

Sustainable management of scab control through the integration of apple resistant cultivars in a low-fungicide input system

Submitted by Bruno Le Cam on Tue, 11/10/2015 - 17:54

Titre	Sustainable management of scab control through the integration of apple resistant cultivars in a low-fungicide input system
Type de publication	Article de revue
Auteur	Didelot, Frédérique [1], Caffier, Valérie [2], Orain, Gilles [3], Lemarquand, Arnaud [4], Parisi, Luciana [5]
Pays	Pays-Bas
Editeur	Elsevier Masson
Ville	Amsterdam
Type	Article scientifique dans une revue à comité de lecture
Année	2016
Langue	Anglais
Pagination	41-48
Volume	217
Titre de la revue	Agriculture, Ecosystems & Environment
ISSN	0167-8809
Mots-clés	Chemical control [6], Cultural practices [7], durability [8], <i>Malus × domestica</i> [9], resistance [10], <i>Venturia inaequalis</i> [11] Evaluation of the sustainability of disease control strategies through experimental field studies is poorly documented. Plant genetic resistance to pathogens offers an interesting alternative to the use of pesticides, but pathogen populations are able to adapt, thus frequently resulting in the breakdown of the resistance. Partial resistance is considered to provide more durable resistance than major genes. However, partial resistance does not confer complete protection and its efficiency can also decrease. Developing appropriate strategies which integrate resistant cultivars into crop systems is therefore needed to increase the efficiency and durability of the resistance, whatever the kind of resistance. The aim of this study was to evaluate the relevance of the association of control methods in terms of increasing the efficiency and durability of two kinds of resistances: (i) partial resistance in the apple cultivar Reine des Reinettes and (ii) major resistance (Rvi6) in the apple cultivar Ariane, when planted in a region where the climatic conditions are very favourable to the disease. It was found that the removal of leaf litter in autumn together with spraying of fungicides in the case of moderate or high risks of scab infection resulted in a sustainable control of scab on Reine des Reinettes over a five-year period and delayed the breakdown of the major resistance Rvi6 of Ariane by virulent isolates.
Résumé en anglais	<p>Chemical control [6], Cultural practices [7], durability [8], <i>Malus × domestica</i> [9], resistance [10], <i>Venturia inaequalis</i> [11] Evaluation of the sustainability of disease control strategies through experimental field studies is poorly documented. Plant genetic resistance to pathogens offers an interesting alternative to the use of pesticides, but pathogen populations are able to adapt, thus frequently resulting in the breakdown of the resistance. Partial resistance is considered to provide more durable resistance than major genes. However, partial resistance does not confer complete protection and its efficiency can also decrease. Developing appropriate strategies which integrate resistant cultivars into crop systems is therefore needed to increase the efficiency and durability of the resistance, whatever the kind of resistance. The aim of this study was to evaluate the relevance of the association of control methods in terms of increasing the efficiency and durability of two kinds of resistances: (i) partial resistance in the apple cultivar Reine des Reinettes and (ii) major resistance (Rvi6) in the apple cultivar Ariane, when planted in a region where the climatic conditions are very favourable to the disease. It was found that the removal of leaf litter in autumn together with spraying of fungicides in the case of moderate or high risks of scab infection resulted in a sustainable control of scab on Reine des Reinettes over a five-year period and delayed the breakdown of the major resistance Rvi6 of Ariane by virulent isolates.</p>
