Exploring the VISTA of glial cells

Astrocytes and microglia from
development to disease

Malte Borggrewe

Propositions

Accompanying the doctoral thesis

Exploring the VISTA of glial cells

Astrocytes and microglia from development to disease

1. Enhancing VISTA signaling amplifies inhibitory signals in neuroinflammation and alleviates multiple sclerosis burden (this thesis).
2. VISTA has important functions in peripheral immunity, but also in the healthy central nervous system, hence modulating its function should be done with great caution as side effects are difficult to predict (this thesis).
3. Microglia maturation during early development renders the fetal central nervous system vulnerable towards perturbations (this thesis).
4. Over-categorizing cellular heterogeneity is obstructive in finding meaningful cellular mechanisms (this thesis).
5. Data sets from omics studies must be more readily accessible for their use in future studies (this thesis).
6. Isolating astrocytes and microglia using (surface) markers poses the risk of bias for functional subtypes (this thesis).
7. True biological mechanisms can most reliably be identified by integrated use of tissue culture, animal models, and intact human tissues.
8. The rise of science deniers illustrates a severe gap between scientists and society, a gap that can only be bridged by researchers engaging with the public and politicians standing up for science.
9. The SARS-CoV-2 pandemic highlights that unconditional data sharing and open science is key to accelerate lifesaving scientific discoveries.
10. Academia suffers from a mental health crisis, and universities are responsible to enforce environments with fair hours, acceptable pressure, and better support.
11. Science is a public good and thus it must be open and free.

Malte Borggrewe

The research presented in this thesis was conducted at the Department of Biomedical Sciences of Cells & Systems, section Molecular Neurobiology, University Medical Center Groningen, University of Groningen, The Netherlands.

The work in this thesis was financially supported by the Dutch MS Research Foundation, and the Jan Kornelis de Cock-Hadders Foundation. Printing of this thesis was financially supported by the University of Groningen, the University Medical Center Groningen, the Graduate School of Medical Sciences, and the Research School of Behavioural and Cognitive Neurosciences.

Cover design & layout: Malte Borggrewe

The book cover and chapter cover pages illustrate a scenic view (VISTA) of glial cells from development to disease.

Print: Ridderprint

This thesis was printed on FSC-certified recycled paper.

ISBN: 978-94-6416-544-9

Exploring the VISTA of glial cells

Astrocytes and microglia from development to disease

PhD thesis

to obtain the degree of PhD at the
 University of Groningen
 on the authority of the
 Rector Magnificus Prof. C. Wijmenga
 and in accordance with
 the decision by the College of Deans.

This thesis will be defended in public on

Wednesday 12 May 2021 at 9.00 hours

by

Malte Borggrewe

born on 4 August 1990
 in Ostercappeln, Germany

Supervisors

Prof. J.D. Laman

Prof. B.J.L. Eggen

Co-supervisor

Dr. S.M. Kooistra

Assessment Committee

Prof. P. Heeringa

Prof. D. van Baarle

Prof. A. Waisman

Paranymphs

Alessandro Grillini

Laura Kracht

Contents

Chapter 1: General introduction and outline of the thesis	8
Glial cells: more than neurons little helper	11
Microglia in the spotlight	14
A brief guide to multiple sclerosis	19
The multifaceted molecule VISTA	23
Outline of the thesis	32
Chapter 2	34
Human fetal microglia acquire homeostatic immune-sensing properties early during development	
Chapter 3	58
Regionally diverse astrocyte subtypes and their heterogeneous response to EAE	
Chapter 4	82
VISTA expression by microglia decreases during inflammation and is differentially regulated in CNS diseases	
Chapter 5	106
Assessing microglia VISTA expression in CNS inflammatory and degenerative diseases using public domain RNA-sequencing data sets	
Chapter 6	116
VISTA regulates microglia homeostasis and myelin phagocytosis, and is associated with MS lesion pathology	
Chapter 7: General discussion and future perspectives	144
Microglia in neurodevelopment	146
Astrocytes and their interaction with microglia in MS	151
VISTA role in microglia and the CNS and its therapeutic potential for MS	155
Chapter 8: Appendices	166
Abbreviations	168
References	172
Nederlandse samenvatting	194
English summary	198
Acknowledgements	202
