benefiting from the management and regulation of contemporary technologies in transportation and land use, and how; and what could possibly be done to improve technology-related outcomes in the near future, including via the use of technology to facilitate greater levels of participatory planning.

## UNDERSTANDING THE LIMITATIONS OF SCHOOL TRAVEL SURVEYS

Abstract ID: 759

Individual Paper Submission

KITCHING, Darcy [University of Colorado Denver] [darcy.kitching@ucdenver.edu](mailto:darcy.kitching@ucdenver.edu), presenting author

Since Congress approved federal funding for the Safe Routes to School (SRTS) program in 2005, researchers have analyzed many aspects of the program, but few have turned a critical lens on the effectiveness of the main sources of data used to justify SRTS programming, policies, and infrastructure changes: the National Center for Safe Routes to School parent survey instrument and tallies of student-reported mode use collected by teachers. The national, standardized parent survey and teacher tallies have been analyzed for their internal reliability and validity (McDonald et al., 2011), but their utility for capturing the accessibility challenges of caregivers and students and for developing active transportation to school interventions that meet the needs of diverse families is unclear.

In Boulder County, Colorado, the two local school districts, Boulder Valley School District (BVSD) and Saint Vrain Valley School District (SVVSD), in collaboration with the county government, have developed SRTS programs supported periodically by federal money allocated to states for SRTS. That funding is contingent upon reporting of data collected through the standardized SRTS parent surveys and teacher tallies. Yet, the parent surveys have consistently elicited low response rates, and the measures used in the survey provide only a generalized snapshot of school travel mode choices and parental concerns about active travel options. Researchers have typically used data

from the National Household Travel Survey to analyze families' school travel mode choices, but this instrument, too, provides limited data for understanding what influences school travel decisions (Kontou et al., 2020).

As part of a larger research project on the transportation needs of families and their choices for school travel, I collaborated with BVSD and Boulder County transportation staff to analyze the content of the comments section in 300 SRTS parent surveys collected by both entities in fall 2019. For this qualitative analysis, I used a grounded theory approach to code the comments, asking the question, "How do parents feel about their children's opportunities to walk or bike to school, and why?" I noted specific comment themes and coded the comments based on the sentiment or emotional tone parents expressed about each theme: satisfied, neutral, or unsatisfied.

The results illustrate the complexity of families' opportunities and inclinations to engage in active travel to school. Parents commented on their concerns about the safety of their children and the behavior of drivers; the lack of adequate infrastructure to support students' walking and bicycling at specific locations around schools; and the impact of school choice, housing costs, and work schedules on the ability of their children to travel actively to school. The comments also indicate the impact of strong, district-based SRTS programs: parents in BVSD, which has three SRTS-focused employees in its transportation department working on implementing programs and infrastructure at schools, were more likely to express satisfaction with active transportation than parents in SVVSD, which does not currently have any employees on staff to directly support SRTS programming or infrastructure. While 20% of the comments by BVSD parents indicated satisfaction with active modes, only 14% of comments by SVVSD parents indicated the same.

The parent survey comment data illustrate the need for researchers and practitioners to go beyond standard SRTS methods and programs that educate and encourage students to travel actively, to explore new opportunities for making active travel convenient and safe for diverse families. That will require new forms of data collection that more accurately capture the complexity of families' lives. As stated by Westman and colleagues (2020, p. 55), "We constantly need to be asking ourselves if we are measuring the relevant factors, and if we are measuring them in a valid way."

#### **DRIVERS' ATTITUDES TOWARDS BIKESHARE USERS IN MEXICO CITY**

Abstract ID: 760

Individual Paper Submission

DUNCAN, Michael [Florida State University] mdduncan@fsu.edu, presenting author

VALDEZ TORRES, Yazmin [Florida State University] yjv11@my.fsu.edu, co-author

Central Theme

Recent research indicates that bikesharing systems have a better safety record than private cycling. This raises questions about why this would be the case. It has been hypothesized that this relates to the quality and size of bikes being used, the location of bikesharing stations, differing attitudes/riding styles of cyclists that use shared bikes, and/or the attitudes of drivers toward different types of cyclists. This study focuses on the last of these reasons. The specific research question we will test is whether drivers have a more positive attitude towards cyclists using bikes provided by a local bikesharing system.

## Methodology

An internet survey of drivers in Mexico City presented respondents with a set of images of cyclists that varied systematically by gender, attire, use of a helmet, and whether the bike being used has the typical color and markings of those provided by the local bikeshare (Ecobici). Respondents were asked to indicate how comfortable they would be driving next to the cyclist in the image using Likert scale ratings (1-4). A regression analysis will be conducted where the stated level of comfort with the cyclist in the image is the dependent variable and the independent variables will be the characteristics of the cyclist in the image (including whether they are using an Ecobici bike) and the individual characteristics of the survey respondent. We hypothesize that Ecobici bikes will increase drivers' level of comfort, all other things equal.

## Relevance

Cycling is a sustainable mode of travel (it is healthy, low cost, and generates no emissions) that is often poorly utilized. Urban planners are frequently concerned with increasing the rates of cycling. The danger of a vehicle collision (real or perceived) and/or acts of aggression from drivers can be significant barriers to increased cycling. Determining the underlying factors that make bikesharing safer than private cycling is an important line of inquiry that can help planners understand how they can make cycling safer and more attractive.

Access to desired destinations is facilitated by the pedestrian network. Whether using active transportation, public transit, or a car, segments of the first and last mile of a trip must be completed by walking or rolling on pedestrian facilities. The pedestrian network, which consists of sidewalks, trails, curb cuts, crosswalks, seating areas, public utility infrastructure, and vegetation, provide greater access for pedestrians if it is conveniently located, and well connected, and well maintained. However, active transportation infrastructure investments are not always

implemented in an equitable manner and project outcomes can lead to greater displacement and gentrification for disadvantaged residents (Lee et al., 2017).

In practice and research, there is a data gap regarding the quality of the pedestrian network because of the costs and effort associated with collecting detailed information. There is also a lack of guidance on how pedestrian facility improvements should be prioritized. Lee, Sener, and Jones (2017) indicate that while equity is commonly employed in motorized and land use planning, it is often missing from active transportation planning practice. In addition, transportation infrastructure investments have historically benefited largely white and higher-income communities while reproducing barriers for marginalized groups (Mahmoudi et al., 2019). Sidewalk quality, in particular, has been identified as a significant environmental barrier to using walking as a mode (Clarke et al., 2011; Ferrer et al., 2015).

Some cities in the United States have published pedestrian plans to demonstrate their dedication to improving the pedestrian network and their region's access to opportunities. Using an evaluation framework based on related literature, this study evaluates the pedestrian plans from four growing cities between published between 2016 and 2019: Seattle, Portland, Austin, and Los Angeles. The evaluation framework helps answer research questions regarding how sidewalks are being prioritized by cities, how the needs of historically marginalized communities are being addressed in pedestrian planning, and how the concept of accessibility is incorporated into pedestrian planning. Common approaches among the cities included a focus on pedestrian safety, the demand for walking to access opportunities, and equity for residents who rely on public transit for travel. Seattle was the only city to explicitly prioritize people with disabilities in their sidewalk improvement process. The results from this study highlight the current state of pedestrian planning and sidewalk prioritization in the U.S. context. This study outlines recommendations for how cities can be more inclusive when planning and investing in pedestrian network facilities.

#### TRANSPORTATION BARRIERS TO HEALTH CARE ACCESS DURING THE COVID-19 PANDEMIC AMONG NORTH CAROLINA RESIDENTS

Abstract ID: 764

Individual Paper Submission

COCHRAN, Abigail [University of North Carolina at Chapel Hill] [acochran@berkeley.edu](mailto:acochran@berkeley.edu), presenting author  
MCDONALD, Noreen [University of North Carolina at Chapel Hill] [noreen@unc.edu](mailto:noreen@unc.edu), co-author

Drawing on results of a large survey study, we investigate transportation barriers to accessing health care during the COVID-19 pandemic among North Carolina residents. Transportation barriers are known barriers to health care and result in delayed care, as well as missed appointments and missed or delayed medication use (Syed et al. 2013).

Examining data from the National Health Interview Survey, Wolfe et al. (2020) found that in 2017 5.8 million people in the United States delayed medical care because they did not have transportation. Groups that are already prone to greater social and economic disadvantage, including individuals who are poor and/or under or uninsured and who have chronic conditions, are more likely to encounter transportation barriers to care and to experience negative health consequences (Wolfe et al. 2020). Addressing transportation barriers resulting in missed or delayed care is important not only for mitigating adverse health outcomes among patients, but also for avoiding costs to the health care system stemming from increased use of emergency departments and hospitalizations (Kangovi et al. 2013; Nguyen and DeJesus 2010).

Synthesizing knowledge on transportation access to health care during the COVID-19 pandemic, Chen et al. (2021) found that some patients seeking care required additional support, particularly those who already experienced socioeconomic and transportation disadvantages such as low-income individuals, people of color, and people with disabilities. They were not always able to rely on others or on public transportation for rides like they had in the past, experienced additional challenges because of economic hardship due to COVID-19, and found it more difficult to fulfill their health care needs using telemedicine. The authors suggested that partnerships between health and transportation systems hold promise for addressing transportation barriers during and after the pandemic, but noted that these partnerships are largely limited to low-income patients enrolled in Medicaid. They reviewed some alternative strategies for addressing patients' transportation needs, including new models for providing non-emergency medical transportation through health care partnerships with ridehailing companies as well as innovations in health care coordination and policy, and concluded that such strategies might reduce transportation barriers and promote equity in health care access.

Analyzing survey results, we examine if and how North Carolina adult residents in the UNC Health system who had at least one medical appointment between April 2020 and April 2021 and are enrolled in Medicaid or Medicare encountered transportation barriers to health care during the COVID-19 pandemic. We explain how barriers affected respondents' care due to missed or delayed appointments, and describe their experiences traveling to in-person appointments during the pandemic as well as using telemedicine, an innovation that may alleviate transportation challenges for some. Using demographic and home location information collected for respondents, we analyze what factors were associated with reporting transportation barriers and related outcomes including missed or delayed care. We conclude by making recommendations regarding strategies to address transportation barriers that might meet the needs of low-income, high-frequency health care users who have higher health care-related transportation burdens and are more likely to encounter transportation barriers to care.

## DISPARITIES VERSUS INSUFFICIENCIES: EQUITY ANALYSIS OF ACCESSIBILITY PATTERNS

Abstract ID: 769

Individual Paper Submission

MARTENS, Karel [Technion – Israel Institute of Technology] kmartens@technion.ac.il, presenting author  
SINGER, Matan [Technion – Israel Institute of Technology] singer.matan@campus.technion.ac.il, co-author

Many studies on equity in transport have analyzed disparities in access to destinations between different population groups (1-3). In this paper, we challenge this disparity-focused approach to equity and propose an alternative: the analysis of accessibility insufficiencies (4). We argue that a disparity-focused analysis fails on two accounts. First, such analyses are based on aggregated group averages that inherently hide possibly large in-group variance. Second, these studies compare levels of accessibility between groups, without addressing whether these levels actually allow people to engage in daily activities. The proposed sufficiency approach, in contrast, avoids the former ecological fallacy and addresses the latter by setting an explicit benchmark for comparison.

In this paper we develop an Accessibility Insufficiency Index to evaluate transport insufficiency in 49 of the 50 largest metropolitan areas in the US. We examine accessibility insufficiency across dimensions of income and race/ethnicity and compare these outcomes to an analysis of disparities along similar dimensions.

The presented empirical analyses for 49 of the 50 largest US metropolitan areas confirm the problematic nature of disparity-focused analyses. In line with most literature, our analyses of disparities show that disadvantaged groups, defined along lines of income or income and race/ethnicity jointly, are virtually always better served by public transport than their more advantaged counterparts. Yet, a systematic sufficiency analysis reveals large inequities in accessibility, irrespective of the exact sufficiency threshold employed. Even for a modest sufficiency threshold of 10% of average car-based accessibility, a total of 19 million people is affected, representing 15% of the total population in the 49 metropolitan regions. A further assessment shows a clear ethnic/racial dimension in the observed insufficiencies, with the poor Black population carrying a substantially larger share of accessibility insufficiency than their share in the poor population.

Moving from a disparities to an insufficiencies analysis allows identifying disadvantaged groups that suffer from inadequate transit and the regions in which this occurs. Thus, we call for more systematic equity analyses, even if that implies inevitably normative, and thus difficult, decisions and the moving away from a seemingly neutral analysis of disparities.

## **PERSPECTIVE OF WHEELCHAIR USERS ON ACCESSIBILITY OF TRANSPORTATION SERVICE HAILED VIA UBER AND LYFT**

Abstract ID: 775

Individual Paper Submission

GEBRESSELASSIE, Mahtot [Virginia Tech] gmahtot@vt.edu, presenting author

Issues of wheelchair accessibility in service hailed through transportation-network companies have led to lawsuits against the companies and have been reported by the media and within grey literature. Uber and Lyft, the two most common ride-hailing platforms, have been criticized for several reasons: a lack of wheelchair-accessible vehicles; poor service for those using non-foldable wheelchairs; unreliable wheelchair-accessible service; long wait times; lack of assistance from drivers; and inadequate training of drivers (Calabro, 2018; Plautz, 2019; Ruvolo, 2020; and San Francisco Municipal Transportation Agency, Taxis and Accessible Services Division, 2019).

Little academic research has investigated the first-hand experience of wheelchair users in relation to service hailed through transportation-network companies. This presents a challenge to understanding transportation experiences of the disability community regarding new mobility options and to overcoming barriers, where they exist, in order to improve their access to opportunities. Thus, the study investigates wheelchair accessibility of transportation hailed through Uber and Lyft in the U.S. from the perspective of wheelchair users. Understanding the topic from their perspective is paramount. In the disability community, the motto nothing about us without us asserts the importance of engaging the disability community as an important stakeholder in work pertaining to the community. This in essence reflects the importance of engaging directly impacted stakeholders as experts of the problem issue in policymaking, planning processes, and building scientific knowledge.

The research question that drives this study is: What are the perceptions, experiences, and travel preferences of wheelchair users? A survey of wheelchair users was conducted to understand general trends and patterns. Participants who have experience with Uber or Lyft were asked questions pertaining to their experiences and preferences of using these services. Those without experience were asked questions that aim to understand their perceptions of transportation through these companies and their preferences in order to use the service. Data was gathered from 224 fully completed and 117 partial survey responses.

Findings show that more than 50 percent of respondents were satisfied with the service, but over 30 percent reported that they experienced service denial. Almost half of those without Uber or Lyft experience reported that they perceive Uber and Lyft as a viable means of transportation for them as wheelchair users. However, close to 40 percent felt discouraged from using the service based on what they heard about these two companies. To address accessibility issues experienced and perceived, both groups of participants indicated the following preferred changes: improved availability of wheelchair-accessible vehicles, training of drivers on the companies' platforms, and elimination of discriminatory practices.

The study contributes to accessible transportation for persons with disabilities in two ways. Firstly, it contributes to the development of new knowledge on wheelchair accessibility of new mobility options currently permeating the transportation landscape. Rosenbloom (2007) stated there is limited knowledge on travel behaviors of persons with disabilities in general; the study fills the gap. Secondly, it outlines recommendations for how the companies, regulators, and policy makers can address the problems of wheelchair accessibility in these services.

## RETHINKING TRANSIT AND HOUSING OPPORTUNITY IN AN ERA OF MAAS, MICROTRANSIT AND AUTOMATED TRAVEL

Abstract ID: 783

Individual Paper Submission

RIGGS, William [University of San Francisco] [william.riggs@usfca.edu](mailto:william.riggs@usfca.edu), presenting author

There has been much recent discussion about disruptive transport that opens up new ways for travel yet very little work has evaluated this trend through lens of housing development and environmental impacts. Although there have been studies that have established common ways to conduct “trip degeneration” and estimate the impacts of smart growth on ITE Trip Generation Rates (Schneider et al., 2015), no work has estimated the effect development projects under the new CEQA regime (SB 743) have on project-related trips or come up with a rubric that environmental professionals can use in the context of SB 748. The era of ridesharing and mobility on demand has opened up the possibility of making mobility more efficient (Cervero, 2017). The emergence of these tools corresponds to generational and demographic trends that have reinforced their growth (Circella et al., 2016; Shaheen, 2018).

At the same time, private sector companies have developed a successful operational on-demand platform to serve as a last mile solution (Via, 2019). In locations like Berlin, discussions with BVG indicate that the service has been a success in dense corridors where it has been piloted. This corresponds to research that indicates that ridesharing tools fill gaps in the transportation network unserved by the taxi industry (Hall et al., 2018; Rayle et al., 2016; Shaheen & Chan, 2016). These new service concepts are being experimented with at scale in places like the Netherlands where planners and engineers are working on “Mobiliteitsknooppunten” or integrated mobility hubs that connect housing with planning for on-demand / MaaS-based transport (Mobiliteitsalliantie, 2019). These offer dramatic potential in the US as we seek to build the future of the accessible and sustainable city.

This study evaluates the VMT for transit in the context of future transit and housing opportunities using the case of the City of San Jose, California. The city implemented compact development and VMT-based project approvals in 2018. Using development information from the city and transportation data collected through intercept surveys and traffic cameras VMT for car-light and car-free verses traditional development. Despite higher density and less parking VMT increases—a trend that is significantly correlated with increased volumes of ridesharing vehicles. While we find that this increase in total mobility may not represent a net negative particularly in the lens of minority populations who had been less served by traditional transit routes, these emerging technologies could confound these policy efforts aimed at emissions reductions. They lead to new ways of thinking about transportation demand management, transport and housing concepts can help promote access and while also increasing the number of sustainable and affordable housing sites.

## DO NEW CYCLING FACILITIES IMPROVE NEIGHBOURHOOD LIVABILITY?

Abstract ID: 787

Individual Paper Submission

MITRA, Ratkim [Ryerson University] [raktim.mitra@ryerson.ca](mailto:raktim.mitra@ryerson.ca), presenting author

GUTMANIS, Micha [Ryerson University] [mgutmanis@ryerson.ca](mailto:mgutmanis@ryerson.ca), co-author

HESS, Paul [University of Toronto] [hess@geog.utoronto.ca](mailto:hess@geog.utoronto.ca), co-author

Livable communities are a key focus for urban planners around the world, and transportation is arguably one of the most important factors that contribute to neighbourhood livability. While the term 'livability' is subjective, current literature has placed an emphasis on connecting people to the places in which they work, live, learn, and recreate (Miller et al., 2013; Wang et al., 2015), and defines livable neighbourhoods as communities where people have access to opportunities they can use in the pursuit of improvements to their quality of life (Appleyard et al., 2017). While there have been attempts to examine how walking and public transit may improve the livability of neighbourhoods and transit corridors (Appleyard et al., 2017; Higgs et al., 2019), very few studies have focused on the role of bicycle infrastructure. This research begins to close this gap by exploring the association between cycling facilities, specifically painted bicycle lanes and on-street cycle tracks, and perceived neighbourhood livability.

An online survey was conducted in 17 urban and suburban neighbourhoods within the Greater Toronto and Hamilton Area (GTHA), Canada: 11 with a recently-built on-street cycling facility (i.e., case study sites) and six without (i.e., case-control sites). A total of 1,640 adults participated in the survey, including cyclists and non-cyclists. Subjective perceptions of livability were captured by nine statements and recorded on a Likert-type scale. A principal component analysis (PCA) was conducted to reduce their dimensionality and create three meaningful factors representing perceptions of various aspects of neighbourhood livability, namely— Street Safety and Comfort, Active Street Life, and Accessibility. Next, multivariate linear regression models were estimated where each model explored one factor as the dependent variable.

Results suggest that the presence of a cycling facility was not associated with the perception of street safety and comfort, after controlling for respondent's socio-demographic characteristics and travel-related preferences and attitudes. However, on-street cycle tracks in an urban neighbourhood (compared to a suburban neighbourhood) correlated with a higher perception of active street life, and a heightened perception of accessibility. The presence of a painted bicycle lane also explained a higher perception of accessibility, regardless of its location. Collectively, these findings indicate an association between newly-built cycling facilities and improved perception of neighbourhood livability, and support the policy emphasis on active transportation, particularly bicycle

infrastructure, in creating better communities.

The growing popularity of e-scooters and their rapid expansion across urban streets has attracted widespread attention (McKenzie, 2019; NACTO, 2020; Gossling, 2020; Bai and Jiao, 2020). To shed light on the impacts of e-scooters on urban mobility, We address two major policy questions in this study. First, do e-scooters substitute existing public mobility options including transit and station-based bikesharing or fill the service gaps left by them (Barajas and Brown, 2021)? Second, do e-scooters promote transport equity in terms of ensuring equitable access and usage in low-income communities?

We examine the first question by analyzing the spatiotemporal patterns of e-scooter service availability and use in Washington DC, focusing on their spatial relationships with public transit and bikesharing. An analysis of three open big datasets (i.e., General Transit Feed Specification, General Bikeshare Feed Specification, and real-time Capital Bikeshare system data) shows that e-scooters have both competing and complementary effects on transit and bikesharing services. The supply of e-scooters significantly overlaps with the service areas of transit and bikesharing, and we classify most e-scooter trips as substitutes for transit and bikesharing uses. A travel-time-based analysis further reveals that when choosing e-scooters over transit, travelers pay a price premium and save some travel time. The price premium is greater during the COVID-19 pandemic, but the associated travel-time savings are smaller. This implies that public health considerations rather than time-cost tradeoffs are the main driver for many to choose e-scooters over transit during COVID. On the other hand, e-scooters also complement existing mobility options. E-scooters expand transportation access to neighborhoods underserved or unserved by transit or bikesharing services. In addition, we estimate that between 8% to 12% of e-scooter trips are taken to connect with the rail services.

To answer the second question, we assess spatial equity of e-scooters services in DC by examining e-scooter availability and usage in D.C.'s Equity Emphasis Areas versus the rest of the city. We will measure spatial accessibility to dockless vehicles with a kernel density approach, and we will measure micromobility use with trips per capita

(jobs plus residents). We will perform the analysis on data collected from 2019 to the present, which allows us to examine equity outcomes over time. Moreover, given that the City of Washington DC has included different equity-related provisions in the dockless micromobility regulations, a longitudinal analysis can show which types of equity requirements can achieve the best policy outcome. Our preliminary analysis suggests that the “equity zone requirement” (i.e., e-scooter operators are required to place 25% of its fleet in Equity Emphasis Areas) indeed promotes greater e-scooter availability in disadvantaged communities; however, the rate of e-scooter use is significantly lower in disadvantaged communities compared to other parts of the city. These results suggest the need for policymaking to go beyond the issue of spatial access and to focus on overcoming other barriers such as lack of information and technology illiteracy.

Our study has important implications for cities that are developing policies and regulations to manage shared e-scooters and other forms of micromobility. Future research may combine the big-data-based analysis presented here with traditional survey methods to further shed light on the interactions between e-scooter services, bikesharing, and public transit. Future research may further assess equity of e-scooter services by focusing on how low-income people perceive e-scooters and the barriers for them to adopt e-scooter services.

BRAUN, Lindsay Maurer [University of Illinois at Urbana-Champaign] lmbraun@illinois.edu, co-author  
CHAKRABORTY, Arnab [University of Illinois at Urbana-Champaign] arnab@illinois.edu, co-author

Connected and autonomous vehicles (CAVs) are expected to dramatically change the future of cities. This includes mobility landscapes, distribution of jobs, safety, urban form, and land use. However, many of these transformations are associated with uncertainties specifically related to development trajectories and community impacts (Freemark, Hudson, and Zhao 2019). As a result, the polarization and entanglement of uncertainties is making it difficult for planners to fully consider CAVs in their long-term plans (Guerra 2016), as is the lack of guidance from the state and federal transportation agencies (Chatman and Moran 2019).

CAV adoption rates and the nature of proliferation will play an influential role in the rollout of CAVs and their impacts on cities. For example, due to a likely decrease in the costs of time spent in traveling, people may be willing to live farther from downtowns and sprawling development may be exacerbated. Likewise, as human-caused crashes are reduced and efficient driving decisions are made, use of CAVs might increase which will impact vehicle

miles traveled (VMT) and congestion. For instance, it is expected that at a CAV penetration of 90%, congestion rates will decrease by 60% and VMT will decrease by 10% (Fagnant and Kockelman 2015).

Impact of CAVs on VMT, congestion rates, equity, accessibility, and urban form is highly dependent on consumer preferences towards overall adoption, type of ownership (private vs. shared CAV), type of ridership (single occupancy vs. shared), and affordability. Those preferences are influenced by individual characteristics such as demographics, familiarity with CAVs, commuting habits, and location of residency (Nodjomian and Kockelman 2019). For example, people living in the suburbs are more likely to use private CAVs. Shared CAVs on the other hand, are expected to be used by commuters, people with lower income or inability to drive, and those who rely heavily on public transportation (Nodjomian and Kockelman 2019).

In this study, we conduct a household survey in Peoria, a mid-sized region in Illinois. The surveys are mailed to 5800 households drawn from a random, address-based sample, with an option to complete the survey online. The survey is designed to gauge participants' familiarity with CAVs and their preferences with respect to a set of future uncertainties, including CAV ownership models (personal vs. fleet), CAV use (single occupancy vs. shared ride), residential location (dispersed vs. compact), and other relevant behaviors. As a complement to this information, we also assess residents' attitudes toward the CAV impacts (e.g., safety, congestion, emissions, job shifts) and relevant sociodemographic characteristics that might affect the rollout of CAVs.

We summarize the survey results and discuss participants' degrees of acceptance and willingness to use CAVs in the future. We expect our results to provide a better understanding of the extent to which residents are aware of CAVs and their willingness to use this technology. We also expect to shed light on the relationship between demographics, travel behavior preferences, and residential location preferences in a CAV-dominant environment. The key benefit of this work is to assist planners, practitioners, and decision makers in mid-size regions and beyond to proactively plan for CAVs in their respective cities.

#### **ENSURING EQUITABLE TRANSPORTATION: AN EXAMINATION OF ADA PARATRANSIT USAGE CHANGE DURING THE COVID-19 PANDEMIC**

Abstract ID: 804

Individual Paper Submission

WANG, Yiyuan [University of Washington] yiyuanw@uw.edu, presenting author  
SHEN, Qing [University of Washington] qs@uw.edu, primary author  
ASHOUR, Lamis [University of Washington] lamis21@uw.edu, co-author  
DANNENBERG, Andrew [University of Washington] adannen@uw.edu, co-author

The passage of the Americans with Disabilities Act (ADA) by the US Congress in 1990 required the transit agencies to provide a transportation service comparable to fixed-route transit for people with disabilities. Such a service, commonly known as ADA paratransit, is an origin to destination service that usually takes the form of calling a ride on ADA-compliant vehicles at least one day in advance (Thatcher and Gaffney 1991). For people with disabilities, ADA paratransit serves as a critical means to perform necessary activities, access socioeconomic opportunities, and maintain social connections (Bascom and Christensen 2017). For society as a whole, ADA paratransit is an essential component for ensuring a fair and just transportation system (Martens, Golub, and Robinson 2012; Manaugh, Badami, and El-Geneidy 2015).

The COVID-19 pandemic poses an unprecedented challenge to both ADA paratransit riders and transit agencies who operate the service (Cochran 2020). The negative impacts are likely to be more severe on the socioeconomically disadvantaged riders as they tend to lack transportation alternatives. Thus, it is imperative to understand the differential impacts of the pandemic on ADA paratransit riders with varying transportation needs, sociodemographic characteristics, levels of disabilities, and neighborhood built environments, so that public transit agencies can strategically prepare for the recovery and future disruptions.

By examining the complete records of service trips and riders between Jan 2019 and July 2020 obtained from the Access Transportation program, the ADA paratransit service in the Seattle region, this study aims to answer the following two questions:

1. How have the ridership and trip purposes of ADA paratransit service changed after the outbreak of the COVID-19 pandemic?
2. At the individual level of ADA paratransit riders, what factors explain their changing levels of service usage in response to the pandemic?

The study employs descriptive statistics for the first question and statistical modeling, including a Hurdle model, for the second. The descriptive statistics show that paratransit ridership has dramatically decreased to only one third of the pre-pandemic level. The most substantial reductions were working and non-essential personal trips, and a majority of the remaining trips have been for medical purposes, suggesting that many of these trips were medical appointments that could not be delayed. The Hurdle model examines associations between various factors and service usage during the pandemic, and it explicitly accounts for the fact that many riders stopped using the service after the outbreak of the pandemic. The model results show that riders' service usage during the pandemic is associated with their sociodemographic characteristics (i.e., age and gender), disability conditions, and pre-pandemic travel demand (i.e., number of trips and types of travel needs), and neighborhood characteristics. Most importantly, when controlling for other factors, riders who live in neighborhoods with lower income and lower access to vehicles are more dependent on the service, which indicates that paratransit services function as a 'safety-net' for those who lack alternative options to travel.

Based on the findings, we recommend that during the pandemic and the subsequent economic recovery, transit agencies prioritize ADA paratransit services for neighborhoods with disadvantaged population groups to ensure an adequate level of accessibility, while strictly implementing safety guidelines to protect the most vulnerable riders. We also recommend that public transit agencies and paratransit operators include ADA paratransit as an important component when they develop plans to prepare for future disruptive events.

## IS WALKABILITY HEALTHY AND ACCESSIBLE FOR ALL? VARIATIONS IN THE ENVIRONMENTAL CORRELATES OF WALKABILITY ACROSS SOCIODEMOGRAPHIC GROUPS IN THE U.S.

Abstract ID: 805

Individual Paper Submission

BRAUN, Lindsay [University of Illinois at Urbana-Champaign] [lmbraun@illinois.edu](mailto:lmbraun@illinois.edu), presenting author

FOX, Eric [Urban Design 4 Health, Inc.] [efox@ud4h.com](mailto:efox@ud4h.com), co-author

FRANK, Lawrence [Urban Design 4 Health, Inc.] [ldfrank@ud4h.com](mailto:ldfrank@ud4h.com), co-author

### Central Planning Issue

Past research suggests that there is a "disadvantaged advantage" in walkability in the U.S.<sup>1</sup>—that is, places with higher proportions of people of color and low-income residents tend to be objectively more "walkable" on indicators such as density and street connectivity. This could pose an opportunity to promote health equity, since populations that are disproportionately burdened by chronic disease<sup>2</sup> may live in environments that are conducive to physical activity from travel.

This potential, however, depends on the extent to which walkable environments in fact support pedestrian activity and health in marginalized communities. Measures such as density and connectivity may not capture the true experience of walking in marginalized communities, which tend to rate less favorably on measures of infrastructure quality and traffic safety.<sup>3,4</sup> Thus, walkability might "look" different across sociodemographic groups in ways that could affect the health benefits of walking.

### Research Questions

We examined differences in the characteristics of walkability across places of varying sociodemographic composition, asking two questions:

1. How is walkability associated with sociodemographic characteristics?
2. Does walkability "look" different with respect to environmental health exposures and accessibility (access to destinations) across places with varying sociodemographic composition?

### Methods

We used data from the National Environmental Database, which provides a standardized set of built, natural, and social environmental measures for block groups across the U.S. The present analysis is based on data from the ten largest regions, and analyses are underway for the entire country.

Our variables fell into four categories. First, we measured walkability using a composite index based on five component measures: residential density, transit access, vehicle miles traveled, intersection density, and employment mix. Second, we measured sociodemographic (dis)advantage using indicators of race/ethnicity, income, education, and vehicle ownership. Third, we measured environmental health exposures in terms of particulate matter 2.5 $\mu$ m (PM<sub>2.5</sub>) concentrations, pedestrian fatality rates, noise levels, and tree coverage. Finally, we measured accessibility in terms of pedestrian-oriented intersection density, employment entropy, and job density.

For the first question, we used multilevel mixed-effects regression models to predict the walkability index as a function of each sociodemographic variable, clustering block groups and standard errors by region. For the second question, we used the same method to predict each environmental health exposure and each accessibility measure as a function of the cross-tabulation between walkability and sociodemographic characteristics in a four-by-four matrix: low walkability/disadvantaged, low walkability/advantaged, high walkability/disadvantaged, high walkability/advantaged (“high” and “low” defined by top and bottom three deciles, respectively, for each variable).

#### Findings

Block groups with higher values of the walkability index tended to be more disadvantaged across all sociodemographic characteristics, aligning with the suggested “disadvantaged advantage” in walkability. However, measures of environmental health and accessibility varied significantly for highly-walkable block groups with different sociodemographic profiles. Compared to “advantaged” walkable block groups, “disadvantaged” walkable block groups tended to have higher PM<sub>2.5</sub> concentrations, higher pedestrian fatality rates, and lower tree coverage. While lower walkability was generally associated with more favorable environmental conditions (lower pollution and noise, higher tree coverage), these benefits were primarily limited to advantaged block groups. Compared to “advantaged” walkable block groups, “disadvantaged” walkable block groups had lower pedestrian-oriented intersection densities, employment entropy, and job densities.

#### Planning Implications

While marginalized populations tend to live in places with higher walkability index values, the characteristics of “high” walkability for these populations tend to also reflect greater environmental health risks (pollution exposure, pedestrian fatalities, limited tree coverage) and lower accessibility than the “high” walkability to which advantaged groups are exposed. These findings illustrate the importance of considering walkability within its sociodemographic context<sup>5</sup> and resolving environmental burdens that could dampen the potential benefits of walkability in marginalized communities.

## **APPLYING AN EQUITY-BASED EVALUATION FRAMEWORK TO ASSESS FTA FUNDED MOD PROJECTS**

Abstract ID: 806

Individual Paper Submission

SMITH-COLIN, Janille [Southern Methodist University] jsmithcolin@smu.edu, presenting author  
BARCHERS, Camille [University of Massachusetts - Amherst] cbarchers@umass.edu, co-author

Emerging research has demonstrated a need to invest in transportation infrastructure and technology to support equitable access to mobility services (Akar & Miller, 2021). While the equity dimensions of physical transportation networks are fairly well understood (e.g., transportation network accessibility) less is understood about the equity outcomes for and implications of new mobility technologies and related digital platforms. Mobility on Demand (MOD) platforms, or integrated and connected multi-modal networks of transportation options, offer digital support for continued and increased transit ridership, shifts from single occupancy vehicle travel to shared mobility, and integrated payment systems (Fedorowicz et al., n.d.). We therefore examined eleven projects funded by the 2016 MOD Sandbox Program of the Federal Transit Administration (FTA) to identify the extent to which equity was included in project goals and performance measures, and desired outcomes.

FTA MOD projects range from integrated carpool and commuting programs, last-mile/first-mile solutions, mobility platforms and open trip planners, integrated fare payment systems, paratransit and adaptive mobility services, and innovative partnerships for transportation delivery. Project goals include integrating transit with other multimodal services through enabling technologies and innovative partnerships; providing equitable, accessible traveler-centric service; and enhancing regional transportation networks by providing efficient, reliable service for all travelers (Mobility on Demand (MOD) Sandbox Program | FTA, n.d.).

A key objective of the MOD Program is to measure the impact of projects on travelers and transportation systems. To better understand how the MOD Sandbox Program contributes to equitable, accessible, traveler-centric service, we evaluated each of the 11 projects using an adapted equity-based scorecard or rating system ((Schrock et al., 2015) Schrock, Bassett, and Green, 2015) evaluating three types of equity - procedural, geographic and social. Project information was used to answer the following questions: How do practitioners measure equity benefits? What disadvantaged groups are practitioners targeting with technology interventions? How do practitioners identify that benefits should be distributed across disadvantaged groups?

This research was conducted in two phases (1) planning and development document review and (2) implementation and evaluation document review. The first phase included a review of project description and planning documents for each of the the 11 MOD Sandbox projects. In the second phase, we examined the evaluation research reports for the 11 MOD Sandbox projects. Information about performance measures, data collected, and the overall evaluation plan and processes were collected. Where necessary, supplemental documentation about each project was consulted including city websites and other relevant transportation or local government resources that detailed progress towards project implementation. The findings suggest that a clearer distinction between procedural, social and geographic equity will help guide FTA and local partners to better integrate these dimensions into future MOD projects. This research provides actionable ways to integrate equity in the design and evaluation of MOD projects, bringing them into alignment with contemporary conversations about equitable access to mobility services.

## LOOKING BEYOND THE FRINGE: EXAMINING THE MARGINAL EFFECTS OF BOGOTA'S URBAN GONDOLA ON JOB ACCESSIBILITY

Abstract ID: 811

Individual Paper Submission

SANTANA PALACIOS, Manuel [University of California Berkeley] [manuel.santana@berkeley.edu](mailto:manuel.santana@berkeley.edu), presenting author

Rapid urbanization and rising land costs often relegate low-income households in global South cities to difficult-to-access peripheral zones far away from urban centers. These peripheries are often characterized by an inadequate provision of public transport services and multiple topographical challenges, resulting in onerous commutes and significant inequalities in access to opportunities. Recognizing the needs of historically marginalized populations and the limitations on other alternatives, several cities, predominantly in Latin America, have invested in electrified cable-propelled transit -- or urban gondolas, which are more environmentally sustainable. During the past two decades, more than two dozen urban gondolas have opened to serve economically disadvantaged communities in places like La Paz, Bolivia; Medellín, Colombia; Caracas, Venezuela; Mexico City, Mexico; Lagos, Nigeria; and Constantine, Algeria. Most recently, Colombia's capital, Bogotá, opened its first cable-propelled line, locally known as TransMiCable, in December 2018.

The rise in investments in urban gondolas coincides with a growing body of scholarship critically examining how expanding public transport infrastructure reshape socio-spatial inequalities in urban areas worldwide, particularly accessibility, broadly understood as the ease of reaching urban opportunities. Despite the increasing interest in assessing the distribution of accessibility enabled by public transport investments, surprisingly little work examines how investments in cable-propelled transit infrastructure reduce employment accessibility gaps in cities in the global South. Furthermore, scholarship studying access to opportunities is rarely in direct conversation with the philosophical principles that often drive transport policy discussions and pays little attention to network or spatial spillover effects from transport investments, with a few exceptions including Fan et al. (2012) but in different contexts.

The rising popularity of urban gondolas has been challenged by some transport engineers and planners who claim they are too expensive and only benefit a small fraction of residents near stations. Criticisms like these are consistent with principles of utilitarianism, which, according to Fainstein (2010), incorporate an ideal of equity, calculated in terms of the utilitarian formulates of the greatest good of the greatest number people. These views are also supported by a growing body of literature assessing the effects of public transport investments that focus on station areas (e.g. Bocarejo et al., 2014). Despite utilitarianism's influence on decades of transport planning, a growing number of scholars advocate for a different moral principle that helps address pervasive inequalities in urban areas, notably political philosopher John Rawls, who contend a just society ought to generate the greatest benefit to the least-advantaged members of society (e.g. Golub & Martens, 2014; Pereira et al., 2019).

This paper takes a Rawlsian distributive justice approach. It uses Bogota's TransMiCable as a case of study to answer three fundamental questions: [1] Is TransMiCable placed where the least advantaged groups locate, in terms of

socioeconomic status and level of access to jobs? [2] How many people across all socioeconomic groups benefit from increases in job accessibility enabled by TransMiCable? [3] What is the role of TransMiCable in reducing employment accessibility gaps in the city? I employed a quasi-counterfactual research design paired with open-access GTFS and jobs data, and multiple descriptive comparative analyses. I demonstrate that, while investing in TransMiCable enabled notable increases in employment accessibility for economically disadvantaged residents near the project's three stations, as expected, positive gains go well-beyond station areas, spilling over multiple low- and middle- socioeconomic status neighborhoods in other parts of the city. With this latter finding, I challenge utilitarian arguments against investment in small projects located in the urban fringe and invite a more nuanced interpretation of Rawls' distributive justice principle. I close by quantifying the extent to which TransMiCable helped close job accessibility gaps in Bogotá.

#### **ASSESSING THE IMPACT OF SHARED MICROMOBILITY ON VEHICLE MILES TRAVELED (VMT): FOCUSED ON DOCKLESS BIKE AND SCOOTER SHARING PROGRAMS**

Abstract ID: 812

Individual Paper Submission

CHOI, Kwangyul [University of Oklahoma] [kchoi@ou.edu](mailto:kchoi@ou.edu), presenting author

PARK, Han [Rice University] [john.park@rice.edu](mailto:john.park@rice.edu), co-author

In the United States, shared micromobility ridership has dramatically risen in the past years. The number of trips on bike share (both station-based and dockless) and scooter share marked 35 million in 2017. Since then, this number increased by a factor of four (136 million trips) in only two years (National Association of City Transportation Officials, 2020). As these new mobility options have been widely used, their impact on our environment, society, and economy has become significant, particularly in urban areas (Roukouni & Homem de Almeida Correia, 2020).

In terms of its travel impacts, it has been expected to reduce regional vehicle travel. For instance, shared micromobility could increase public transit ridership by dealing with the first/last mile connection issue if it complements the local or regional transit system (Ma et al., 2015; Zhang & Zhang, 2018). However, findings are rather mixed. Another study shows shared micromobility as substitute might compete with the public transit service in the area (Campbell & Brakewood, 2017), which does not lead to reduction in regional vehicle travel. Despite these uncertainties, the impact of shared micromobility on vehicle travel, in particular, vehicle miles traveled (VMT), has been understudied.

To fill this gap in the existing literature, this study assesses the impact of two specific shared micromobility options on regional VMT. To this end, this study identifies 127 U.S. cities where dockless bike or scooter sharing program has been in operation. The sharing services considered in this study include six most popular services—Bird, Lime, Lyft, Skip, Spin, and Jump. With an urbanized area (UA) as the unit of analysis, this study examines the changes in VMT per capita before and after the arrival of shared micromobility while controlling the built environment and other demographic and socio-economic characteristics of the areas.

By assessing the impact of shared micromobility on regional VMT, this study suggests policy implications for future regional transportation planning.

KERMANSACHI, Sharareh [University of Texas at Arlington] sharareh.kermanshachi@uta.edu, co-author  
ROSENBERGER, Jay Michael [University of Texas at Arlington] jrosenbe@uta.edu, co-author

Elderly and people with disabilities, as a part of the transportation-dependent population, have specific mobility needs. The share of the transportation-dependent population has steadily increased in recent years (Vespa et al., 2018). Accordingly, a rich body of the literature has studied the travel behavior and associated socio-demographic characteristics of the group. Most of the existing research has been performed in large cities with mass transit services (Deka, 2014; Zegras et al., 2012). Few studies have addressed this issue in smaller cities lacking mass transit systems where transportation-dependent people may rely only on dedicated transit services or other means. This research fills the gap by studying the spatial patterns of travel and related socio-demographic characteristics of the transportation-dependent group in the City of Arlington, TX. The city of Arlington is the largest city in the US without a mass transit service. However, it offers two city-wide on-demand ridesharing and paratransit services. Recently, the city started a pilot project to integrate autonomous vehicles with its existing on-demand ridesharing service.

Most of the existing research has been conducted based on collected data from large geographic scales such as census tracts or higher (Yang et al., 2018). This study investigates the spatial patterns of trips at a block group level

while controlling for socio-demographic variables.

We analyze trip level data from Handitran- a paratransit service- dedicated to providing service for people with disabilities and older adults in the city. The data set we obtained contains a total number of 373,172 trips requested by users through Handitran during the year 2019. We employ the Geographically Weighted Regression (GWR) technique to analyze the spatial patterns of determinant socio-demographic factors. GWR, contrary to simple regression techniques, provides in-depth information about spatial patterns at a localized scale and helps discover patterns at a disaggregated scale (Nkeki & Asikhia, 2019).

Our results indicate that the usage of Handitran service is not uniformly distributed, but it varies spatially across the city. The study findings also show that the effects of socio-demographic characteristics such as race, income, age, educational attainment level and vehicle ownership on paratransit ridership vary in different parts of the city. Our results help stakeholders and policymakers to have a deep understanding of demand of services in a local context and allow them to allocate resources more efficiently. Our analysis could be used as a low-cost decision support tool for decision-makers in optimizing the existing services or expanding services in the near future.

#### **HAS THE TRAVEL DISTANCE/TIME PATTERN FOR LONG-DISTANCE TRAVEL CHANGED ACROSS GENERATIONS? THE COMPARISON BETWEEN GENERATIONS IN THE UNITED STATES**

Abstract ID: 816

Individual Paper Submission

LI, Yang [The University of Texas at Austin] [yangli19@utexas.edu](mailto:yangli19@utexas.edu), presenting author

ZHANG, Ming [The University of Texas at Austin] [zhangm@austin.utexas.edu](mailto:zhangm@austin.utexas.edu), primary author

There have been widespread concerns about transportation-related Green House Gas (GHG) emissions. Many studies have examined the GHG contributions of daily travel. The role of long-distance travel to GHG emissions has been acknowledged but inadequately investigated, mainly due to the lack of long-distance travel-focused surveys and related data. The concern over GHG emissions from the transportation sector and the inadequate research on long-distance travel motivate this study. Specifically, the study compares the travel distance/time pattern for long-distance travel (50+ miles one-way) between Millennials, Generation X, and Baby Boomers. In the United States, Millennials are the largest generation in the current population (The Council of Economic Advisers, 2014). They have

attracted much attention and have been seen as the keys to the future travel industry. However, existing studies have shown diverse and conflicting findings in terms of Millennials' travel distance/time patterns. Being born to be the first generation to grow up with the rapid development of information and communication technology (Pedró, 2011), they are found to own few vehicles, delay to obtain a driver's license, and travel fewer miles and make fewer trips than the previous generations of the same life stage (Blumenberg et al., 2012). And the decreased auto usage results from the decreasing trip rate, rather than the shift to other transportation modes or shorter travel distance (McDonald, 2015). However, news media has reported that Millennials would more like to conduct long-distance trips or travel to another city/country for vacation. The average U.S commute time gets longer, increasing from 25.1 to 26.9 min between 2005 and 2017. The proportion of workable laborers (16+) who commute over one-hour one-way increases from 7.9% to 9.3% during the same period (Mitra & Saphores, 2019). Motivated by the conflicting findings reported by existing studies, this study aims to answer the research question:

How and to what extent do the Millennials' travel distance/time patterns for long-distance travel differ from those of other older generations?

What variables impact the travel distance/time of the members belonging to each generation (cohort)? This study assembles a dataset on long-distance travel from six U.S. National Household Travel Surveys (NHTS) and Nationwide Personal Transportation Surveys (NPTS) from 1983 to 2017. Trip distance/time will be regressed against cohort and period (year) predictors along with a set of socioeconomic and spatial variables. The study's findings are expected to shed light on generational characteristics of long-distance travel and inform policy deliberations on travel demand management strategy and travel-related GHG emission reduction policy.

#### **WHAT TYPES OF TRAVEL DO WE PRIORITIZE DURING COVID-19? AN EXPLORATION OF SOCIAL AND SPATIAL DISPARITIES IN THE ACTIVITY-TRAVEL BEHAVIOR CHANGE**

Abstract ID: 821

Individual Paper Submission

WANG, Jueyu [University of North Carolina at Chapel Hill] olivia91@ad.unc.edu, presenting author

MCDONALD, Noreen [University of North Carolina, Chapel Hill] noreen@unc.edu, co-author

The onset of COVID-19 has disrupted many aspects of human life, which has, directly and indirectly, changed people's mobility styles (Shamshiripour et al., 2020). Studies have revealed significant disparities in mobility reduction among different socio-demographic groups during the lockdown; neighborhoods with higher percentages of white and people with higher income and high education degree tend to have more mobility reduction (Dasgupta, 2020; Pepe, et al., 2020). However, limited is known about the changes in activity-travel behavior during the lockdown and whether the changes persisted afterward or bounced back to the pre-pandemic level. This

knowledge will be useful to guide health policymakers to make public health policy. it would be also important for planning policymakers to develop more equitable and resilient transportation systems.

To fill this gap, this research investigates how and to what extent people's activity-travel behavior has changed in North Carolina during and after the lockdown compared to the same period in 2019 and how these changes are associated with the socio-demographic and spatial characteristics at the block group level. Specifically, using the mobile phone data from Safegraph, we analyze the activity-travel behavior of seven types of activities, including offices, retail stores, grocery stores, outdoor and indoor recreational activities, health care and social assistance, and restaurant/bars, and estimate models to examine the correlation between changes in activity-travel behavior with the socio-demographic characteristics at the block group. The analysis reveals significant changes in people's travel behavior and disparities in these changes by block groups with different socio-demographic and spatial characteristics.

## TURNING STREETS INTO HOUSING

Abstract ID: 829

Individual Paper Submission

MILLARD-BALL, Adam [University of California Los Angeles] [adammb@ucla.edu](mailto:adammb@ucla.edu), presenting author

“Living on the streets” is synonymous with homelessness. While unhoused people use many different strategies for shelter, from couch surfing to formalized shelter accommodation, the images of street sleepers is particularly visceral. At the same time, the number of people living on the streets reflects the sheer amount of space that is available on rights-of-way, whether on sidewalks, in medians, in parking spaces, or at the side of freeways. Between 13% and 30% of land in US cities may be devoted to street rights-of-way (Meyer & Gómez-Ibáñez, 1981).

The use of streets by unhoused people is normally seen as a social problem. In this paper, in contrast, I consider whether and how the large reservoir of land devoted to streets can be repurposed for short- and long-term housing options. I argue that wide residential streets in US cities are both a contributor to homelessness and a potential strategy to provide more affordable housing.

I first discuss the economic as well as the social imperative for turning streets into housing. In US residential neighborhoods, subdivision ordinances typically set binding standards for street width, far in excess of what is economically optimal or what private developer and residents would likely prefer (Millard-Ball 2021). These street width standards are one contributor to high housing costs and supply restrictions, which exacerbate the housing affordability crisis in high-cost cities.

If and when autonomous vehicles become widely available, the imperative may become a practical one as well. Anti-

camping ordinances become hard to enforce when a car or camper van can slowly cruise or periodically reposition itself throughout the night. Thus, future planning for autonomous vehicles may highlight the overprovision of streets in urban areas. Because they can evade municipal anti-camping restrictions that restrict the use of streets by unhoused people, autonomous camper vans have the ability to blur the distinction between land for housing and land for streets.

I then discuss the practicality of turning streets into housing, and sketch out two potential pathways for established neighborhoods. First, cities could permit camper van parking on the right-of-way, analogous to liveaboard canal boats that provide housing options in UK cities such as London and Oxford. Cities could allow vehicle owners to rent part of the street on a short- or long-term basis, and provide sanitation, water, electricity and other basic services. The accommodations need not even be a van; mobile tiny houses could do the same, with a year-long lease agreement making the transportation and set-up costs worthwhile for residents.

Second, in the longer term, cities could begin to cede their excess rights of way to adjacent property owners in order to permit accessory dwelling units or redevelopment at higher densities. Many possible configurations are possible, including free-standing units, garage conversions or expansions, or extensions to the main house that creates space for separate units.

In short, I argue that cities should not seek to evict unhoused people from the streets, but rather find ways to turn those streets into adequate housing. Streets provide the largest reservoir of public land in most cities, and much of this land can and should be used to house, or at least shelter, unhoused people.

#### **"HOW WILL IT HELP?" LEGITIMACY AND REPRESENTATIVENESS OF CROWDSOURCING IN TRANSPORTATION PLANNING**

Abstract ID: 830

Individual Paper Submission

GRIFFIN, Greg [University of Texas at San Antonio] greg.griffin@utsa.edu, presenting author  
BRAUN, Lindsay [University of Illinois at Urbana-Champaign] lmbraun@illinois.edu, co-author  
BARAJAS, Jesus [University of California, Davis] jmbrajas@ucdavis.edu, co-author

Planners deploy crowdsourcing in transportation planning to fill gaps in data, information, and ideas, but critical questions exist regarding their suitability (legitimacy) and coverage of communities (representativeness). If planners are to integrate crowdsourcing in meaningful ways, we must consider the structures and mechanisms of crowdsourcing in its techno-organizational context (Bygstad, Munkvold, and Volkoff, 2016). We recruited 31

interviewees from a sub-set of 105 respondents to a previous survey, composed of transportation professionals in the United States. We developed a nine-question, semi-structured interview guide that centered on two guiding research questions: 1) how do planners navigate their role in organizational use of crowdsourced data for transportation planning?, and 2) how do planners conceptualize and address (if at all) potential gaps in data representation? We coded transcripts through a three-stage process of indexing, analysis, and meta-analysis.

Initial findings suggest 13 inter-related topics that provide answers to our guiding questions about the legitimacy and representation of crowdsourcing in transportation planning. The most prevalent topics in our interviews concerned equity in planning (160 instances), the cost or expense of data (155 instances), and collaborative planning processes (154 instances). We find a balance of optimism and skepticism regarding the legitimacy of crowdsourcing in transportation planning. Many of these assessments are context-dependent—crowdsourcing cases range from mining smartphone app data for trip records to local generation of policy alternatives. For instance, the same planner who framed the challenge of planners using crowdsourced data as “how will it help?” also pointed to previous failures in including bicycle and pedestrian counts with motor vehicle counts, along with privacy concerns with “smart” lights capable of monitoring traffic with cameras. We also found that planners describe the (mis)representation of communities in crowdsourcing as a persistent challenge, with varying perceptions of whether these problems can be mitigated through technical and community engagement means.

In the context of previous scholarship, our findings suggest crowdsourcing requires changes in data collection and public engagement mechanisms of urban planning (Liao, et al., 2019) that can center the communities of interest (Bai and Jiao, 2020), and further an open data ethic (Schweitzer and Afzalan, 2017). A critical realist perspective proposes that deeper changes may be needed to realize crowdsourcing as a representative community approach in urban planning, such as the mechanisms of planners’ data collection and public engagement, and the legal and organizational structures of what constitutes data versus opinion. Though we are continuing analysis as of this writing, initial findings suggest opportunities to reform federal and state requirements for transportation agencies regarding data collection and public engagement through crowdsourcing. Researchers may also transfer our approaches to the analysis of other techno-organizational challenges. Practicing planners can apply our findings to decide on the appropriateness of crowdsourcing as an approach to gather data, information, and ideas in light of persistent problems of representation. Educators of planning theory, transportation, and public engagement can use our interview analysis to add context and stories to emerging issues in each field.

#### PREPARING TRANSIT FOR THE NEXT FUNDING CRISIS: UNDERSTANDING THE INTERNATIONAL FINANCIAL RESILIENCE OF TRANSIT FUNDING

Abstract ID: 838

## Individual Paper Submission

WEINREICH, David [Technion-Israel Institute of Technology] david.weinre@campus.technion.ac.il, presenting author  
MARTENS, Karel [Technion-Israel Institute of Technology] kmartens@technion.ac.il, co-author

### Preparing Transit for the Next Funding Crisis: Understanding the Financial Resilience of Transit Funding Through International Research

Clearly the pandemic has taken a toll on the ability of public transit systems to operate. In particular, transit operations in the US is highly dependent on local funding sources earmarked for public transit. An international comparison will shed light on the limitations of the current system that could be remedied to improve its resiliency in future crises, like those seen in 2020 and 2009. This research will conduct an international survey to gain an understanding of the various financing sources of public transport operations, the extent to which they have been affected by the Covid crisis, and the various ways in which authorities, operators and governments (local, regional, national) have responded to the financial challenges. In particular, the type of funding source, as well as the level of government that provides it are likely to have important impacts on transit agencies' ability to weather the crisis, but the extent to which this is the case is not fully understood, nor are the specific impacts on real transit agencies or operators. The sample used in this study will provide a strong contrast between states and countries that use highly localized funding sources with those that use highly centralized ones. It also examines those with strong national support with those where such support is very weak, and examines a myriad of different types of taxes and fees—some likely to be more sustainable than others during a financial crisis. The outcome is likely to provide very practical results for cities, transit agencies and operators looking to design their structure in a way that can withstand future crises.

At the same time, this work builds toward greater comparison of financial and governing systems for public transit across countries and continents. A small but interesting literature has done work on this question so far, though it has yet to yield a systematic understanding of the governance/finance differences, and how they may impact real-world outcomes—which could lead to subsequent work focusing on the impact on the transit systems, their coverage, fragmentation and ridership, and how these are influenced by governance and financial structures that vary significantly from one country to another.

## THE EFFECT OF THE PROVO-OREM BUS RAPID TRANSIT (BRT) ON TRAVEL BEHAVIOR, LAND USE, AND EMISSION

Abstract ID: 845

Individual Paper Submission

KIM, Junsik [University of Utah] profjunsik@gmail.com, presenting author  
EWING, Reid [University of Utah] ewing@arch.utah.edu, co-author

Today, the US population is growing continuously, and vehicle miles traveled (VMT) are also rapidly growing. Therefore, the importance of public transportation is emerging more than ever before (NHTSA, 2017). Among many types of public transportation, Bus Rapid Transit (BRT) is receiving attention for its efficiency and relatively low cost as compared to rail modes. It is available to carry many people simultaneously, and it has more reliability than conventional bus service.

In Utah County, BRT's positive attributes, transportation agencies opened the Utah Valley Express (UVX) line in Central Utah County in 2018. This line is operated by Utah Transit Authority (UTA) and runs between southwest Orem to south-central Provo by way of Utah Valley University (UVU) and Brigham Young University (BYU).

Previous research found that BRT leads to increased job growth, increased land price premiums, increased retail employment, increased accessibility to jobs and healthcare, and decreased delay (Nelson, 2013., Cervero and Kang, 2011., Lee and Miller, 2018). Additionally, Ewing et al. (2014) researched light-rail's (LRT) impact on traffic in the University TRAX travel corridor in Salt Lake City. BRT is often described as rubber-tired LRT because they share operating characteristics. From this research, Ewing et al. found LRT was associated with increased transit ridership and decreasing vehicle traffic volume within the travel corridor.

However, there has been limited exploration of the comprehensive quantitative impact of BRT on travel behavior, land-use change, and air quality in previous papers. Especially, there has been limited exploration of how BRT impacts travel behavior (traffic volume, travel time, ridership, crash rate), land use (land use, trip generation, parking occupancy), and emission. In fact, from the previous BRT studies, BRT worked very well in Bogota, Lahore, or Mexico City. However, in the Delhi and Taichung cases, BRT was failed (Tsivanidis 2019, Majid et al. 2018, Bel and Holst 2018, Pojani and Stead 2017).

Therefore, in this study, to achieve an understanding of the quantitative effects of BRT, we studied public transit ridership, traffic volume, travel time, land-use change, total and injury crash rate, emission, parking occupancy, and trip generation change in the 0.5 miles buffer area of the UVX alignment from 2013 to 2019 through time series analysis. BRT was constructed and opened during that period. In particular, we used a quasi-experimental research method to estimate the causal impacts of an intervention (BRT) on the target area. This comes as close to a true scientific experiment as one typically can come in the social sciences.

As a result, even though the population (+9.17%) and the student enrollments in the study area (+6.27%) were increased between before and after the BRT operation, however, the traffic volume in the BRT line (-2514 VPD or -7.38%) and in the 0.5 mile buffered area from BRT line (-1514 VPD or -6.81%) was decreased than the estimated value due to the increased bus ridership (+8687 or 122.66%).

In addition, due to the BRT, commercial area (+1.18%), public area (+9.87%), the numbers of residential units (+962 units), total trip generation (commercial: +12309, residential: +5326, total: +17634), and parking spaces (+3126 parking spots) were increased, and vacant land (-17.76%), travel time (-6.13%), total (-25.26%) and injury (-33.30%) crash rate, and estimated emission were decreased than predicted value. This research can be strong evidence providing the justification for the introduction of BRT.

## **CONSEQUENCES OF COVID-19 ON PEDESTRIAN MOVEMENT IN THE URBAN SPACES: CONSIDERATIONS FOR ESTEVES JUNIOR STREET IN FLORIANOPOLIS, BRAZIL**

Abstract ID: 850

Individual Paper Submission

ZABOT, Camila [Florida State University] cdz20d@my.fsu.edu, presenting author

DUNCAN, Michael [Florida State University] mdduncan@fsu.edu, co-author

Florianopolis is a city of 600.000 inhabitants located in Brazil's southern region. The city's economy is based on tourism, public services, and the technological industry. Its urban form follows the typical Portuguese configuration, with a downtown characterized by narrow streets, tiny sidewalks, storefronts, with no setbacks.

Esteves Junior street is an example the central city's mixed-use configuration. It has stores, restaurants, bakeries, and supermarkets combined with apartment buildings, houses, and institutional structures (schools, fitness centers, and government buildings). These uses are complemented by several squares and large plaza at the end of the street. The mixed-use character of this street is a critical component in promoting pedestrian activity (Cervero and Duncan, 2003). In 2018, the street was further improved by adding bikeways, increasing sidewalk width, and narrowed crosswalks. The addition of these types of facilities have been demonstrated to encourage pedestrian activity (Hutabarat, 2009). The arrangement of urban space along this street provides security and reasons to walk, adding a feeling of belonging and improving social interactions. According to Amancio (2005), continuous interaction between people and the built environment is a fundamental aspect of good urban spaces.

In 2019, we analyzed pedestrian usage of this street. An instrument was developed to evaluate the presence and movement of people on the route. It examined the quantity of pedestrians, their interactions, and the types of activities they were conducting in the different squares. The analysis considered whether people were walking or standing, whether they were by themselves, or whether they were interacting with other people, or just passing through. The Syntax Observation Manual was the method used to count the number of pedestrians in each square (Saboya, 2007). According to Gehl and Gemzoe (1996), one of the easiest and quickest ways to understand pedestrian movement in urban spaces is to count the number of people walking or involved in various activities. The diversity of people, especially children, the elderly, and people with special needs, denotes the quality, integrity, and health of the pedestrian space. The results confirmed the potential of mixed land uses and urban infrastructure in promoting pedestrian movement and public interactions. For example, at least 600 pedestrian were observed per hour during the morning and afternoon.

Several factors can affect the demand for non-motorized transport, such as climate, temperature, infrastructure, security, and urban design (Moudon, 2001). We plan to build on this work by examining how the current pandemic brought many functional changes to urban spaces. Social distancing and quarantines resulted in many behavior changes, including pedestrian movement and interactions in urban spaces.

In an effort to understand the changes in how people interact with each other in urban spaces, this study will repeat the previous analysis of pedestrian usage on Esteves Junior Street following the Syntax Observation Method that

was previously used. The new observation will be done during Spring 2021. These results will be directly compared with the 2019 results to assess the impact of the pandemic on the use of urban spaces.

Preliminary results showed a reduction in the number of people walking, and a drastic reduction in social interactions and recreational activity in urban spaces, especially in terms of group interactions.

This study will be helpful in understanding the implications and complications of COVID restrictions on interactions and socialization. As we beyond the pandemics, urban planners will need think carefully about how to restore confidence in the use of urban spaces. More generally, it can provide lessons in how to think creatively about overcoming barriers to pedestrian activity.

#### **THE INFLUENCE OF UBER AND LYFT ON AUTO USE AND OWNERSHIP ACROSS LEVELS OF TRANSIT ACCESS IN METROPOLITAN BOSTON**

Abstract ID: 859

Individual Paper Submission

MONTILLA, Michael [University of California, Berkeley] michaelmontilla@berkeley.edu, presenting author  
CHATMAN, Daniel [University of California Berkeley] dgc@berkeley.edu, co-author

Many envision a transition away from widespread personal vehicle ownership in which future urban transportation demands are satisfied through a combination of shared mobility and public transit. A key element of these predictions is the role of transportation network companies (TNCs) such as Uber and Lyft. On one hand, surveys of TNC riders indicate that TNC availability may encourage urban commuters and single millennials to forego private vehicle ownership (Coogan et al., 2018). But despite the potential for these services to discourage car ownership, current data suggest that driving has increased since the advent of TNCs. Several studies conclude that TNC operations increase congestion and vehicle miles traveled (VMT) within service areas (Erhardt et al., 2019; Henao & Marshall, 2019). With regards to TNCs interaction with public transit, there is growing evidence suggesting that TNCs act as a compliment to public transit in some situations, but as a substitute in others (Young, Allen, & Farber, 2020; Hall, Palsson & Price, 2018). As such, TNCs may more strongly encourage users to forego personal vehicle use in situations where TNCs compliment transit, but to what extent is unclear. With these dynamics in mind, we address the following research question: Does access to TNCs, or to both TNCs and transit, lead to reduced personal vehicle use or ownership? In contrast to previous research, this current study uses data that can more directly measure whether access to TNCs, or access to both TNCs and public transit, affect the use of individual personal vehicles, by analyzing changes in auto ownership and use using data from the Massachusetts vehicle census (MVC) of 2009-14, focusing on the metropolitan area of Boston. The MVC includes annual vehicle mileage data collected at the time of emissions testing and inspection. It also includes locational and storage data sourced through the vehicles' registration. Using the MVC, we assess the impact of TNCs on private vehicle use by analyzing changes to the stock of vehicles and to the annual VMT of individuals depending on vehicles' level of access to TNC and transit services as defined by their registered location over time. The findings of this study provide insight into TNCs influence on personal vehicle use and ownership, and whether this effect is amplified, muted, or unchanged in areas

with varying levels of transit access. Such insight has the potential to inform local transportation policy, particularly how to regulate TNCs and personal vehicle use as part of an evolving transportation system, and when considering the role of TNCs alongside transit.

Public transit ridership has faced a steep decline in the last few years. From 2014 to 2017, the top 40 urban centers in the United States had over 85 percent of the country's decline in ridership, and the Covid-19 pandemic has worsened the situation (Dickens, 2020). Historically overburdened communities with health and racial inequities are the ones who suffer the most in the crisis aftermath. Those transit-dependent communities need reliable public transit to access basic needs, such as health care, education, and jobs.

Since 2013, all top transit operators in Florida have experienced a decline in their services (Polzin & Godfrey, 2020). On-demand services (such as microtransit) are functional in a low job and population density. Transit agencies started using microtransit to improve riders' experiences by providing on-demand services with flexible routing and scheduling. In January 2019, the City of Gainesville Regional Transit System (RTS) offered free microtransit services in East Gainesville (RTS, 2019). The flexible routes covered by the microtransit service supports a geographically dispersed area with a low-income, transit-dependent population, who have limited access to conventional public transit. We evaluate the success and shortcomings of the microtransit services while exploring what steps the RTS should take to connect more individuals to those services, considering that existing digital inequalities adversely impact East Gainesville communities' access to new mobility options, such as microtransit.

#### Methodology

We completed 15 interviews with local officials and community leaders either in person or over Zoom about their perspective on the efficiency and effectiveness of the microtransit service and how the service met the needs of residents of the neighborhood. The interviews were transcribed and analyzed using Zoom to categorize the responses.

### Findings

The microtransit services in East Gainesville initially covered two routes and provided access to the central bus station. Services then expanded to three routes and made a connection with a variety of popular destinations. Given the significance of accessibility for all transportation users, the city and microtransit providers need to work together to address the existing disparities to accessibility of resources across the metropolitan area — specifically the reliability of services and availability in other parts of the city. The existing infrastructure does not meet the transportation needs of the residents in the pilot neighborhoods. Community leaders have emphasized the urgency of improving existing infrastructure in order to leverage the features and strengths of the microtransit service. Additionally, community leaders and local officials agree that regional partnership, with employers, are essential to ensure long-term sustainability and efficiency of services. Partnerships are also key to continuing existing services and expanding routes in other parts of the city, specifically considering the aging population's transportation constraints, such as digital divide.

### Implications of the Research

The microtransit pilot program is filling the gap of conventional public transit, which is the only mobility option for a considerable number of citizens in East Gainesville. Microtransit services can have substantial equity implications if those being used to replace low-usage transit routes, and those services are abruptly canceled by the local authorities. Therefore, local partnerships among key stakeholders are essential to ensure transparency and the long-term financial stability of services. The recommendations provided in this research will help local officials effectively expand services and equitably meet the needs of transit-dependent and transportation-disadvantaged communities in Gainesville.

## **SLOW STREETS AND DOCKLESS TRAVEL: USING A NATURAL EXPERIMENT FOR INSIGHT INTO THE ROLE OF SUPPORTIVE INFRASTRUCTURE ON NON-MOTORIZED TRAVEL**

Abstract ID: 866

Individual Paper Submission

THIGPEN, Calvin [Lime] calvin.thigpen@li.me, presenting author

LEE, Seula [University of Southern California] seulalee@usc.edu, primary author

GROSS, James [University of Southern California] jamesanthonygross@gmail.com, co-author

BOARNET, Marlon [University of Southern California] boarnet@price.usc.edu, co-author

At the onset of the COVID-19 pandemic, several cities implemented slow street programs which limited car travel to local traffic, reduced speeds, and allowed a substantial shift of street space from car lanes to non-motorized travel. These slow streets programs were intended to provide a safer, supportive infrastructure for the people to walk, bike and ride other non-motorized vehicles. The slow street program allows an unprecedented opportunity to study how supportive non-motorized travel infrastructure is associated with increases in non-motorized travel. While there are some other cities with similar programs, we have identified 4 cities, Los Angeles, Oakland, San Francisco, and Portland, which initiated slow street programs since April 2020 as a part of COVID 19 response with data available for the analysis. By using these four case study cities, this study focuses on understanding the impact of supportive infrastructure on non-motorized travel. As a comparison, a recent study of bike-lanes examined the development of 92 miles of bike lanes in Boston over a 7-year period (Pedroso, et al., 2016), similar to the size of the slow street programs that we study, which were implemented within a few months.

We partnered with Lime, a major national provider of dockless bicycle and scooter services, to obtain data from July, 2019 (first baseline), November, 2019 (second baseline), July, 2020 (after first-wave implementation of slow streets), and November 2020 (after second-wave implementation). We use a before-after, experimental-control group research design to examine the effect of Slow Streets on dockless vehicle flows during the pandemic. We use data including counts of daily trips that crossed the midpoints of about 3,000 blocks that were converted to slow streets as the experimental group and blocks in a surrounding  $\frac{1}{2}$  mile area and  $\frac{3}{4}$  to 1 mile areas as control groups. Our analysis is based on aggregated trip counts by weekday/weekend, and by four different times of day including AM peak, mid-day, PM peak, and night. For the first and second control groups, we match experimental and control blocks based on similar street characteristics. Additionally, we identify a third control group which includes blocks which were identified as candidates for slow streets, but never actually implemented due to conflicts with stakeholders, or were implemented in a later phase. This third control group can be seen to represent blocks with similar characteristics to slow streets blocks, which will allow for an additional model using treatments and controls which are likely to be characteristically similar. While the effects of a supportive infrastructure program can be difficult to estimate due to differences in underlying characteristics between treated and untreated blocks, this data will allow us to address that concern using block-level fixed effects. Therefore, we implement a differences-in-differences statistical model to measure the effect of slow street implementation, relative to control groups, on dockless travel.

Results show large increases in dockless travel on the converted slow streets. By examining the land use characteristics and slow street project details that are most strongly associated with increased dockless travel, the results will suggest concrete actions cities can take to implement supportive infrastructure to encourage non-motorized travel.

## **CAR OWNERSHIP TRANSITIONS AMONG LOW-INCOME HOUSEHOLDS**

Abstract ID: 871

Individual Paper Submission

KLEIN, Nicholas [Cornell University] njk8@cornell.edu, presenting author

This research precarious car ownership among low-income households. Previous research has painted a partial picture of these transitions which have a large effect on households' wellbeing. We know that low-income households' grasp on car ownership is tenuous. These households experience more transitions into and out of car ownership compared with more affluent households. We also know that having or gaining a car is associated with upward economic and social mobility. Yet, we know little about how low-income households acquire cars or the consequences for these households when they lose or give up a car. This research examines these two aspects of car ownership transitions.

First, I examine the consequences of losing access to a car for low-income households. My research will highlight the effects of losing a car on employment, finances, healthcare, access to food, recreational opportunities, childcare and child-serving travel, and residential mobility. Second, I examine how households subsequently regain a car. When searching for a car, low-income households often have to navigate subprime lenders and informal markets and risk buying unreliable vehicles. My research will examine the search processes, risks, constraints, and compromises entailed in purchasing a car.

To address these questions, I plan to interview low-income individuals in and around Philadelphia, PA, and Ithaca, NY. I will work with social service agencies in both cities to recruit participants with annual household incomes below \$40,000. In these interviews, I will adopt a biographical approach to focus on the processes of change (the search for cars) and the consequences of these changes (the effects of losing a car) over the life-course.

Transit ridership has been falling in virtually every U.S. city. Hypotheses abound. Analysts have cited falling gas prices, the economic recovery and rising incomes, the rise of ride-hailing and new mobility options, and the

adoption of driving by immigrants who arrived in the past two to three decades (Manville et al., 2018). Yet, those factors are largely outside of the ability of transit agency control. This study will examine how transit system characteristics – including frequencies, routes, first/last-mile access – would affect job access in the Southeast Los Angeles (SELA) region, focusing on (but not necessarily an exclusive focus) on buses. Public transit systems across the United States were vulnerable to disruption and shocks caused by the global pandemic; reports reflect disparate declines in ridership among metropolitan areas (Liu et al., 2020). The paper also pays attention to the effects of COVID-19 on both transit networks and economic development in the SELA region. The region is densely populated, with a relatively low median household income, and low car ownership rates, making residents highly dependent on public transportation (Giuliano et al., 2017). Historically, low-income communities are at a disadvantage due to limited mobility (Giuliano, 2005).

Compared to the County of Los Angeles, ACS data estimates from 2019 indicate that a high percentage of households in the SELA region have no private vehicle and live below the poverty line. The research will leverage new open-source data on transit accessibility from Remix, an online commercial transit access software tool, and ArcGIS to simulate how transit improvements affect regional job access in the SELA region. Our simulation is conducted at the city level, where we use the number of jobs that can be reached from each SELA region city's geographic centroid to represent the job access for residents living in this city. In addition to quantitative analysis, we also use qualitative methods - survey and focus group interviews - to learn more about residents' needs. The simulation results indicate that first-last mile access, including robust bike-share and rapid shuttle, are the best options for increasing residents' mobility and, in turn, improve transit job access. The results corroborate similar accessibility models that focus on using faster station access/egress modes such as bicycles and rideshare that reduce transit service wait time (Boarnet et al., 2017). Before COVID-19, the Los Angeles Metro Transportation Agency, the major public transit supplier in the region, aimed to reduced bus headways during peak hours. Unfortunately, the transit agency had no choice but to reduce its service frequency. Our results show that the second-best option for improving transit job access is a 10-minute headway or less on all lines within the SELA region. The responses from the survey and focus group interviews also correspond to the above two findings.

#### WHAT TYPE OF INFRASTRUCTURES DO E-SCOOTER RIDERS PREFER? A ROUTE CHOICE MODEL

Abstract ID: 883

Individual Paper Submission

ZHANG, Wenwen [Rutgers, The State University of New Jersey] wenwen.zhang@ejb.rutgers.edu, presenting author  
 BUEHLER, Ralph [Virginia Tech] ralphbu@vt.edu, co-author  
 BROADDUS, Andrea [Ford Motor Company] abroaddu@ford.com, co-author  
 SWEENEY, Ted [Spin] ted@spin.pm, co-author

E-scooter is an innovative transportation mode that meets the travel demand of many travelers by providing flexible, affordable, and accessible mobility services. E-scooters have proven popular with the public, with usage increasing at a much faster rate than other forms of shared mobility (i.e. cars, bicycles) (Clewlow, 2019). In 2018, there were 85,000 e-scooters available for public use in 100 U.S. cities, resulting in 38.5 million trips (NACTO, 2018). Local policymakers, however, face the challenge of providing safe and convenient environments to accommodate this emerging travel mode. This study contributes to the research gap by developing an e-scooter route choice model using revealed preference data collected using Global Position System (GPS) units installed on e-scooters on Virginia Tech Blacksburg Campus.

This study uses 2000 randomly sampled GPS observations of e-scooter trips on Virginia Tech's Blacksburg Campus. The used dataset represents a sample of trips from riders who gave consent to participate. E-scooter trajectory data were collected using the default GPS units on the e-scooters, which record locations every 5 seconds. To protect users' privacy, the GPS trajectory points located in the first and last 50 feet of the trajectory were removed prior to analysis. GPS trajectory point data were then map-matched to the open street map to generate routes before feeding data into the route choice model. We used Recursive Logit (RL) models to examine e-scooter riders' route preferences. The RL model overcomes the limitation of conventional route choice model by consistently estimating route preferences with a dynamic choice set. The link-level infrastructure attributes, including length, slope, presence of different types of transportation infrastructures, turning angles along the roads and at intersections, etc., are used for model estimation.

The results suggest e-scooter users are willing to travel 59% and 28% longer on segments with bikeways and multi-use paths. Local roads, such as tertiary roads or one-way roads (including roads with wide medians to separate right of the ways) are also found to be attractive, as the perceived travel distance is reduced by 15% and 21% correspondingly. Bikeways display the largest positive estimated coefficients and are the most preferred infrastructures. Stairs on walkways are considered as unattractive, and e-scooter users are willing to travel 55% longer to avoid them. The coefficients of other infrastructures, such as pedestrian ways, primary and service roads, bridges, and tunnels are found to be statistically insignificant, indicating e-scooter users are not sensitive to these amenities on Virginia Tech's campus. This may be attributed to the fact that there is a limited amount of these transportation infrastructures on campus and e-scooter users are not allowed to travel in the Town of Blacksburg. Similar to cyclists, e-scooter users also tend to take shorter and simpler routes, and to avoid left turns and U-turns. However, different from the findings of bicycle route choice models, the upward slope of the segment is not negatively perceived, likely because e-scooters are powered by an electric motor.

#### CAR MODIFICATION FOR PEOPLE WITH DISABILITIES: A CAPABILITY APPROACH

Abstract ID: 884

Individual Paper Submission

KWON, Jamie [Rutgers, The State University of New Jersey] [jamie.kwon@rutgers.edu](mailto:jamie.kwon@rutgers.edu), presenting author

Sixty-one million Americans have disabilities, and many face transportation barriers to social and economic participation (Henly and Brucker, 2019). Understanding the transportation barriers people with disabilities face and how they navigate those barriers is necessary to help expand access to opportunities. To date, research on transportation barriers among people with disabilities has focused primarily on their experiences using paratransit services and public transit. While these efforts represent helpful steps, they neglect a key avenue through which people with disabilities can get to places: private modified vehicles (Darcy and Burke, 2018).

Private modified vehicles are adaptive cars or vans for the use of a person with physical disabilities. Owning a modified vehicle improves the well-being of many people with disabilities (Darcy and Burke, 2018). Previous work has shown that people with disabilities who own a modified vehicle have higher chances of receiving job call-backs (Tsai, et al., 2014) and higher salary (Berkowitz, et al., 1998).

Yet, this access comes at a high cost; the average cost of car modification is \$6,500 and can be as expensive as \$65,000 (Berkowitz, et al., 1998). As a result, many people with disabilities have difficulty accessing a modified vehicle (Darcy and Burke, 2018).

Most of the existing studies on automobility among people with disabilities have looked at the association between car ownership and social or economic outcomes. This quantitative approach tells us little about how financial barriers to getting a modified car were negotiated and how having a modified car changes travel behavior. This research gap calls for a qualitative research for two reasons: first, qualitative methods can situate the lived experience of people with disabilities in looking for a modified car in a rich context that takes into account social welfare policy, barriers to other transportation options, and transportation needs. Second, qualitative methods can enrich our understanding of how having a modified car enables people with disabilities to access opportunities.

My research examines how having a modified car affects access to opportunities among people with disabilities and situates the access to these cars within their economic resources, personal characteristics, and environmental factors. I interviewed 30 working-age people with Spinal Cord Injuries who own or wish to own a modified car. I asked them about their experience purchasing or looking for a modified car and their experiences of traveling to job opportunities and healthcare services.

I used the capability approach to understand how car ownership affects the traveling and activity of people with disabilities. Sen Yamagata explains that a person's functioning, or activity, is achieved through three factors: the person's economic resources, environmental factors, and personal characteristics. Adopting this approach, Mitra (2007) defines disability as a deprivation of functioning, which arises from the interactions between those three factors. I conceptualize a modified car as an economic resource and examine how the modified car interacts with the disabled person's environment (i.e. access to paratransit services) and personal characteristics (i.e. severity of disability). Then, I studied how these interactions affect their functioning to travel and access opportunities.

My findings enrich our understanding of how car ownership is both challenging and beneficial for people with disabilities, a contradiction most previous studies have not addressed. My work also informs policymakers and planners how solving transportation challenges for people with disabilities needs to include resources to support car modification. Finally, it reveals how car modifications can improve access to medical appointments and job opportunities.

## THE INDEPENDENT AND COMBINED INFLUENCE OF METROPOLITAN ACCESSIBILITY AND LOCAL PEDESTRIAN ENVIRONMENT ON STATION BOARDINGS

Abstract ID: 901

Individual Paper Submission

RAMOS-SANTIAGO, Luis Enrique [Clemson University] eramoss@clemson.edu, presenting author

Numerous studies have documented key determinants of transit ridership along a variety of explanatory vectors. These include land-use and urban design (e.g. 3Ds; walkability; special generators); socio-economic characteristics of residents; transit service quality; and network topology. More recent studies highlight the importance of bus feeder connectivity; residential bias; regional economic conditions; local policy support; competition from other travel modes (e.g. automobile); among other contextual factors. Still, very few studies have explored the potential influence of metropolitan accessibility (e.g. gravity-based cumulative opportunities measures). Furthermore, to this author's knowledge no study has explored its potential interaction with local-level walkability factors or with other ridership determinants. This study explores this possibility, as well as other potential interactions between covariates. Multi-level generalized linear models were implemented where key predictors are regressed onto station-level average weekday boardings ( $n=102$  stations). Station-level boarding data is drawn from Los Angeles bus and rail on-board survey (2011). Other sources of data for predictors are station WalkScore® ranks and their sub-components; US-Census ACS and LEHD databases for population and employment levels; and LA multi-agency GTFS files (LA Metro + SCAG; Southern California Association of Governments) for service levels calculations and for development of the gravity-based metropolitan accessibility index. The time impedance matrix for the metropolitan accessibility matrix was calculated with transit network tools in ArcGIS Pro (v.2.X) using year 2011 GTFS files (morning peak schedules). Results indicate that independently metropolitan accessibility is significant at a 90% confidence level with a small relative effect; and walkability around stations, operationalized as a multi-dimensional WalkScore rank, is not significant. However, their interaction results in a significant but small effect at a 90% confidence level. Because of a relative high collinearity with the number of jobs, WalkScore® ranks were replaced with sub-component measures related to design attributes of the built environment around stations (e.g. intersection density, median block size), and these yielded significant independent results in a new model. The variable intersection density also yielded a positive and significant interaction effect with the metropolitan accessibility index, but also yields a relatively small effect when compared to other predictors. Other predictors and control variables registered significant results with the expected sign. The final model reports a good fit (Cox-Snell/ML pseudo- $R^2 = 0.87$ ; mean VIF=2.76). Variables representing station topological functions transfer hub and terminal report the largest multiplicative factors. The number of jobs (log-transformed) and population (squared) parameters report the largest IRR (incidence rate ratios) parameters. Taken together, results suggest that LA's rapid-transit patrons, which include users of heavy-rail, light-rail, and bus rapid-transit value the greater spatial accessibility to dispersed destinations afforded by the multimodal network, and this reflects on transfer hubs high significance and effect, and with higher number of bus feeder connectors per station. Although statistically significant, it appears that users don't necessarily value metropolitan-wide accessibility when compared to other predictors. This could be a result of the way it was operationalized in this study. Yet, this author speculates that LA's metropolitan employment landscape, argued by some urban geographers to be better described as dispersed rather than polycentric, could partly explain the unexpected weak influence of the metropolitan accessibility measure, in

contrast to the high significance and greater magnitude of effect noted in other studies based on center-focused cities.

Recent advancements in technology and regulation are integrating Unmanned Aerial Vehicle (UAV) transportation into existing communities. UAV integration represents a form of disruptive transportation (Adam Cohen, 2020) with the potential to positively and negatively affect communities of all sizes. UAV can complete various tasks, such as food and medicine delivery, package delivery, and eventually human transport. To best support the integration of UAVs into our communities for such tasks, it will be necessary to implement a system of hubs referred to as vertiports. Vertiports are used to facilitate interaction with ground-based transportation systems. Exactly how, where, and what vertiports will be in the future is still widely unknown; as planners, it will be essential to understand how these systems will be distributed throughout communities, as well as the potential implications (Vascik & Hansman, 2017). This study is supported by the Utah Department of Transportation and is centered on understanding where vertiports can be integrated within the region's transportation system by focusing on residential delivery services.

Our study is being conducted within the Wasatch Front region in Utah (a greater Salt Lake City area). The Wasatch Front contains approximately 80% of Utah's population, predominantly suburban with several city centers and peri-urban regions. This region is bordered by the Great Salt Lake and the Wasatch Mountains, with a population predominately situated along I-15 and eastward into the foothills. The region is one of the fastest-growing in the country and is host to the Salt Lake City international airport, military and air force bases, wildlife refuges, and vast public lands.

To conduct our analyses, we have developed two different frameworks—conceptual and procedural—based on the literature and stakeholder inputs. The conceptual framework provides the foundation for establishing the various elements of importance, while the process framework facilitates the spatially explicit analysis of vertiport siting. Determining these locations is accomplished through a weighted discrete combination-based suitability analysis that allows for the analysis of community elements through five community dimensions and eighteen categories. Guidance for developing the conceptual framework is provided by a Technical Advisory Committee that consists of individuals from government, non-government, and university entities. The process framework

follows conventional suitability and sensitivity analyses (Steinitz, 2012) but has been adapted specifically for UAV in residential communities.

This paper focuses on the selection and integration of the various spatial criteria that make up the conceptual framework. We have identified five dimensions important for the consideration of vertiport planning (in italics). The built environment consists of existing physical elements constructed for societal use and includes land usage, transportation networks, essential facilities, and population density as proxies for broad indications of infrastructural development. The natural environment recognizes environmental hazards that may pose a risk to UAV vice versa. These include recreational areas, large water bodies, vegetation, environmental hazards, topography, and vulnerable areas. Regulatory restrictions address the range of regulatory or legal bodies with potential control or limitations over UAV in the project area, including air, land, and water-based regulations. Technological aspects of the model encompass significant limitations of UAVs due to their limited flight distance and electrical demand. Finally, value-based factors include spatially explicit elements of equity, walkability, audible and visual nuisance potential, and spatial distribution of vertiports.

This study represents the first known spatially-explicit model for vertiport planning within residential communities. We demonstrate the integration of the five dimensions through an ESRI ModelBuilder suitability analysis. Spatial rules predominately focus on various instantiations of buffering and network analyses, and the resulting maps highlight suitable locations for vertiports. We also discuss the planning implications of vertiports on land-use, transportation, and society (e.g., equity and nuisance).

#### **ARE PUBLIC LIBRARIES LOCATED FAIRLY IN CITIES?: CASE STUDY OF BUSAN, SOUTH KOREA**

Abstract ID: 904

Individual Paper Submission

JANG, Saewoom [Pusan National University] bb1211@pusan.ac.kr, presenting author

PARK, Jiyong [Pusan National University] jyxnq@daum.net, co-author

JUNG, Juchul [Pusan National University] jcjung@pusan.ac.kr, co-author

[Problems] The purpose of this paper is to examine the accessibility of libraries that provide various functions to the community among public service facilities. Currently, public services are being converted to non-face-to-face services. As individual activities are restricted, concerns about the decline in community capacity have been raised. Concerned about the deterioration of the community due to this situation, many regions are looking for ways to ensure the sustainability of their communities. After the end of COVID19, the non-face-to-face service will continue, but the desire for community communication and face-to-face activities is expected to come true. Therefore, this study aims to analyze the accessibility of public libraries that can be considered as a base for community centers. In addition to book rentals, the library offers movie screenings and a variety of educational programs and is sometimes used as a meeting place for people. It is not just an open space, it has become a hub for a community that provides a complex culture by providing educational and cultural programs to local residents(Park et. al. 2018). However, depending on the current situation, the library's book rental service is being converted to contactless services such

as e-books and unmanned loans. Serious areas have been temporarily closed or face-to-face programs have been temporarily suspended. Meanwhile, the libraries are operating services that the community needs, such as providing childcare services to families in need. These services are provided to local residents, and residents living near the library benefit. Local governments provide a variety of public services to citizens, but public facilities have the characteristics of public goods whose benefits decrease as the distance increases (Tiebout, 1956). In addition, since cities are complex and large in size, it is difficult to consider all groups in the city, creating spaces and groups that are inconvenient to use services. In urban planning, researchers have conducted on the equity of space. In addition, at the UN Habitat III conference, the "City for All" vision of [New Urban Agenda] was shared. The issue of segregation and exclusion of space has been raised, and the equity of urban facilities has become important. Therefore, equity studies of public services and major urban services are continually being conducted. [Research Methodology] The study area of this paper covers Busan Metropolitan City in South Korea. GIS network analysis was used. After deriving the service area through network analysis, We derived the public meaning of service accessibility by overlapping the data of the socially vulnerable class with the service area. [Findings] We conducted GIS network analysis and overlay analysis on Busan Metropolitan City. As a result, an old downtown that includes 'Seo-Gu,' 'Jung-Gu,' 'Dong-Gu' in Busan Metropolitan City has few public libraries. Some little libraries in there have been deteriorated, and it is almost impossible to find programs for people. The people living in old downtown have a lower income than the other places on average. Also, there are more older people living in the old downtown than the others. As a result, there is an imbalance in the supply of public services from public libraries for citizens. [Policy Implications] The role of the government is growing in emergencies situation. Citizens are also expecting an Quick response. Non-face-to-face services for government-provided public services have increased due to emergencies, but there are still services that can only handle face-to-face. To rebuild the community solidarity after the end of COVID-19, local governments will implement policies around community centers. In this situation, it is necessary to analyze groups and regions that are marginalized and prepare alternatives in order to develop regional policies into cities for all.

## EXAMINING MICROMOBILITY USER EXPERIENCE USING TEXT MINING TECHNIQUES: AN INVESTIGATION ACROSS GENDER

Abstract ID: 915

Individual Paper Submission

JOMEHPOUR CHAHAR AMAN, Javad [Southern Methodist University] jjomehpour@mail.smu.edu, presenting author  
SMITH-COLIN, Janille [Southern Methodist University] jsmithcolin@smu.edu, primary author  
ZHANG, Wenwen [Rutgers University] wenwen.zhang@ejb.rutgers.edu, co-author

Developments in battery technologies and supporting equipment have enabled a variety of shared and electronic micromobility services to flourish and expand (Shaheen and Cohen, 2019). The surge in public desire to use scooters as a mobility tool has surprised both the public and private sectors (Populus, 2018). In response, some private bike-share companies have even switched their fleets from bikes to scooters (Nacto, 2019). Given that recently launched e-scooter sharing programs have generated 35.5 million trips in the U.S. in one year (Nacto, 2019) and are identified as first-mile/last-mile solutions for daily trips (Arendsen, 2019), it is critical that mobility companies, transportation

planners, and decision-makers gain more insight into the factors that inspire or influence e-scooter user satisfaction and experience (Bai and Jiao 2020) . Limited research, to date, has utilized app store reviews to investigate the opinions of e-scooter users. Factors that influence rider satisfaction are still misunderstood as there has been limited use of traditional techniques (e.g., surveys) to examine e-scooter rider satisfaction or sentiment. Moreover, very few studies have investigated the impact of gender as an attribute relevant to riding experience and satisfaction. Assessing factors that contribute to user or rider satisfaction, therefore, offers the ability to evaluate current and future barriers to e-scooter access, rider needs, and willingness to ride.

In this study, app store reviews from two important micromobility companies are examined using text mining techniques to identify the factors that affect rider satisfaction. Using topic modeling, over 12,000 rider-generated reviews on app stores were analyzed to identify factors related to rider satisfaction. These factors cover various topics such as safety (speed and riding lane), ease of use, pricing, and app interface, to name a few. Moreover, name-centric gender classification is applied to detect rider gender. Then, differences in general review content and level of satisfaction across gender were identified. Our analysis suggest that female riders show more positive emotion and are more satisfied than men, it is widely recognized that micromobility is not a gender-neutral mode of transportation, and men are considered as the main user group. Another finding of this paper is that women's satisfaction (unlike men) is not associated with technical features of the apps or vehicles, including lock, map, app issues, or safety-related factors. Research findings contribute to the existing literature by demonstrating the use of app store reviews in a transportation mobility study to investigate shared electric scooter user opinions.

The development of a method to assess factors contributing to the user or rider satisfaction offers the ability to evaluate current and future e-scooter rider needs and barriers to access and participation. Thus, providing companies, planners, and policymakers the opportunity to employ consistent, effective, and integrated strategies for improving the e-scooter experience and meeting rider expectations.

#### DOES RIDESOURCING PROVIDE EQUITABLE ACCESSIBILITY?

Abstract ID: 917

Individual Paper Submission

WANG, Sicheng [Rutgers University] sicheng.wang@rutgers.edu, presenting author

NOLAND, Robert [Rutgers University] rnoland@ejb.rutgers.edu, co-author

HUANG, Xiao [University of Arkansas] xh010@uark.edu, co-author

Accessibility is an indicator of the ease with which people can access opportunities for specific activities by specific modes of transportation. Scholars have quantified accessibility for a variety of transportation modes (e.g., car driving, public transit, walking, bicycling, etc.) and demonstrated that there are inequities in access to many opportunities. It has been claimed that the emerging app-based ridesourcing services such as Uber and Lyft could improve transportation accessibility, especially for areas with poor transit access or low car ownership. However,

little is known about whether ridesourcing provides accessibility equally across space and population groups. It is also unclear what factors are associated with ridesourcing accessibility.

In this study, we conduct a comprehensive evaluation of the accessibility offered by ridesourcing services. We measure ridesourcing accessibility by applying gravity-based metrics that include the attractiveness and travel impedance factors. We use transportation network providers' data for Chicago to calculate the average travel times between origins and destinations for ridesourcing trips. Travel impedance factors are computed based on the real travel times. Both the employment volume by sector and points of interest locations are used to measure the opportunity attractiveness. We estimate accessibility for three types of non-work destinations: healthcare facilities, restaurants, and grocery stores, and compare the accessibility between ridesourcing, transit, and taxis. Given the presence of spatial autocorrelation in our data, we estimate both ordinary least squares regression models and spatial autoregressive models to examine the associations between ridesourcing accessibility and census tract-level demographic and socioeconomic indicators. We find that ridesourcing has a less equitable distribution compared to transit and taxis, based on the median household income of census tracts and minority populations. Ridesourcing accessibility is also negatively associated with the percentages of three age groups (0 – 5, 6 – 17, and 65 plus) but positively associated with the percentage of zero-vehicle households.

The implications of our analyses not only aim to address the inequality of transportation but also shed light on the allocation of social and economic resources for disadvantaged populations in response to the emergence of new transportation technologies and mobilities. First, new mobilities like ridesourcing may not promote the equity of accessibility as people expect. People in low-income or minority communities still need private automobiles to access essential opportunities in their daily life due to the limited ridesourcing accessibility. Increasing service supplies in these areas could help, but it would not fundamentally resolve the problem given the relatively fixed travel durations to potential opportunities, not to mention the much higher prices compared to public transit. Transit services are still critical for disadvantaged populations' accessibility given their relatively equal provision and affordable prices. Therefore, the investment for transit should not be distracted by the development of emerging urban mobilities. Increasing available opportunities is the key to the promotion of accessibility for economically and socially disadvantaged populations.

#### **MACHINE LEARNING AUTOMATED VEHICLE (AV)-RELATED MODE CHOICE AND NONLINEAR AND THRESHOLD EFFECTS OF KEY FACTORS**

Abstract ID: 918

Individual Paper Submission

WANG, Kaidi [Virginia Tech] kaidi@vt.edu, presenting author

ZHANG, Wenwen [Rutgers University] wenwen.zhang@ejb.rutgers.edu, primary author

The majority of simulation efforts on the impacts of Automated Vehicles (AVs) assume homogeneous mode choice (Narayanan et al., 2020) despite the heterogeneity of AV mode choice suggested by a wealth of literature (Zhang et al., 2020). This is because discrete choice models adopted by most studies have low prediction accuracy, which may introduce biases if directly integrated into simulation efforts. Additionally, existing AV mode choice studies assumed linear relationships between independent variables (e.g., socioeconomic) and the dependent variable (i.e., mode choices) which is barely true in reality (Hillel et al., 2021). Moreover, limited is known about the generalizability of AV mode choice models across areas. Therefore, the objective of this study is to propose an interpretable machine learning framework to predict AV mode choice, which provides high prediction accuracy, insights on the nonlinear effects of key factors, and estimation of generalization error across areas.

This research is conducted using an AV mode choice experiment survey collected in Seattle metropolitan area. The survey collects respondents' socioeconomic and demographic, travel habit, attitudes towards environment and AVs. Each respondent takes six mode choice experiments for a revealed trip taken in a typical week given scenarios about travel time, walk distance and cost. The choice set includes current mode (i.e., private vehicle, transit, taxi, walk and bike), PAV, SAV and SAV pool. We only model the AV mode shift behaviors of vehicle and transit users, since the sample sizes of taxi and active modes are small (i.e., less than 30 responses). There are 3,186 and 312 experiments taken by vehicle users and transit riders separately. SAV and SAV pool choices are combined together due to their small share in choice experiment results. Specifically, the share of current mode, PAV, SAV and SAV pool choices from choice experiments are 73.82%, 21.31%, 3.45% and 1.41% for vehicle trips and 46.47%, 32.69%, 11.54%, and 9.29% for transit trips.

The research method is three-fold. First, we group the respondents by their current mode usage and train machine learning models on each set of responses. The trained model predicts future mode shifts, given the current mode choices. We balanced the distribution of dependent variables for model training to avoid possible model biases towards favored mode choice. The models examined include Decision Tree Classifier, Support Vector Classifier, K-Neighbors Classifier, Random Forest Classifier, and Gradient Boosting. We use five-fold cross validation to select the best model with the highest average prediction accuracy since we have already balanced the training samples.

Second, we identify the nonlinear and threshold effects of key factors from the best model using an interpretable machine learning tool, i.e., Individual Conditional Expectation (ICE) plots. ICE plots visualize the probability of selecting each mode across the values of an independent variable for each observation. Based on the findings, we provide suggestions to promote adoption of sustainable travel modes (i.e., SAV and SAV pool). Finally, we use the spatial cross validation method (i.e., iteratively train models on selected zip codes to predict the mode shifts for respondents in zip codes that the model has not seen before) to determine the generalizability of the trained machine learning model.

This study may inform the policymakers about the key factors influencing mode shifts in the era of AVs. Specifically, the results provide insights on the nonlinear and threshold effects of the explanatory variables so that policymakers can be informed to devise more efficient policies and interventions to promote the adoption of sustainable AV modes. Additionally, the trained models can be generalized to other areas with an estimation of prediction accuracy and be integrated into simulation studies to conduct more robust impact analysis.

## SEGREGATION IN SHARED MICRO-MOBILITY AND IMPACT OF PLANNING IN U.S. CITIES

Abstract ID: 919

Individual Paper Submission

WOLFSON, Rebecca [Tufts University] [rebecca.wolfson@tufts.edu](mailto:rebecca.wolfson@tufts.edu), presenting author

JIANG, Shan [Tufts University] [shan.jiang@tufts.edu](mailto:shan.jiang@tufts.edu), primary author

The growth of shared micro-mobility (bikeshare and scooter share) in the U.S. has been tremendous in the past few years. In 2019 alone, the US increased 60% of more trips than in 2018 on shared bikes, e-bikes, and scooters (NACTO, 2019). Shared micro-mobility has been envisioned as the alternative to automobile-oriented transport to make cities more livable and adapt to climate change. However, as shared micro-mobility systems have gained popularity in the U.S., data has repeatedly shown that users skew higher income and are predominately white, not reflecting the demographics of their cities' populations as a whole.

Many barriers have been identified that exclude or limit participation and access by low-income people and people of color (Ursaki and Aultman-Hall, 2015, Howland et al., 2017, Caspi and Noland, 2019). Cities and shared mobility operators have been working to address these challenges, though measuring the success of equity interventions has limitations and has lacked standardization. Few have quantified changes in the shared micro-mobility use and access by ethnicity groups over multiple cities and years. As ethnoracial residential segregation persists in communities across the U.S. (Chodrow, 2017), we argue that it is important for cities to measure changes in access between areas of different profiles with respect to race and income.

To address these gaps in the literature, we focused on bikeshare programs in four US cities (metro Boston, Chicago, New York City, and Philadelphia) over five years (2015 to 2019). Low-income communities of color often bear the brunt of the burden with respect to traffic emissions, which are also the biggest contributors to climate change in many cities. Understanding the mobility barriers in these communities to access bikeshare is critical to creating a lower carbon transportation future and freedom of mobility in impacted communities.

We define restricted or limited travel between areas of different race and income profiles as mobility segregation. We quantify a new measure of bikeshare equity and systemwide equity improvement attempts to date. Using publicly available bikeshare trip data from four U.S. cities in five years and sociodemographic data from American Community Survey (ACS), we design a data mining framework to measure the degree of mobility segregation by race and income and its changes over time. Location quotients by race (for white non-Hispanic and Black) and income at bikeshare station locations are calculated, and flow between trip origin and destination is analyzed to determine the degree of mobility segregation.

We find that bikeshare trips in Chicago and New York City demonstrate the highest degree of segregation by both race and income and those in Philadelphia and Boston are more equitably distributed. The built environment and equity considerations during system startup and design both play a role in mobility segregation. Equity infusions that are not sustained or intentional will not have the intended impact. Philadelphia, which is heralded for incorporating

equity into the system planning from the start, showed an increase in segregation over time, as investment in the system did not continue with a strong focus on under resourced communities. Finally, we provide policy recommendations and call for planning actions for cities to mitigate and disrupt mobility segregation, to design and expand the shared micro-mobility systems in more equitable ways to adapt to climate change, and to create uniform data collection and sharing principles across cities to make the planning and assessment processes more open and accessible for the public.

### **NOT ENOUGH PARKING, YOU SAY? A STUDY OF GARAGE USE AND PARKING SUPPLY FOR SINGLE-FAMILY HOMES IN SACRAMENTO AND IMPLICATIONS FOR ADUS**

Abstract ID: 924

Individual Paper Submission

VOLKER, Jamey [University of California, Davis] [jvolker@ucdavis.edu](mailto:jvolker@ucdavis.edu), presenting author  
THIGPEN, Calvin [Lime] [cthigpen@asu.edu](mailto:cthigpen@asu.edu), co-author

Minimum residential parking standards are problematic. Parking is expensive to build and maintain, it can be environmentally destructive, and it has untold opportunity costs for the land it paves. Yet despite minimal evidence of parking demand, local jurisdictions across the United States frequently require both on-street and off-street residential parking, particularly in single-family neighborhoods. This can create parking surpluses that exacerbate parking's high costs and negative impacts. Yet few attempts have been made to estimate the sufficiency of the parking supplies in single-family neighborhoods, let alone explore how nominal off-street parking spaces are actually used. We use a survey of homeowners in Sacramento, California to help fill those gaps. We also use our findings to examine one of the most commonly cited reasons for opposing construction of accessory dwelling units in single-family neighborhoods – that the new residents would overwhelm scarce on-street parking. We find that 63% of single-family detached homeowners in Sacramento use their garage at least partially for car parking. However, only 18% use their garage solely to park cars, while 27% use their garage exclusively for storage. Regarding parking sufficiency, we find that more than 75% of households have enough off-street parking to park all their vehicles. When we combine off-street and on-street parking supplies, we find that households have an average of 1.59 more parking spaces available to them than they have vehicles. That surplus is more than enough to accommodate the average ADU tenant and their vehicle. Our findings thus tend to belie claims that ADUs will overwhelm existing parking supplies in single-family neighborhoods.

## DIVERSITY, DEMOGRAPHIC CHANGE, AND VOTER SUPPORT FOR REGIONAL TRANSIT

Abstract ID: 928

Individual Paper Submission

BETTIS, Eric [University of Michigan] ebettis@umich.edu, presenting author

Despite the frequent linkages between efficient, comprehensive public transportation and economic development, transit referenda in highly segregated metropolitan areas have often faced fierce opposition by various regional interest groups. These proposed network expansions often reveal acute political and social tensions, particularly between low-income urban residents seeking transit connections with suburban employment centers and suburbanites who fear both transit development's tax burden and its impacts on the character and social fabric of their towns. There are, however, instances when the interests of more affluent suburbs and central city residents converge. Despite decades-long resistance to the expansion of Atlanta's MARTA system, many metro counties are now creating plans to integrate and expand transit capacity, as evidenced by the very narrow defeats of referenda in 2019 and 2020 for wealthy Gwinnett County, both of which garnered broad bipartisan support. In contrast, Metro Detroit has attempted numerous times to expand regional transit through ballot initiatives and legislative action, most of which have failed as recently as 2016. Despite historically sharing a common racial-spatial regional configuration, Detroit's demographics have remained largely stable while Atlanta's metro populations have experienced massive shifts with increased diversity. Both regions, however, continue to be subject to strong anti-transit sentiment that has prevented the development of comprehensive regional transit. Differing from these two regions, the Seattle metro area, which has a smaller but arguably better integrated minority population, has had much greater success at passing transit ballot initiatives. Is this region's progress with referenda due to its greater racial integration, and do the same political or demographic factors that discourage transit support in more segregated regions have any resonance in a more diverse metropolitan region? Using both the Racial Threat Hypothesis and the closely related Politicized Places Hypothesis as conceptual lenses, this paper discusses the roles of demographic composition in reflecting, and potentially influencing, changing levels of regional transit referendum support. Through comparative census, geospatial, and electoral data analyses of the case study metropolitan regions, this study seeks to establish spatial and demographic patterns that may nurture voter hostility to regional transit. Preliminary results indicate that transit opposition at the voting district level has a particularly strong relationship to racial composition and its proxies (poverty status, partisanship) in more segregated counties. Conversely, districts in diverse counties exhibit little connection between race and transit support, with AMI and proximity benefits from transit development being better predictors. This research has meaningful implications for understanding how demographic transition can influence anticipated support for transit expansion, and may provide guidance for where and to whom transit advocacy resources can most effectively be focused.

## WHAT MAKES A CITY ‘SMART’? A REVIEW AND ANALYSIS OF USDOT’S SMART CITY CHALLENGE

Abstract ID: 935

Individual Paper Submission

CHIN, Jae Teuk [University of Memphis] jchin3@memphis.edu, presenting author

GUTHRIE, Andrew [University of Memphis] guthrie1@memphis.edu, co-author

The concept of a “smart city” has gained currency in the planning field as a recognition of the potentially transformative role advanced information technology will play in urban transportation as the 21<sup>st</sup> century progresses. What makes a city “smart”, however, and who is the smart city for are crucial questions for the planning literature to systematically address. Despite the concept’s recent popularity, “Smart City” is a poorly defined term and remains an undertheorized dimension of urban scholarship. Little existing theoretical work on the Smart City concept focuses on the United States, with its particular mix of build forms, public policies and social conditions—all of which shape how transportation systems help constitute the city. The smart city idea has gained in prominence as federal urban policy has retrenched from direct service provision in favor of policies to more effectively or intelligently utilize existing resources. As such, the smart city concept operates from the implicit assumption that sufficient material resources already exist in cities to solve urban problems such as sustainability or traffic congestion if only those resources were allocated in a sufficiently efficient manner. In addition, by focusing heavily on information technology, the smart city concept approaches incomplete, disconnected and/or delayed information as primary barriers to effective planning (Luque-Ayala & Marvin, 2015; Viitanen & Kingston, 2014).

To address these knowledge gaps, this research synthesizes a working concept of the “Smart City” from the U.S. Department of Transportation’s (USDOT) Smart City Challenge, launched in 2015 as a competitive grant program with the intent to provide a spark for incentivizing the development of smart infrastructure in mid-sized US cities (Kelley et al., 2020). We compare the action plans of the seven finalist cities selected to create plans to implement their visions, including Columbus, Ohio, the eventual winner. We employ interpretivist content analysis of the applications and award decision, as well as of early implementation in Columbus, to explore shared meanings of recurring themes and key concepts, building a grounded theory of the Smart City in the U.S. context (Allen & Davey, 2018). The comparative analysis of implementation strategies revealed insights into challenges associated with deploying the vision elements framed by USDOT at the city level. While an overhaul of city operations toward smart management benefits integrating information and communications technology silos across sectors and communities, it may be more effective to implement sector-specific strategies incrementally and integrate functionality with current systems where capacity to do so exists. The findings of the comparative analysis reveal further insights into prevailing challenges in smart city deployment, particularly for the areas lacking inherent technology platforms.

## **SOCIAL AND ENVIRONMENTAL JUSTICE IN URBAN BLUE SPACE: PORT ELECTRIFICATION SCENARIO IN NEW JERSEY**

Abstract ID: 939

Individual Paper Submission

PARK, Yeonkyeong [Cornell University] yp394@cornell.edu, presenting author

Over the past three decades, waterfront redevelopment has been discussed as one of the key research topics in planning literature, mainly around benefits for industry, manufacturing and transportation for economic growth (Avni and Teschner 2019). Simultaneously however, these redevelopment issues also created debates on inequity, exclusion and privatization of space (Avni and Fischler 2020). These angles can be studied from ports and their emission impacts on the ambient air quality, especially on how the social and environmental justice is affected on the nearby port terminal residents (Houston, Krudysz, and Winer 2008). Due to ever-growing global supply chain networks, the importance of cleaner industrial operations became more critical for lower environment impacts on the local community. Accordingly, port electrification has actively been discussed to effectively reduce the long-term carbon emissions from port industrial activities (Gillingham and Huang 2020).

This paper aims to visualize the impacts by conducting port electrification scenario planning on Urban Footprint, to investigate the electrification impacts on the long-term carbon emissions of port and social vulnerability level in the Union county and Essex County, New Jersey. The research questions are centered around: If the port is electrified, how the trajectory of long-term emissions will be spatially illustrated? What are the socio-economic implications on the local communities living around the port terminals? What will the spatial distribution of long-term port emission explain about environmental justice?

The research is designed by three different scenarios – 1) baseline model of emission level in the status quo, 2) scenario A of partial electrification on the truck level, and finally 3) the scenario B of the entire port electrification at full degree. In terms of the datasets, the emission level of annual concentration of carbon dioxide is collected from the 2019 port emission inventory reports at the Port of New York and New Jersey. The Social Vulnerability Index data are from the Centers for Disease Control and Prevention’s Social Vulnerability Index based on the U.S. Census data to determine the social vulnerability of every census tract.

The study implications lie on the environmental justice accountability of industrial activities on the immediate residents to live in a cleaner environment for a higher quality of life. Especially, residents nearby port-terminal areas are more likely to be whose income levels are below average compared to the other neighborhoods with cleaner environment distant from the port terminals. Ports, as public infrastructure, are accountable for upholding principles of environmental justice and to protect marginalized and vulnerable groups of people for their fundamental right to live in a clean and healthy environment. The local air pollution is likely to be highest in the Union county and Essex county where three biggest container terminals are located. While emission contributions vary by pollutants and locations within the states, the study would like to provide a guiding evidence by providing

scenario planning.

Key Words: blue space, waterfront redevelopment, port electrification, environmental justice

#### ACCESS FOR ACCESS: IMPROVING PUBLIC TRANSIT ACCESSIBILITY FOR PEOPLE WITH LIMITED MOBILITY

Abstract ID: 971

Individual Paper Submission

KIM, Ja Young [University of Utah] jaykim37@gmail.com, presenting author

BARTHOLOMEW, Keith [University of Utah] bartholomew@arch.utah.edu, co-author

CHANDRASEKHAR, Divya [University of Utah] D.Chandrasekhar@utah.edu, co-author

Public transportation plays a critical role in ensuring access to basic needs for all people regardless of income, race, social status, age, or ability by providing a range of travel choices to the destinations. For people with limited mobility, including older adults and people with disabilities, physical accessibility to public transportation is a prerequisite for them to access transit. Transit agencies have invested in making the fixed-route transit service possible for many people with limited mobility by improving their fixed-route bus and rail services wheelchair accessible with lift-equipped or low floor buses and trains and driver training to assist passengers with disabilities. According to the 2020 Public Transportation Fact Book presented by APTA(American Public Transit Association), there have been huge improvements on accessible public transit vehicles during recent decades. Although it didn't forget to note that transit system accessibility is also affected by station accessibility, it still lacks the consideration of comprehensive transit accessibility—way to get to the station. Despite the increased attention on getting to and from transit stops/stations—frequently referred to as "first mile/last mile," — transit accessibility for populations with limited mobility has received much less attention.

This study will explore the needs and current transit planning practices that account for built environment conditions to public transportation for people with limited mobility to identify the barriers and opportunities in transportation planning. In the first phase, the authors will explore how physical accessibility to transit is considered in transit planning and try to find gaps between the needs of users and the efforts of transit providers through focus groups and interviews with ADA paratransit users, staffs in transit agencies, and disability advocates, along with the content analysis of the meeting minutes and recordings of a citizen advisory group for accessible transportation. Notably, it is addressed that beyond transit stops, institutional barriers lie behind physical and environmental barriers. Oftentimes, it is not the sole agency that can solve the issues. Given that the study started from a single mid-size metropolitan area, Salt Lake City region, Utah, we will seek the efforts and strategies to improve comprehensive public transit accessibility by reviewing the practices, processes, and plans of other US transit agencies and MPOs. Our finding would benefit both practitioners and policymakers in incorporating comprehensive transit accessibility not exclusively for those with limited mobility but for all riders and communities in planning

process to achieve accessibility justice.

#### DO ICT DEVELOPMENT AND TECHNOLOGY USE DECREASE THE DEMAND FOR BUSINESS TRAVEL?

Abstract ID: 972

Individual Paper Submission

MATSUO, Miwa [Kobe University] mmatsuo@rieb.kobe-u.ac.jp, presenting author

GAYDARSKA, Hristina [Kobe University] gaydarska@rieb.kobe-u.ac.jp, co-author

In the early 2000s, researchers argued to what extent information and communication technology (ICT) would replace face-to-face communications, including distant-communication that involves business travels. Early studies say that technology cannot fully replace physical meetings (Urry, 2002; Wickam and Vecchi, 2008), while other studies find substitute effects on long-distance business travels (Arnfolk and Kogg, 2003; Denstadli, 2004).

This paper contributes to long-lasting debates about substitution vs. complementary effects of ICT on business travel demand from two different perspectives. One is the heterogeneity by occupations, and the other is heterogeneity by the timing of ICT developments. Regarding the first point, literature documents the communication needs and relationships with the communication counterparts are different by profession. Researchers also argue that affinity with the ICT varies by frequency, depth, and complexity of communications. Thus, we hypothesize that the effects of ICT familiarity on business travel behavior vary by occupation. Concerning the second point, we hypothesize that the ICT impacts on business travel behavior vary by the timing of ICT developments. Since the early 2000s, we have observed rapid advancements in the internet infrastructure, mobile tools, and virtual communication applications. These improvements would affect the degree of virtual substitution of face-to-face communication and alter the marginal impacts of ICT usage on business travels.

Our analysis reveals how technology usage associates with (1) the likelihood of making business travels, (2) business trip frequency per day, and (3) business travel distance per day. We employ Probit, Poisson and Tobit censored estimation techniques, respectively. As an indicator of familiarity with the ICT, we focus on the frequency of internet usage. All the data are obtained from the National Household Travel Survey data of 2001, 2009, and 2017. We define internet-savvy as frequent internet users (a few times per week or more) and non-internet-savvy as infrequent internet users (less than weekly). We closely examine the marginal effects of internet familiarity for a specific occupation and year.

Our analysis finds a significant and continuous decrease in business travels throughout the period. As the ICT advances and become universally accessible, business travels seem to be substituted by digital communications. Yet,

the impacts of internet usage on business travel vary among occupations. The complementary effects between technology usage and business travel are more substantial for sales and service workers than other professions. The substitution effect is more significant for professionals than sales and service workers.

Our findings provide implications on the business practices in the post-pandemic era. In 2020, COVID-19 added pressures for substituting face-to-face communications by ICT due to the disrupted personal interactions. As the post-crisis effect might take years to revive business activities, it is critical to understand the heterogeneous relationships between ICT developments and business communication. By examining the 20 years of previous experience, we would be able to predict the bottlenecks of digital transformation and advance further to the new virtual realm.

## PREDICTING FUTURE REDUCTION OF TRAFFIC CRASHES DUE TO ADOPTION OF FULLY AUTONOMOUS VEHICLES

Abstract ID: 984

Individual Paper Submission

ZHAI, Liang [University of Florida] lzhai@ufl.edu, presenting author  
BEJLERI, Ilir [University of Florida] ilir@ufl.edu, co-author

#### Background:

As part of transportation planning, the concerns for improvements in traffic safety have recently become critical. This is because it is estimated that traffic crashes killed over 42,000 people in 2020, an alarming 8% increase compared to 2019, despite the reduction of driving mileage by 13%. Inspired by the promise of a safer future, autonomous vehicle (AV) developers are making progress in trying to deliver fully AVs (Level-5 AVs), which have the potential to significantly reduce crashes by replacing human drivers and eliminate human driver errors. However, complete replacement of human drivers in every vehicle would require a long adoption process. During this adoption process, fully AVs would need to interact with human-driven vehicles and therefore the safety concern will remain.

Since very little is known about AVs' effectiveness in reducing traffic crashes when interacting with human-driven vehicles in various geographic areas, subsequently it is unknown how transportation planning would address AV implementation in terms of traffic safety. For instance, what kind of crash reduction rates and where could we expect them as a function of the number of the AVs deployed and the types of roadways in which they are deployed?

This research aims to predict the future crash reduction as a result of the deployment of fully AVs and to project the trend of crash reduction as AVs would gradually replace human-driven vehicles.

#### Method:

The approach of this research is to determine avoidable crashes due to the adoption of fully AVs by analyzing historic crashes and replacing traditional vehicles with fully AVs. We reconstruct crash scenes of about 3,000 historical crashes in Florida and examine whether each crash could be avoided under the situation when a) the crash initiating vehicle was a fully AV; b) the responding vehicles were fully AVs; c) or all the involved vehicles were fully AVs. We utilize machine learning to automate the process of identifying avoidable crashes. A prediction model was developed to randomly replace the human-driven vehicles with fully AVs in an entire year of historic crashes in Florida. We then measure the crash rate reduction as the percentage of AVs in the market increases gradually. The location of the vehicle ownership is also considered to adjust for the different rates of AV adoption in urban and rural areas.

#### Preliminary Results:

Preliminary results show the estimated crash reduction number and trend in Florida and its different counties when the share of fully AVs gradually increases. Interestingly the results show that not all crashes would be eliminated when the percentage of fully AVs would reach 100%. The results show disparities regarding the effectiveness of expected crash reduction in different geographic areas. The AV adoption speeds in urban and rural vehicles affect the number of crashes reduced.

#### Conclusion/Contribution:

This research makes the following contributions: 1) Provides insights in understanding the crash reduction of fully AVs during their adoption process; 2) Offers a methodological contribution by providing machine learning models that can identify avoidable crashes by fully AVs; 3) Provides a summary of rare crash events that are challenging for fully AVs to handle, which can be useful for AV developers to improve AV capabilities; 4) Can assist planners and other stakeholders in developing plans and incentives to influence fully AV deployment in order to reach their crash reduction goals.

## TRANSIT-ORIENTED DEVELOPMENTS AND PHYSICAL HEALTH OUTCOMES

Abstract ID: 985

Individual Paper Submission

SHEKARI, Elham [Florida State University] es18m@my.fsu.edu, presenting author

The intricate linkage between the built environment, transportation infrastructures and public health represents an important area to realize the potential for improved public health outcomes such as higher levels of physical activity and lower levels of obesity. While evidence has shown how physical activity on a regular basis benefits physical health outcomes, further exploration is warranted on how active transportation—walking and biking to destinations—and transportation infrastructures can be leveraged to improve physical well-being. Land-use patterns have followed a historical trajectory of massive suburbanization, massive interstate highway development, and urban sprawl since the end of WWII. Subsequently, urban sprawl has led to increased levels of automobile dependency, sedentary lifestyles, and lower levels of walking and biking. Even though walking and biking are relatively easy, low-risk modes of active transportation that can potentially fulfill a quarter of all trips that are less

than a mile, these modes are severely underused due to the higher speeds of automobiles for most trips (Handy et al., 2002, p. 72). Two ways that can increase levels of active transportation is through promoting educational programs informs people on the merits of walking, and also through incorporating built environment elements that are pedestrian-oriented, including mixed-use developments and street connectivity (Handy et al., 2002, p.72).

Transit-oriented developments (TODs) presents a context in which to realize pedestrian-oriented designs encouraging active transportation, less reliance on automobiles, and the potential to unlock more active and healthier lifestyles. TODs were first coined by Peter Calthorpe (1993) who defined them as “a mixed-use community within an average of 2,000 foot (or 10-minute) walking distance of a transit stop and core commercial area” (p.9). TODs are walkable by design, and represent a synergistic combination of transit services, infrastructures supporting active transportation, and mixed-use development patterns. The operationalization of TODs was conducted through the “D” hypothesis by Cervero and Kockelman (1997), which posits that Density, Diversity and Design are the necessary antecedents or “D’s” for decreased vehicle miles traveled (VMT) and increased transit use. The three “D” hypothesis has been extended to the six “Ds” to include Distance to Transit, Destination Accessibility, and Demand Management (Ewing and Cervero, 2010), paving the way to quantitatively measure TOD. The now twenty-eight year old concept of TOD has been explored extensively in relation to property value-capture and marketing effects, yet there remains a gap in the literature on whether TODs are associated with higher physical activity levels and lower obesity (Jamme et al., 2019). This gap is addressed by exploring the research question of how physical activity outcomes (such as walking and biking) and obesity levels compares between areas that display higher levels of TODness (higher levels of the “D” variables) as compared to areas with less TODness. A statistical regression analysis of a single-case study on the Chicago metropolitan region using data from the EPA smart location database and the CDC 500 healthy cities report was analyzed to observe whether higher levels of “D” variables (and thereby TODness) are significantly associated with higher levels of physical activity and lower obesity levels. Statistical analysis of this data reveals that areas with higher levels of TODness are associated with higher levels of physical activity, as well as lower level of obesity. The implications from this study are that TODs should not only be embraced for their value-capture properties that has been thoroughly captured in the literature, but also for the potential health benefits that they hold through their support of active transportation infrastructures.

#### **AN INNOVATIVE APPROACH TO USING CROWDSOURCED DATA AS A TRANSPORTATION PLANNING TOOL: STUDYING TRAFFIC CONGESTION IN KARACHI, PAKISTAN THROUGH TWITTER DATA**

Abstract ID: 986

Individual Paper Submission

QAISRANI, Muhammad [University of Texas, Arlington] muhammad.khan10@mavs.uta.edu, presenting author  
PAN, Qisheng [University of Texas at Arlington] qisheng.pan@uta.edu, co-author  
ETMINANIGHASRODASHTI, Roya [University of Texas at Arlington] roya.etminani@uta.edu, co-author

Rapid population growth, economic development, and large-scale migration towards cities worldwide have created great mobility needs for urban dwellers. The increasing travel demand has burdened the existing transportation infrastructure resulting in issues such as traffic congestion, crashes, and deteriorating air quality (Rajé et al., 2018). Traffic congestion is a perpetual challenge for sustainable transportation development around the world. This becomes even a bigger challenge for cities in developing countries due to the scarcity of infrastructure, lack of enforcement of traffic laws, and poor or non-existent traffic regulation plans (Pucher et al., 2005; Sietchiping et al., 2012). While traffic data collection is a standard in the developed world, the availability of reliable, updated, and accurate traffic data in developing countries is limited, rendering effective monitoring or data-driven planning almost impossible. This could bring about the high cost of transportation data collection and management (Misra et al., 2014).

Advancements in science and technology and the growing number of social media users have created several new data streams where a large volume of information is voluntarily contributed by users in real-time. Such data is available in the form of social media posts, blogs, geographical data, and pictures/images. Twitter is one of the oldest and most widely used social media networks. On this micro-blogging platform, users generate more than 500 million posts (called Tweets) per day (wordstream.com). Tweets are used to express personal opinions, ideas, and feelings. Recently, government and private organizations have started using Twitter to communicate with their users/followers for delivering important and real-time information.

Keeping in view the lower cost, high volume, and ease of data collection, this research suggests an innovative approach to collecting Twitter data for temporal and spatial analysis of traffic congestion in one of the biggest cities in the world- Karachi, Pakistan.

We intend to scrape tweets made by the official twitter account of the city traffic police department which regularly tweets about real-time traffic situation in the city such as locations and reasons of traffic jams. An extensive database of tweets is built by collecting tweets from last five years. The tweets' content is then analyzed using text analysis by employing Natural Language Processing (NLP) algorithms to get insights about traffic problems in the city.

The analysis results reveal spatial and temporal patterns and the major causes of traffic congestion in the city. These findings could be used by policy and decision-makers to devise future strategies for mitigating traffic congestion on city streets.

## HOW FAR DOES THE US POPULATION TRAVEL AMID THE COVID-19 PANDEMIC?

Abstract ID: 1004

Individual Paper Submission

CHEN, Kanglin [University of Florida] kanglinchen@ufl.edu, presenting author

STEINER, Ruth [University of Florida] rsteiner@ufl.edu, co-author

In 2020, the outbreak of the novel coronavirus (COVID-19) suddenly occurred, and large segments of the population immediately began to stay at home and socially distance. People's travel behavior was drastically reshaped almost immediately. At least 316 million people in 42 states, D.C., and Puerto Rico were placed under statewide stay-at-home orders before mid-April 2020. By comparison, the other eight states either only had such an order in part of their state or did not have an order at all (The New York Times, 2020). Though the changes in public travel behavior have attracted researchers' attention, many early studies are conducted through questionnaires, the results of which are limited to the survey samples. Mobile phone data and geo-tagged tweets are analyzed in later literature; however, most of the studies use the early months of 2020 as their baselines. This procedure excludes the disparities of travel in different periods during the year. Moreover, only a few studies investigate the changes in trips by distance. This research gap leaves us with an unclear question: How far does the US population travel amid the COVID-19 pandemic?

This research unveils the percentage changes of two travel behavior indicators due to COVID-19 for people in all US states and the nation, including the population staying at home and the number of trips of ten distances from less than one mile to over 500 miles. We ask two research questions: 1) Which distances of trips have been affected, and to what degree? and 2) How far do people in different states travel? This research analyzes the data of over two million mobile phones and uses the same periods of 2019 as the baseline. This research investigates two periods since the start of the pandemic: a significant voluntary restriction (SVR) period of public travel behaviors between mid-March to mid-to-late May, as well as its following (post-SVR) period until the end of September in 2020.

COVID-19 results in an approximate 30% increase of the US population staying at home and a slightly over 30% decrease of the number of trips per capita during and after the SVR. With the decrease of the population staying at home after SVR, the percentage change of number of trips also decreases after SVR. We demonstrate that the two indicators are not necessarily associated in an individual state. Moreover, walkable trips (<1 mile) and medium-distance trips within one-hour to one-day driving (50-500 miles) are less affected than trips of other distances during SVR. A new demand emerges for these medium-distance trips after SVR, and they even surpass those of 2019. These findings suggest that people's desire to go out after the initial travel restriction do not reflect on the increase of number of trips but are somewhat compensated by the increase of travel distance. Furthermore, the stay-at-home order did not exert a significant impact on public travel behaviors. People in the eight states without statewide orders had similar drops in travel as some other states during and after the SVR, and the drops did not show a generalizable rule. This finding indicates that people's fear of COVID-19 suppresses travel. This research suggests that urban planners and policymakers should consider the provision of services and facilities based on the criticalness of the travel needs and people's changing travel habits. Regional features should also be taken into account due to the varied changes in public travel behaviors among states.

## **TRANSIT FARE POLICY IN THE WAKE OF COVID-19**

Abstract ID: 1041

Individual Paper Submission

KING, Hannah [University of California Los Angeles] hrking@g.ucla.edu, presenting author

TAYLOR, Brian [University of California Los Angeles] btaylor@ucla.edu, co-author

A year since the start of the COVID-10 pandemic, transit patronage in Los Angeles, and indeed most of the U.S., is half of its historical trend. Reduced ridership isn't the only way that transit use has changed as a result of the ongoing crisis. Transit riders are now required to wear masks, and transit operators have taken a variety of steps to reduce the public health risks associated with transit use. include more frequent cleaning of vehicles, distribution of personal protective equipment to employees and riders, and the blocking off of seats to allow for social distancing between passengers. Transit operators in Los Angeles, like transit operators nationwide, have also experimented with "fare-free" transit as a way to reduce the risks of spreading COVID-19.

Transit operators have historically been reluctant to adopt innovative fare policy due to equity concerns, a firmly-established history (in the United States) of flat-rate transit fares, and risk-averse transit management (Yoh, et al., 2010). "Flat" fares may seem equitable at first blush but charge different travelers the same price for trips of different lengths, modes, and time of day, effectively cross-subsidizing longer, more expensive-to-provide trips with revenues from shorter, less-expensive-to-provide trips (Nuworsoo, et al., 2009). Fare schedules that charge different fares to different user groups based on ability to pay can help mitigate vertical equity concerns, while distance-based fares that vary by trip distance and/or time-of-day do a better job of matching the price charged for transit service to the cost of serving that trip (Farber, et al., 2014). Other factors influencing the cost of trip provision include the mode of transit used, passenger counts, vehicle load factors, and the specific characteristics of the urban area being served. Although Los Angeles Metro and other operators around the U.S. expressed interest in experimenting with fare-free transit before the current pandemic as a response to longstanding structural issues stemming from over-reliance on flat fares, it took the unforeseen exigencies of COVID-19 to incentivize rapid widespread experimentation in fare policy. Coupled with reduced patronage, however, experiments in fare-free transit have exacerbated long term declines in the share of transit agency costs covered by fare revenues.

In this paper we review innovative fare policies currently being explored or implemented by transit agencies nationally, with a focus on Southern California. We identify the characteristics of transit agencies that are currently exploring or implementing innovative policies. We evaluate the success of agencies in generating revenues and addressing equity concerns. We specifically examine fare-free transit compared with those that vary based on time, distance, and customer type. We focus on the recent rise of fare free transit, evaluating its effects. Given that eliminating payments also eliminates the need for fare enforcement, what does the net fiscal and equity impacts of free fare policies tend to be? What are the opportunity costs? In short, we are interested in understanding, based on current practice and research, the future of transit fare policy.

We contribute to existing literature by summarizing the current landscape of innovative transit fare policy and analyzing these policies through an equity and efficiency lens. The results of our analysis will be used to shape our future work on the fiscal and performance implications of innovative fare policies for specific agencies. By better understanding how emerging technology can help to match the marginal costs of serving different traveler and trip types, our findings can help ensure that fare policies are equitable but also economical. In doing so, we endeavor to

provide actionable guidance for transit agencies as they move toward fare policy reform in the wake of COVID-19.

### DRIVING ELECTRIC WITH EQUITY: AN EVALUATION OF CURRENT ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Abstract ID: 1042

Individual Paper Submission

SA, Boyang [University of Washington] boyangsa@uw.edu, presenting author

BAE, Christine [University of Washington] cbae@uw.edu, co-author

Amongst the financial or non-financial incentives for adopting electric vehicles (EV), those who target electric vehicle supply equipment (EVSE) infrastructure, also known as charging stations, aim to increase the attractiveness of EV by not only making the vehicle more affordable, but to decrease the cost of owning EV. Financial incentives for EV charging infrastructure include subsidies, rebates, or tax credits to defer the purchase and installation costs of EVSE. Adopting EV depends on developing charging infrastructure, and they can be charged from a standard power outlet or at a direct current fast-charging station. Infrastructure is not a direct way to motivate consumers to adopt EV, but increasing the number of EV charging stations could incentivize consumers to adopt the technology. Policymakers, workplaces, utility companies, and local agencies are promoting the introduction of such infrastructure in the hope of increasing EV's market share. Some states also proposed financial incentives for EVSE installations with an income tax credit at the state level. In Georgia, businesses could obtain qualified EVSEs and receive 10% of the cost of EVSE as a tax credit, up to \$2,500. New York also offers an income tax credit for 50% of the cost of charging infrastructure for up to \$5,000.

However, with all the incentives and policies, there is no evaluation of how equitable these initiatives are, i.e., whether or not the less-advantaged communities can benefit from them, as current EV owners tend to have higher education, with higher income, younger, owning more than one vehicle, and male-dominated. Hence, it is equally important to make sure that charging infrastructure funded by public dollars are distributed equitably and fairly. Government-provided or subsidized charging infrastructure is expected to help address the problem of limited EV range and the inability to charge at home for those who do not own a home of sufficient space to install charging equipment. Yet, existing literature and professional reports do not evaluate the equity aspects of these policies and incentives. This study intended to focus on a spatial analysis of the equitability of current EVSE installation site selection. Moreover, the study aims to build an EVSE equity measurement, which could provide nuanced analysis for stakeholders to take into account the socioeconomic conditions while a rapid transition is happening to the transportation sector, and also promote climate justice when electrification is considered to alleviate climate change.

To evaluate current EVSE spatial distribution, we collected the location of all non-residential charging stations in North America, and identified if a spatial relationship between the distribution of charging facilities and the less-

advantaged communities can be found. We focused on four cities in the west coast, namely Los Angeles, San Francisco, Portland, and Seattle, whilst all of them among the cities that are considered “friendliest” for EV ownership. The result indicated different EVSE accessibility in the less-advantaged communities in different cities. Portland, for instance, has shown statistically significant positive correlation between lower-income or colored neighborhoods and public funded charging infrastructure. Los Angeles, on the other hand, faces a gap of EVSE accessibility in Latino neighborhoods. We also found that less-advantaged groups benefit better from the EV policies and incentives when equity is addressed in EV strategies in planning documents. The results suggest that the current incentive model of providing subsidies to everyone who purchases EV or EVSE does not take social equity into account. Governments should actively explore for a more comprehensive inventory of planning policy toolboxes that target mobility, accessibility, sustainability, and equity could be simultaneously built. This study could contribute to building such toolboxes and a framework that helps governments weigh their priorities when planning for EV infrastructure.

#### PILOT TESTING A QUIET STREET INITIATIVE IN RESPONSE TO COVID-19 IN KINGSTON, ONTARIO, CANADA

Abstract ID: 1068

Individual Paper Submission

COLLINS, Patricia [Queen's University] [patricia.collins@queensu.ca](mailto:patricia.collins@queensu.ca), presenting author

When COVID-19 sent the country into lockdown in March 2020, rates of physical inactivity increased for many Canadians (Lesser and Nienhuis, 2020). In response to this worrying trend, health experts began encouraging residents to walk or bicycle within their neighbourhoods for exercise, recognizing the physical and mental health benefits that such activity would confer (Colley et al., 2020). This new reality stimulated calls for cities to quickly introduce active transportation (AT) corridors to accommodate residents’ needs to be active while also being physically distant from each other (Fischer & Winters, 2021). Indeed, by June 2020, the Federation of Canadian Municipalities had released its own Street Rebalancing Guide, to give municipalities some direction on how this work can be completed quickly and with minimal effort and resources (FCM, 2020). It remains unclear, however, whether such initiatives have been effective at increasing active transportation engagement among residents, as well as how they have been received by residents who live along the affected corridors.

In response to growing public enthusiasm for street rebalancing initiatives, on June 16, 2020, Kingston, Ontario’s city council voted unanimously to delegate authority to a locally based not-for-profit organization, the Kingston Coalition

for Active Transportation (KCAT), to implement the city's first ever Quiet Street. Following a series of consultations with city councillors, city staff, and community association leaders, KCAT designed a single 3km Quiet Street route that would traverse the city's central and downtown neighbourhoods. The Quiet Street was approved by City staff on August 5, 2020, and the initiative ran from September 1 to November 9, 2020. KCAT partnered with Queen's University to evaluate the initiative in terms of AT engagement along the corridor, perceived safety of the corridor among AT users, and corridor residents' attitudes towards the initiative. The evaluation was conducted using three data sources: street observations; an online survey of Quiet Street users; and an online survey of Quiet Street residents.

The observations revealed that AT engagement increased from baseline to October on weekdays, and that walkers were the majority AT users during all observation periods. The majority of AT users perceived the Quiet Street corridor as safe, but bicyclists felt more positively about the initiative than walkers/runners. The majority of resident survey respondents felt the Quiet Street corridor created a safe space for pedestrians and bicyclists, observed no change in congestion caused by the initiative, and felt positively about the initiative.

Several recommendations emerged to guide future efforts: solicit applications from neighbourhoods to facilitate greater community buy-in and support from residents; address arterial road barriers to expand beyond the city's core; use low maintenance and inviting street barriers that cannot be easily moved by residents; promote the initiative through events and street stewards; and run the initiative for longer periods to induce sustained changes in travel habits. The moderate benefits observed from a 3km Quiet Street corridor coupled with minimal adverse effects suggests this approach to street rebalancing should be expanded and tested elsewhere.

#### CAR CULTURE AND DRIVING CESSATION

Abstract ID: 1073

Individual Paper Submission

PIATKOWSKI, Daniel [University of Nebraska Lincoln] [dpiatkowski2@unl.edu](mailto:dpiatkowski2@unl.edu), presenting author  
MARSHALL, Wesley [University of Colorado Denver] [Wesley.marshall@ucdenver.edu](mailto:Wesley.marshall@ucdenver.edu), co-author

Driving cessation is the process of individual physical and mental declines resulting in losing the ability to drive a car. Driving cessation in the United States, and the myriad problems it poses, tend to be treated as an inevitable aspect of aging. But losing the ability to drive is only a problem if one depends on a car. As such, efforts to address the problem of driving cessation at its root must start at addressing the larger culture in the US that treats auto-dependence as a normal, and even a celebrated component of American identity.

Car Culture in the United States is perhaps best typified by the popular culture of the post-World-War II era. Films like George Lucas' "American Graffiti" (1973) and songs like The Beach Boys "Little Deuce Coupe" (1963) celebrate the cultural significance of the car in the US. In the intervening years since WWII, the children who grew up in the suburbs of the post-war era have largely spent their lives in auto-dependent places. In turn, the so-called "baby boomers" raised in these suburbs have watched their parents lose the ability to drive and dealt first-hand with the consequences of driving cessation.

Rosenbloom, in a 2010 study, suggested a "policy window" to address driving cessation had opened as boomers faced their own parent's driving cessation. Unfortunately, in the intervening decade, there have been limited policy-responses to address driving cessation. If we are to still take advantage of this inflection point, we need to better understand car culture as a barrier to addressing driving cessation. This research empirically assesses the assumption of American car culture as a monolith. We do this by uncovering latent individual attitudes and perceptions that are typically grouped together as a single car culture. We use data drawn from a household survey administered in the midwestern United States (a region known for its auto-dependence and increasing proportion of older people in the population).

We developed over 50 attitudinal questions about driving cessation and car culture by following applicable theories in aging and travel behavior research. Questions regarding social integration, ability to contribute to society, and individual autonomy are rooted in a recent application of the Capabilities Approach (Sen, 1985) to functional aging (McKee and Shuz, 2015). From the travel behavior literature, we developed questions incorporating elements of Ajzen's Theory of Planned Behavior (Ajzen, 1991), including attitudes, subjective norms, and perceived behavioral control, supplemented with measures meant to quantify personal efficacy, identity, and habit (Anable, 2005).

Results of a Principal Components Analysis indicate six attitudinal factors associated with age-related driving cessation: car-dependent lifestyle, active-aging and walkable-community policies, personal identification around cars/driving, desire to voluntarily stop driving, concerns around autonomy and losing the ability to drive, and rejection of the possibility of losing the ability to drive. We then identified significant correlations between these factors and variables representing the built environment, travel behavior, demographic, and driving cessation policies.

Our results point to generational divides in addressing age-related driving cessation. Younger people tend not to associate cars and driving with their identity or their independence, and thus may be more likely to support accessibility-enhancing policies in general and as a means to address age-related driving cessation. In contrast, some older individuals are particularly tied to driving, identify favorably with "car-culture," and perceive continuing to drive as necessary for personal independence (and potentially a social indicator of one's continued independence in later life). Our results suggest that policies to address age-related driving cessation in a holistic way should focus on how such approaches can increase independence and ability to engage with society as one ages.

## **(DIS)ASSOCIATION OF TRANSIT QUALITY AND RESIDENTIAL LOCATION DECISIONS OF IMMIGRANTS IN TORONTO SUBURBS**

Abstract ID: 1075

Individual Paper Submission

HARUN, Rafael [Wilfrid Laurier University/Balsillie School of International Affairs, Waterloo]

rafael.harun@gmail.com, presenting author

FILION, Pierre [University of Waterloo] pfilion@uwaterloo.ca, co-author

This research sits at the juncture of three themes: immigrants' residential patterns, their choice of commuting modes, and the uneven distribution of public transit quality. It is a well-known fact that immigrants' transportation behavior is substantially different from that of non-immigrants. Studies point towards higher use of transit and carpooling, lower individual car use, and also shorter travel distances, among immigrants compared to the non-immigrants (Heisz & Schellenberg, 2004; Newbold, Scott, & Burke, 2017). Meanwhile, immigrants are increasingly residing in the suburbs, departing from the past tendency to settle in traditional inner-city gateways. This change in the residential settlement pattern has resulted in the rise of ethnoburbs, where the immigrants cluster near their co-ethnic population in the suburbs, and form fully functional ethnic communities consisting of ethnic businesses, services, and institutions (Li, 1998; Wang & Zhong, 2013). This suburbanization of immigrants can place those who rely on public transit in a difficult position as public transit service levels are lower and more uneven in suburbs than in more central parts. Research has linked the quality of neighbourhoods with higher transit use and lower car use among their residents (Foth, Manaugh, & El-Geneidy, 2013). That immigrants are residing in the suburbs where transit quality is uneven, we can expect that suburban living will cause many immigrants who use public transit to transition more rapidly to the car. Other transit-reliant immigrants may instead be drawn to those suburban residential locations registering transit quality levels above the suburban norm.

This study investigates whether transit quality of neighbourhoods influences residential choices of immigrants living in the suburbs. It also gauges the relation between the transit quality of an area registering concentrations of immigrants and the level of transit use among residents of this area. A number of questions are addressed in this research. How important is transit quality as a factor of immigrant residential location? How does the attraction of transit quality in residential areas vary between immigrants and non-immigrants? To what extent does transit quality influence the modal choice in the areas where immigrants reside? How does transit quality compare to other variables in determining modal choices in immigrant neighbourhoods?

The research focusses on the Toronto metropolitan area, where nearly half of the population are immigrants, and the suburbs register uneven transit quality. In order to single out the effects of economic and cultural differences among immigrant communities on their attractions to quality transit neighbourhoods, we concentrate on two largest immigrant groups in Toronto, Chinese and South Asians. The analysis in this research is performed in three stages. First, a new transit quality index is devised for Toronto neighbourhoods, since prior ones do not explicitly consider the suburbs, as well as different types of transit services. Second, the association of transit quality and the residential and modal choices of immigrants is determined. Finally, the relationship between transit quality and modal share in Chinese and South Asian suburban settlements is derived.

Findings from this study reveals that although immigrants generally register a high propensity to use public transit and are attracted to quality transit neighbourhoods, transit quality has a weak impact on immigrants' residential location and commuting mode decisions. There are also differences in the extent of the relationship between the Chinese and South Asian immigrants residing in the Toronto suburbs. The study determines stronger influence of locational factors other than transit quality influencing these immigrants' choice of residential locations and commuting modes. From a planning perspective, the findings are further evidences of the difficulties transit oriented development strategies encounter when trying to assure that transit-reliant populations live close to high quality transit services.

## OPERATIONAL CONSIDERATIONS OF ZERO EMISSION HEAVY-DUTY TRUCKS: PERSPECTIVES FROM THE TRUCKING INDUSTRY

Abstract ID: 1084

Individual Paper Submission

DEXTER, Sue [University of Southern California] [shdexter@usc.edu](mailto:shdexter@usc.edu), presenting author

FANG, Jiawen [University of Southern California] [jiawenf@usc.edu](mailto:jiawenf@usc.edu), co-author

GIULIANO, Genevieve [University of Southern California] [giuliano@usc.edu](mailto:giuliano@usc.edu), primary author

Freight is a significant cause of air pollution and greenhouse gas emissions in Southern California, in part due to 20,000 full and empty containers traversing the freeways to and from the San Pedro Bay port complex to industrial parks and intermodal facilities daily. According to the California Office of Environmental Health Hazard Assessment, these corridors have the highest diesel particulate matter and overall pollution burden for California communities. (California Office of Environmental Health Hazard Assessment) To reduce greenhouse emissions, battery-electric vehicles (BEV) and other alternative powertrains are gaining headway in California and elsewhere, especially in the medium-duty delivery truck market. But what about heavy-duty trucks? Can zero-emission vehicles handle the operational requirements of firms with this type of equipment? For example, battery-electric trucks must carry heavy batteries, which limits the cargo they can carry. Between charges, BEV trucks have a lower range than their diesel counterparts. Also, fleets will need to reconfigure their lots to accommodate the charging infrastructure. This presentation addresses California's legal framework driving heavy-duty BEV technology and the magnitude of operational adjustments firms will face to implement BEVs in the near to medium term.

The first part of this presentation discusses California's legislation to reduce emissions from trucks. California has passed laws for both market and rule-based policies on heavy-duty trucks to promote zero and near-zero vehicles and infrastructure. A brief discussion of these different policies will demonstrate California's commitment to the evolution of trucking technology. (Dexter; Choe)

The second section presents potential markets for alternative fuel trucks in the Los Angeles region. Using Southern California Association of Governments (SCAG) regional transportation model data, a spatial analysis concluded that by overlaying truck trip intensity, employment, distribution center locations, and intermodal facilities, three specific truck-related activity clusters exist in the greater Los Angeles area. In-depth interviews of fleet operation managers provided industry insights on alternative fuel heavy-duty trucks arising from demonstration projects and BEV truck manufacturer contact. Finally, to understand the nature of operations, three vastly different types of firms provided daily operational data for daily truck trips. Analysis of these case studies estimates how much demand could be

handled by BEVs. Results of the interviews and case studies demonstrate that while BEV technology has made strides in the heavy-duty space, efficiencies must improve before firms will commit to the additional expense of electric vehicles except for some cherry-picked routes. Incentives alone cannot compensate for the massive changes in operations that would be required. (Giuliano et al.)

Over the last few decades, cities have been making a series of multibillion-dollar investments in hub airports not only as transportation nodes to manage regional traffic growth but also as employment centers to drive local economic growth (International Transport Forum, 2014). The development of airport systems, including 24-hour operation, runway expansion, terminal modernization, service automation, and ground transportation, is expected to produce additional capacity, improve operational efficiency, increase service accessibility, attract competitive firms, create business opportunities, and, consequently, uplift commercial property values in airport-linked free economic zones and industrial parks. Indeed, a series of airport expansion projects are also likely to generate property value discounts for extra negative externalities (e.g., traffic congestion, noise, air pollution, building height restriction, and infectious disease spread) in nearby economic zones.

Numerous hedonic price studies have been conducted with public concern about the geospatial influences of airport noise exposure on residential communities since the 1970s. A meta-analysis across cities in North America suggests that the positive influences of airport accessibility and employment opportunities can be more valued by local communities than the negative externality effects of airport proximity, depending on land use zoning requirements and socioeconomic conditions (Nelson, 2004). One hedonic price analysis also infers that some advancements in aircraft technology and airport design are likely to produce greater opportunities for land use rezoning and real estate development around hub airports in North America (McMillen, 2004). Another study suggests that the operation of city airports is undesirable for their significant noise costs and insignificant accessibility benefits to densely developed commercial areas in Europe (Ahlfeldt and Maennig, 2013). However, the positive and/or negative influences of airport system development on nearby commercial properties are less reported, especially from cities with hub airports in Asia.

This study presents the influences of airport system "development" (a series of new terminal, runway expansion, and airport rail link construction projects), as well as "suspension" during the recent pandemic/lockdown periods of Severe Acute Respiratory Syndrome (SARS) in 2003 and Coronavirus Disease 2019 (COVID-19) in 2020/2021, on (i) office, (ii) retail, and (iii) industrial values, respectively, using property sales transaction data around Changi Airport in Singapore for the past few decades. Spatiotemporal inferences drawn from the three sets of hedonic regression models are summarized for the dialogs between, airport managers, planning authorities, property owners,

commercial tenants, and local communities, with special attention to the competitiveness and sustainability of cities with hub airports in Asia or called “airport centric development” in North America (US Government Accountability Office, 2013).

#### MITIGATION OF TRANSPORTATION DISASTERS DURING EXTREME FLOODING IN HARRIS COUNTY, TX

Abstract ID: 1094

Individual Paper Submission

POWERS, Liza [Texas Southern University] l.powers4800@student.tsu.edu, presenting author

Flooding is the second most common natural disaster to result in death, and approximately sixty percent of those who die in extreme flooding events are in their vehicle (Ashley & Ashley, 2006). Improved weather prediction technology has not translated to fewer lives lost as the number of deaths has increased in the last twenty years (Terti, Ruin, Anquetin, & Gourley, 2017). While technology and community education have aided in the decline of other natural hazards such as lightening and tornadoes, significant decline in flood related fatalities has not occurred (Maples & Tiefenbacher, 2009). Literature offers uncharted opportunities to bridge the gap between mitigation and transportation policy, which from a theoretical lens, parallels each other but fails to work in tandem to realize greater mitigation in roadway disaster during extreme flooding events.

In an interdisciplinary study, researchers determined through a predictive scenario survey of participants in Denver and Austin that experience with historic flooding led to more cautious drivers, those that did not take warning seriously were more likely to drive in flooded roads, those that didn't realized that half of fatalities in flooding came from drivers were more likely to drive in flooded roads and drivers with no previous experiences to flooded roadways and drivers under the age of thirty-five were also more willing to risk driving with water on the road (Drobot, Benight, & Gruntfest, 2007). Zahran et al. (2008) used social vulnerability to measure against flood-related deaths and found that flooding near socially vulnerable populations, increased rain the day of the flood, the duration of the flood, and population density can increase the number of deaths. This study did recommend that future research include a qualitative component (Zahran, Brody, Peacock, Vedlitz, & Grover, 2008). Jonkman et al.'s review of flood fatalities from Hurricane Harvey found that most of those deaths occurred outside the 100-year floodplain, and that men comprised seventy percent of the deaths, with those over the age of 50 an increasing trend (2018).

Various quantitative research projects indicated observed characteristics of those most likely to die and the potential reasons for it; however, the field is missing a narrative to explore the reasons behind the phenomenon. Despite the body of quantitative analysis, no one understands why people end up driving into flood water.

Specifically, urban planning studies could provide a missing link to engage a more interdisciplinary discussion among public health officials, highway designers and engineers. This critical case study focused on vehicle related deaths from Tropical Storm Allison (2001), Memorial Day Flood (2016), Tax Day Flood (2016), Hurricane Harvey (2017), and Tropical Storm Imelda (2019) in Harris County, Texas. Harris County's seat, Houston, is the fourth largest city in the United States. With twenty-two waterways flowing to the Gulf of Mexico, Harris County is prone to both sudden onset and slow onset flooding. Flood fatalities in the greater Houston metropolitan lead in numbers for the United States (Sharif, Hossain, Jackson, & Bin-Shafique, 2012). Victims of these selected storms that died in an automobile or died from abandoning their vehicle were mapped in GIS. The researcher conducted 97 semi-structured interviews of people who drove during these extreme flood events as well as reviewed past and current mitigation policies for driving during extreme flooding. Street observations of all the locations were made to determine any patterns in the death to improve current mitigation practices of Harris County.

### **REDUCING IMPACTS OF HEAVY DUTY TRUCKS IN COMMUNITIES OF COLOR**

Abstract ID: 1113

Individual Paper Submission

GIULIANO, Genevieve [University of Southern California] giuliano@usc.edu, presenting author

DEXTER, Sue [University of Southern California] shdexter@usc.edu, co-author

BINDER, Robert [University of Southern California] rbinder@usc.edu, co-author

RANDAZZO, Marley [University of Southern California] marley.randazzo@usc.edu, co-author

There is extensive evidence that the externalities of freight traffic disproportionately affect low income, minority communities. Studies of truck traffic in New York revealed that neighborhoods near the ports – predominantly low income and minority -- incur a heavy burden of diesel pollution and noise (Lena et al, 2002). Studies of the Los Angeles region show the same pattern (Kozawa, Fruin & Winer, 2009; Houston, Li & Wu, 2014). Warehouse and distribution clusters, which attract heavy freight traffic, are major sources of pollution, and are disproportionately located near minority communities (Bluffstone, & Ouderkirk, 2007; Yuan, 2018).

The purpose of our research was to examine impacts of freight traffic on communities of color located in southeast Los Angeles County. We partnered with a local community organization, the Southeast Los Angeles Collaborative (SELA), to examine impacts and develop recommendations for mitigation. The SELA area includes 11 cities and some unincorporated areas of Los Angeles County. With a population of 750,000 within 62 square miles, it is one of the densest areas of the County. It is majority Hispanic, and the median income is below the County average. It is identified as a high pollution, high population burden area by CalEnviroScreen.[1]

Our approach was informed by the interests and concerns of the community. We used a mixed methods approach

that included interviews with public agencies, community focus groups, data analysis, field observation, and micro-simulation modeling. The original purpose of the research was to focus on emissions from truck traffic and identify strategies for reducing emissions. Our research changed after the first focus group revealed traffic safety to be a more critical concern than air pollution. The research therefore addresses both emissions reductions and traffic safety.

Findings to date include the following:

Regional truck traffic: Using data from the regional transportation planning model we identified truck trips that originated, arrived, or traveled through the SELA area. Most truck traffic is through traffic, and SELA has a higher proportion of truck traffic than the average for the region. Mitigation of emissions at the regional level will be required to substantially reduce emissions within SELA.

Local truck traffic: We identified hot spots of concentrated truck activity. As expected, these were areas of warehousing and manufacturing and the major arterials connecting these areas. Truck crashes and pedestrian safety: We used a California crash database to examine truck involved incidents over a three year period. Truck crashes per capita are higher in SELA than the region as a whole, and 55% of the crashes take place on local roads. We identified hot spots based on truck volumes, crash numbers, location with respect to sensitive facilities, and other factors. We selected 5 hot spots for detailed analysis. Of these, we selected two for modeling the impact of mitigation strategies.

Full results, conclusions, policy recommendations, and reflections on the collaboration with SELA will be included in the final paper.

[1] CalEnviroScreen is a mapping tool that uses environmental, health and socioeconomic data to rank vulnerability of communities to the impacts of pollution. See <https://oehha.ca.gov/calenviroscreen/about-calenviroscreen>.

### **DO ECONOMIC ACTIVITIES HAVE A CAUSAL RELATIONSHIP TO TRAFFIC FATALITIES? AN INTERNATIONAL STUDY FROM 76 COUNTRIES**

Abstract ID: 250

Poster

XU, Xingjing [University of Florida] axuxinjing@ufl.edu, presenting author  
BEJLERI, Ilir [University of Florida] ilir@ufl.edu, co-author

While traffic safety improvements have been an ongoing focus of the transportation planning research community for a long time, traffic fatalities trend in recent years in the world remains unacceptably high. According to the World Health Organization (WHO), in 2018, the number of road traffic fatalities was about 1.35 million, ranking eighth among all causes of death in the world. The number of fatalities has been growing and there are significant differences among countries with different income levels. A higher traffic fatality rate exists in low-income countries and traffic fatalities have become the most severe problem in several developing countries.

Kopits & Cropper (2005) describes the relationship between traffic fatalities and economic growth as an inverted-U pattern. In this study, we develop a more detailed inquiry to associate the traffic fatality rates with economic indicators, and examine the causal effects of changes in economy on traffic fatalities. Our research question is concentrated on understanding which economic indicators have causal impacts on traffic fatality rates, and whether there is a difference among countries of different economic levels.

Our study models the fatality rates in 76 countries of different income levels and explores the possible causal relationship between economic development and traffic fatality rates. We use panel data including traffic fatalities, economic indicators, regulation-related indicator, and other related indicators. The countries were studied in groups by income level. The evidence shows different influences on traffic fatality rates from explanatory variables by group. The dynamic panel data (DPD) model and Random Forests (RF) were applied. DPD is a classic econometric approach that contains one or more lagged dependent variables, allowing for modeling unobserved heterogeneity. The major advantages of this model include the considerations of individual time series for each unit area and the cross-sectional variations among the unit areas. RF is a machine learning method famous for its predictive capabilities. Though it is not designed for causal inference, the flexibility of RF could help to reveal the relationship among the variables as well as the lagged variables by its predicting abilities.

By comparing the DPD and RF models among countries of different income levels, this study concludes that there is causality between some economic indicators and fatality rates, such as GDP per capita, energy consumption per capita, and unemployment rate. GDP per capita has a causal effect on fatality rates in high-income countries, but not significant in the rest of the countries. Unemployment rate shows consistent causal effects on all groups of countries. The other related variables, did not show statistically significant causality to fatality rates.

The study illustrates the causal links between economic developments and traffic safety issues. Reducing fatality rates is an important goal for all countries worldwide. High-income countries could focus on the raise of GDP per capita, since it has a causal link to the drop of fatality rates. The rest of the counties - upper-middle, lower-middle, and low-income - would remain suffering the noncausal relationship from the GDP growth to the drop of fatality rates. By raising the energy consumption per capita, these countries could reduce fatality rates. Other related variables, such as people's attitude towards the law showed its importance in predicting the fatalities. Thus, to adopt the safety-related legislation and to educate the driving population may also improve traffic safety. Future research could focus on the causal connection between traffic fatalities and government safety legislations and expenditures.

## EFFECTS OF LIGHT RAIL TRANSIT ON TRAFFIC IN A TRAVEL CORRIDOR: AN UPDATE

Abstract ID: 617

EWING, Reid [University of Utah] [ewing@arch.utah.edu](mailto:ewing@arch.utah.edu), co-author

In 2014, researchers at the University of Utah completed a study on the short term effects of a light rail extension along a 2.3-mile stretch of University Blvd from downtown Salt Lake City to the University of Utah. The report concluded that the light rail extension reduced traffic in the corridor by about 10,400 vehicles per day in 2012 compared to traffic volumes in 1999 before construction began. Since this study was published, the University Blvd corridor has undergone rapid change, with transit station area zoning having encouraged much high density mixed use development near rail stations in the corridor. Several large apartment buildings and mixed use developments have been constructed since the study's completion, yet University Blvd still rarely experiences heavy congestion. This led the Utah Transit Authority to wonder whether light rail continues to suppress traffic volumes in the corridor.

This study serves as an update and investigates how new development in the University Blvd corridor has affected traffic levels since 2012. The study also aims to quantify the value of new development in the corridor and the amount of air pollution and carbon emissions avoided due to light rail. Before the update, anecdotal evidence suggested that traffic volumes in the corridor remained well below levels expected with the large amount of new development, and this also suggests substantial pollution and carbon emission reductions. Using a quasi-experimental design, this study concludes that, despite an uptick in traffic volumes and a slight decrease in overall transit ridership since 2012, traffic levels in the corridor remain about 7,800 vehicles per day lower than expected based on trip generation calculations. This amount of traffic suppression prevents an estimated 5.93 million pounds of carbon dioxide emissions annually and causes a sizable decrease in several other common air pollutants. The analysis also finds that about \$7.7 billion worth of development occurred in the light rail corridor from 1999 to 2020, with \$3.2 billion occurring in the most recent decade.

As cities and metropolitan areas move into the future, climate change and environmental justice will remain two of the largest and most challenging issues. The transportation sector is one of the largest sources of carbon emissions and other pollutants, and this study provides evidence that well-planned rail transit can not only substantially reduce carbon emissions directly by taking vehicles off the road but also by encouraging denser, more compact development which produces less carbon per capita. It is our hope that this research can help planners and decisionmakers justify planning, funding, and constructing rail transit to address climate change and increase transportation equity.

MOZAFFARIAN, Ladan [University of Texas, Arlington] ladan.mozaffarian@uta.edu, presenting author

LI, Jianling [University of Texas, Arlington] jjli@uta.edu, co-author

PRATT, Ezra Samuel [University of Texas, Arlington] ezra.pratt@mavs.uta.edu, co-author

FUNG, Vivian L [University of Texas, Arlington] vivian.dillen@mavs.uta.edu, co-author

During the past century, cars dominated urban transportation in the U.S, which resulted in car-oriented urban landscapes and car-dependent cities. However, during the past decades, many scholars and planners have discussed that car-dependent cities are not sustainable (McNeil, 2011) due to issues such as traffic congestion, climate change, air pollution, shortage in energy resources, and lack of physical activity (Winters et al., 2013; Krenn et al., 2015). Accordingly, there have been various efforts to moderate issues resulted from car-oriented urban planning. To provide more sustainable and equitable transportation options, biking and designing bike-able cities are among the most acceptable and widespread strategies. Unlike pedestrians, cyclists can access a broader type of destinations, travel faster, and carry loads more easily (McNeil, 2011; Winters et al., 2013). Therefore, providing accessible, safe, and ample bike routes is becoming one of the central policies for cities all around the nation.

The City of Arlington is the self-proclaimed "American Dream City," a place characterized by entertainment, education, and entrepreneurial opportunity. In support of this ideal, the City of Arlington is taking strides towards implementing the infrastructure that facilitates this claim. One of the City's actions towards this goal is the release of its "Hike and Bike System Master Plan" in 2011. Since then, the City has begun implementing a network of 138 miles of on and off-street bike routes and trails in addition to the limited existing hike and bike trails (City Of Arlington, TX., 2011). Therefore, this study aims to investigate whether Arlington's existing and planned bike network connects its residents to key destinations within the City?

We assess the existing and planned bike network's accessibility to identify if it specifically facilitates bike connections between residential areas and six major destinations within Arlington, including apartment complexes, healthcare destinations, educational facilities, top employers, municipal facilities, and food destinations. Utilizing ArcGIS Pro, we mapped the locations of the six categories of key destinations. We then proceeded to overlay each category with the existing and planned Arlington bike network. To assess the accessibility of the key destinations to the bike network, we determined if the key destination that lies within 0.25 miles of some portion of the bike route is accessible to the network (McNeil, 2011; Perry, 1929). Finally, we conducted a spatial query to determine which of the key destinations in each category intersected with the 0.25-mile buffer.

Our analysis reflects that the accessibility of these key destinations will improve dramatically through the establishment of the City's planned bike routes. Our findings indicate that the three key destinations currently

having the lowest accessibility rate to the existing bike routes are healthcare facilities, key food establishments, and municipal facilities, with 25%, 36%, and 40%, respectively. The accessibility rate will be improved dramatically to 63%, 67%, and 83%, respectively, when the planned bike routes are constructed and added into the network. The other three key destinations, including education centers, apartment complexes, and top employers, are accessible by the existing bike network with 44%, 48%, and 50% of key destinations lying within a quarter-mile of the network, respectively; however, these rates will hop up to 84%, 74%, and 60% respectively with the addition of the planned segments of the network. In its application, this study can help to explore where existing and planned infrastructure is adequate and which neighborhoods may not be receiving much-added value from the planned bike routes. This kind of analysis provides a powerful visual aid to identify zones where changes are needed to support sustainable transportation options.

## **GENDER DIVISION OF HOUSEHOLD CAR USE: A COMPARISON BETWEEN “AUTO-DEFICIT” AND “NON CAR-DEFICIT” HOUSEHOLDS**

Abstract ID: 962

Poster

SINGH, Seema [Cornell University] ss3625@cornell.edu, presenting author

RANGARAJAN, Shriya [Cornell University] sr2248@cornell.edu, co-author

Individuals without adequate access to cars face higher social and transport disadvantages, and by consequence, social exclusion. This is particularly true in car based economies like the US where about 15 percent of total households reported fewer vehicles than drivers in 2017. These “car-deficit” households have however not received enough research or policy attention, particularly in terms of how it marginalizes certain members of the household. In this paper, we investigate the travel characteristics of car-deficit households with a focus on how gender shapes access to household vehicles among heterosexually paired couples. How do these “car-deficit” households differ from “non car-deficit” households (in which, the number of drivers is equal to the number of vehicles)? What are the implications for transport planners and policymakers in general?

We use the 2017 National Household Travel Survey data to compare the gender division of automobile use at the intra-household level between households which are car-deficit and those which are not. Our dataset combines household, person-level, and trip data using household IDs and filters for the following characteristics: (i)

Households headed by heterosexually paired couples; (ii) where both are drivers; and have (iii) either a single car (car-deficit) or two cars (not car-deficit). We control for regional (urban) characteristics, and use statistical and regression analyses to evaluate gender differences in household characteristics and trip behaviors.

The preliminary study findings indicate that how and how much a car is used among car deficit households is often a function of household income, that is, low-income, car-deficit households show constrained and reduced travel. A gendered analysis reveals that women in car-deficit households have greater access to the household car than their male counterparts, primarily a result of their complex travel patterns involving their need to travel for work as well as for household care trips. This stands in contrast to previous findings that highlight men's greater access to private vehicles.

The findings would be helpful in identifying areas/neighborhoods where public transport investments must take priority based on poor access to opportunities using cars among households/individuals from car deficit households. It will also allow planners to innovate, plan, and introduce interventions like car sharing schemes in low income areas or areas with poor transport accessibility.

Covid-19 has had an unprecedented impact on people's travel behavior over the world, in particular, the United States, which has greatly decreased people's mobility and affected people's daily lives. With the development and delivery of vaccines in a short period since the breakout of the pandemic, people's travel activities should recover to varying degrees. Decreased mobility will seriously affect economic development (Borkowski et al., 2021), but it is still unclear to what extent the Covid-19 Vaccine Rollout in the USA affects daily human mobility. This study utilizes Apple Mobility's mobility data, which is a location-based service data with detailed information about mobility and economic trends from Apple users during the pandemic, at both the state- and county-level based on three types of travel (driving, walking and transit) to explore the impact of Covid -19 vaccine distribution and administration on the mobility patterns. Using regression analyses, this study will investigate the statistical relationship between the

changes in people's flow and the total doses of vaccines that have been administered in a given state or county. From the state perspective, the study could help us understand the comprehensive trend of mobility change due to vaccination. From the county perspective, this study allows us to understand the heterogeneity among counties with more detailed data and to improve planning management in the face of infectious diseases. In addition, other factors, such as the number of confirmed cases of Covid -19, the number of deaths, related restrictions on traffic, and other socio-economic factors, will be taken into consideration will increase the rationality of the research.

We use the OLS regression method to analyze the influence of the total administrated doses at the state level. The equation is specified as follows.

$$Y = \beta_0 + \beta_1 \text{AdministeredTotal} + \beta_2 \text{ConfirmedCases} + \beta_3 \text{DeathCases} + \beta_4 \text{racePercentage} + \beta_5 \text{medianIncome} + \beta_6 \text{age} + \beta_7 \text{femalePercentage} + \beta_8 \text{temp} + \beta_9 \text{rain} + \varepsilon$$

where  $Y$  is one of the three modes of transport – driving, walking and transit. *AdministeredTotal* represents the total Covid-19 vaccine doses that people have been administered in a given state. It should be noted that people might have received one dose and have not received the second one yet. *ConfirmedCases* and *DeathCases* refer to the Covid-19 confirmed cases and death cases, respectively. *racePercentage* stands for the proportion of black people in a given state and *femalePercentage* the proportion of females. *temp* represents the average temperature. *rain* is a dummy variable referring to whether it is raining or not.

In addition, the study will also investigate the different impacts of vaccine administration among different counties in the same state. More specific traffic data, known as StreetLight Data will be analyzed using the Geographically Weighted Regression (GWR) to examine the spatial factors that influence travel behaviors among different regions.

The preliminary results based on the OLS analyses show that the total administered doses have a positive effect on the flow of people significantly. Specifically, walking has experienced the most significant increase while transit has the smallest growth. This shows that vaccination promotes people's outdoor walking activities. Although the flow of public transportation has also increased slightly, confined public spaces may still be a hindering factor. In addition, this study proposes to delve into the impact of vaccination on a different group of people.

This research will provide an essential understanding of intercity travel behavior during COVID-19, which may facilitate the decision-making for future transportation planning. In particular, the empirical evidence may provide timely insight to help planners and policymakers to improve the effectiveness of resource allocation to achieve a sustainable and equitable planning strategy for future infrastructure development.

The expansion of micromobility services such as shared bikes and shared e-scooters presents an exciting realm of study in the context of sustainable and resilient modes of transportation. Given the recent expansion of shared e-scooters, the usage patterns and trip purposes of this mode of transportation remains understudied (Caspi et al., 2020), and even less is known about how e-scooters were used during the COVID-19 pandemic. Travel behavior studies show that shared e-scooters—in contrast to shared bikes—are not usually used for commuting purposes (McKenzie, 2019), nor for fulfilling the last-mile (Mathew et al., 2019). The purpose behind e-scooters usage has been shown to be more so for leisure, recreation, and tourism purposes (McKenzie, 2019). In order to understand the resiliency of e-scooters and how trip purposes may change during a time of crisis, the Covid-19 pandemic serves as a context to study what the trip purposes have been during this global crisis. This can provide insights into the travel behavior propelling the usage of shared e-scooters during the pandemic and how it may or may not have changed as compared to pre-pandemic times, as well as inform future studies on how e-scooter usage patterns will compare in the post-pandemic era.

This research explores trip purposes of e-scooters in the Chicago region during the COVID-19 pandemic. A comprehensive survey sponsored by the Illinois Center for Transportation (ICT) was designed by the Translab of the University of IL at Chicago in collaboration with the Chicago Department of Transportation (CDOT), and was distributed by all the of the shared e-scooter vendors to their registered users. The data collected was between November 20<sup>th</sup> and December 15<sup>th</sup>, and there were a total of 2,400 completed responses received, which represents users from all three e-scooter vendors (i.e. Lime, Spin, and Bird). Information was collected regarding the attitudes and preferences of respondents towards e-scooter usage, and Google Maps API was incorporated in order to collect approximate residential locations of those surveyed. The research question explored through the survey results was how people perceived and used shared e-scooters during the pandemic, and how this data could help improve the benefits of shared e-scooters for future users.

In order to analyze survey results, users were grouped based on their patterns of usage—including those who used shared e-scooters for one major purpose, those who used shared e-scooters for two or more purposes, those who used shared e-scooters for or one major purpose sometimes and those who used e-scooter for two or more purposes sometimes. The main contribution of these results is that it shows how various segments of the population perceive e-scooters and the function of e-scooters depending on their usage patterns. Results indicate that there are some common purposes for riding e-scooters among all users (whether they used it always or sometimes for those purposes)—including avoiding transit for COVID-19-related reasons (i.e. to avoid proximity to others), for fun (i.e. for the sake of riding the e-scooter itself), to reach recreational destinations, and for avoiding transit for purposes besides COVID-19. While the purpose of riding shared e-scooters for leisure, recreation and tourism has been documented prior to the pandemic, survey results indicate these purposes persisting throughout the pandemic (McKenzie, 2019). In addition, survey results indicate how the pandemic may have specifically affected riders' habits by serving as a substitution to transit services.

## INDIVIDUAL PAPER SUBMISSIONS

### RETHINKING SUBURBAN DESIGN: STREETS V/S ALLEYS IN IMPROVING NETWORK CONNECTIVITY

Abstract ID: 14

Individual Paper Submission

KHANAL, Asim [Khalifa University] khalanal.asim73@gmail.com, presenting author

ALAWADI, Khaled [Khalifa University] khaled.alawadi@ku.ac.ae, primary author

ALHINAI, Sara [Khalifa University] sara.alhinai@ku.ac.ae, co-author

The notion of an urban-suburban dichotomy is deep-rooted in the planning literature, which regularly denigrates suburbs and nostalgically glorifies urban centers. Movements such as Compact City, New Urbanism, and Smart Growth have reinforced the narrative that unfairly label suburbs as undesirable and wasteful landscape. Suburbs have been contested and evolved over the course of the long history of urban design and planning scholarship and practice. Meanwhile, suburbs have continued to prevail and dominate the urbanization process in many regions. This paper does not reject suburbs as an undesirable phenomenon but instead investigates how suburbs can be improved and transformed into better places. The article focuses on the efficiency of one urban form element in suburbs: street connectivity. Connectivity efficiency is quantified using Pedestrian Route Directness (PRD), a measure which captures the ability of the layout to provide direct routes between origins and destinations. Taking Abu Dhabi and Dubai as case studies, the article studies the connectivity efficiency and provides design strategies and guidelines for retrofitting and improving connectivity in suburbs. Results reveal that not all suburbs have inefficient connectivity, but there is a room for improvement. One major improvement strategy is reclaiming alleys, which are usually critical but forgotten infrastructure elements in suburbs. Results reveal that the utilization of a complementary network of alleys enhances PRD results by 31 percent in some areas.

Currently, suburbs dominate the built landscape throughout the world. In the UAE also, suburbs occupy significant portions of the built landscape, more than 50% of Abu Dhabi's urbanized land and 38% of Dubai's urban area. Suburbs are constantly vilified unlike the spectacularization of downtown revival. Nevertheless, suburbs have continued to exist, and therefore cannot be ignored blatantly without exploring the potential to retrofit for enhancing pedestrian connectivity.

In the UAE, public housing programs are the main contributors to suburban growth. Similar to North America and the rest of the world, the typologies of neighborhoods changed from compact forms to dispersed suburbs. This article studies the connectivity efficiency of diverse suburban street typologies to provide design actions and guidelines for future suburban street design. It is unwarranted to discard any suburban typology simply because it does not represent a pre-modern dense fabric. Thus, the paper analyses a total of sixteen neighborhoods, eight each from Dubai and Abu Dhabi, that represent different street typologies of suburbs from their origin (early 1970s) to present and asks three questions- 1) How connected are the suburbs of Dubai and Abu Dhabi for pedestrian movement? 2) What are some similarities and divergences between the suburbs of Abu Dhabi and Dubai in terms of connectivity efficiency? 3) What kinds of urban design strategies would increase the connectivity efficiency of future/existing suburbs?

## **TRANSFORMATIVE APPROACHES TO MITIGATE THE IMPACTS OF BOOM-AND-BUST IN DECLINING URBAN COMMUNITIES**

Abstract ID: 16

Individual Paper Submission

LARA, Jesus J. [Ohio State University] lara.13@osu.edu, presenting author

Strategic partnerships between universities and declining urban neighborhoods with limited resources have resulted in some innovative and forward-thinking approaches to land use and planning that respond to the impacts of boom-and-bust through the implementation of problem-based solutions, and have spurred development to make communities more resilient. The university-community partnerships and engagements have multiple goals. They include increasing university responsiveness to local needs, stimulating real-world change, and preparing students to effectively address complex social challenges (Dorado, 2004). However, such approaches are complicated by a variety of factors, including stakeholder expectations, power imbalances, and the conflicting goals of educators and community members (Mansuri and Rao, 2004). While the benefits of service-learning programs to universities are well documented, the benefits of such higher education partnerships to community participants are not as well known (Netshandama, 2010). Successful engagements seem to require community involvement and decision-making authority at every phase, mutual accountability, and trust (Winkler, 2013). This presentation refers to a series of case studies of community engagement and neighborhood empowerment in the development of a collective sustainable plan/vision for declining inner-city neighborhoods with limited resources. These neighborhoods, located in Columbus, Ohio, have seen tremendous declines in population and economy over the past years due to significant loss of manufacturing jobs. The case studies demonstrate that service-learning has the potential to provide communities with place-specific guidelines and recommendations that improve the quality of life for residents, but their implementation requires a collective effort that goes beyond the classroom.

## **MODERN PEDESTRIAN PLAZAS: UNDERSTANDING PROGRAM EFFECTIVENESS**

Abstract ID: 27

Individual Paper Submission

AMOS, Dave [California Polytechnic State University, San Luis Obispo] daveamos@calpoly.edu, presenting author

Cities across the United States have implemented plaza programs to create new pedestrian spaces in the roadway. Some have been high profile downtown projects, like the Times Square pedestrianization project. Most have been smaller, such as closing a small, underused street to traffic. These programs cite benefits that include encouraging walking and cycling, creating new gathering spaces, and traffic calming. This research asks the question: how effective are plaza programs at achieving these goals? This research question is addressed through semi-structured interviews with plaza program staff and community partners in Los Angeles, California.

This research focuses on the Los Angeles Department of Transportation's "People St" program. This program provides a way for community partners to receive City permission to transform street space into plazas. It resulted in the installation four plazas between 2012-2015. The plazas are designed to be installed at a low cost; bollards, paint, tables and chairs, and umbrellas are key pieces of the toolkit. The City's stated hope is that these projects lead to more capital-intensive, permanent installations as a part of a larger corridor or area plan.

Our research team is in the process of interviewing key stakeholders in the People St program, including City staff and community partners. This method is similar to the one used to measure pedestrianization program effectiveness in Auckland (Wooller et al., 2012). This is one of the first studies of how modern pedestrian streets are used and managed where there is a significant time gap (five years) between installation and study. These interviews will be complemented by background research on similar plaza programs throughout the United States.

The negative impacts of car-oriented development and car-only street design have become well-known in recent years. As our society confronts global climate change and the role of cars as major emissions sources, we must look for ways to reduce driving. Returning streets to pedestrians and cyclists can encourage walking and cycling, and it is one of the goals of this program. This research is critical, as the results will point to best practices and practices to be avoided when designing, implementing, and operating new plazas. This research also builds on the recent growing literature on historic pedestrian malls and plazas in the United States (Gregg, 2018; Amos, 2019; Matuke et al., 2020). It relies on knowledge of these historic examples to contextualize the strategies and locations for modern plazas.

#### **TOWARDS RESILIENT SHOPPING CENTRES AMID THE RISE OF ONLINE RETAILING: A TYPOMORPHOLOGY OF SHOPPING CENTRES WITH AN APPLE STORE IN THE US**

Abstract ID: 32

Individual Paper Submission

RAO, Fujie [School of Design, Shanghai Jiao Tong University] raofujie@gmail.com, presenting author

This research explores in what socio-spatial forms shopping centres could coexist with online retailing, based on a typomorphological analysis of all shopping centres with an Apple store in the US.

20th-century shopping centre development in the US features a boom-and-bust cycle where the rise of shopping malls forced main streets into a decline and the subsequent proliferation of power centres stimulated 'dead malls'. This boom-and-bust cycle has morphed into a new stage where the fast expansion of online retailing poses a threat to all types of shopping centres. There has been a long list of retail bankruptcies with massive store closures since 2010, leading to a concern that all stores would disappear with everything traded online; the 'retail apocalypse'.

While being an unlikely dystopian scenario, the 'retail apocalypse' was dramatically turned into reality when cities went into lockdown to combat the COVID-19 pandemic. As the US re-embraced science and democracy after the end of Trump's presidency, there are fewer doubts that the country would emerge from the pandemic. However, the deepening penetration of digital technologies into people's everyday life during the pandemic, where online retailing is arguably at the forefront, is likely to continue, leading to what some called the 'digidemic'.

While many brick-and-mortar stores struggle amid the rise of online retailing, exceptions exist. Apple store has become one of the most profitable retail spaces in the US. It offers various kinds of experience, from the touch-and-feel, to a sense of user-community, and the latest 'town square' experience. These experiences are seamlessly integrated with online retailing (Apple.com) so that each Apple store generates revenues well beyond its in-store sales. Apple store strategically joins iconic shopping centres in a metropolitan area; it can be considered a key indicator for resilient shopping centres.

There is, however, a lack of urban planning/design research investigating the ways that socio-spatial forms of shopping centres could be adapted to online retailing. Economists and the shopping centre industry have widely discussed the impact of online retailing on shopping space; they identified a shift of focus in the contemporary shopping space: from 'price' to 'experience' (Singleton et al., 2016; Dolega et al., 2019). A few urban planning/design studies linked the current shopping experience to the urban sense of place (Rao, 2020; Weltevreden and van Rietbergen, 2009), yet this viewpoint requires empirical tests.

This research seeks to explore the key socio-spatial forms of shopping centres that could be adapted to online retailing, examining whether the trend of morphological changes in contemporary shopping centres is towards the urban experience. All shopping centres with an Apple store in the US, a total of 269 examples (as of March 1st, 2021), are selected for a typomorphological analysis. Typomorphology is an emerging urban design research method for unravelling complex socio-spatial changes/forms of city space (Moudon, 1997) and is therefore suitable for this research.

There are two key preliminary findings. First, most of the selected shopping centres are synergies between the main street, shopping mall, and power centre, indicating that a mix of retail types may foster resilience. Second, most examples of retail synergies embody malls or power centres emulating the socio-spatial form of the main street. Thus, this research confirms that the trend of morphological transformations in current shopping centres is towards the street/urban experience.

There are important implications for practice. Retail planning should be more open to dynamic socio-spatial forms of shopping centres while reducing its dependency on a static retail hierarchy and typology. Retail planning should also focus more on mediating the conflicts between the curated urban experience for profits and the urban public life.

## USING GOOGLE STREETVIEW IMAGES TO EVALUATE THE ROLE OF BEAUTY IN TRANSPORTATION PLANNING

Abstract ID: 64

Individual Paper Submission

HOLLANDER, Justin [Tufts University] justin.hollander@tufts.edu, presenting author

SITU, Minyu [University of Texas, Austin] minyusitu@utexas.edu, co-author

This presentation will explore the relationship between perceived beauty and transportation policies. A convolutional neural network was trained using a dataset containing beauty perception scores for Google Street View images taken in Boston, MA, generated by Raskar et al. (2015). The beauty perception scores of Montreal and Toronto were then generated by applying the trained neural network to Google Street View images of coordinates in those two cities. We used cross-sectional datasets that included both beauty scores, transportation policy variables, and a set of control variables to estimate probit, logit, and linear regression models by regressing the beauty perception scores on the rest of the variables. We then observed the direction, magnitude, and statistical significance of the coefficient estimates associated with the policy variables across all regression models. Based on the transportation policies we studied for the past decade in Montreal and Toronto, our findings show that the census tracts with lower beauty perception scores were mainly the locations targeted with transportation investments by planners. The study adopts Google Street View images as a novel data source for evaluating recently completed and on-going transportation policies, which makes a methodological contribution to the analysis of transportation planning and extends planning insights to consider the beauty perception of the built environment as a factor in policymaking.

## BLACKLIGHTING URBAN DESIGN: RECONSTRUCTING PUBLICNESS AS BLACKNESS IN PHILADELPHIA AND LOS ANGELES

Abstract ID: 114

Individual Paper Submission

MILLER, Matthew Jordan [University of Pennsylvania] drmatt@upenn.edu, presenting author

Since the late twentieth century, postindustrial American cities' have worked to re-make themselves into beacons of cultural capital. Spurned by New Urbanism (Appleyard and Jacobs, 1987), sociocultural assets like neighborhood retail, art galleries, and waterfronts are cast as desirable characters in this postmodern urbanist fantasy and "re-theorising" of public realms (Carmona 2015). While tolerating the perennial social justice critiques, few urban design theories and practices have actively incorporated and systematically preserved public realms of Black heritage as valuable. In this paper, I ask: what if Blackness mattered to urban design's public function and forms? How do Black urban actors perceive and steward public space? By comparing separately conducted mixed-methods qualitative studies of cultural planning in two large urban cities with historic Black populations – Los Angeles from 2016-2019 and Philadelphia from 2019-2021– it reveals ongoing (missed) opportunities to reconstruct Blackness in/as public space. In Philadelphia, it focuses on a subset of Black residents with memories of the Delaware riverfront amid Philadelphia's pursuits of nearly \$500 million for connectivity projects, a chance for urban maritime design and creative placemaking to be in conversation with Black Philadelphian history. In Los Angeles, the focus was on Black small business owners and artists in a historic neighborhood in the Crenshaw district of South Central amid Metropolitan Transportation Agency's deployment of a light-rail line in 2020. Both evince Black ecopoetics – Pan-African senses of place and relations (Glissant 2010) – in unique yet related ways.

In Philadelphia, the paper finds that the aims of inclusive design ambitiously pursued in the participation process may still reproduce forms of injustice due to politically advantageous historical amnesia from white elite stakeholders. The case locates three contemporary and historical associations that represent a broader life cycle beyond the short-term "connectivity" and "access" framing of the planners eliciting participation. Specifically, this paper shines light through three specific Black relations to the riverfront: 1) spectacle, 2) sugar industrialism, 3) slavery – which persist despite a failure by several public-private actors to spatialize most of these meanings into the design strategy. This Black globalized sense of place exists, even in the absence of a localized formal claim to property rights, on the waterfront. Los Angeles offers an exceptional profile on the surface: Leimert Park, a historically Black retail corridor assembled in the wake of 1960s' suburban white flight by artistic merchants and property owners who have re-designed the identity as a Black creative "mecca." Their cultural and economic vibrations are seen and felt in community institutions: Destination Crenshaw, People's Plaza, Drum Circle. However, in welcoming transit-oriented development, property-based placemakers are challenged by machinations of gentrification and succession planning. I find that Black designers are learning how to balance cultural commerce with stewarding sociality, long-term management, and environmental justice: an improvisational form of Black spatiality.

Together, my findings call for conceptual reconstructions in urban design to recognize Blackness' importance in public realms. Whether it's an absence of property rights to draw upon or struggles to maintain ownership amid resurgent investment, I find that neither "placemaking" or "place-keeping" operationalizes the liminal forms of place attachment found in Black Geographies. I offer a new term as a bridging concept to validate the existence of a prismatic spectrum of needs and intentions among everyday actors who steady place identities. The work raises concerns and needs for a critical accompaniment of the "interdiscipline" of Black Studies and Black Geographies in design education to be meaningful for Black people and refuse the placeless "distemic space" polluting cities' gentrifying urban landscapes (Greenbie 1976). Cultural histories can be translated for planning scholarship to render environmental justice both authentic and beautiful.

## THE MAKING OF VOLUMETRIC HONG KONG: THREE-DIMENSIONAL PEDESTRIAN NETWORK AS THE CRITICAL WALKING INFRASTRUCTURE

Abstract ID: 190

Individual Paper Submission

SUN, Guibo [The University of Hong Kong] gbsun@hku.hk, presenting author

A three-dimensional (3D) pedestrian network is crucial for Hong Kong. Government authorities, international consulting firms, and urban designers love to talk about walkability. However, when it comes to the high-density city, unfortunately, their analyses are hardly convincing. Besides miss-conceptualisations of walkability for Asian contexts, usually, from European and North American experience, they also use inaccurate data. Pedestrians walk on the 3D networks, such as the footbridges and undergrounds. But since the city did not have such data in the past, people use road network as a substitute.

In this paper, first, I deliberate how a continuous 3D pedestrian network constitutes an entirely different urban morphological spatial hierarchy compared to a two-dimensional city because of the footbridge system, underground connected with metro stations, and paths connected with mall developments. I argue that high-density adds to a good city form only if the city elements are well connected for pedestrian movement. The connection is conceived, physically, as a 3D pedestrian network, through which the interplay of density, concentration, complexity and verticality becomes possible to produce a high degree of urban intensity.

Second, I show how we mapped the 3D pedestrian network of Hong Kong from 2016 to 2019. Our 3D pedestrian network model in GIS classifies segments into 23 categories with multi-height levels, such as sidewalk, footbridge, underground, crosswalk, ramp, and rooftop paths. The network is over 8000 km, which is 2.4 times in length and 8.5 times in link size greater than the road network (Sun et al., 2019). During the mapping, I visualise how all independently operated urban systems connect to and comply with each other at different levels, and how public space has not been shaped by a prescriptive design code but rather by a consensus reached by a variety of stakeholders.

Third, I present a few analysis to demonstrate how the network makes a striking difference in walkability evaluation compared to road network. A connectivity comparison through a betweenness measure reveals striking differences between the two networks and indicated that footbridges and underground links could enhance walkability when they are well connected with the ground-level networks. A walkability scoring (Zhao et al., 2020) evaluation would show a serious underestimation if use road network as substitute, and streets were considered twice as walkable if rated by pedestrian network.

Last, I present a few local cases in the making of volumetric Hong Kong in which I demonstrate how the interaction is greatly benefited from on staircases, escalators and elevators that allow for movements between layers both

above and below ground and transfers between interior and exterior networks, horizontally and vertically. Volumetric development is a highly compressed and internalised city form through highly connected buildings and their spaces (Bruyns et al., 2020). It is the 3D network that facilitates interaction and vibrancy by integrating a diverse set of sectors in a volumetric way.

The pedestrian network provides us with an angle to investigate the city and to decipher spatial relationships and design rationales. Unpicking it will give clues to other high-density cities in Asia and elsewhere about how to better connect up multiple levels, neighbourhoods, groups, and land uses through the urban design lens.

## **TOWARDS COOPERATIVE, PARTICIPATORY, AND SUSTAINABLE STREET DESIGN: A CASE STUDY OF POLICY CHANGES IN SHANGHAI**

Abstract ID: 318

Individual Paper Submission

WANG, Lin [Shanghai Jiao Tong University] wanglinalice@sjtu.edu.cn, presenting author  
MO, Chaoyu [Shanghai Jiao Tong University] 623403452@qq.com, co-author

The street is a key urban public space for residents. With the increasing socio-economic conditions of residents in Chinese cities, the improvement of urban landscape and public space through street design has attracted much attention. However, the streetscape consists of multiple dynamically changing socio-spatial elements and embodies multiple stakeholders. How to build a consensus between multiple parties and effectively implement the street design is a key and challenging topic for contemporary urban planning and design.

First, the street space includes multiple spatial elements such as architecture, greening, and municipal infrastructure. In China, the municipal departments for these spatial elements are different, including planning, housing administration, transportation, city appearance and environment, public health, and so forth. These departments often initiate street design from their respective perspectives, often without an overall consideration. Also, there is often a lack of communication and cooperation between departments. As a result, street design is often difficult to be implemented in a sustainable way. In addition, the streetscape improvement involves multiple stakeholders such as property owners, shopkeepers, local residents, and the government. Due to their different perspectives, the difficulty in planning, coordination, communication, and cooperation is escalated.

The planning and design of streetscape in China has gone through three stages in the recent two decades: First is to demolish illegal constructions and eliminate buildings with safety hazards (the street regeneration stage). Second is to prepare street design plans and establish government-led management (the street beautiful movement). Third is to prepare detailed street design guidelines and foster cooperative, participatory, and sustainable street design centered on community governance (the consensus building stage). The first author of this article has directly

participated in the development of street design policies and practices in Shanghai, from the one of the leading planners initiating the street design policies in 2007, to a key street designers in 2015 and one of the first community planners in 2017. Her rich urban/community planning and street design experience provides rare first-hand insights to this research. Using the city of Shanghai as an example, this article reviews street design policies and plans since 2007, categorizes the development stages, identifies the evolution of street design modes, and reflects the issues and challenges of street design. This research, in particular, focuses on the core area of the previous Shanghai French Concession (area 4.4Km<sup>2</sup>, 31 historical streets).

This article summarizes the evolution of the Chinese street design regime: from top-down governmental control to community-based co-governance between multiple stakeholders. This article also highlights two core elements for cooperative, participatory, and sustainable street design. One is to build a participatory planning regime with a strong consensus between various municipal departments (e.g., planning, transportation), business, and residents on promoting street design. This can be done by recruiting community planners and professional design teams to generate comprehensive, holistic, and detailed street design and guidelines. Second is to rely on the local community to scrutinize and tackle the dynamic changes of streetscapes. Here community planners should play a key role of coordinating the implementation of street design guidelines in specific projects.

#### **PRESERVING MODERNISM AT THE URBAN CORE: A CASE STUDY OF THE DECLINE AND RESURRECTION OF LAWRENCE HALPRIN'S MANHATTAN SQUARE PARK IN ROCHESTER, NY**

Abstract ID: 344

Individual Paper Submission

WASSERMAN, Judith [West Virginia University] judith.wasserman@mail.wvu.edu, presenting author

Destruction of landscapes designed and installed during the modernist era (early 1950's to late 1970's) are endemic in contemporary planning practice. Since the stark brutalist forms are often blamed as contributory to urban decline, their removal and redevelopment is declared the solution. Manhattan Square Park (now Martin Luther King, Jr. Park) in Rochester, NY offers an example of a city that elected a different option. In restoring their modernist landscape, they sought to renew the urban core through celebrating the moment the city embraced modernism as a statement of urban innovation.

In 1971 the City of Rochester hired landscape architect Lawrence Halprin to design a signature statement in their urban core. Halprin's Forecourt Fountain (now the Ira Keller Fountain) in Portland had just opened in 1970 to widespread positive media attention. City officials throughout the United States clamored to possess the haute couture of civic urban centers; a Halprin fountain. With ambitions to rival New York City as a center of commerce

and the arts in New York State, Rochester chose the name Manhattan Square Park to reflect its aspirational goal. Completed in 1976, the park achieved its purpose as a space of active civic engagement. Performances, impromptu gatherings, and organized sports venues inhabited the park. The large abstract Halprin fountain and space frame served as focal points for the activities.

Two decades after installation the city suffered decline and a subsequent disinvestment in the urban core. In 1990 the fountain fell into disrepair and was shuttered. While use was minimal, positive moments of site engagement persisted. Gaping concrete walls and empty space invited both impromptu urban graffiti and a city sanctioned participatory community mural. An underground parkour group found the brutalist concrete forms perfect for their athletic urban gymnastics. In fact, they became stewards of the site and revered Halprin, claiming him as a “Parkour Architect”. And rather than destroy the failing derelict space, the city elected restoration. The plaza was rebranded as the Martin Luther King, Jr. Park, and on July 4, 2017, after a 1.2 million-dollar investment, the fountain was turned back on.

Understanding the life-cycle process of this modernist centerpiece in Rochester details the mixed legacy of urban renewal, the complexity of modernism in urban places, and how one community elected to transform and restore their modernist gem. Reviewing the redevelopment effort is key in understanding how a period design can maintain relevancy through the restoration process.

Through an in-depth examination of the urban life cycle of this space the analysis and investigation reveal significant findings germane to reinterpretation of historic public space design within a continually evolving context. Mixed-method methodology for this research includes: Archival investigation; Interviews with involved planners, designers, and engineers; Participant community site observation mapping and interviews; Visual design analysis; and Visual documentation of the restoration process.

Creation and destruction are continual cycles in urban evolution. While this story is of one place within one city, it can serve as a guide to other cities contemplating the best actions to take to either preserve or dismantle significant designed landscapes, and how it can impact urban growth or decline. This investigation also documents and interprets how the significance of community memory and designed landscapes are key in determining urban change or preservation.

## MULTI-APPROACH URBAN DESIGN PRACTICES SLOWING DOWN NEGATIVE IMPACTS OF GENTRIFICATION: CASE STUDIES OF CHICAGO'S 606 TRAIL AND NEW YORK'S HIGH LINE PARK

Abstract ID: 413

Individual Paper Submission

LOTFATA, Aynaz [Chicago State University] alotfata@csu.edu, presenting author

GEMCI, Ayse Gul [Yildiz Technical University] aysegulgemci@gmail.com, co-author

While the advent of modern urban design brought new possibilities in terms of mobility of goods, people, and the provision of amenities, it has also had numerous documented negative impacts on communities. The lack of social coherence and a diminished sense of place are understood to be the symptoms of the death of urban space. The modernist approach defines the urban space as an engineered social product. The social engineering approach has led to continuous negative impacts on the vitality of daily flux, social and spatial amnesia by demolishing the built environment, and a sort of urban decline of communities such as the Pruitt-Igoe which is a prime example of modern urban design failure. This form of urban approach can be traced back to the modernist architect Le Corbusier, who laid the blueprint for demolishing high-density urban areas and old buildings in his bid to escape the unsustainable urban environment (Gehl, 2010). This paper identifies a new position in understanding and approaches the city. Cities are inexhaustible and contain so many overlapping and interacting meanings related to visual qualities, perception, sense of place, and public realm that they are never reconciled into a single understanding. Gentrified urban space is thus inherently a contested field (Urry, 1995; Freeman, 2006). In this study, the combination of multi-angled urban design approaches including tactical urbanism, everyday urbanism, and landscape urbanism approaches are highlighted to create a socially coherent and diverse built environment (Kelbaugh, 2001; Chase et al., 1999). The multi-design approach delineates the physical domain of everyday activities in urban spaces as the connective tissue that binds the social activities together while contributing to the emergence of creative activities and relations strengthening the social and economic coherence of urban space. By taking into account the multi-approach urban design, this study raises these research questions:

What is the relationship between gentrification and urban design approaches?

How can the multi-approach urban design process influence gentrification practices?

Why does gentrification need to be reformulated? In this study, we researched the triangulated interaction of the multiple effects of urban design practices on social, spatial activities, and ipso facto ripple effects on the built environment. From this perspective, we focused on two recent urban projects: the Bloomingdale Trail (entitled the 606 Trail), Chicago, and the High Line, NYC. These projects are effective in providing the functional support necessary to create a socially cohesive space and a sense of community to neighborhoods within a 15-minute walking distance. In the meantime, these projects are socio-spatial icons of transition from the modernist urban designs to the multi-approach urban design practices encouraging ipso facto creative urban practices. Thereby, this study aims to extract and map the visible and invisible social and spatial actors, relations, and activities working together and creating a built environment of these urban projects. The analysis includes two steps: 1) mapping of social and cultural activities (passive and active participation), and spatial land-use zoning, using daily online news sources (Media Content Analysis), and secondary geospatial data, and 2) surveying of the literature for investigating theoretical frameworks of urban design practices. The results have shown that several social, spatial actors and measures, such as awareness, resident-led approaches, and multi-functionality shaping urban space makes it socially resilient to external interventions (e.g., profit-based gentrification projects) (Gehl, 2010). Further, an integrative design framework is suggested to reduce the negative impacts of gentrification, such as racism and gender inequality. In the meantime, this study identifies a design approach to the conversion of the non-utilized railway lines. This study represents zones of social and spatial transitions with the new social arrangements.

## HOW CAN A TRADE-OFF METHOD WITH APPLIED CONNECTIVITY ANALYSIS CONTRIBUTE TO THE DESIGN AND PLANNING OF LARGE URBAN PARKS?: YONGSAN PARK IN SEOUL, KOREA

Abstract ID: 420

Individual Paper Submission

WOO, Jung Hyun [Harvard University] [jh.woo@outlook.com](mailto:jh.woo@outlook.com), presenting author  
CHOI, Hyeyoung [Sungkyunkwan University] [hyeyoung@skku.edu](mailto:hyeyoung@skku.edu), co-author

Since the development of empirical research methods for urban environments, urban planning processes have actively used empirical approaches to improve urban project and policy development. However, the urban park design and planning process still uses the conceptual research approach, which generally involves a designer's abstract ideas and philosophical concepts. Because the conceptual research approach is based on the designer's interpretation of urban environments, discrepancies often arise between the designer's intention and real phenomena. In this work, we examine and propose a trade-off method for urban park design and planning that integrates a connectivity analysis, specifically for the Yongsan Park master plan. Yongsan Park is a mega-scale urban park project with a unique history as a military post-industrial site that has been in development for a long time. The park site is in the center of Seoul Metropolitan City, but it has been isolated and untouched as the surrounding neighborhoods have evolved. To re-link the park site, a former military enclave, to its urban context, connectivity is a key issue in park design and planning that will affect park visitors' behavior, utilization, and visitation. Therefore, the urban connectivity of the park requires careful consideration both conceptually and empirically during the design and planning process. We used the spatial network analytic methods of accessibility and centrality to empirically investigate the potential visit load for the park at the pedestrian level proposed by the park master plan. Then we used statistical analysis to understand the causal relationships between park accessibility and built environment factors. The results indicate that (1) office and community facilities are the only factors that can substantially increase park visitor demand based on the current park master plan; (2) the park entrance location or hierarchical order should be updated to properly reflect the designers' and planners' ideas about the project; (3) an iterative process is needed between conceptual design ideas and empirical connectivity analyses, as in the proposed trade-off method, to improve the long-term outcomes of large urban park design and planning in the city; and (4) the trade-off method also provides insights that can improve the urban planning strategies for nearby neighborhoods to enhance park connectivity and potentially contribute to the park management phase.

## **STREET EXPERIMENT PLACE-MAKING IN AN ASIAN HIGH-DENSITY CITY: WHY POSITIVE FEEDBACK DOES NOT PROMISE LONG-TERM CHANGES?**

Abstract ID: 423

Individual Paper Submission

ZHAO, Jianting [The University of Hong Kong] jzhao20@connect.hku.hk, presenting author  
SUN, Guibo [The University of Hong Kong] gbsun@hku.hk, co-author

Street experiment is a quick and low-cost way to test out urban design ideas. It has gained popularity among European and North American cities in the recent decade for its flexibility and room for innovation. Project-based studies have shown increased physical activity, enhanced neighborhood relationship and other positive benefits brought by street experiments (Bertolini, 2020). However, this kind of activities is not yet prominent in Asian high-density cities. Reasons could be that underlying issues are different between the Asian and Western context. Room for experimentation is limited in high-density cities, as spaces are sought after by private developers, and the economic value often precedes public interest. There is also a lack of citizen initiative in community development (Cheung, 2011). The official urban planning agencies take the role of decision making, and the public is there to be informed. Only in recent years did citizens start to demand better public spaces (Rossini, 2019).

While the street experiment is praised for its short-term efficiency, its long-term influence is limited in the Asian context. In Hong Kong, a known Asian high-density city, NGOs had tried temporary pedestrianization, installation of ground-level pedestrian lights, and re-purposing of parks to be all-user friendly. However, only the park re-purposing was partially adopted and scaled-up by the government. There has not been an existing study on government adoption mechanisms in Asian context, where civic engagement is different from its western counterparts. A study on the low adoption rate is needed to maximize the social impact of future experiments.

This research aims to investigate the outcomes and problems of street experiment in an Asian context through a year-long project conducted in Hong Kong. The project was located in a school zone within a densely populated neighborhood, Sham Shui Po. A local NGO led a series of public participatory workshops to devices prototypes to address the pedestrian-vehicle conflict and provide a large open space for nearby families. They tested out the prototypes during a three-day pedestrianization of a parking street, and the neighborhood welcomed their event. The project preparation started in late 2019 and lasted one year due to interruptions by the covid-19 pandemic, and the implementation took place for three days in mid-November 2020.

The research methods include field survey, direct observation and semi-structured interviews. Prior to the experiment, the researchers conducted pedestrian counting around the site, a two-street-block school district, at different times frames of the day. Videos and photos were taken to supplement the documentation. This survey provides an understanding of the normal traffic flow in the area. During the experiment, the researchers documented participation size and activity types. This is crucial to the understanding of residents' actual preferences in the real-world setting. Interviews were also taken from event participants and pedestrians to learn their opinions on the experiment. Shortly after the experiment, interviews were conducted with stakeholders, including the project team, school representatives, and government officials. The multifaceted views would help draw suggestions for improvements.

The study's expected results include the contribution of the participants to the experiment, the degree of satisfaction from different stakeholders, and the challenges of actualizing design prototypes and converting short-term projects into long-term changes. The results of this study will contribute to the existing literature by discussing the mechanism, difficulties, and opportunities in implementing a street experiment in a high-density city under an Asian context.

#### A GLOBAL PERSPECTIVE ON MURAL POLICIES: RESULTS OF AN INTERNATIONAL SURVEY

Abstract ID: 482

Individual Paper Submission

MENDELSON SHWARTZ, Eynat [Technion - Israel Institute of Technology] mendelson.shwartz@gmail.com, presenting author

MUALAM, Nir [Technion - Israel Institute of Technology] nirm@technion.ac.il, co-author

In recent decades, murals have become a common phenomenon in urban landscapes, acting as a major avenue for public expression and reflecting and influencing the city's social, political, cultural, and aesthetic values (Halsey and Young 2006; Iveson 2010). They are markers of identity and can provide benefits to individuals, communities, and cities. Some murals are created sporadically (or insurgently), while others are carefully promoted by the establishment. Because of their artistic character, location, and public exposure, murals incorporate tensions and contradictions that present many challenges to policymakers, owners, and those involved in their creation. Furthermore, unsanctioned murals, created without permission, are considered by many municipalities to be chaotic and threatening, leading cities to develop an ambivalent approach towards murals in general. In addition, murals confront the planning system and city governments with questions regarding ownership, rights, and control.

With the global shift towards cultural planning, cities around the world have been adopting (or coopting) murals as an acceptable element in their municipal toolkit, crafting mural policies that focus on facilitating and managing of mural artwork in the public domain. While a plethora of studies exists regarding murals and public art in general, their policy aspects have been somewhat neglected by the literature. Furthermore, studies that directly relate to mural policies usually focus predominately on specific topics or focus on specific cases. Only few scholars, however, undertook analysis of mural policies in a broader comparative context (Halsey and Young 2002; Young 2013; Sheldon 2015). Moreover, to my knowledge, there are no scholarly contributions that map mural policies, nor provide an overarching global view of the way cities react to, conceptualize, and regulate murals.

This paper seeks to fill-in this gap. In it, I will present results of an international survey that included 119 cities from 40 countries across five continents regarding their mural policies. The data in this research were obtained through an internet-based survey which applied a structured questionnaire. The survey was disseminated during the spring

of 2020. The structure of the questionnaire is based on a comprehensive literature review on mural policies and regulation previously conducted, data obtained from semi structured interviews, and a pilot questionnaire administered to 14 artists and mural experts employed by governmental and non-governmental agencies.

The paper will present the result of this survey, focusing on key questions. Additionally, it will present a cluster analysis conducted on the data using a k-means method. This analysis shows how cities around the globe can be divided into sub-groups on the base of their similarities.

An example of an interesting finding from the survey is that although the majority of respondents indicated that unsanctioned artworks are always or sometimes criminalized in their city, when asked if unsanctioned murals were generally tolerated, a different picture emerged. Only 26% of respondents answered that unsanctioned murals are not tolerated in their city. 36% noted that unsanctioned murals are generally tolerated and additional 28% indicated that unsanctioned murals are tolerated in certain neighborhoods or areas, or in specific sites. These figures indicate that in many cities there is an interesting gap between the ‘formal’ approach which criminalizes certain artworks and the ‘informal’ disposition, which is more tolerant, at least on the face of it. This gap may be attributed to a range of factors, such as political awareness to the importance of insurgencies in the city, or – alternatively- enforcement considerations (prioritizing and lax enforcement).

#### **CAPTURING THE EPHEMERAL LINKAGES BETWEEN SPATIAL AND SOCIAL STRUCTURE: A STUDY OF EMAIL COMMUNICATIONS AND SPATIAL RELATEDNESS ON THE MIT CAMPUS.**

Abstract ID: 488

Individual Paper Submission

SEVTSUK, Andres [Massachusetts Institute of Technology] [asevtsuk@mit.edu](mailto:asevtsuk@mit.edu), presenting author  
CHANCEY, Bahij [MIT] [bahij@mit.edu](mailto:bahij@mit.edu), co-author

How does urban spatial structure affect social structure among its users? This question has fascinated planners and sociologists alike, but remained elusive to careful examination due to lack of spatialized data on social relationships. Here we present the results of a study conducted on the MIT campus, where we used an anonymized dataset of e-mail communication of faculty and researchers to examine how spatial relationships between researchers’ offices can impact the likelihoods of social ties (in the form of email communication) between them. Our analysis finding suggest that spatial structure affects social ties in at least three distinct ways—i) people whose offices are within a closer walking distance from each other are more likely to exchange emails with each other, ii) people who are more likely to walk past each other’s offices on the way to or from work, are more likely to exchange emails with each other, and iii) people who share access to similar eating venues around their offices are more likely to exchange emails with each other. These relationships remain significant after controlling for relatedness and size of departments and centers where they work. However, two mitigating factors also impact the spatial-social tie formation. First, the existence of social ties is negatively affected by crowdedness—if encounters with each other’s

offices occur at more crowded locations, chances of communication are reduced. Second, indoor corridor connections between offices lead to higher rates of social exchange than outdoor connections on the MIT campus. Email communication is more likely if researchers are connected along MIT's renowned "infinite corridor" network than if the physical connection between them requires crossing a courtyard or other outdoor space. We hypothesize that the campus offers a microcosm of built environments where similar spatial mechanisms may operate at a larger scales with more complex interactions.

#### **WHOSE SPACE IS PRIVATELY OWNED PUBLIC SPACE? EXCLUSION, UNDERUSE AND THE LACK OF KNOWLEDGE AND AWARENESS**

Abstract ID: 493

Individual Paper Submission

LEE, Dahae [Technical University of Dortmund] dahae.lee@tu-dortmund.de, presenting author

Privately Owned Public Space/s (POPS) refers to physical space that is owned and managed by private owner but is dedicated to public use and enjoyment. While the provision of POPS has become a popular mechanism to increase provision of public space, particularly in densely built-up urban areas, the quality of POPS has been called into question. Two problems that are often mentioned in the literature are exclusion and underuse. Several attempts have been made to increase the inclusiveness and liveliness of POPS, and solutions are often found in design aspects, i.e. the provision of essential amenities and high accessibility. This research questions whether well equipped and highly accessible POPS are indeed inclusive and lively.

A research was conducted in Seoul – a highly populated and densely built city with a population of over 10 million. In an effort to provide public space, a POPS program was introduced and it is now a popular means of providing public space in the city. Within the city, a case study area along the Teheran-ro was chosen for two reasons: 1) the area has a high number of POPS; and 2) the area is part of mixed-use neighborhood that is busy during both the day and night, full of people from different groups, such as office workers, pedestrians, residents and school children. Twenty POPS within the case study area were visited and their design analyzed. In addition to field visits and observations, a survey with 68 actual occupants of POPS was carried out to gain a better understanding of their use. A survey was also conducted in the neighborhood to see how POPS are perceived and if they fulfilled their role as public spaces. The survey involved 93 pedestrians, 107 residents and 476 schoolchildren – they are the ones constantly present and thus regarded as potential occupants of POPS. Furthermore, the research involved semi-structured interviews with eight experts including public sector planners, an architect, a scholar, a member of non-profit organization and a building manager.

The result of empirical work suggests that POPS can still be exclusive or underused even though they are well-

equipped and highly accessible. This paper argues that the problem of exclusion and underuse is not simply due to the lack of amenities provided or inaccessibility. Instead, it is, in the first place, due to the lack of knowledge about POPS and then the lack of awareness that they are public spaces. Hence, more should be done than just improving their design. Two suggestions are made here. First, the city policy regarding the use of POPS should be promoted further by lowering the threshold for getting a permit. Second, I recommend more engagement of various stakeholders with POPS. Engaging various actors would increase the inclusiveness and use of POPS as the public start to know what POPS are and what rights they have in regard to POPS. Through such engagement, they would feel more responsible and this might increase the quality of POPS as the public become more active in monitoring them. The more their demands are fulfilled, the more people will become involved, and the stronger the civic life will be. The establishment of a civic organization could help further, as it would connect all the relevant actors, encourage their engagement with POPS, and thereby promote the use of POPS.

### **DESIGNING DHAKA'S ADAPTATION REGIMES: CLIMATE CHANGE, URBANIZATION, AND THE ROLE OF DESIGNERS IN REMAKING WATER MANAGEMENT IN BANGLADESH'S CAPITAL**

Abstract ID: 504

Individual Paper Submission

LAMB, Zachary [University of California Berkeley] [zlamb@berkeley.edu](mailto:zlamb@berkeley.edu), presenting author

Dhaka, the fast-growing capital of Bangladesh, is frequently included on lists of the global cities most vulnerable to climate change. In recent years, infrastructure investments and land use planning for the capital region have often been framed as adaptations necessary to counter present and projected climate vulnerabilities. Design professionals are increasingly included alongside state engineering bureaucracies and international development institutions in advocating for massive investments in water management infrastructure to enable urban expansion and to protect already urbanized areas from flooding.

This paper examines the role that design professionals (urban designers, landscape architects, and architects) have come to play in Dhaka's evolving "adaptation regimes," the coalitions of actors shaping "the landscape of possible intervention in the face of climate change" in the city (Paprocki 2018). The paper is based on analysis of documents from historical and ongoing flood infrastructure and planning projects, along with interviews with over 80 participants and observers in recent projects. Drawing on these sources, the paper examines how designers shape Dhaka's adaptation regimes in ways that are simultaneously linked to global networks of "urban environmental project making" (Goh 2019) and rooted in Dhaka's place-specific and historically-contingent processes of infrastructural modernization and urbanization.

Since the end of the colonial era, Dhaka's flood planning and infrastructure have been shaped by shifting coalitions of domestic water engineering and planning bureaucracies and international contractors, donors, and lending

institutions. While some recent Dhaka flood protection proposals, including those put forward by a state-linked Chinese engineering and construction firm, are broadly in keeping with 20<sup>th</sup> century models of Promethean infrastructural modernization (Kaika 2004), advocates of Dutch “delta planning” present their projects as a new paradigm. Promising a novel approach to ‘living with water’ and ‘designing with nature,’ many of these efforts prominently feature design professionals and design methods (Meyer 2014). In spite of these bold ambitions, many of these design-supported efforts actually seem to recycle strategies and, in some cases, whole projects from earlier problematic eras of flood control in Dhaka. The paper closes by identifying three specific mechanisms by which designers contribute to climate adaptation “antipolitics” (Swyngedouw 2010). The Dhaka cases illustrate how designers can wittingly or unwittingly revive long critiqued water management strategies and obscure uneven costs and benefits by invoking: 1) existential urgency; 2) restorationist visions of harmonious relations between human settlements and landscape processes; and 3) promises of costless transformations in which everyone wins.

The paper makes two primary contributions. First, it places contemporary climate change-oriented flood infrastructure design in relation to historical processes of city making in Dhaka, a city that has seen relatively little international scholarly attention compared to other South Asian mega-cities. Second, it examines how the inclusion of designers and design methods in these processes shapes Dhaka’s adaptation regimes, advancing particular urban infrastructural futures while ignoring or obscuring other possibilities. The role of design in shaping adaptation regimes is an increasingly pressing concern as cities around the world look to designers to manage complex urban climate adaptation processes that can have profound and enormously inequitable impacts on the lives of city dwellers.

Urban street design has been changing to better accommodate pedestrians and cycles and create better public spaces. Cities have improved cycling infrastructure, created new pedestrian spaces, and implemented “complete streets” and “vision zero” policies (Hess, Gregg, and Whitney 2019). The COVID-19 pandemic further accelerated these changes as cities sought to manage public space access and changing transportation needs. What was not immediately clear was what design strategies should be employed. Some officials advocated opening up roadways to pedestrians and cyclists to support physical activity and essential travel; others initially resisted these ideas as in conflict with public health goals of “social distancing.” Concurrently, advocacy organizations argued that the

reduced traffic allowed cities to radically rethink streets and permanently move away from auto-centric designs. Over the course of several months, cities experimented with a number of interventions that may have longer-term impacts on the design and use of streets beyond the period of the pandemic.

This paper uses content analysis of national news media sources to probe COVID-related street design strategies along with the rhetoric that accompanied them. We examine the range of design interventions, goals, perceptions, and discussions from the initial stay-at-home orders through the fall of 2020. We draw ideas from literatures on disaster recovery planning (Johnson and Olshansky 2017), policy mobilities (Peck and Theodore 2015), and path dependencies and critical junctures (Sorensen 2015) to consider the permanence of new ideas and how they may travel in a time of crisis. To do so, we coded some 150 articles for a number of themes including: the interventions implemented and how these changed over the time period studied; the stated goals for each; regulatory and procedural issues including public consultation; equity and public space concerns; and whether interventions were considered short-term or as intended to create longer term changes.

Our initial findings present a typology of interventions used. We then discuss four key themes: process and tactical response; gathering vs social distancing; mobility and challenging automobility; and public space and privatization. After an initial period of experimentation, cities converged on three major strategies: the rapid expansion of cycling networks with new bike lanes; the creation of “slow streets” to support socially-distanced walking, cycling, and other non-motorized activity; and programs that allowed restaurants to quickly establish outdoor cafés in roadway and sidewalk space to allow outdoor dining. Initially, cities were most concerned with creating space for social-distancing and expanding cycling networks, a strategy discussed throughout the study period. Towards the end of the period, attention shifted to street cafes and supporting economic activity, almost to the exclusion of other goals. Projects were largely unquestioned in terms of their top-down implementation with little public consultation, nor in terms of how they impact social equity and public space use. In many ways the pandemic became a testing ground to experiment with street design that has drastically altered the way cities allocate space for pedestrians, cyclists, and café uses. Some, but not all, of these changes will have longer term impacts but whether they will constitute a critical juncture is not yet clear.

#### **STREET GREENERY INDICES: DEVELOPMENT OF ACTIVITY-FRIENDLY STREET GREENERY MEASURES AND ASSOCIATED ENVIRONMENTAL JUSTICE ISSUES**

Abstract ID: 538

Individual Paper Submission

CHOI, Dong-ah [The University of Utah] dongachoi@gmail.com, presenting author

PARK, Keunhyun [Utah State University] keunhyun.park@usu.edu, co-author

RIGOLON, Alessandro [The University of Utah] alessandro.rigolon@utah.edu, co-author

Urban green space is a critical public amenity that promotes physical activity, mental health and well-being, and social interactions (Astell-Burt et al., 2014; Thompson Coon et al., 2011). Easily accessible street greenery, including trees, grass, and shrubs, might have a higher potential to support active transportation, regular physical activity, and outdoor social engagement than distant public parks, especially for groups with limited mobility (e.g., low-income households, seniors, children, and people with disabilities). Besides the moral imperative to plan for these groups, U.S. law also includes provisions to support their needs. Specifically, the U.S. Environmental Protection Agency requires the fair treatment of all people regardless of race, color, national origin, or income to achieve environmental justice, and that fair treatment includes the provision of green space. Nevertheless, only a few recent studies have analyzed whether street greenery is equitably distributed across socioeconomic, racial/ethnic, and age groups (Choi et al., 2020; Nesbitt et al., 2019), and this is in part due to the lack of agreement about how to measure the quantity and quality of street greenery. In this study, we (1) introduce quantitative measures of street greenery qualities that might help promote physical activity, such as accessibility, connectivity, and a sense of enclosure, and (2) examine whether these measures vary by socioeconomic status, race/ethnicity, and age.

The study sites are neighborhoods of large urban areas in the lower U.S. West that display a semi-arid and desert climate with an extremely long and hot summer. The major source of street greenery is aerial images generated by the U.S. National Agriculture Imagery Program (NAIP). We use locally-identified Normalized Difference Vegetation Index (NDVI) values and road buffers to extract vegetation along city streets. To develop the street greenery index, street greenery is first measured in four different ways: Street Greenery Coverage (total street greenery per unit area), Street Tree Coverage (total street tree cover per unit area), Street Tree Enclosure (total length of street links enclosed by 25% tree shade density), and Street Tree Connectivity (total number of intersecting points between street links enclosed by 25% tree shade density). While the first two measures quantify overall street greenery availability in a neighborhood, the third and fourth measures capture the street greenery qualities (enclosure and connectivity) that might promote physical activity (Ewing and Handy, 2009). Finally, we build regression models to analyze whether the indices are associated with neighborhoods' sociodemographic (income, race/ethnicity, education level, age) and built environmental characteristics (population density, land use diversity, street connectivity, presence of sidewalks, park area density, neighborhood age). Preliminary analyses show that significant unjust patterns were found in terms of household income, educational levels, race, and ethnicity across all the four street greenery measures for the neighborhoods of four urban areas we examined, including Denver, Las Vegas, Salt Lake City, and Albuquerque. The unjust relationships were stronger for two indices—street tree enclosure and street tree connectivity—than the other two—street greenery coverage and street tree coverage.

This study sheds light on everyday greenery that can be easily accessed by a wide range of people, including those with limited mobility (older adults, children, people with low-income, and people with disabilities), who have been often underrepresented in planning practice. This quantitative measure of street greenery can provide a comprehensive perspective on whether urban residents have adequate green environments for walking and other outdoor activities in their neighborhoods. Moreover, the research findings help decision-makers to navigate areas for street environment improvement, public health promotion, and tree planting initiatives, such as the 4,000-tree initiative in Salt Lake City and the "Urban Forest Plan" of San Francisco.

## **CHILDREN'S PLAY EXPERIENCE IN THE THORNCLIFFE PARK NEIGHBOURHOOD, TORONTO**

Abstract ID: 563

Individual Paper Submission

SHADKAM, Anahita [University of Waterloo] annahita.shadkam@gmail.com, presenting author

Parks and playgrounds are now widely accepted as children's formal playspaces in urban areas. However, the way the public realm itself can offer informal play opportunities has been overlooked within planning practices. Previous research demonstrates that the availability of playgrounds does not necessarily guarantee their usability and functionality (Veitch et al., 2006). Furthermore, it has been argued that formal playgrounds alone do not entirely meet children's playing needs in urban environments (Hanssen, 2019). Therefore, it is important for planning to aim for play-inclusive public spaces that can serve both adults and children.

It is crucial to understand that play experience is not limited to what happens within the physical boundaries of parks and playgrounds (Hanssen, 2019). Children tend to play everywhere and under any circumstances (Walsh, 2006). However, different factors may impede their freedom of play outside of the designated playspaces. Among them are the risk of traffic interactions and strangers' danger as two important safety concerns frequently studied in previous research (Horschelmann & Van Blerk, 2012). This is while in the past year, the role of outdoor free play has become crucial for children after the provincial park closures in Ontario, Canada due to the Covid-19 Pandemic. However, social distancing measures and health concerns exasperate children's presence in the public realm. Providing informal play opportunities within the public realm is particularly important when it comes to dense urban areas with limited open spaces.

The overarching objective of this research is to understand how the public realm can provide play opportunities for children living in urban neighbourhoods. Drawing on a case study in the city of Toronto, the main question of this research is "what are the forms and qualities of children's outdoor play?" This study is also looking to understand "how the Covid-19 pandemic may have changed the quality, frequency, and range of children's outdoor play?" The challenge in answering these questions is that planning for a play-inclusive urban public realm can be very context-specific. Meaning that creating informal playspaces is, at least in part, related to the lived experiences of children and depends on the social and geographical dimensions of the area.

To closely examine children's play experiences in urban environments, this study uses online surveys to collect information about the play experiences of children between 7 to 12 years old residing in the Thorncliffe Park Neighbourhood, Toronto, Canada. Although located in mid-town Toronto and characterized by its smaller housing units and high-rise dwelling types, the share of children's population is relatively high (27%) in this neighborhood as compared to the city-wide percentage (15%) (Agrawal & Rutgers, 2014). Moreover, the percentage of immigrants living in Thorncliffe Park is 63% of the total neighbourhood population. This number is the highest among the neighbourhoods of a similar profile that are located in central Toronto (downtown and mid-town). Given the existing cultural diversity of the city of Toronto, this case study provides useful information regarding the correlation between children's cultural background and their informal play experiences within the neighbourhood.

Due to the Covid-19 pandemic and safety guidelines, this study had limitations in the choice of research methods. Online surveys are chosen over more interactive data collection methods such as in-person walk-along interviews with children to adhere to the "social distancing" guidelines. To validate the data collected through the survey questions a number of participants will be invited to virtual interviews to elaborate on their answers. The results of this study will inform future planning and design projects aiming for the creation of safe and quality playspaces for

children living in dense urban neighbourhoods. Furthermore, this study will create an understanding of how circumstances such as the 2020 pandemic can be considered in future planning practices that aim for child-friendly environments.

### EXPLORING THE STRATEGY OF TRANSFORMING VACANT LOTS TO POCKET PARKS TO IMPROVE PARK ACCESSIBILITY IN CINCINNATI, OHIO

Abstract ID: 585

Individual Paper Submission

LIU, Shu [University of Cincinnati] liu2s4@mail.uc.edu, presenting author  
WANG, Xinhao [University of Cincinnati] wangxo@ucmail.uc.edu, co-author  
CHEN, Na [University of Cincinnati] chennn@ucmail.uc.edu, co-author  
HAN, Lin [University of Cincinnati] hanli@mail.uc.edu, co-author

During the COVID-19 pandemic since the spring in 2020, people around the world have been suffering from various activity restrictions. As these physical and mental restrictions increase people's need and desire for outdoor activities (especially doing physical exercise, relaxing, and getting close to nature) and social interactions, urban population's accessibility to parks has been greatly compromised since many urban neighborhoods do not have sufficient parks reachable on foot. In response, many researchers have advocated for attention to the once overlooked problem of lack of accessible urban green space for all social groups by focusing on walking-accessible parks, such as pocket parks (Honey-Rosés et al., 2020). Research has shown that quality pocket parks can contribute to the health and well-being of urban populations through multiple functions such as acting as a place for leisure activities and relaxation (Gibson and Canfield, 2016) and providing green outdoor exposure for psychological restoration. In addition, highly accessible pocket parks can serve as daily convenient recreational destinations for urban population, promoting physical activities of nearby residents and contributing to more social interactions and thus strong community sense (Nordh and Østby, 2013). Such benefits would remain and even get more evident during abnormal situations such as the COVID-19. Compared with large parks, the relatively small size of pocket parks gives them the advantage of making an easier fit into vacant properties scattered throughout the urban fabric to maximize their proximity to a variety of urban populations (Peschardt, 2014). The design of pocket parks can also be flexible to fit the surroundings and meet local needs.

In this study, we explore the feasibility and effectiveness of developing vacant lots into pocket parks as a solution to the problem of local park accessibility across Cincinnati, Ohio. Adopting the concept of geodesign in combining the creation of design proposals with impact simulations informed by geographic contexts (Geertman and Stillwell, 2020), our study includes three phases: knowledge-building phase, design intervention phase and impact assessment phase. In the first phase, we perform spatial analysis of the distribution of existing parks and their service areas to

identify areas with insufficient park resources for meeting local population needs and eligible vacant lots for developing pocket parks. In the second phase, after categorizing pocket park design types (facilities, green space and other amenities) based on the prioritization of needs from differential social groups in the study region, we will develop guidelines for site selection and pocket park design to effectively serve the surrounding neighborhoods. In the final phase, we will assess the impact of converting eligible pocket parks to the improvement of park accessibility.

Pocket parks are considered to have multiple merits and great potential in improving park accessibility in many studies over the years, and the current pandemic situation has drawn attention to urban green space and the importance of accessible parks for urban population's health and well-being. This research will provide a framework to evaluate the strategies of turning vacant lots into pocket parks to improve the urban park system by increasing local park accessibility to all urban population. Through applying the geodesign concept of combining strategic spatial analysis and context-specific pocket park design guidelines, we provide more actionable pocket park proposals for future development project that can benefit urban population during normal times and abnormal situations like the current coronavirus pandemic.

#### **SOCIO-DEMOGRAPHIC CHANGES OF URBAN SPRAWL RETROFITTING PROJECTS**

Abstract ID: 688

Individual Paper Submission

HADAYEGHI, Hooman [Utah State University] hooman.hadayeghi@aggiemail.usu.edu, presenting author  
PARK, Keunhyun [Utah State University] keunhyun.park@usu.edu, primary author

As a city grows, the population flows out of the urbanized area and forms a suburban settlement beyond the city boundary. These settlements are often scattered throughout big blocks, having low walkability and accessibility to amenities and services. This kind of development is referred to as urban sprawl. Urban sprawl negatively impacts the environment, society, and economy, decreases accessibility, and promotes car dependency. It also modifies a community's population structure by attracting or repelling specific groups or races. Urban redevelopment, as a response to sprawl, has received a great deal of attention. However, not many studies examine socio-demographic changes resulting from those redevelopment projects, often called sprawl retrofitting. This study will explore neighborhoods that experienced urban sprawl retrofitting projects to understand the impact of those projects on socio-demographic patterns.

We first collected sprawl retrofitting projects across the country. The projects were informed from several books (e.g., *Retrofitting Suburbia* by Ellen Dunham-Jones, *The Sprawl Repair Manual* by Galina Tachieva), academic articles, and websites (e.g., Congress for New Urbanism project database, the Town and Paper Traditional Neighborhood

development list). The criteria we used to define a sprawl retrofitting case were 1) it needed to have a previous use; while there are many examples of new developments built with sprawl retrofitting principles, they were not considered if there was no previous built environment use, 2) the new development must have a mix of uses. For example, public housing redevelopment projects were excluded if they remained residential-only community, and 3) to compare socio-demographic characteristics before and after the project, we had to limit our cases to those completed between 2000 and 2017, aligned with Decennial Census 2000 and ACS 2015-2019.

Sprawl retrofitting aims to modify the environmental quality of urban settings in a better way to increase the sustainability aspects of dispersed areas. Since any changes in physical attributes affect inhabitants, we can see demographic changes before and after every project. This research's primary purpose is to examine socio-demographic attributes of the retrofitted suburbia and examine its relationship to the physical status of sprawl retrofitting cases around the United States. We finally compiled a list of 75 projects in the U.S. and joined those with Census block-group-level data from NHGIS and LEHD. The changes in demographic status before and after projects are analyzed, and results are illustrated on maps.

Our study finds that as a result of a sprawl retrofitting project, a neighborhood became to have higher population density, higher gross rent, fewer renter-occupied housing units, and fewer older adults, compared with a comparison group (block groups near those study neighborhoods). Also, we observed a decrease in average time to work, implying improved job accessibility. Possible reasons include an improvement in walkability and public transit access and developments for a job-housing mix.

This study can help the future sprawl retrofitting research better understand the socio-demographic changes from those urban redevelopment projects. Planners can also apply the research findings to identify strengths and weaknesses in development projects, which improves demographic resilience and equity in a community.

#### **DIFFERENTIAL INCLUSIVENESS: INVESTIGATING GOVERNANCE REGIMES STRATEGIES OF DOWNTOWN DALLAS SIGNATURE PARKS**

Abstract ID: 701

Individual Paper Submission

GHAFFARI, Nazanin [University of Texas, Arlington] [nazanin.ghaffari@uta.edu](mailto:nazanin.ghaffari@uta.edu), presenting author

This study explores some of the more current tendencies in the management of public spaces to consider whether current directions in downtown Dallas signature parks are driven by a desire to improve social inclusion and justice in such spaces. Also, the study benefits from the theoretical lenses provided by urban design and planning, political

feminist geography, and public administration scholarship and their differential views in conceptualizing and operationalizing just and inclusive management and control over public spaces. Lefebvre's theory of the production of space plays a foundational role in contextualizing the conflicts between contradictory ideas and ideals of competing interests.

This research benefits from a Social constructionist comparative case analysis on three publicly used signature parks deliberately selected in downtown Dallas representing different combinations of public/private ownership and management: (1) publicly-owned, publicly-managed; (2) publicly-owned, privately-managed; (3) privately-owned, privately-managed. The research methodology includes interviews with park managers and city staffs and content analysis of official documents, local newspapers, and social media accounts. I critically studied a variety of inclusionary/exclusionary strategies in different times, spaces, and events. Investigating these anecdotes and governance practices in public space challenges some long-held assumptions about privatization and the degree of inclusion in quasi-public spaces.

Throughout this work, I have discussed ownership, management, and use as the main contributing factors to our understanding and perception of publicly-used spaces. Still, I have focused on how governance regimes reshape the contestations between managers and other prominent stakeholders versus current and potential users to reveal whether a space is truly public. The documented governance regimes' attributes center around five general concepts, including privatization, commercialization, eventization, securitization, and representation, introduced as governance strategies. I have studied and evaluated how these strategies are handled and applied by those in power, including designers, managers, board members, and city officials.

Through numerous instances, this study has shown while undoubtedly significant to classify and analyze public spaces, private ownership and management are not as central as previous studies have shown. After scrutinizing and examining the three case studies, I argue it is difficult to claim a sharp conceptual distinction between the two realms of inclusive versus exclusive. The investigation of three case studies demonstrates that public space and social inclusion are rich, contestable, and not at all simple concepts, mainly because of the powerful structural element to the notion of social inclusion. Downtown Dallas signature park are simultaneously 'spaces of provision' and 'spaces of prescriptions,' and the users' experiences differ in the time-space-event continuum. Thereby, it is problematic to reduce the social inclusiveness value to a simple dichotomy of private versus public. Perhaps trichotomies like private-faith-based-public or continuums from less to more public across time, space, and events can better express the phenomenon.

#### **OPTIMIZE THE HOSPITAL DESIGN TO REDUCE TRAFFIC CONGESTION THROUGH GENERATIVE DESIGN**

Abstract ID: 703

Individual Paper Submission

HAN, Lin [University of Cincinnati] hanli@mail.uc.edu, presenting author

CHEN, Na [University of Cincinnati] chennn@ucmail.uc.edu, co-author

WANG, Xinhao [University of Cincinnati] xinhao.wang@uc.edu, co-author

Due to the lack of systematic science and moderately forward-looking overall planning and design, problems of parking difficulties and traffic congestion are common around large hospitals in China, which have affected the quality of health care service and urban mobility. Since many hospitals are currently located in urban places accessible to residents, it is not advisable to relocate them. How to balance the need of utilizing the limited land resources and mitigating traffic congestion is the key challenge (Ge et al., 2011). Therefore, the research question in this study is how urban planners and designers can help minimize the negative impact of hospital trips on traffic in surrounding areas. Most existing studies are qualitative analysis of traffic congestion outside hospitals to derive strategies without data and models to quantify their effectiveness (Wu, 2012). In order to fill this gap, this study quantitatively explores the dynamics between hospital design and the inbound and outbound traffic. Microscope traffic simulations are embedded in a generative design process to optimize the reduction of hospital traffic congestion during morning peak hours.

The design of hospital buildings and interior space is commonly in strict accordance with medical building design and construction manual. There is little flexibility to change the layout of interior space to tackle the traffic congestion problem. At the same time, the design of exterior entry space of hospitals is not supported with the actual flow data modeling and analysis. In reality, different sources of flows near hospital entrances are mixed, which is the major cause of traffic congestion around it (Ge et al., 2011). Therefore, there is room for optimizing hospital exterior design to reduce traffic congestion.

Generative design framework allows designers to leverage the power of computation to derive novel and high-performing design solutions based on a set of goals, which has been widely applied in the domains of industrial design and engineering (Nagy, Villaggi & Benjamin, 2018). Addressing urban design problems can significantly benefit from the generative design due to the complexity of problems and the consideration of multiple stakeholders. Some scholars have explored the artificial intelligence-based urban space generative design (Lin et al., 2019; Quan et al., 2019). In this study, the generative design process consists of two modeling components and an optimization component. Hundreds of design options are first produced through a parametric model with a set of predetermined site parameters by using Grasshopper for Rhino3D. The site parameters include hospital entrance locations, pickup and drop-off locations, and main spaces like parking lot, and pedestrian space. The non-hospital related traffic volumes on streets at existing and potential hospital entrances are set as constants. The performance of each design is then modeled against the design goal. The design goal of this study is to reduce traffic congestion at the hospital entrance, and we use PTV VISSIM to simulate traffic flow. Finally, a pool of top performing designs is compiled using a metaheuristic optimization search algorithm. Decision-makers select the final design from the pool for implementation.

This study will advance the understanding of hospital flow generations and the knowledge of optimizing hospital designs. This generative design framework can be used in new hospital design or modification of existing hospitals. We will show that hospital design can be optimized to alleviate the stress on urban traffic and improve the efficiency and quality of hospital services.

## **AGE-FRIENDLY COMMUNITY PLANNING STRATEGIES BASED ON THE KOREAN SENIORS GPS TRACKING SURVEY**

Abstract ID: 714

Individual Paper Submission

KO, Youngho [Architecture and Urban Research Institute] yhko@auri.re.kr, presenting author

This study derived the Korean elderly's daily walking area and use of facilities and services through GPS tracking survey of the elderly's outdoor activities in their communities. The age-friendly urban welfare policies and projects were proposed based on the study findings.

First of all, the policies and cases of countries with the aging society were reviewed. This study found that the US, Japan, and major European countries strengthened the access to health welfare and convenience facilities and services within the range of the elderly's daily walking area. Korean policies for creating such the elderly access friendly so to be age-friendly built environment were insufficient, despite the emphasis on improving welfare services for the elderly. The analysis of policies and systems for creating an age-friendly built environment at home and abroad, this study derived implications for the necessity of strengthening the elderly's accessibility to facilities and services within the local daily walking boundary. In addition, it was confirmed that the necessity of demonstrating the daily life of Korean seniors in detail to reveal the characteristics of the elderly's daily walking area.

As the secondary spatial data analysis, using the Korea national geographic information map data, it was analyzed that the accessibility of major outdoor convenience facilities for the elderly within their local community boundary. This study found that the Korean elderly had to travel up to about 30% longer distance than the population of all age groups to use the outdoor convenience facilities in their local communities. Using the raw data from the Korea national survey of the elderly life in 2017, it was also found that the Korean elderly showed dissatisfaction with the lack of daily convenience facilities in their current residence or low accessibility to the use of facilities.

This study then conducted a GPS tracking survey on the Korean elderly's daily walking movement to reveal their actual daily walking area with their daily convenience facilities use status. The daily waking movement of a total of 128 elderly samples (a total of 453,458 GPS recording points from July to September in 2020) were collected. The senior participants were selected in 4 different case regions where had similar population aging ratio (15-17%) with similar socioeconomic environments each other. The case areas were differentiated mostly by their housing types (an apartment-dominant area group vs a single-detached houses dominant group).

Through analysis of differences in accessibility to facilities of the elderly, analysis of awareness of the living environment, and GPS tracking survey results of elderly people, this study proposed that Korean age-friendly urban welfare policy should consider differences in the distribution of major housing types for elderly people in their community, and should strengthen access to services, food, health, culture and arts, religion, and educational facilities for the elderly.

This study also proposed the basic direction of Korean age-friendly urban welfare policies related to create an age-friendly built environment. The necessity of planning for an age-friendly built environment especially within the daily walking area of the elderly, and improvement of related laws were presented. The necessity of designation of a model district for creating of an age-friendly built environment, the main contents of the model district designation project, and improvement of related laws were proposed. The policy proposals for the creation of an age-friendly

built environment at the daily walking area scale and the establishment of age-friendly community network and a platform have been suggested.

### **COMMUNITY ENGAGEMENT DURING COVID-19: A REVIEW OF THE EMERGING LITERATURE AND A CASE STUDY OF OPPORTUNITY VILLAGE IN EUGENE, OREGON**

Abstract ID: 715

Individual Paper Submission

MEIER, Briana [University of Oregon] brianameier@gmail.com, presenting author  
KO, Yekang [University of Oregon] yekangko@uoregon.edu, co-author  
MURACA, Barbara [University of Oregon] bmuraca@uoregon.edu, co-author

This study presents a critical review of emerging literature on pandemic community engagement and a case of a co-design project for Opportunity Village in Eugene, Oregon. Since 2019, a team of faculty and students at the University of Oregon has led a participatory landscape design project with residents at Opportunity Village, a transitional housing community in Eugene, Oregon. The research project focuses on a co-design process and landscape improvements for Opportunity Village. The team is working with the community to improve their living conditions through landscape interventions including an agro-photovoltaic system that will allow for increased food and energy production, on-site water management, and growing plants for income through a series of co-design workshops and co-building. The project scope and engagement process has been significantly impacted by the COVID-19 pandemic and the team is actively working to develop and implement engagement methods appropriate during the pandemic. We emphasize a variety of ethical concerns and considerations involved in engaging with vulnerable communities during this difficult time. To understand how other practitioners and researchers are working with communities during the pandemic, we completed a review of emerging academic and nonacademic literature. Our presentation will demonstrate a series of key themes from our review of approximately 25 texts published during the earlier months of the pandemic from March through August 2020. We will also share the community engagement redesign process we have been undertaking to accommodate the present circumstances. We contrast our new strategy with the co-design process that we had initially employed prior to the pandemic. Lastly, we will share the preliminary results of a series of surveys completed by Opportunity Village residents in 2020 and 2021. The surveys ask residents about their perspectives on how the pandemic has impacted the way they interact with the research team, how they engage with the community outside of Opportunity Village, and their day to day lives. We will discuss specific implications and make recommendations for community engagement with vulnerable populations living in transitional housing.

## THE ROLE OF MICROCLIMATIC FEATURES OF STREET DESIGN IN THE HEAT - PEDESTRIAN ACTIVITY RELATIONSHIP

Abstract ID: 748

Individual Paper Submission

KIM, YouJoung [Texas A&M University] [kyj0244k@tamu.edu](mailto:kyj0244k@tamu.edu), presenting author  
JANG, Seonju [Texas A&M University] [sjjang1037@tamu.edu](mailto:sjjang1037@tamu.edu), co-author  
BROWN, Robert [Texas A&M University] [rbrown@arch.tamu.edu](mailto:rbrown@arch.tamu.edu), co-author

The microclimate impact on outdoor activity in urban public space has been explored in numerous studies. The correlation of thermal comfort to the user's attendance, types of activity, and spatial distribution in public space are the major concerns in the studies on environmental behavior and design (Zacharias et al. 2004; Klemma et al, 2017). While parks and plazas are often selected to explore this heat-outdoor activity relationship, urban streets where the majority of pedestrian activities occur have received less attention. Given the increase in extreme heat events resulting in harm to urban street vitality tightly linked to economic and social interactions (Sharifi & Boland 2018), climatic-induced pedestrian behavior related to the thermal comfort of urban street spaces is increasingly important for a safe and favorable walking environment.

To date, the climatic-induced human behavior in relation to urban street design has been discussed in terms of three issues: (1) what meteorological factors determine outdoor thermal comfort, (2) what types of meteorological conditions effect pedestrian activities, and (3) how microclimatic features of street design improve thermal comfort and encourage walking activities. However, in their discussions, most previous studies fail to consider the behavioral thermal adaptation, which conceptually frames how people adapt to given thermal stress by adjusting their behavior (Brager & Dear 1998). While this adaptation process determines the thermal threshold of outdoor activity where people stop walking or choose to stay in a given thermal condition (De Freitas et al. 2007), its empirical relationship with street design features is rarely examined. In this context, this study is guided by the following two questions:

How does thermal comfort impact pedestrian activity, especially for walking and sitting, in terms of behavioral thermal adaptation? And how is it related to different physical features of the microclimatic urban street design?

To address them, this study aims to explore the effects of microclimatic street design features on the relationship between pedestrian activities and outdoor thermal comfort. The key focus lies on (1) revealing the different spatial scales of meteorological effect (weather and microclimate) on two pedestrian activities, walking (active behavior) and sitting (sedentary behavior); (2) measuring the combined effects of microclimate and street design features on the activities at street and block scale; and (3) identifying the thermal threshold of the activities according to five observation spots with different types of microclimatic design features. Panel data analysis and piecewise regression are used to estimate microclimatic street design impacts and identify the associated thermal threshold levels. The Highline' five major leisure activity spots in New York City are chosen as case study sites. For the data collection, on-

site microclimate measurement is adopted and unobtrusive observation using video recording are used to count people who are walking and sitting in each observation spot.

The study results indicate that pedestrian activity is significantly determined by meteorological conditions and thermal comfort regulated by microclimatic design features. Walking count is associated with weather conditions, while the sitting count is primarily determined by microclimate conditions, especially for the ratio of shading cover areas. Regarding the microclimatic design features, Sky View Factors (SVFs) have a considerable impact on the thermal threshold for sitting count, but its impact on walking count is relatively minor. This is largely because the shading effect of solar geometry is the most influential factor to determine where pedestrians prefer to stay. It is expected that this study outcome provides practical knowledge and a deeper understating for designing heat-resistant street spaces that maintain and support pedestrian activities during extreme summer heat events.

AMELI, S. Hassan [University of Utah] s.hassanameli@outlook.com, presenting author  
EWING, Reid [University of Utah] ewing@arch.utah.edu, co-author

Streets are one of the most significant elements of urban spaces to accommodate the public activity. Streets provide access to many different locations and services. Daily activities, travel to and from work, shopping, and all other active travels occur here. Many studies characterized the built environment in terms of D variables density, diversity, design, destination accessibility, and distance to transit (Cervero and Kockleman, 1997, Ewing and Cervero, 2001). Measurement of four D variables is relatively straightforward, while the D variable, design, is more nuanced. In terms of walking experience, design measures sidewalk (pavement) coverage, building setbacks, street widths, numbers of pedestrian crossings, and presence of street trees. However, pedestrian experience is influenced by the streetscape features. Urban designers believe that these micro features are important for active street life but have little empirical evidence to back the claim. However, unlike macroscale characteristics of the built environment, field observation is required for measuring microscale design elements or streetscape features which is resource-intensive. This study will be the first to determine if twenty streetscape features rated in field observations can be reliably replicated using web-based Google Street View (GSV).

Ewing et al. (2016) identified streetscape features that explain pedestrian traffic volume by measuring D variables and 21 microscale streetscape features for 588 street segments in New York City. First, this study uses negative binomial regression to identify streetscape features that explain pedestrian traffic volume in 179 street block faces in downtown Salt Lake City, Utah, which is arguably a more typical of the auto-dependent United States compared with NYC. We will use GIS to calculate D variables. For measuring 21 streetscape features, a team of graduate students used an illustrated Field Manual (Clemente et al. 2005) and recorded data for each of 21 variables walking all the block faces within the study area and counted pedestrians for half an hour for each block face. Second, this study tests Google Street View (GSV) for efficiency and effectiveness as a method of measuring urban design qualities without having to be present in the field. The same team of graduate students will use the same field manual but will collect data remotely by using GSV. This study will use Cronbach's Alpha, a measure of internal consistency and scale reliability, and also Intraclass Correlation Coefficient (ICC) to evaluate the reliability of the data (Koo et al., 2016) collected from GSV versus the data collected in field. Finally, we will perform an Inter-rater reliability test to capture the degree of agreement among five independent observers/raters who used GSV to measure streetscape features for the same 20 street block faces.

#### **BEYOND #HASHTAG ARCHITECTURE: URBAN DESIGN IN THE AGE OF THE SELFIE**

Abstract ID: 945

Individual Paper Submission

WAGNER, Jacob [University of Missouri-Kansas City] wagnerjaco@umkc.edu, presenting author

Scholars and practitioners of urban design today are dealing with a much different public imagination. Urban design - which once suffered from a lack of visibility and public awareness amidst the everyday ubiquity of the object of study – faces a very different context for the public experience and understanding of cities. We find ourselves addressing public officials, property owners and voters over-saturated with digital images, sometimes through their own devices, and sometimes by means beyond their control.

One of the greatest changes to urban design practice in the past decade is the rapid proliferation of the digital image and the exponential growth of social media. To speak of the future of planning and urban design without addressing this phenomenon seems irresponsible – or at least evidence of our “ritual ignorance” (Cuthbert 2020). This paper intends to inspire a reflective discussion of urban design in the age of the selfie and #hashtag architecture.

Architects, real estate developers and urban designers are (re)designing the urban built environment and civic spaces in ways that take this reality of image saturation into account – either through a position of smug indifference or as complicit participants in the competition to design and build the next-great, Instagram-able-space,

aka #hashtag architecture.

The research is organized in three parts. First, I analyze the conditions that have led to the ubiquity of digital photography, images of cities and how this prevalence of the “Instagrammable” space is changing urban design and the spatial politics of urban development.

#Hashtag architecture is a form of urban design and capitalist production of space rooted in the currency of the digital image, where urban space is now a platform (both physically and digitally) for the proliferation of images. This is not Dolores Hayden’s power of place. Is this the “wilderness of mirrors” forecasted by the poet Octavio Paz?

Next, the paper presents a case study of The Vessel in the Hudson Yards project of New York. Using a wide variety of social media posts, videos, and other digital representations of urban space, the paper asks – what are implications of this new form of urban space and urban design in which an overriding purpose is to produce a space that generates more images?

The Vessel signals the arrival of #hashtag architecture in urban design. A new form of hyper-mediated urbanism in which the citizen experience of the city is not as a civic space of meaning and identity rooted in solidarity and democracy, but rather the city as image-saturated spaces and consumer experiences magnified by thousands, if not millions of digital influencers. #Hashtag architecture is the lens through which we experience the city through the backlit glow of the handheld device. Is their meaning here? Or - have architecture and urban design become empty vessels to be filled, not with meaning, but with other images?

Finally, the paper concludes with a reflection on the challenges of teaching planning and urban design in the age of the selfie and #hashtag architecture. What does the proliferation of #hashtag architecture mean for a new generation of urban designers and planners of urban space?

#### **VERTICAL GREENING SYSTEMS: HOW IMPORTANT IS CLIMATE TO THE FEASIBILITY OF BIOPHILIC ELEMENTS?**

Abstract ID: 946

Individual Paper Submission

MACEDO, Joseli [Dalhousie University] joseli@dal.ca, presenting author

MACMILLAN, Kate [City of Mississauga] kt943221@dal.ca, co-author

As cities try to implement strategies to deal with the consequences of climate change, several of them are considering vertical greening systems—along with green roofs and various other biophilic elements—to filter pollutants, absorb greenhouse gases and retain carbon. With the urgency imposed by now evident consequences of climate change, several cities are instituting incentives and programs to encourage the adoption of innovative techniques and the implementation of biophilic systems. Vertical greening systems (VGS) is the most common term used in the literature to describe green building envelopes; green walls is another commonly used term. For the

purposes of this research, we use VGS to refer to green building envelopes, green façades, exterior green walls, living walls, and vertical gardens; in other words, VGS is the umbrella term for any greenery added vertically to the exterior of a building.

Cladding buildings with vegetation is not a novel idea. The mythical Gardens of Babylon, built about 600 years before our current era, are the first notable example despite there being no written records to confirm this hypothesis. In cold climates, vegetation was used to insulate roofs; the Vikings, for example, used turf on their roofs. All across Europe, vines have covered buildings and shaded pergolas and balconies for millennia. This paper considers the feasibility of VGS in contemporary cities in cold climates. We discuss different types of VGS, their adaptability potential to different climates, and the barrier and benefits of installing these biophilic elements in places with less than ideal conditions. We then evaluate the performance of VGS installed in several cities located in climates that are not conducive to maintaining lush greenery 12 months of the year. The intention is to determine which biophilic elements can be adopted by communities seeking to become more sustainable, which ones can be adapted to less than ideal conditions, and which ones should simply be replaced by more feasible alternatives that lead to similar outcomes.

Since most biophilic elements provide ecosystem services, it is necessary to gauge their value within each urban context. Some of the design considerations include: purpose, secondary features, environmental factors, project budget and funding support, anticipated level of maintenance, building characteristics, building codes and bylaws, assessment of risks, and accessibility. Each variable influences the type of VGS, the design of the structure, and the plant selection. In colder climates, certain adjustments must be made for the structure and growing materials to tolerate the temperature and humidity changes.

Beyond their physical properties, biophilic elements can also contribute to the identity of a place and represent the cultures and traditions of their peoples. We recommend that professionals seeking to install VGS and other biophilic elements in urban landscapes draw from the knowledge of locals, particularly indigenous groups, to not only pay homage to native traditions, but also to implement ecosystem services that are better suited to the respective environments.

This work is relevant to urban planners, ecologists, urban designers, landscape architects, architects, developers and builders. The recent debates around climate change suggest that cities need to be part of the solution and increase the number of biophilic elements in their built environments. Providing incentives to designers and builders to incorporate certain elements in their projects is but one way to implement change and start a trend towards greener, healthier, and more energy efficient cities.

#### EXPLORING OLDER ADULTS' DISCRETIONARY TRIPS AND MENTAL WELL-BEING IN THE 500 LARGEST US CITIES

Abstract ID: 969

Individual Paper Submission

BAI, Xueyin [University of Florida] xueyin.bai@ufl.edu, presenting author  
ZHAI, Wei [Hong Kong Baptist University] wei.zhai@ufl.edu, co-author  
STEINER, Ruth [University of Florida] rsteiner@dcp.ufl.edu, co-author

The World Health Organization firstly introduced the global Age-Friendly Cities program to guide the construction of environments to support active aging in 2007. Among all the topic areas in the guide, older adults' transportation and mobility is a crucial part (World Health organization, 2007). Academics from different disciplines have been probing the relationships between living environment, older adults' mobility, and older adults' well-being for a decade. However, research limitations still exist. First, for older adults' mobility, much attention has been paid to trips and activities for maintenance purposes, such as medical trips and trips to access food, while limited attention has been put on their discretionary trips, such as trips for social and recreational pursuits. The benefits of discretionary mobility for older adults' social connection and well-being still needs further exploration (Siren, Hjorthol, and Levin, 2015). Second, regarding the construction of environment, one of the most heavily examined topics in planning literature is the neighborhood design characteristics related to older adults' walking behavior. However, cohorts of the new aged are healthier, wealthier, and have more extended life-space boundaries than previous generations (Lee and Tan, 2019). Only investigating the effects of within-neighborhood environment on older adults' daily trips and well-being is not sufficient.

This study addresses the above limitations. By applying structural equation model, we feature the relationships between third places, discretionary trips, and mental well-being among older adults in the 500 largest US cities. Third places are social surroundings outside home and work where people may gather, enjoy the company of others, and interact (Oldenburg, 1999), such as pubs, cafes, public libraries, or parks. To extract information of discretionary trips, we use data from a panel of 20 million mobile devices provided by a company named SafeGraph. SafeGraph database covers dynamic human mobility patterns of these anonymous device users. The data sampling correlated highly with the US Census populations. We also selected third places and obtained their geolocations and geometries from the Point-of-Interest (POI) dataset provided by SafeGraph. To compare the effects of third places and neighborhood walkability, we use the National Walkability Index created by the Environmental Protection Agency. We acquired tract-level mental well-being data from the Centers for Disease Control and Prevention, and we obtained tract-level socioeconomic data from the American Community Survey.

This study yields several meaningful findings. First, we find that the accessibility of third places promotes older adults' discretionary mobility and mental well-being. Second, neighborhood walkability shows no significant influence on older adults' discretionary trips and mental well-being as expected when we control for the effects of third places. Third, the accessibility of third places within the neighborhood could increase older adults' discretionary trips but the accessibility of third places beyond the neighborhood may have greater positive impacts on their mental well-being.

Our findings generate some policy recommendations. First, while helping older adults meet basic life requirements are important, more attention should also be paid on promoting older adults' discretionary mobility, creating third places, and reshaping places in terms of their popularity to accommodate the needs of older adults. Secondly, we urge practitioners to extend the planning scope for active aging beyond "increasing neighborhood walkability". Developing and strengthening older adults' social and recreational networks over a wide geographical area is not only necessary but essential.

Mobility is central to cities – the ability to connect people and goods creates the myriad opportunities that urban life affords. However, with automobiles taking a disproportionate share of mobility, particularly in the U.S., has resulted in uncontained sprawl, environmental degradation, declining sociability, and health and well-being concerns (Handy, 2002). While access is affected by numerous factors, the focus of accessibility studies is heavily on mobility (Proffitt et al., 2015). This research is intended to shift the focus from mobility driven access to proximity-based access. Improving walkable proximity to a diverse range of everyday goods, services and amenities can significantly improve access and thus quality of life, especially in neighborhoods with social and geographic impediments to mobility (Leyden, 2003). The COVID-19 pandemic has further demonstrated the importance of self-sustaining neighborhoods and the relevance of walkability and proximity. We argue that policy makers should pay close attention to proximity-based access to make cities more just, equitable and resilient. In order to do so we ask, if walkable access is afforded only to those with means and if income determines walkable access to everyday goods, services and amenities?

At its core, the idea is simple – all residents should have everyday needs (excluding jobs) met within easy walking distance of their residence (Moreno et al., 2021). This premise returns to human-centered place-making and contains the building blocks for sustainability, resilience and inclusivity as defined by the United Nations’ Sustainable Development Goals (UN, 2015). The first step in doing so is to determine proximity at a scale that provides meaningful outcomes. To do so we use geo-spatial data distributed over a one-acre hexagonal grid to model physical proximity to everyday amenities. The one-acre hexagonal grid allows for the redistribution of data collected at various geographic boundaries (parcel, block, block groups, census tracts, zip codes) to a uniformly sized grid. It also neutralizes the scalar and aggregation variations induced by spatial geography and makes the data comparable across various metrics.

Proximity is measured as 15-minute walkability to five categories (with a total of 14 sub-categories) - shopping (grocery stores, convenience stores, restaurants/coffeeshops/bakeries, etc.), care (hospitals, pharmacies), learning (schools, libraries), cultural (museums, theaters, religious centers) and recreational (formal and informal) facilities for walk modes with impedance factors for topography and lack of supportive infrastructure for walking. Using ESRI Business Analyst’s Facilities Data by NAICS codes and Google search, each sub-category is geocoded in GIS. Walk-time network buffers are generated around each sub-category to identify the areas (with population) that have 15-minute walking access to goods, services and amenities. The study area (city of Cincinnati) is divided into one-acre hexagonal tessellations where people live that are assigned a walk score if they fall within the walking buffers for each sub-category. Highest score denotes 15-minute walking access to all sub-categories. Findings from spatial regression analyses show that proximity-based access to certain categories is related to income whereas other categories of amenities are more equitably distributed across the city of Cincinnati. The outcomes of this research are especially relevant for planners and policy makers to address the issues of equitable

distribution of resources including access to everyday needs especially as it relates to populations with mobility challenges. The unique methods used in the research have broad applicability for cities. Most importantly this research shows how the transformation from mobility-based to proximity-based access is possible for community development and urban design thinking that responds to the adaptive planning needs of the 21<sup>st</sup> century.

#### EXCITING WALK-ONLY PRECINCTS IN ASIA, EUROPE AND NORTH-AMERICA

Abstract ID: 1028

Individual Paper Submission

BALSAS, Carlos [Ind. scholar] cbusa06@yahoo.com, presenting author

Walkable places are assets in cities. They have advantages over vehicle-oriented spaces in terms of economic, social, health, energy and environmental perspectives. Walk-only pedestrian precincts have been built in various parts of the world with different degrees of success. City size, and all the urbanization and planning implications that it brings, is not the main determinant to the building of walk-only precincts, since these can be found in large as well as in small and medium size cities in Asia, Europe and the Americas. The research question asks how and to what extent three pair-wise large and small cities in three distinct continents have recently planned, designed, managed and extended walk-only areas. Therefore, the paper attempts to compare and contrast walk-only pedestrian precincts in these cities: Shanghai (China) and Macau (SAR of PRC); Lisbon and Figueira da Foz (Portugal); and New York City and Miami Beach in the United States. Field work, conducted in all case studies during the last decade and a half, was followed by desk research of specialized literature, popular press, and public policy documents. The field work entailed footfall observations, documentation of subway and transit stations and stops, the location of public buildings, major shopping centers and anchor venues, sketches of pedestrian paths and flows, explorative surveys with photographic investigations, notes about dominant uses in the adjacent built environments and their main commercial transformations, changes in traffic patterns, and functional land uses, among others. The paper builds upon the author's earlier work on walkable cities via the application of an eight-pronged Commercial Revitalization Vibrancy (CRV) theory to centrally located urban precincts. The CRV theory is based on these tenets: (i) location of the streets in the cities and main reasons for their creations, (ii) proportion of the pedestrian precincts in relation to the cities and to other centers and subcenters, (iii) relationships between the streets and the surrounding areas and activities, (iv) accessibility to the pedestrian precincts and movement in the streets, (v) conciliation between the needs of different street users, (vi) strategies to respond to the competition from new and emerging centers, (vii) funding of improvements and continued management activities, and (viii) perpetuation of success and avoidance of decline. Conclusions and key findings for the success of this type of precincts are distilled. The key takeaways are the growing popularity of walk-only precincts in the three continents examined, their preeminence according to their host territories' urban and functional hierarchy, their conception of connecting key destinations in cities, and the

existence of idiosyncratic niche markets capable of distinguishing and individualizing each precinct in the cities' vast urban and metropolitan hinterlands. The paper also suggests ways for walk-only precincts to adapt their revitalization and management strategies to a post-2020 pandemic reality.

#### **PANDEMIC RELATED STREET CLOSURES AND THE FUTURE OF THE PEDESTRIAN MALL**

Abstract ID: 1066

Individual Paper Submission

SCHMIDT, Stephan [Cornell University] sjs96@cornell.edu, presenting author

Historically, pedestrian malls have generally not been particularly successful in American cities. Originally introduced from European cities in the post-war period, pedestrian malls were conceived as a means to address the urban crisis in US cities of the 1960s and 1970s. Often ill-conceived and without broad political support, many of these malls failed and were subsequently removed (Matuke et al, 2020; Amos, 2019). However, over the last decade there has been increasing interest in closing off streets to automobile use (Times Square in NYC for example). This trend has only accelerated due to the pandemic closures of 2020, as declining traffic volumes encouraged many cities to experiment with street closures. This research explores these Covid induced closures (Combs et al, 2020) and ongoing discussions regarding whether to make the closures permanent. The goal of this research is to conduct a series of case studies to better understand the political, social, and economic dynamics behind these developments through interviews with local officials and advocates and compare and contrast the differences with the previous generation of pedestrian malls. We find that there is significant support among the business community to make some of the closures permanent. The support of the local business community is in stark contrast with the earlier generation of pedestrian malls, which were often opposed by local retailers.

Key Words: pedestrian mall, street closure

## NEARNESS TO OPEN SPACE AND ASTHMA OUTCOMES: A STUDY IN CONNECTICUT, US

Abstract ID: 1069

Individual Paper Submission

TAGORE, Pratiti [Trinity College] pratiti.tagore@gmail.com, presenting author

Neighborhoods have an intimate relationship with human well-being. Past research has found that several aspects of human health are linked to the place they live in. For example, residents are less likely to be obese and experience better cardiovascular functions if they live in walkable neighborhoods. Similarly, people who live near a park or access nature are more likely to experience better mental health and express feelings of well-being.

In recent years, respiratory health has emerged as an important area of research. Razavi-Termeh et al. (2021) studied several asthma-prone areas in Tehran, Iran. Among several environmental indicators, the authors found a strong spatial correlation between pediatric asthma and nearness to parks. This research identifies that by simply providing access to open space, children with asthma are benefitted. There is a greater possibility of asthma flare-ups in places where parks are either far away from residences or altogether absent within walking distance. Similar associations have also been found by Chang et al. (2015).

In this study, I dig deeper into the relationship between open space and asthma outcomes. The study characterizes 'open space' by a) city parks, b) other municipal open space, c) privately owned open space, and d) trails. Asthma outcomes are measured by five-year asthma hospitalization rates (2010-2014) in selected towns in Connecticut, United States. Ankrah (2019) found that higher physical activity in specific locations in a county in the United States is correlated to lower asthma-related emergency hospital visits, while lesser physical activity is correlated to more asthma-related emergency hospital visits. Asthma flare-ups are lesser when the patient engages in mild to moderate physical activity, and physical activity can be achieved by active living within one's neighborhood. This research hypothesizes that nearness to at least one of the four open spaces encourages active living, thus reducing the risk of asthma flare-ups. Consequently, greater distance from open spaces discourages active living, thus increasing the risk of asthma flare-ups. In summary, the study explores the link between access to open space and asthma flare-ups, the reason for asthma-related hospitalizations.

Past literature has identified several determinants of asthma such as suspended particulate matter, ozone levels, humidity, and built environment factors such as road density and nearness to highways. The research will take a quantitative approach to address the research objective, controlling all the above factors. The study will use a combination of spatial (ArcGIS) and statistical (R) software. It will analyze the relationship between asthma hospitalization data in selected towns in Connecticut and access to open space within the towns.

There are several important outcomes of the research. First, this research will quantify the link between respiratory health and nearness to green space in towns and expand academic knowledge and scholarship on the topic. Second, the results of this research will have future implications in public health strategies in urban areas. The next possible steps of the research will expand on the results of this research and explore neighborhood residents' well-being in relation to open spaces.

## TYPOLOGICAL INDEX OF ALLEYWAYS: MAPPING FORGOTTEN URBAN FORM ELEMENT

Abstract ID: 1074

Individual Paper Submission

SOHDY ABDELFATTAH, Rawan [Khalifa University] 100057966@ku.ac.ae, presenting author

ALAWADI, Khaled [Khalifa University] khaled.alawadi@ku.ac.ae, primary author

KHANAL, Asim [Khalifa University] asim.khanal@ku.ac.ae, co-author

Cities are complex systems that are agglomerations of a variety of components (Batty, 2009). The physical characteristics of a city are often labelled into one of the umbrella terms such as ‘urban form’ (Anderson et al., 1996), ‘urban typology’ (Reinhold, 1994), or ‘urban pattern’ (Lynch, 1981). The elements of urban form include buildings, street patterns, urban blocks, lot configuration, landscape, layout of public spaces, etc. (Wiedmann, 2008). However, one of the critical components, alleyways, has been marginalized when discussing the elements of urban form, despite their major role in shaping pedestrian network system and cities. In most cases, the network of alleyways is not accounted while defining, assessing, or interpreting the urban forms of cities. Thus, this research aims to contribute to the existing literature by carrying out a typological index of alleyways.

Alleyways and streets are similar in many respects. Both are thoroughfares of movement and exist as a vast web of interconnected segments. However, streets are considered more important as circulation elements, utility holders, as well as arenas for heterogeneous social encounter and political expression (Rapoport, 1987; Lefebvre, 1996; Mehta, 2013). The importance of streets is attributed to three factors. First, they are the initial point of design and hence heavily impact city form as well as city vitality (Victor and Masegale, 2013; Jacobs, 1961). Second, streets are ubiquitous as they sometimes occupy over 50% of urban land (Moudon, 1987). Consequently, the seemingly minor changes in street standards augment and eventually impact the number of blocks, access points, route options, trip lengths, and even transportation mode choice (Ben Joseph and Southworth, 2003). Third, a copious amount of research is dedicated to how streets are, in effect, social spaces which promote place-making, tolerance, and innovation (Mehta, 2013).

Despite alley’s novelty and rising importance, studies on street networks often omit alleys or label them as a single type without identifying their shapes and patterns. Scholars classified streets based on their pattern and function such as gridded streets, fragmented, looping, curving, and dendritic. Similar to streets, not all alleys are identical. Alleys can be motorized or non-motorized, they can be overlooked by building fronts/ sides/ backs, they can be located in zones of varying uses and densities, and they vary in width and morphology (Doty, 1983; Fialko and Hampton, 2011; Hage, 2014). Thus, an in-depth understanding of the typologies of alleys is lacking in the literature.

The article takes Abu Dhabi and Dubai’s urban evolution as case studied and intends to explore how the morphology of alleys evolved over the years within different street patterns. This study takes a total of twelve neighborhoods, six each from Dubai and Abu Dhabi. Dubai neighborhoods include: like Dubai Creek, Al Satwa, Al Badaa, Al Rashidiya, Al Quoz, and Al Warqa whereas, Abu Dhabi neighborhoods include West Island, Baniyas, Khalifa City, Al Bahya, MBZ, and Al Falah. The selected neighborhoods represent different growth phases such as Inception (1967-1980), and Dispersion (1980-2007) in both cities, while the Redemption (2007-Present) is applicable only for Abu Dhabi. Previous studies have calculated the street network’s efficiencies (Hillier, 2007; Peponis et al., 2008; Rashid, 2017), and the contribution of alleyways in improving the efficiency. However, the alleyways were not differentiated, and all alleys were treated the same. Thus, this study explores and categories the alleys according to their differing morphologies by answering the following research questions: - What are the different typologies of alleyways? How have the typologies of alleys varied across different growth phases in Abu Dhabi and Dubai in terms of pattern?

### **PLANNING AND DESIGN OF THE SITE SYSTEM FOR STREET VENDORS IN COMMUNITIES OF DOWNTOWN CHONGQING, CHINA**

Abstract ID: 404

Poster

HU, Miao [College of Architecture and Urban Planning, Tongji University] 2557569172@qq.com, presenting author

In April 2020, after China's prevention of Covid-19 became gradually stable, the "street vendor economy" was proposed as a "catalyst" to stimulate economic recovery. Important and basic work was to select a series of suitable sites for street vendors scientifically so that they not only meet the everyday needs of residents but also meet the requirements of epidemic prevention. This paper takes Chongqing, one of the cities with the richest everyday urban activities in China, as an example and examines how to use GIS, POI data, suitability evaluation of the land, and other techniques and methods to establish a system of sites for street vendors in communities.

First, this paper reviews related theories and practices and proposes three steps for the selection of sites: a) Preliminarily determine the demands of each community based on the local demographic structures; b) Determine the principles, goals, and criteria in the selection of sites, evaluate and give scores to the suitability of all the available plots, and select the most suitable ones as sites; c) Determine the number of street vendors and the range of goods in each site with the help of local communities and design how to manage these sites. Next, this paper elaborates on how these steps are carried out:

Estimate communities' needs and screen candidate plots: Analyze community plans and the demographic characteristics of each community, and estimate the total number of street vendors and the main types of goods required. Screen all the available plots in GIS according to the plan of public space, including street open spaces, small green spaces, squares, etc., and exclude plots that obstruct traffic or threaten public safety. The design uses 10m\*10m as a unit of plot, which can accommodate about 10 market stalls.

Evaluate the suitability of the plots in GIS: Divide all the candidate plots into a 5m\*5m grid, and set three goals for the evaluation of plots: a) Select plots with good traffic accessibility. The criteria include plots' distance from main streets, plots' distance from bus stations, the density of surrounding bus stations, and plots' distance from the entrances of the metro. b) Select plots with high urban vitality. The criteria include the POI kernel density of surrounding commercial facilities, the POI kernel density of surrounding social and cultural facilities, and the density of people at the gates of surrounding schools, residential and industrial compounds. c) Combine sites with historical and landscape resources as much as possible to shape cultural assets and promote the development of communities. The criteria include the point density of surrounding historical buildings and community parks and

plots' distance from them. After that, it standardizes scores of each criteria map, calculates their weights by using the AHP method, overlays all the criteria maps, and weights the maps. After several adjustments and the sensitivity analysis, it will obtain the result of the suitability evaluation.

Community management and the selection of goods: Considering the coverage rate and uniformity of the site system, the plan selects 1 or 2 most optimal plots from each community as the final sites for street vendors. The plan draws their 300m buffer zones (the 5-minute walk), analyzes the POIs and population in the buffer zones, and thereby determines the main types of goods and numbers of street vendors on each site. This part of the work is completed with the help of community committees. Many other issues are discussed as well.

To sum up, this paper reflects the new trends of Chinese urban planning under the current background of China's reform of territory spatial planning and the rise of community planning and urban design.

## **ANALYZING THE EFFECTS OF WALKABLE ENVIRONMENTS ON COMMERCIAL PROPERTY VALUES BASED ON DEEP LEARNING APPROACHES**

Abstract ID: 627

Poster

SHIN, Hyung Sup [Hanyang University] shin5494@hanyang.ac.kr, presenting author

WOO, Ayoungh [Hanyang University] ayounghwoo@hanyang.ac.kr, primary author

Walking behavior, which can be encouraged from surrounding environments in neighborhoods, substantially affects the quality of urban residents' life. Walkable environment not only enhances public health and social outcomes regarding individual physical health and social interaction, but also promotes environmental outcomes in terms of reducing air pollution and improving streetscape (Talen & Koschinsky, 2013). Hence, there is a growing consensus among urban planners, policymakers, and public health leaders that the promotion of walkability and walkable environments is a significant issue for residents in current society (Pivo & Fisher, 2011).

Along with social, environmental, and public health benefits, walkable environments may provide multifaceted economic outcomes in neighborhoods, particularly in terms of increasing property values and tax revenues, and decreasing transportation costs (Li, W. et al., 2015). Particularly, as various benefits of neighborhood walkability can be capitalized and reflected into surrounding property values, many studies empirically examined the associations between walkable environments and surrounding property values. Despite some studies examining the impacts of neighborhood walkability on residential property values, there is a limited understanding of the relationships

between walkable environments and ‘commercial’ property values. Neighborhood walkability may play a significant role in economically affecting neighboring commercial properties because commercial business may be more sensitive to pedestrian (i.e., potential customer) volume that may be directly resulted from the quality of walkable environments. Hence, this study focuses on specifying the associations between neighborhood walkability and commercial property values.

In terms of empirically measuring walkable environments, many previous studies used the Street Smart Walk Score and/or various elements of the 3Ds (e.g., density, diversity, and design) in neighborhoods although there are no standard approaches to measuring neighborhood walkability. For instance, Li et al. (2015) identified neighborhood walkability based on Street Smart Walk Score obtained from walkscore.com while Yin et al. (2020) used an accessibility-walkability index (AWI). However, previous approaches may not account for individual perception of the street image from the pedestrian’s perspective and the harmonization of various built environments along streets (Yin, L., & Wang, Z., 2016). Our research fills this gap by employing deep learning techniques—allowing to objectively measure street view image at the eye level of pedestrians—to identify neighborhood walkability.

This study empirically examines the spatial effects of walkable environments on commercial property values in Seoul, Korea. Based on around 8,000 commercial sales transactions between 2017 and 2019, we employ the spatial hedonic price model to clarify the relationships between neighborhood walkability and commercial property values. Particularly, this study estimates walkable environments through the Deep Learning technology: Semantic Segmentation based on Google Street View panorama images. Beyond the traditional measures on neighborhood walkability (e.g., 3Ds in terms of the accessibility to subway stations, bus stops and parks, the density of intersections and crosswalks, and land use mix), the deep learning measures may specify the visual preference and satisfaction of pedestrians at the street-level walkability. The results of this study may suggest a variety ways to encourage walkable environments positively increasing the economic values of commercial properties.
