

Compact Saloplastic Poly(Acrylic Acid)/Poly(Allylamine) Complexes: Kinetic Control Over Composition, Microstructure, and Mechanical Properties

Submitted by Emilie Roger on Wed, 10/12/2016 - 15:42

Titre	Compact Saloplastic Poly(Acrylic Acid)/Poly(Allylamine) Complexes: Kinetic Control Over Composition, Microstructure, and Mechanical Properties
Type de publication	Article de revue
Auteur	Reisch, Andreas [1], Tirado, Patricia [2], Roger, Emilie [3], Boulmedais, Fouzia [4], Collin, Dominique [5], Voegel, Jean-Claude [6], Frisch, Benoît [7], Schaaf, Pierre [8], Schlenoff, Joseph B [9]
Pays	Allemagne
Editeur	Wiley
Ville	Weinheim
Type	Article scientifique dans une revue à comité de lecture
Année	2013
Langue	Anglais
Date	11 fév. 2013
Numéro	6
Pagination	673-682
Volume	23
Titre de la revue	Advanced Functional Materials
ISSN	1616-301X
Mots-clés	hydrogels [10], polymeric materials [11], porous materials [12], stimuli-responsive materials [13], tissue engineering [14]
Résumé en anglais	<p>Durable compact polyelectrolyte complexes (CoPECs) with controlled porosity and mechanical properties are prepared by ultracentrifugation. Because the starting materials, poly(allylamine hydrochloride) (PAH) and poly(acrylic acid sodium salt) (PAA), are weak acids/bases, both composition and morphology are controlled by solution pH. In addition, the nonequilibrium nature of polyelectrolyte complexation can be exploited to provide a range of compositions and porosities under the influence of polyelectrolyte addition order and speed, and concentration. Confocal microscopy shows these “saloplastic” materials to be highly porous, where pore formation is attributed to a combination of deswelling of the polyelectrolyte matrix and expansion of small inhomogeneities by osmotic pressure. The porosity (15–70%) and the pore size ($< 5 \mu\text{m}$ to $> 70 \mu\text{m}$) of these materials can be tuned by adjusting the PAA to PAH ratio, the salt concentration, and the pH. The modulus of these CoPECs depends on the ratio of the two polyelectrolytes, with stoichiometric complexes being the stiffest due to optimized charge pairing, which correlates with maximized crosslinking density. Mechanical properties, pore sizes, and pore density of these materials make them well suited to three dimensional supports for tissue engineering applications.</p>
