

Ligand-Induced Anisotropy of the Two-Photon Luminescence of Spherical Gold Particles in Solution Unraveled at the Single Particle Level

Submitted by Matthieu Loumagne on Tue, 07/21/2015 - 11:05

Titre	Ligand-Induced Anisotropy of the Two-Photon Luminescence of Spherical Gold Particles in Solution Unraveled at the Single Particle Level
Type de publication	Article de revue
Auteur	Loumagne, Matthieu [1], Richard, Alain [2], Laverdant, Julien [3], Nutarelli, Daniele [4], Débarre, Anne [5]
Pays	Etats-Unis
Editeur	Open Access House of Science and Technology
Ville	Fayetteville
Type	Article scientifique dans une revue à comité de lecture
Année	2010
Langue	Anglais
Date	Nov-08-2010
Numéro	8
Pagination	2817-2824
Volume	10
Titre de la revue	Nano Letters
ISSN	1530-6984
Mots-clés	Brownian rotation [6], dual correlation spectroscopy [7], gold-ligand interaction [8], Single molecule spectroscopy [9], two photon fluorescence correlation spectroscopy [10], two photon luminescence of gold Particles [11]
Résumé en anglais	<p>Here we report on the visible luminescence properties of individual spherical gold particles in solution, obtained by two-photon excited fluorescence correlation spectroscopy and by an original dual Rayleigh-fluorescence method, correlating the Rayleigh scattering and the luminescence fluctuations of the same particle. The results demonstrate that the power needed to observe the two-photon excited visible luminescence depends on the illuminated particle and that the corresponding emission is anisotropic at low power. These observations combined with the evolution of the dynamics of the luminescence with respect to excitation power are interpreted by the presence of unique emissive surface states that are randomly switched off and on by the heat-induced movement of the molecular coating. These characteristics, which remain hidden in macroscopic experiments, have important implications with respect to the potential use of the particles as labels in two-photon imaging in aqueous samples.</p>
