## 1. Introduction

In Section 3 of the published article, it was mistakenly reported that the proto-BCG is the second most massive galaxy in the protostructure. Instead, it is the second most massive galaxy in its parent density peak (peak [9]), but it is also consistent within the errors with being the most massive in that peak ( $M_* = 10^{10.90 \pm 0.04} M_\odot$  for the proto-BCG versus  $M_* = 10^{10.93 \pm 0.15} M_\odot$  for the other most massive galaxy candidate). It is among the top five most massive galaxies in the entire coeval spec- $z$  sample.
