Acknowledgements

The research on multiagent systems described in this thesis was conducted at the faculty of Management and Organization (Faculteit Bedrijfskunde) of the University of Groningen, the Netherlands. People often ask how I got involved, as a cognitive psychologist, in doing research on multiagent systems. In looking back over the years, the answer is that people (individual) and how they interact as social systems (whole) always has been the focus of my attention. Early on in my career, I worked in the capacity of social therapist with groups of juvenile delinquents. After I graduated as a cognitive psychologist from the University of Utrecht in 1992, I worked as a research assistant for one year at the AI laboratory of the Rotterdam School of Management of the Erasmus University Rotterdam, on Distributed Management Information Systems. Considering this background, it was, conceptually speaking, not a difficult step for me to become a Ph.D. student and doing research on intelligent artificial “communities” that consist of collections of coordinated knowledge-based processes.

The research proposal that I wrote during my first year as a Ph.D. student already contained the ingredients and themes central to this thesis. First of all, the fact that multiagent systems are applied as simulation models of organization, to me held the consequence that the agents used must possess a degree of cognitive plausibility. The second theme is the notion that within artificial multiagent systems the social level sprouts from agent interaction and that the agents are the only tangible entities within social systems. The methodological implication is therefore that, being a distinct analytical level, the social level can only be described and explained in terms of the individuals and their representations. The third ingredient was the idea of an alignment study to prove the basic assumptions.

Despite this conceptual clarity, it took a while for me to understand the relation between the fields of cognition, multiagent systems and organization theory, and to understand what drove me to combine them. In retrospect, the central connection and my motivation was my firm belief that if one wants to understand collaborative systems one needs to have insight in the cognitive and representational aspects of the collaboration and coordination process. Modern team literature supports this notion with the acknowledgement that people involved in team activities, need (and have) team knowledge, i.e. knowledge that is related to the collaboration process itself, and which is additional to the individual task knowledge. The analyses of the cognitive aspects of cooperation and coordination, is nowadays labeled as Team Cognitive Task Analyses. The cognitive aspects of collaboration processes forms the conceptual counterpart of the so-called psycho-social factors covering phenomena like motivation, team coherence and leadership. At TNO Human Factors, my current employer, these two aspects are recognized and reflected by the fact that the Department of Group work consists of two sections called Distributed Decision Making and Psycho-Social Interactions. Working within the group work department, again provides me the opportunity of studying people working within collaborative and group work domains.

I thank my advisors Henk Gazendam, John Simons and René Jorna for allowing me the intellectual freedom and time for figuring out the deeper understanding of my work and for their trust in my competence and endurance to carry out this project. Having different backgrounds all three advisors had different roles and contributions to this project. René's background is on cognitive psychology and philosophy and I thank him for introducing me to the Soar cognitive architecture and the issue of knowledge representations in the mind. I thank John Simons, who is a mathematician, for the lessons learned on consistent reasoning and for guarding the logical consistency and transparency of this thesis. I thank Henk Gazendam, who has a background in formalization of organization theories, multiactor systems and financial information systems, for reading thousands of pages and discussing numerous drafts, for introducing me to organization theory and for sharing his insights with me. Apart from their individual contributions also the joint session where of much value to me because they always resulted in interesting and intense discussions in which the concepts and ideas were put to the test. I consider it an important collective and collaborative achievement that this thesis satisfies them all.

Many colleagues at the faculty of management and Organization have contributed to this undertaking in various ways. In particular, I would mention, in alphabetical order, Jacques Boersma, Ad Breukel, Bert de Brock, Constantijn Heesen, Vincent Homburg, Derk Jan Kiewiet, Han Numan, Magriet Offereins, Johan Oldenkamp, Dick Schaap, Simon Sibum, Hans van Uitert, and Swen van der Zee.

Outside the university of Groningen, I thank the Soar community for their support, especially Frank Ritter, Aladdin Akyurek, Jans Aasman, and Richard Young. I have enjoyed and benefited from my contacts with Kathleen Carley at the Carnegie Mellon University and Harko Verhagen of the university of Stockholm. I also thank the people of the special interest group of Agent Based Social Simulation, especially Rosario Conte and Cristiano Castelfranchi. I thank Tomas Klos and Ad van den Broek for their support and discussions, and for being my "paranymphs". I also thank my colleagues of the department of Groupwork at TNO Human Factors for their support with completing this thesis and for discussing and shearing the results with me. I thank Kumar Jamdagni for his excellent work on improving my English and correcting the final manuscript.

I would also like to thank my family for their support and interest in this research and I especially thank my brother Ad van den Broek and his wife Lia for their help and support in the past, without which I would not have achieved all of this.

Finally, I thank Margo with all my heart for here love and indispensable support, for the valuable discussions on people and social systems, and here endurance and patience during all these years.

Cheers, Hans van den Broek,
Zwolle, Oktober 2000.

Table of contents

Chapter 1.....	1
Introduction	1
1.1 The subject	1
1.2 Introducing the research question	3
1.3 The alignment study	6
1.4 Relating multiagent systems and organization theory	9
1.5 Elaborating the research question	12
1.6 The structure of the thesis.....	16
Chapter 2.....	17
Computational Multiagent Systems.....	17
2.1 Introduction	17
2.2 The Distributed AI approach.....	17
2.3 Relating the individual level to the social level	24
2.4 Emergence.....	33
2.5 Conclusion.....	39
Chapter 3.....	41
Modeling Organizations	41
3.1 Introduction	41
3.2 The coordination model.....	41
3.3 How does the multiple-agent model align with organization theory?.....	48
3.4 The fit between organization theories and multiagent models	58
3.5 Refuting criticism on the individualistic view on organizations.....	66
3.6 The way around psychological reductionism	71
3.7 Conclusion.....	74
Chapter 4.....	77
Modeling individuals	77
4.1 Introduction	77
4.2 The bounded rationality model.....	78
4.3 Agent requirements.....	81

4.4	From agent specification to agent implementation.....	89
4.5	Agents as knowledge level systems.....	91
4.6	The Soar cognitive architecture	102
4.7	Conclusions	110
Chapter 5.....		111
The alignment study.....		111
5.1	Introduction	111
5.2	The simulation experiment.....	111
5.3	The experimental design	118
5.4	The simulation environment	125
5.5	Summary and conclusion	131
Chapter 6.....		133
The micro-level aspects of the alignment study.....		133
6.1	Introduction	133
6.2	Learning within the non-cooperative work condition	133
6.3	The single Soar agent performance data	142
6.4	Discussing the learning mechanisms of the two agent models.....	146
6.5	Discussing data chunking.....	151
6.6	Summary and conclusions concerning the micro-level aspects of the alignment study.....	155
Chapter 7.....		159
The macro-level aspects of the alignment study.....		159
7.1	Introduction	159
7.2	The cooperative work condition	159
7.3	The experimental results.....	172
7.4	Conclusions and discussion concerning the replicated experiment.....	180
7.5	Conclusions and discussion concerning the original experiment	181
7.6	Conclusions and discussion concerning the multiagent level of both experiments	183
Chapter 8.....		185
General conclusions		185

8.1	Introduction	185
8.2	Theoretical conclusions	185
8.3	Conclusions of the alignment study.....	189
8.4	Addressing the central research question	196
8.5	Final remarks.....	198
	Literature.....	201
	Appendix A: The agent productions.....	209
	Appendix B: Simulator code	225
	Appendix C: The problem-solving view interface.....	238
	Appendix D: The non-cooperative condition data table.....	243
	Appendix E: The cooperative condition data table.....	249
	Samenvatting (Summary in Dutch)	255
	Index	261
