Zhu, Yihan, "Almost periodic functions and almost periodic equidistributed functions" (2022). *UWill Discover Conference*. 24.

<https://scholar.uwindsor.ca/uwilldiscover/2022/2022Day1/24>

This Event is brought to you for free and open access by the Conferences and Conference Proceedings at Scholarship at UWindsor. It has been accepted for inclusion in UWill Discover Conference by an authorized administrator of Scholarship at UWindsor. For more information, please contact [scholarship@uwindsor.ca](mailto:scholarship@uwindsor.ca).

# Almost Periodic Functions and Equidistribution

Yihan Zhu

joint work with

Dr. Mehdi S. Monfared

University of Windsor

March, 2022

# Outline

- 1 Almost periodic functions
- 2 Equidistributed sequences
- 3 Almost periodic equidistribution
- 4 The Weyl Criterion

## Periodic phenomena in our lives:

- The recurrences of days and nights repeat every 24 hours.
- Seasons occur regularly roughly every  $365\frac{1}{4}$  days.

# Periodic phenomena in our lives:

Figure 1: Motion of the Earth around the Sun and motion of the Moon around the Earth

# Periodic functions (on real line $\mathbb{R}$ )

**Question: Is the linear combination of two periodic motions still be periodic?**

# Periodic functions (on real line $\mathbb{R}$ )

**Question: Is the linear combination of two periodic motions still be periodic?**

If  $f$  and  $g$  are two periodic functions,  $f + g$  need not be periodic. For example, the function

$$h(t) = \cos t + \cos \sqrt{2}t$$

is not periodic since the equation

$$h(t) = 2,$$

has a single solution  $t = 0$ .

**This phenomenon leads us to the notion of “almost periodicity”.**

# An Almost Periodic Motion

- 4 The Weyl Criterion

# Almost periodic functions on topological groups

In 1926 and 1927, mathematicians Bohr and Bochner gave equivalent version of definitions of almost periodic functions on real line  $\mathbb{R}$  respectively. In this research we will consider almost periodicity of functions on topological group  $G$  [1]. We denote the set of all continuous almost periodic functions on topological group  $G$  by  $AP(G)$ .

# Almost periodic functions on topological groups

In 1926 and 1927, mathematicians Bohr and Bochner gave equivalent version of definitions of almost periodic functions on real line  $\mathbb{R}$  respectively. In this research we will consider almost periodicity of functions on topological group  $G$  [1]. We denote the set of all continuous almost periodic functions on topological group  $G$  by  $AP(G)$ .

## Some advantages of almost periodic functions:

- (i) Every periodic function is almost periodic.
- (ii) If  $f, g$  are in  $AP(G)$ , then  $f + g$  and  $fg$  are in  $AP(G)$ .

# Outline

- 1 Almost periodic functions
- 2 Equidistributed sequences**
- 3 Almost periodic equidistribution
- 4 The Weyl Criterion

# Equidistributed sequences

Equidistribution is also known as uniform distribution. The formal definition of equidistribution mod 1 of sequences was given initially by Weyl [4] in 1916. A sequence  $\{x_n\}_n$  in  $[0, 1]$  is **equidistributed** if for every interval  $[a, b] \subset [0, 1]$ ,

$$\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^N 1_{[a,b]}(x_n) = b - a. \quad (1)$$

# Equidistributed sequences

Equidistribution is also known as uniform distribution. The formal definition of equidistribution mod 1 of sequences was given initially by Weyl [4] in 1916. A sequence  $\{x_n\}_n$  in  $[0, 1]$  is **equidistributed** if for every interval  $[a, b] \subset [0, 1]$ ,

$$\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^N 1_{[a,b]}(x_n) = b - a. \quad (1)$$

For example, the sequence

$$0, \frac{1}{2}, 0, \frac{1}{3}, \frac{2}{3}, 0, \frac{1}{4}, \frac{2}{4}, \frac{3}{4}, 0, \frac{1}{5}, \frac{2}{5}, \dots$$

is equidistributed along  $[0, 1]$ .

# Example 1

If  $\gamma$  is irrational, then the sequence of fractional parts  $\langle \gamma \rangle, \langle 2\gamma \rangle, \langle 3\gamma \rangle, \dots$  is equidistributed in  $[0, 1)$ . (Bohl, Sierpiński, Weyl, 1909-1910)

Figure 2: The set  $\{\langle \gamma \rangle, \langle 2\gamma \rangle, \langle 3\gamma \rangle, \dots, \langle N\gamma \rangle\}$  when  $\gamma = \sqrt{2}$

## Example 2

In particular, an equidistributed sequence must be dense in  $[0, 1]$ , and finite sequences are not equidistributed in this sense.

For example, the sequence  $\langle \frac{np}{q} \rangle$  is not equidistributed since it is finite.

# Outline

- 1 Almost periodic functions
- 2 Equidistributed sequences
- 3 Almost periodic equidistribution**
- 4 The Weyl Criterion

# Almost periodic equidistribution

In our research, the notion of equidistribution was extended from sequences to the more general case of functions.

## Definition 1 (a.p.-equidistribution)

Let  $S$  be a locally compact space equipped with a regular Borel measure  $\lambda$ , and a monotone compact cover  $\{K_\alpha\}_{\alpha \in I}$ . Let  $H$  be a topological group and  $M$  the invariant mean on  $AP(H)$ . A continuous mapping  $\varphi : S \rightarrow H$  is called **a.p.-equidistributed** along  $\{K_\alpha\}_{\alpha \in I}$  if for all  $f \in AP(G)$ ,

$$\langle M, f \rangle = \lim_{\alpha \in I} \frac{1}{\lambda(K_\alpha)} \int_{K_\alpha} f \circ \varphi(s) d\lambda(s). \quad (2)$$

# Outline

- 1 Almost periodic functions
- 2 Equidistributed sequences
- 3 Almost periodic equidistribution
- 4 The Weyl Criterion

# The Weyl Criterion

An important tool for verification of equidistribution of sequences is the Weyl criterion, which is given by Weyl [4] in 1916.

The sequence  $(x_n)_n$  of real numbers is equidistributed mod 1 if and only if

$$\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^N e^{2\pi i h x_n} = 0 \quad (3)$$

for all integers  $h \neq 0$ .

# Our Generalization on the Weyl Criterion

In our research [3], this criterion has been extended so that it becomes a useful tool for verification of equidistribution of functions.

## Theorem 2 (the generalized Weyl criterion)

*Let  $S$  be a locally compact space equipped with a regular Borel measure  $\lambda$  and a monotone compact cover  $\{K_\alpha\}_{\alpha \in I}$ . Then a continuous mapping  $\varphi : S \rightarrow H$  is a.p.-equidistributed along  $\{K_\alpha\}_{\alpha \in I}$  if and only if*

$$\lim_{\alpha \in I} \frac{1}{\lambda(K_\alpha)} \int_{K_\alpha} (\sigma_{ij} \circ \varphi)(s) d\lambda(s) = 0, \quad (4)$$

*for all  $\sigma \in \mathcal{R}_H$ ,  $\sigma \not\equiv 1_H$ ,  $1 \leq i, j \leq d_\sigma$ .*
